

# **EuAPS – X-rays Betatron Radiation Source at SPARC\_LAB**

Alessandro Cianchi  
University of Rome Tor Vergata and  
INFN

On behalf of WP2 EuAPS project

---

Betatron radiation

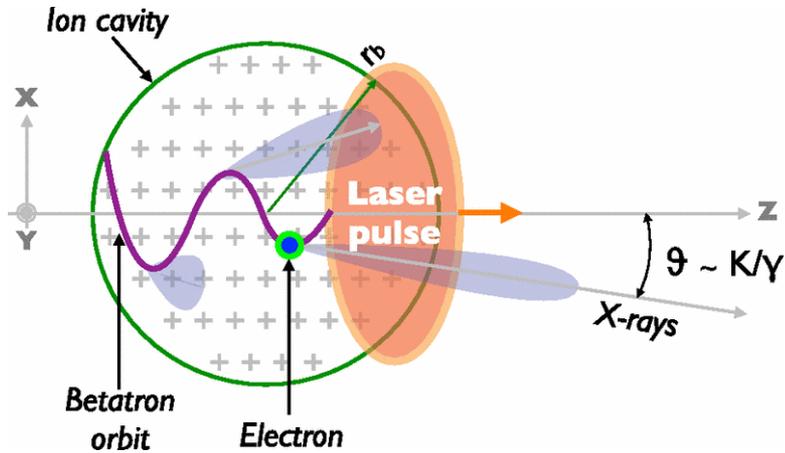

WP description

Upgrade of the current layout

Tentative agenda

$$\left. \frac{d^2 I}{d\omega d\Omega} \right|_{\theta=0} = \sum_{n=1}^{\infty} \frac{e^2}{\pi \epsilon_0 c} \frac{\omega}{\omega_n} \frac{\gamma^2 N_{\beta}^2 F_n R_n}{1 + K_{\beta}^2/2}$$

$$K_{\beta} = \gamma k_{\beta} r_{\beta} \quad k_{\beta} = \frac{k_p}{\sqrt{2\gamma}}$$

$$r_{\beta}^{\max} = \frac{2\sqrt{a_0}c}{\omega_p}$$

$$N_{ph} \propto N_e N_{\beta} K \propto N_e N_{\beta} \sqrt{\gamma n_e} r_{\beta}$$

$$\theta_r \propto K/\gamma \propto \sqrt{n_e} r_{\beta} / \sqrt{\gamma}$$

$$\Delta\theta_{\perp} \sim 1/\gamma$$

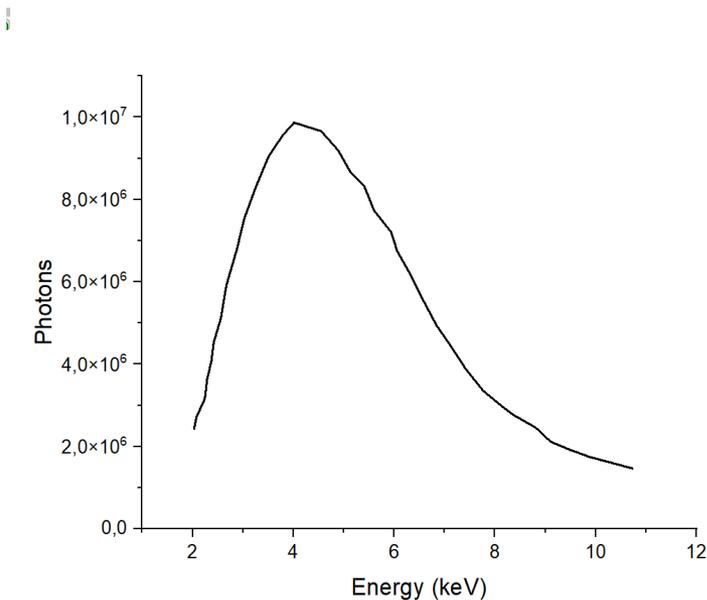

$$\hbar\omega_c \propto \gamma^{1.5} \sqrt{n_e} K \propto \gamma^2 n_e r_{\beta}$$

$$\langle N_{\gamma, \hbar\omega_c} \rangle \simeq \frac{2\pi}{9} \frac{e^2}{\hbar c} K N_{\beta} \simeq 5.6 \times 10^{-3} K N_{\beta}$$

