

# Workflow

# Things to do

---

- Short term:

- Hack digitization and reconstruction for calorimeter in and merge the two podio outputs.
- Solve memory leaks (and geometry overlaps).
- Make sure the code can run in multithread.
- Make sure the code can run on HepMC files.
- Make sure the simulation can run with G4 11 and the most recent key4hep stack.

- Longer term:

- What formats/content do we want at what stage?

# Last merge request (technical details)

- Cleanup of the repository
- `install_standalone` now using template scripts → No overwriting of scripts in repository
- Main `CMakeLists` file replaces `install_standalone` up to converter compilation.
