Sexten2022

Sexten - 19/7/2019

Blazars in a nutshell

SED dominated by the relativistically boosted non-thermal continuum emission of the jet.

Special relativity at work

Doppler beaming

$$\delta = \frac{1}{\Gamma(1 - \beta \cos \theta_v)}$$

Amplification $L_{\text{obs}} = L' \delta^4$

Blueshift $\nu_{\text{obs}} = \nu' \delta$

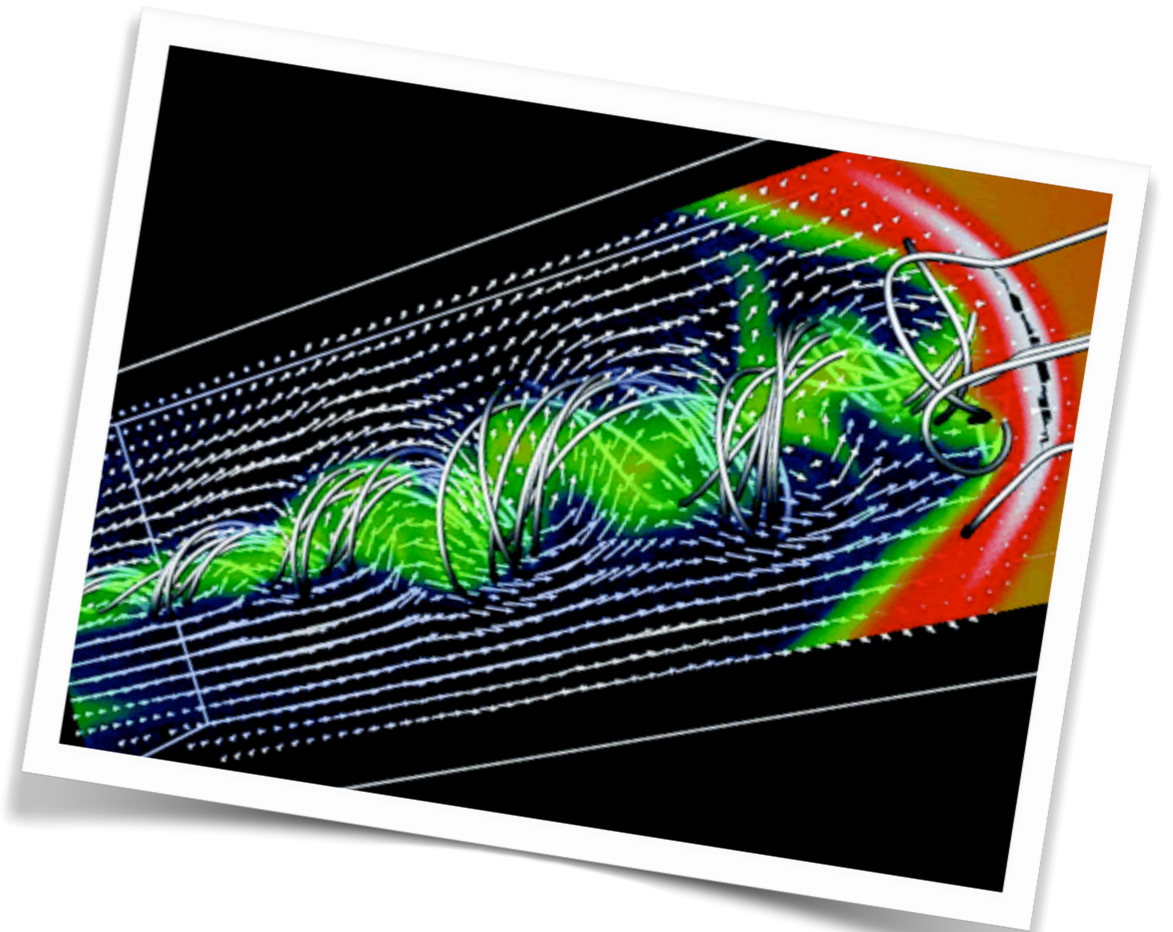

Shortening
of timescales $t_{\text{obs}} = t' / \delta$

$$\delta \approx 10 - 20$$

Jet physics

Particle acceleration
Plasma and B-field physics
Reconnection vs shock
Hadronic vs leptonic emission
Location of emission region

...