First measurements of betatron radiation at FLAME laser facility

A. Curcio<sup>a,b,\*</sup>, M. Anania<sup>a</sup>, F. Bisesto<sup>a,b</sup>, E. Chiadroni<sup>a</sup>, A. Cianchi<sup>a</sup>, M. Ferrario<sup>a</sup>, F. Filippi<sup>a,b</sup>, D. Giulietti<sup>c</sup>, A. Marocchino<sup>a</sup>, F. Mira<sup>b</sup>, M. Petrarca<sup>d</sup>, V. Shpakov<sup>a</sup>, A. Zigler<sup>a,e</sup>

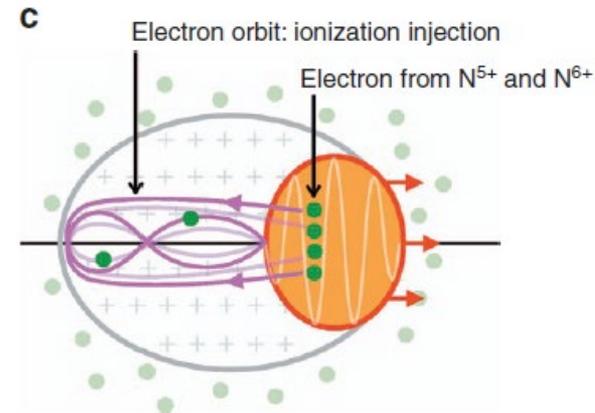

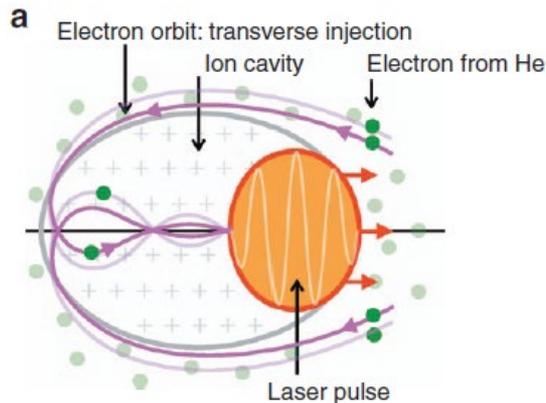

**Fig. 6.** Betatron radiation spectrum detected by the *CdTe* spectrometer. Laser, plasma and electron parameters: energy per pulse  $E_L = 1.5$  J, pulse duration  $\tau = 35$  fs, focus rms radius  $\sigma_r \sim 5$   $\mu\text{m}$ . Electron plasma density  $n_e \sim 6 \pm 1 \times 10^{18}$   $\text{cm}^{-3}$ , electron mean energy 200 MeV, energy spread 30%, electron beam divergence 12 mrad, bunch charge 20 pC. The acceleration length was 1 mm.

