## Separator

- ❖ H and He burning:
  - ❖  ${}^7\text{Be}(p,\gamma){}^8\text{B}$  at  $E_{\text{cm}} > 1 \text{ MeV}$
- ❖  ${}^7\text{Be}$  Ionized Half Life (ASBeST)
  - ❖  ${}^7\text{Be}$  RIB production optimization
- ❖  ${}^{12}\text{C}(\alpha,\gamma){}^{16}\text{O}$ 
  - ❖ Total Cross section
  - ❖ Angular distribution (through gamma detection)

## Particle spectroscopy

- ❖ Advanced burnings
  - ❖  ${}^{12}\text{C}({}^{16}\text{O},p){}^{27}\text{Al}$  and  ${}^{12}\text{C}({}^{16}\text{O},\alpha){}^{24}\text{Mg}$

# $^{12}\text{C}(\alpha, \gamma)^{16}\text{O}$ ( $Q=7.162$ MeV)

- Low energy cross section is dominated by
  - The ground state transition
  - E1 and E2 multipolarities
  - A 1- and 2+ subthreshold state, a broad 1- resonance at 2.3 MeV
  - Interference effects are strong
  - Weak E2 direct capture can interfere with strong E2 subthreshold state to produce a sizable effect, for example

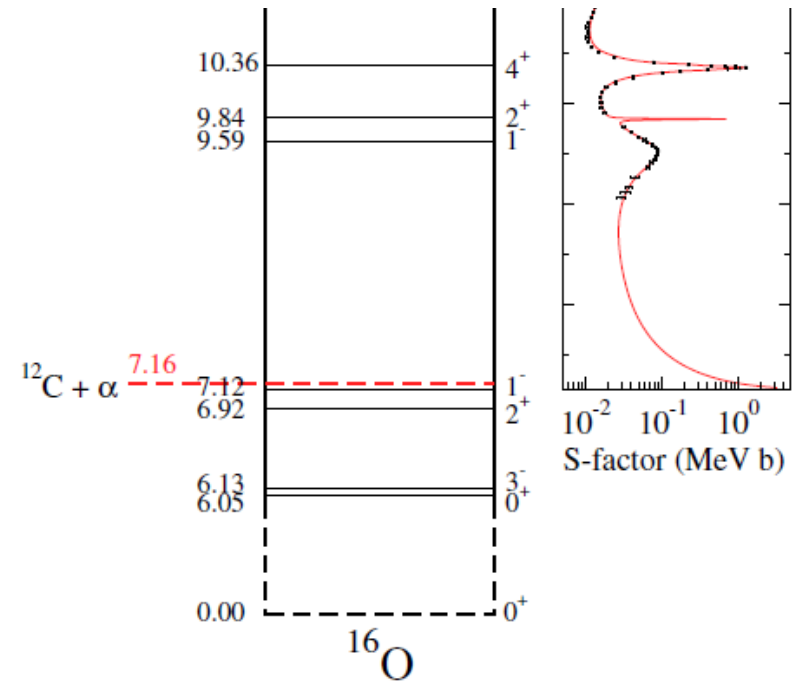

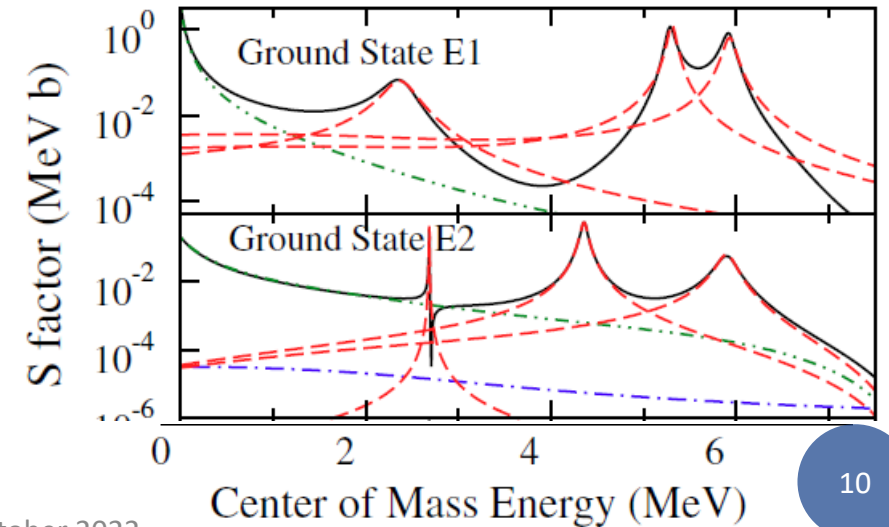

Figure 2: Schematic drawing of the ToF-tracking detector.

# Triple- $\alpha$

→ new experiments are required!

Recently approved experiment MORALIS @ INFN-LNL (2023) aims to measure  $\Gamma_{rad}/\Gamma$  using *particle-particle coincidence techniques*.

Using **fragment separators** might help to perform an experiment with *enhanced sensitivity*, a possible reaction:  $^{13}\text{C}(^3\text{He},\alpha_2)^{12}\text{C}^*$ ,  $\Gamma_{rad}/\Gamma$  can be extracted measuring  $\alpha_2$ - $^{12}\text{C}$  coincidence with  $^{12}\text{C}$  close to 0-degrees → **ERNA @ CIRCE**.

A complementary alternative, underground  $\gamma$ -spectroscopy experiments using  $^3\text{He}$  beams at 3 MeV on  $^{13}\text{C}$  targets to populate the Hoyle state →  $\gamma$ -cascade reconstruction with *zero-background* → **Underground**.

For  $T > 2$  GK → higher excitation energy states in  $^{12}\text{C}$  play a role → present spectroscopic ambiguities call for **high-sensitivity particle or  $\gamma$ -spectroscopy experiments**.