Propagation effects

Extragalactic background light
Intergalactic magnetic field
Hadronic beams
LIV and ALPs-induced effects and other anomalies

The spectral energy distribution

Extended over the whole EM spectrum
Extremely variable

Important observational effort

Blazars: basic phenomenology

Blazars occur in two flavors:

FSRQ: high power, thermal optical components (broad lines)

BL Lacs: low power, almost purely non-thermal components

The "blazar sequence"

Fossati et al. 1998
Donato et al. 2002
Ghisellini et al. 2009

But see several papers
by Giommi & Padovani

Blazars in a nutshell

BL Lacs: “naked” jets

FSRQ: “dressed” jets

Producing the jet

Producing the jet

The full problem

A (very) simple model

A modest model - 1

"One zone"

A modest model - 1

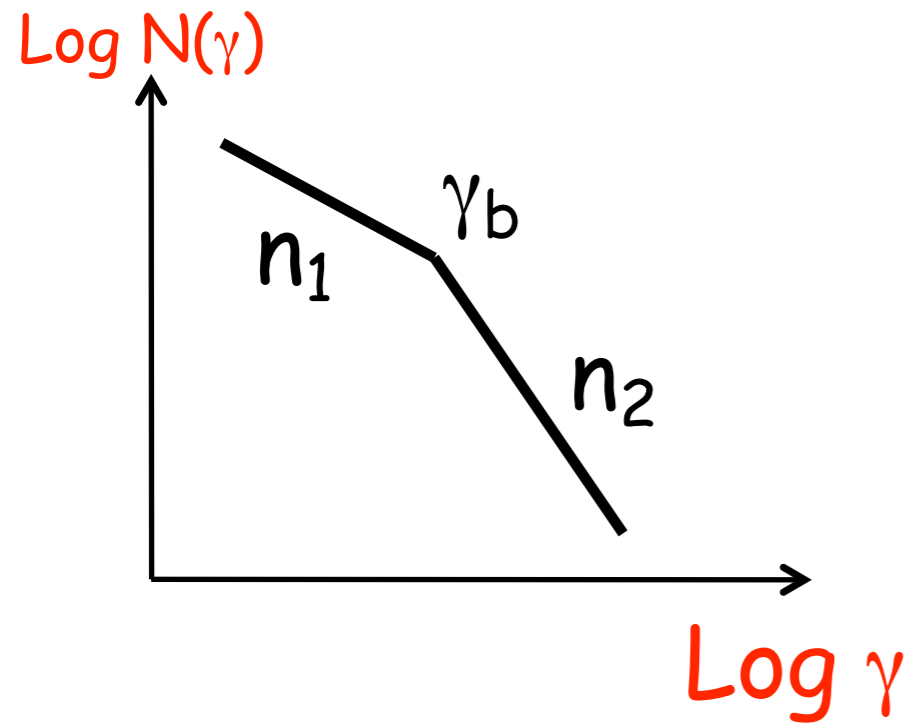

leptonic

Hadron not important for the emission (but not for energetics!)

A modest model - 1

$$N(\gamma) = \begin{cases} K_1 \gamma^{-n_1} & \gamma < \gamma_b \\ K_2 \gamma^{-n_2} & \gamma > \gamma_b \end{cases}$$

A modest model - 1

$$N(\gamma) = \begin{cases} K_1 \gamma^{-n_1} & \gamma < \gamma_b \\ K_2 \gamma^{-n_2} & \gamma > \gamma_b \end{cases}$$