- Result already obtained at Flame with He

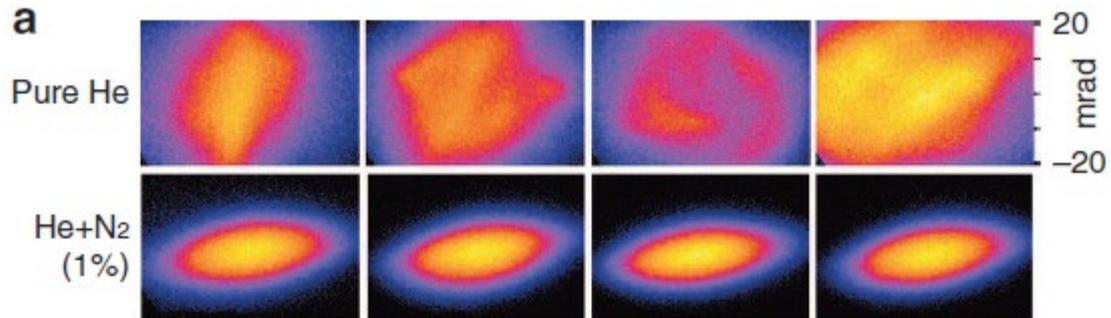

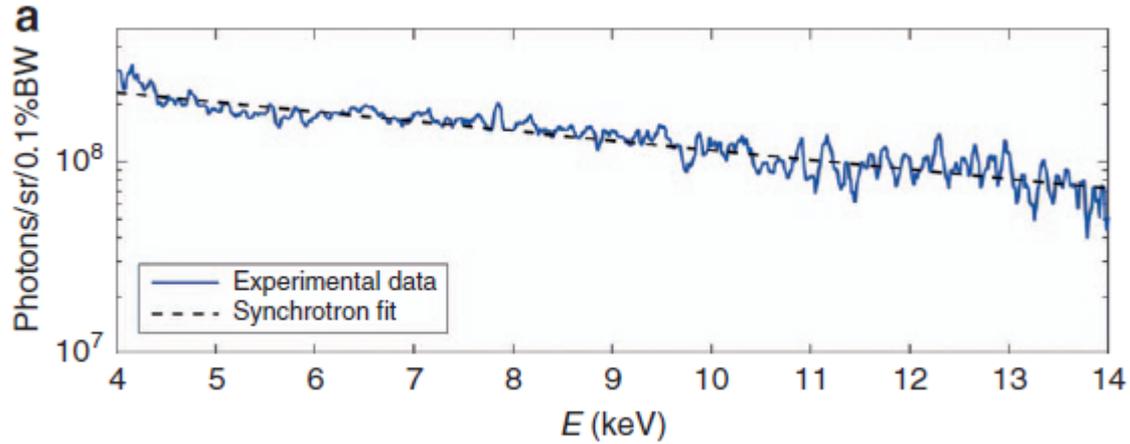

## Stable femtosecond X-rays with tunable polarization from a laser-driven accelerator

*Light: Science & Applications* (2017) **6**, e17086; doi:10.1038/lsa.2017.86; published online 17 November 2017