## 12C+12C

## 12C+16O

50 years of measurements still carry huge uncertainties, discrepancies between data sets and inaccurate extrapolations → Direct measurements are required!

Both reactions can be measured at low energies with charged particles (protons and alphas) at CIRCE-DM.

### Estimated beam on target:

- 4 months for **12C+12C** (up to  $E_{cm} = 2$  MeV)
- 1 months for **12C+16O** (up to  $E_{cm} = 3$  MeV)

(Received 2 December 1983)

- A single measurement of the resonance strengths.
- Actually, measurements on going at DRAGON separator.
- Large acceptance necessary, due to large  $Q_{\text{value}}$ , update necessary.
- There are a lot more  ${}^{10}\text{B}+p$  data
- Multichannel R-matrix calculations
- Obtaining a simultaneous fit to all data has proved to be very challenging.

FIG. 4. Resonance curves for the  ${}^7\text{Be}(\alpha,\gamma){}^{11}\text{C}$  reaction. For both resonances the yield of  $\gamma$  rays to the ground-state transition is plotted.

  - \*  ${}^7\text{Be}(d,p){}^8\text{Be}$  with THM
- \* H and He burning:
  - \* Triple- $\alpha$  process ( ${}^{13}\text{C}({}^3\text{He},\alpha_2){}^{12}\text{C}^*$ )
  - \*  ${}^{16}\text{O}(\alpha,\gamma){}^{20}\text{Ne}$ 
    - \* Total Cross section
    - \* Angular distribution
- \* AGB  ${}^{19}\text{F}$  nucleosynthesis
  - \*  ${}^{15}\text{N}(\alpha,\gamma){}^{19}\text{F}$
  - \*  ${}^{14}\text{N}(\alpha,\gamma){}^{18}\text{F}$
- \* Advanced burnings
  - \*  ${}^{12}\text{C}({}^{12}\text{C},p){}^{23}\text{Na}$  and  ${}^{12}\text{C}({}^{12}\text{C},\alpha){}^{20}\text{Ne}$  (chiedere energia LIZ)
- \* P-process
  - \*  ${}^7\text{Be}(\alpha,\gamma){}^{11}\text{C}$
- \* Other applications:
  - \* THM applications  ${}^{13}\text{C}(\alpha,n){}^{16}\text{O}$  ;  ${}^{22}\text{Ne}(\alpha,n){}^{25}\text{Mg}$ ;  ${}^{23}\text{Na}(p,\alpha){}^{20}\text{Ne}$ .
  - \* **Ionized Gas Jet Target (CIRA collaboration)**