$$\nu_s = 3 \times 10^6 B \gamma_b^2 \delta$$

$$\alpha_i = \frac{n_i - 1}{2}$$

Synchrotron emission

A modest model - 1

+

$$U'_{\text{syn}} = \frac{\nu_s L(\nu_s)}{4\pi R^2 c \delta^4}$$

Inverse Compton

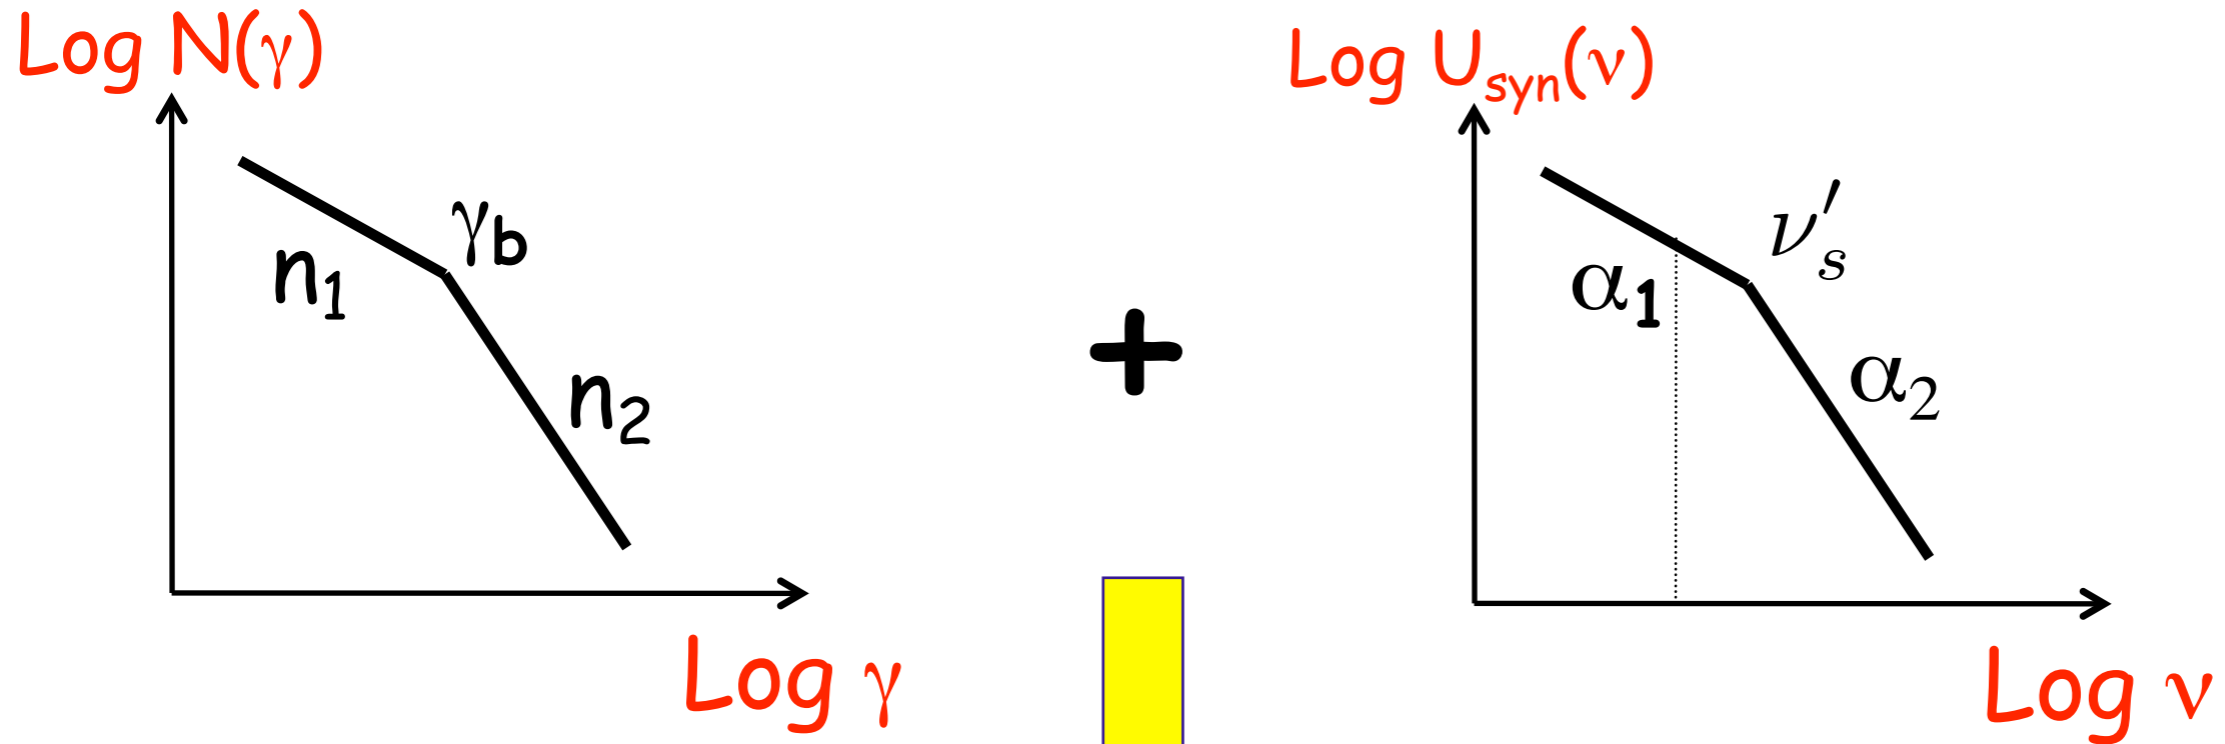

A modest model - 1

$$\nu_c = \nu'_s \gamma_b^2 \delta \quad \nu'_s = \nu_s / \delta$$

A modest model - 1

“Klein-Nishina regime”

$$h\nu'_s \gamma_b > m_e c^2$$

In principle, in this simple version of the **Synchrotron-Self Compton** (SSC) model, all parameters can be constrained by quantities available from observations:

7 free parameters

R B N_0 γ_b n_1 n_2 δ

7 observational quantities

ν_s L_s ν_c L_c t_{var} α_1 α_2

Blazars in a nutshell

BL Lacs: “naked” jets

FSRQ: “dressed” jets

Application: BL LACS

Tavecchio and Ghisellini 2016

Model	γ_{min}	γ_{b}	γ_{max}	n_1	n_2	B	K	R	δ
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
1	500	1.7×10^5	2×10^6	2.2	4.8	0.075	1.3×10^4	1	25
2	700	2.5×10^5	4×10^6	2.2	4.8	0.06	3.2×10^3	3.6	14