- Higher charge -> higher photons
- Higher stability
- Polarized X-rays

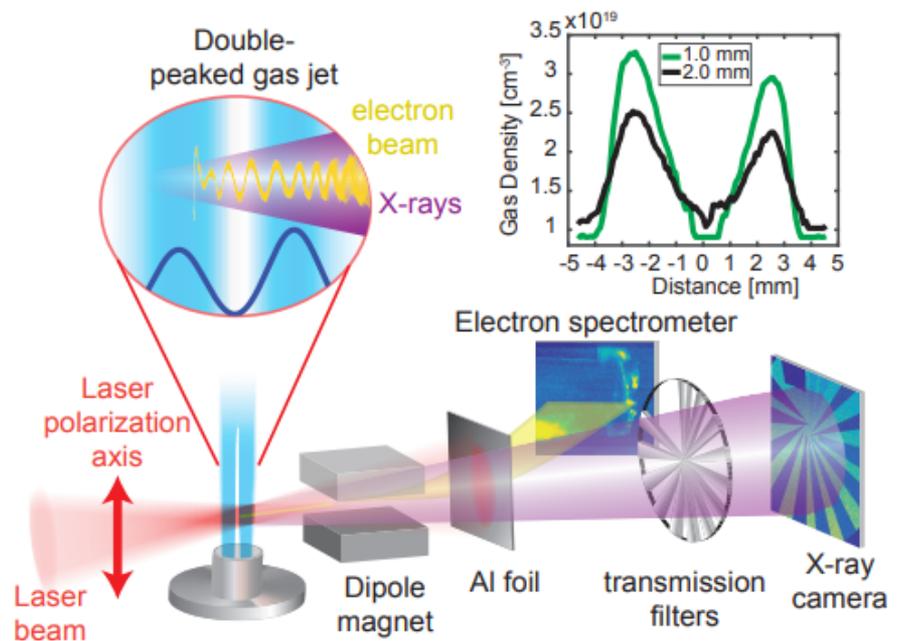

## Transverse Oscillating Bubble Enhanced Laser-driven Betatron X-ray Radiation Generation

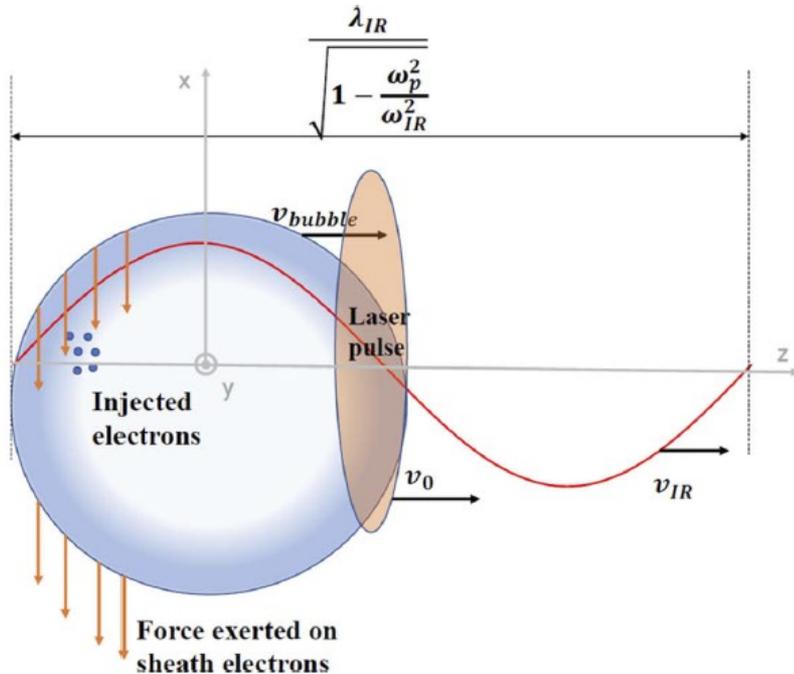

Rafal Rakowski,<sup>1, a)</sup> Ping Zhang,<sup>1, a)</sup> Kyle Jensen,<sup>1</sup> Brendan Kettle,<sup>1</sup> Tim Kawamoto,<sup>1</sup> Sudeep Banerjee,<sup>1</sup> Colton Fruhling,<sup>1</sup> Grigory Golovin,<sup>1</sup> Daniel Haden,<sup>1</sup> Matthew S. Robinson,<sup>1</sup> Donald Umstadter,<sup>1</sup> B. A. Shadwick,<sup>1</sup> and Matthias Fuchs<sup>1, b)</sup>

(Dated: 4 February 2022)

- A high-power laser (red) is focused into a double-peaked “M” shaped gas jet (blue).
- The laser evolution during the first density peak leads to off-axis electron injection during the following density downramp.
- Subsequent large-amplitude betatron oscillations (yellow) cause emission of intense X-ray radiation (purple).

