## **”Measurement of the CR light component primary spectrum”**

*Wednesday, 25 May 2011 14:30 (20 minutes)*

The ARGO-YBJ experiment, located at Yangbajing Cosmic Ray Laboratory (Tibet, 4300 m a.s.l.,  $606 \text{ g/cm}^2$ ) has an high segmentation that allows the detection of air showers with greater granularity and lower energy threshold than other EAS-arrays. The spectrum of the primary Cosmic Rays light (p+He) component in the energy range  $\sim 10 - 100 \text{ TeV}$  is measured selecting vertical showers with the reconstructed core position located in a  $40 \times 40 \text{ m}^2$  fiducial area. The results are compared with other measurements carried out with direct methods.

**Primary authors:** Dr PANICO, Beatrice (Universita' Roma Tor Vergata - INFN Roma Tor Vergata); Dr DI SCIASCIO, Giuseppe (INFN Sezione di Roma Tor Vergata)

**Presenter:** Dr PANICO, Beatrice (Universita' Roma Tor Vergata - INFN Roma Tor Vergata)

**Session Classification:** Parallel session: High Energy Gamma and Neutrino