# Electron screening- Ionized Supersonic Gas Jet Target

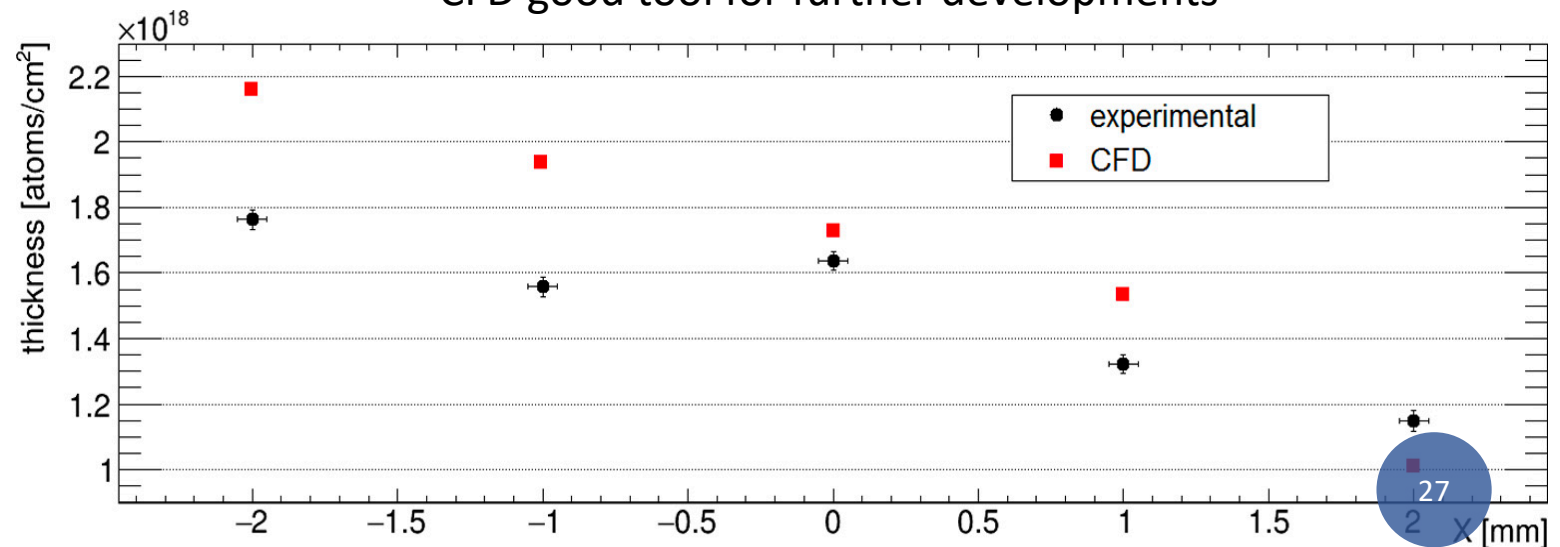

- short (less than 1 cm)
- dense  $\sim 10^{18}$  nuclei /  $\text{cm}^2$
- auto-confinement, i.e. no gas diffusion in the reaction chamber
- ionizable

## OUTLOOKS

- heat conditions for ionization must be calculated in advance (CEA2, NExT codes)
- a possible market available technology should be found

CFD good tool for further developments

# Thanks