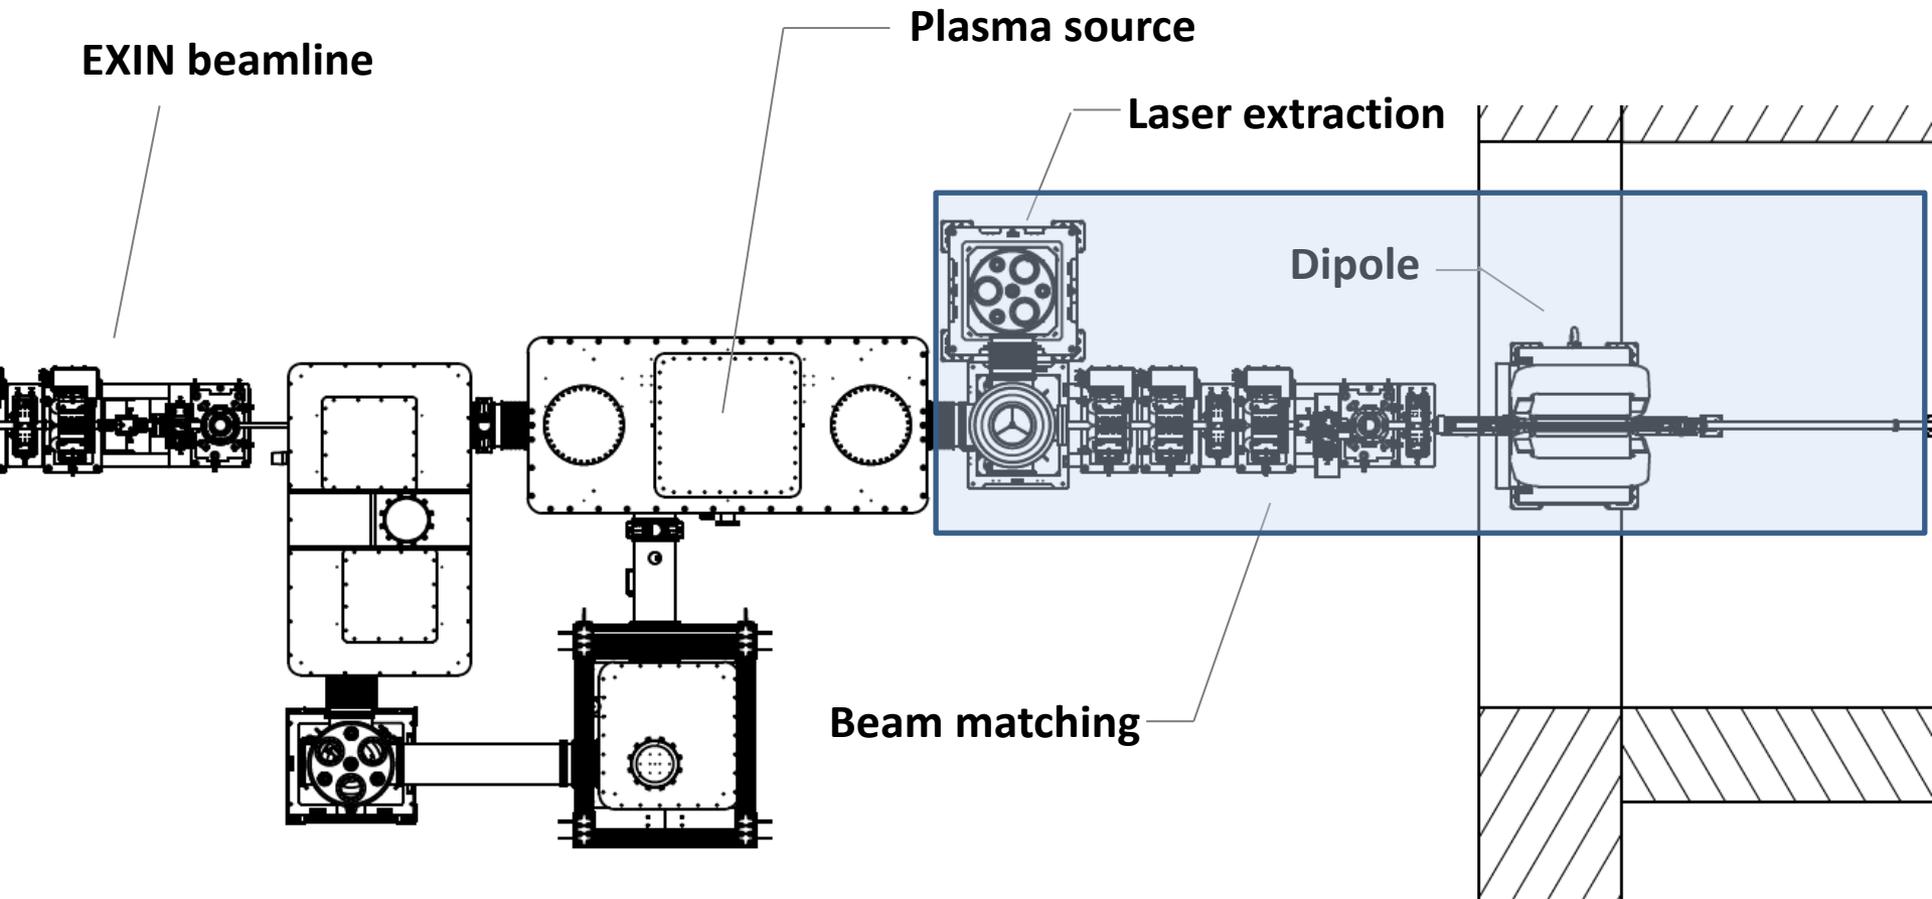

- The blue circle represents the plasma bubble.
- The bubble is moving downwards due to the transient positive mid-infrared control field.
- The injected electrons thus experience a transverse force downwards from the restoring field of the bubble.
- Due to the superluminal phase velocity of the mid-infrared control laser field, the bubble and injected electrons experience high frequency transverse oscillation when the control laser field rapidly changes its sign.

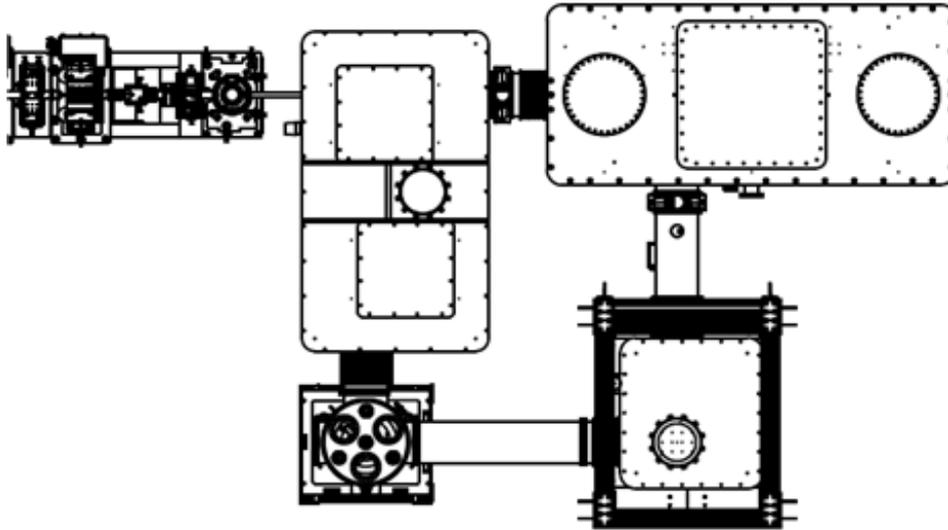

Chen, Jiyan, et al. "Enhanced soft x-ray betatron radiation from a transversely oscillating laser plasma wake." *Optics Express* 29.9 (2021): 13302-13313.

- **We need to make R&D @FLAME to:**
  - Define the scheme to use
  - Define the spectrum and the tunability
  - Define the source properties in terms of flux and spatial properties
- **This work is fundamental for the best design of the X rays beamline**
- **The final design of this beamline depends on these results!**

COSTS (€)			
WORK PACKAGE [WP.2 - Betatron Radiation Source]			
	Costs included in the request for funding		
	To be located within the eight southern Regions	To be located outside the eight southern Regions	Total requested grant
a. Fixed term personnel specifically hired for the project	120.000,00	878.000,00	998.000,00
b. Scientific instrumentation and technological equipment, software licenses and patent	1.000.000,00	6.840.400,00	7.840.400,00
c. Open Access, Trans National Access, FAI principal implementation	0,00	0,00	0,00
d. Civil infrastructures and related systems	0,00	0,00	0,00
e. Indirect costs, including running costs	78.400,00	540.288,00	618.688,00
f. Training activities	0,00	0,00	0,00
<b>Total</b>	<b>1.198.400,00</b>	<b>8.258.688,00</b>	<b>9.457.088,00</b>

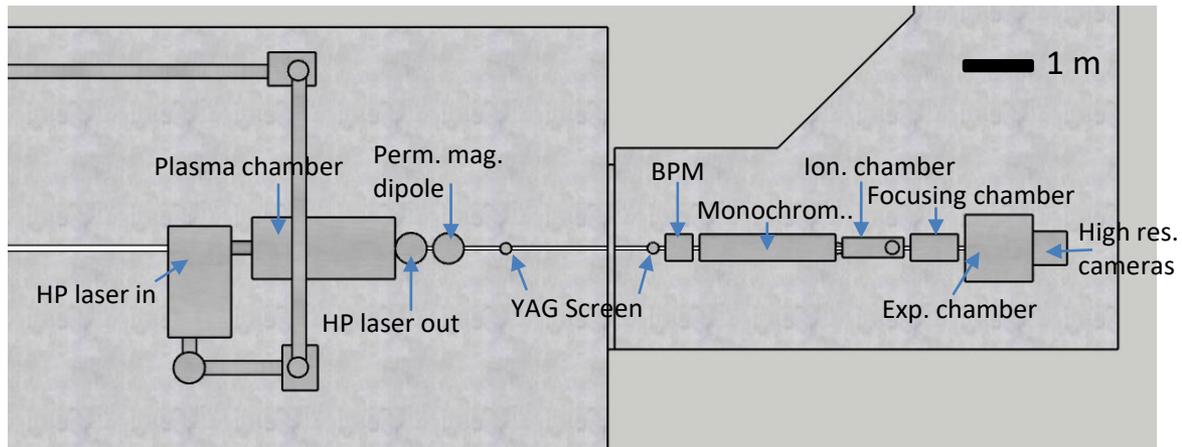

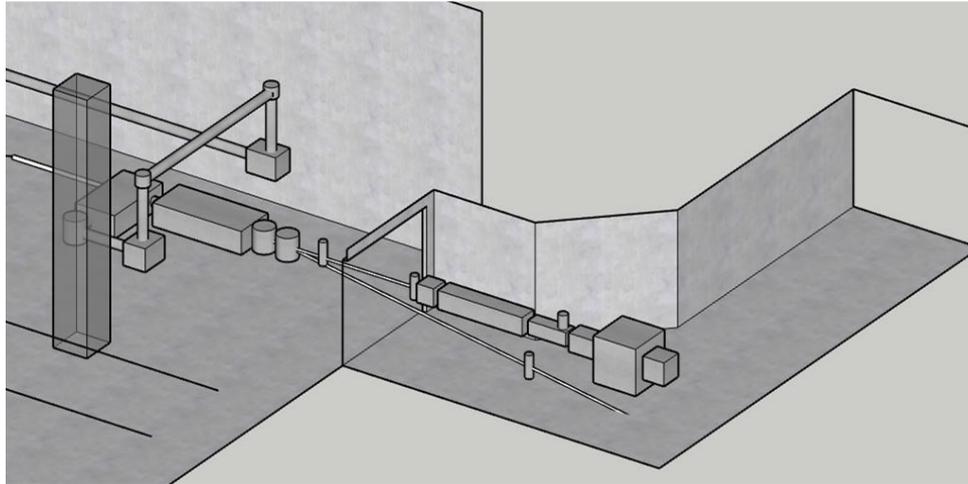

- 2.1 INFN-Milan simulations
- 2.2 Plasma source INFN-LNF
- 2.3 Synchronization INFN-LNF
- 2.4 X rays diagnostics CNR-ISM-Potenza
- 2.5 End user station Unitov
- 2.6 X rays temporal characterization CNR-ISM-Montelibretti

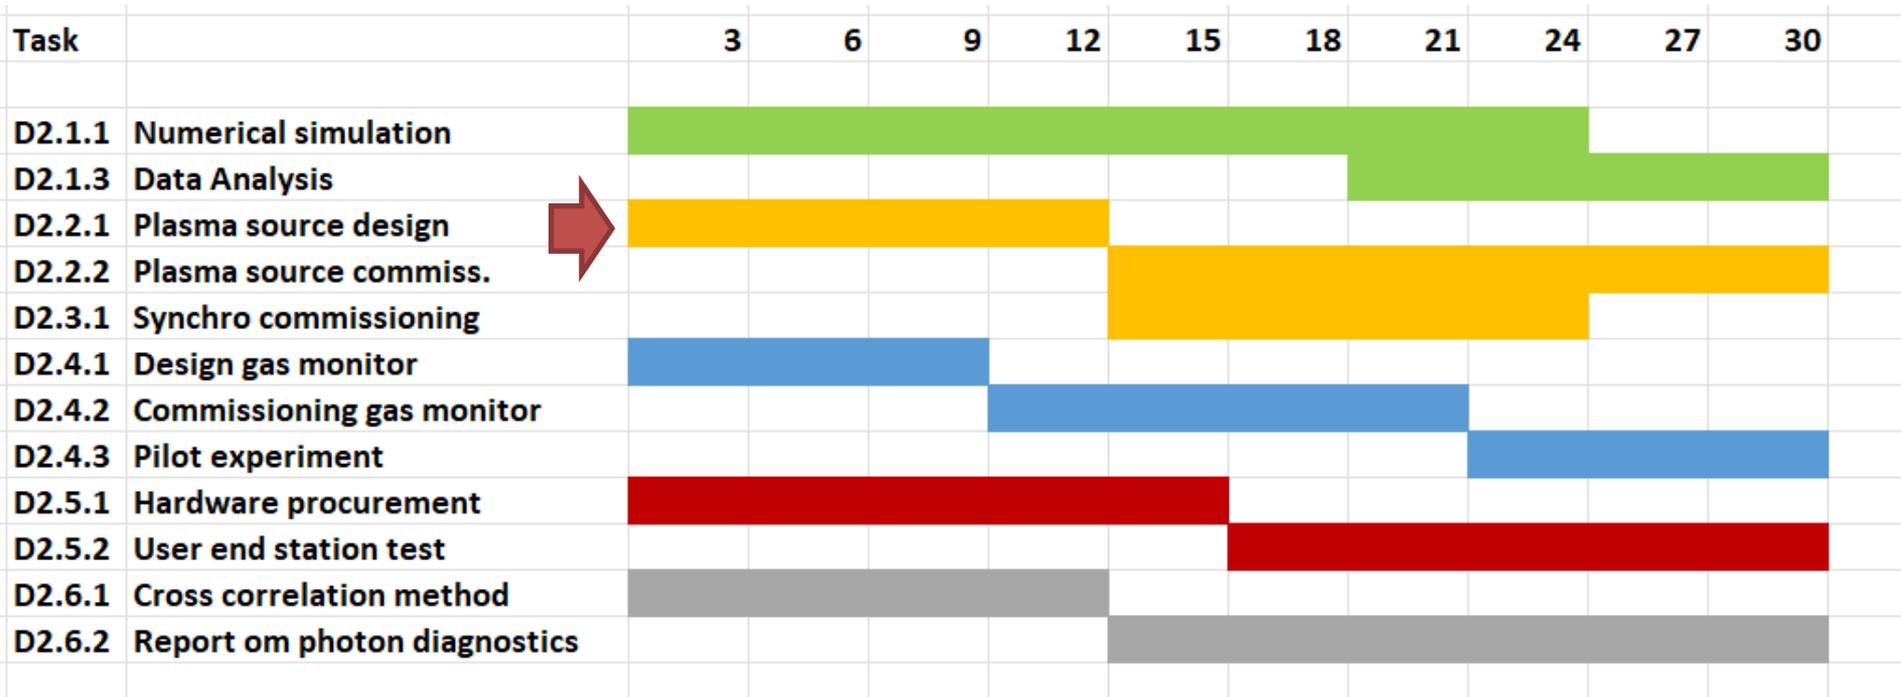

- Laser removal with a dedicated chamber maybe only for EXIN
- Electron and photons separation as soon as possible, big energy spread can be a problem
- Permanent tunable dipole to bend the beam to a parallel line to run below the X photons to the dump
- The laser removal is a bigger problem here because the focal is shorter and the laser divergence after the interaction is very large about 66 mrad.

# First attempt to be improved

# Official deliverables schedule

- **First year:**
  - Betatron: parametric studies@FLAME
  - Definition of the new machine layout
  - Simulations
  - Starting hardware procurement for big parts
  - Vacuum tests
  - Design of the laser removal
  - Hire the personnel
- **Second Year:**
  - Installation of compressor @SPARC
  - Transport of laser and plasma source @SPARC
  - Installation of the new beam line
  - Starting source commissioning
- **Last 6 months**
  - Installation of X rays diagnostics
  - Installation of user chamber
  - Diagnostics commissioning
  - Pilot experiment

Define the radiation properties to tailor X ray beamline and pilot experiment

Overlap between betatron radiation developing @FLAME and laser replacement @SPARC

Gas removal

Synchronize Flame with experiments

Hardware procurement

EuAPS installation will prevent future installations in SPARC, or we have to dismount the line every time that we need to move big hardware