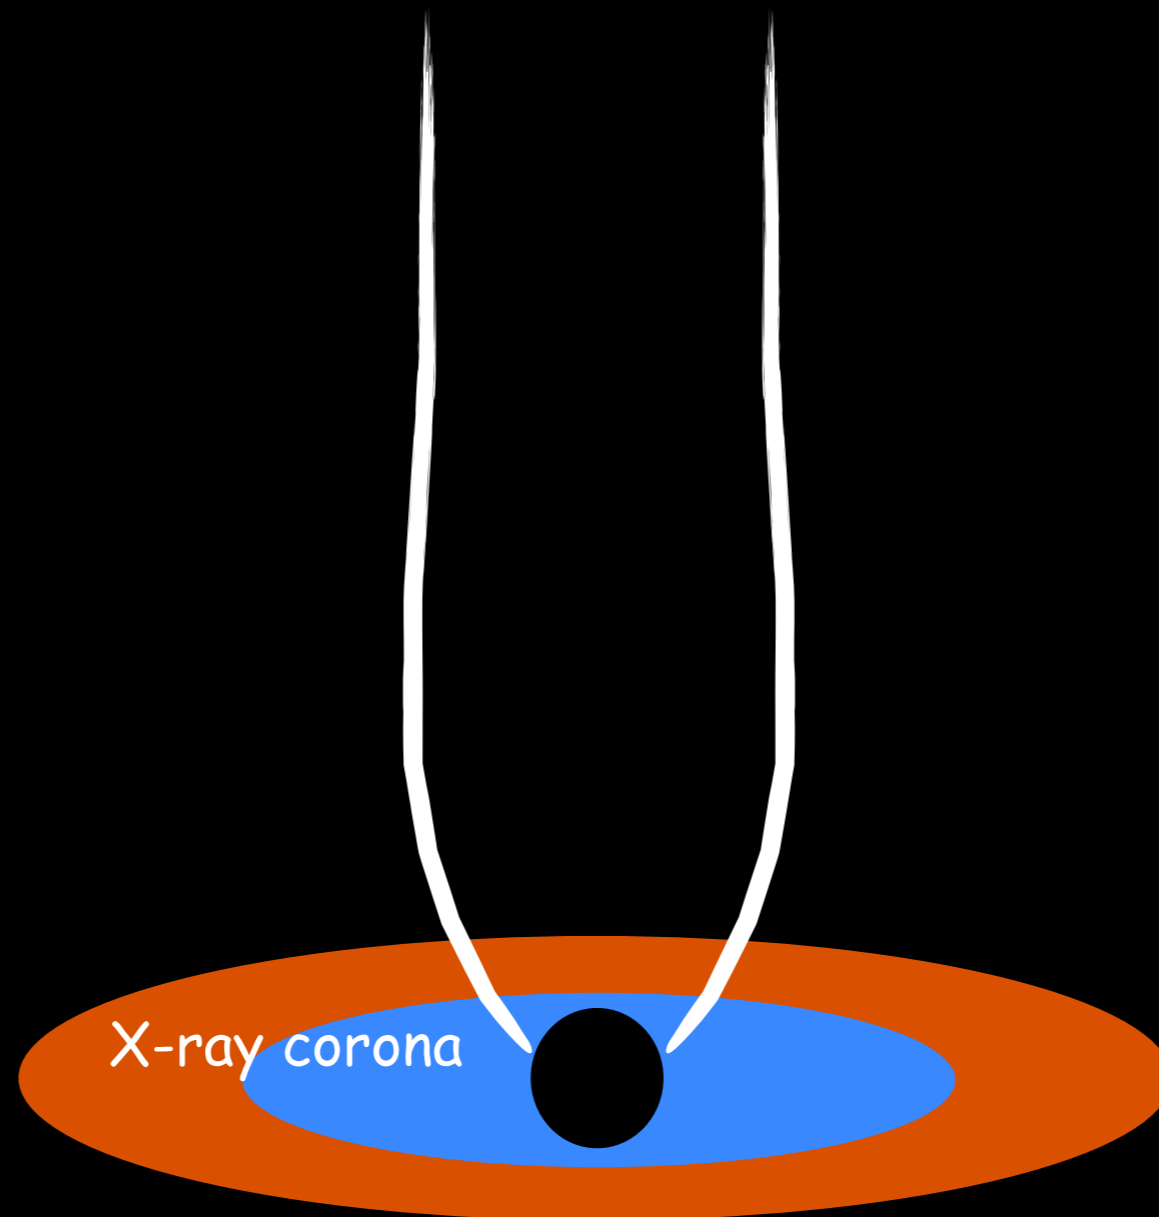

Application: BL Lacs

Short time-scales

Small spatial scales
Close to the BH

Large amplitudes

Bonnoli et al. 2011

Time dependent models

Continuity equation

$$\frac{\partial N(\gamma, t)}{\partial t} = \frac{\partial}{\partial \gamma} [\dot{\gamma}(\gamma, t) N(\gamma, t)] + Q(\gamma, t) - \frac{N(\gamma, t)}{t_{\text{esc}}}$$

cooling

injection

escape

$$\dot{\gamma} = \frac{4}{3} \frac{\sigma_T c}{m_e c^2} [U_B + U_{\text{rad}}(\gamma, t)] \gamma^2$$

Time dependent models

Continuity equation

$$\frac{\partial N(\gamma, t)}{\partial t} = \frac{\partial}{\partial \gamma} [\dot{\gamma}(\gamma, t) N(\gamma, t)] + Q(\gamma, t) - \frac{N(\gamma, t)}{t_{\text{esc}}}$$

cooling

injection

escape

$$\dot{\gamma} = \frac{4 \sigma_T c}{3 m_e c^2} [U_B + U_{\text{rad}}(\gamma, t)] \gamma^2$$

Chiaberge and Ghisellini 1999

Final thoughts

Jets are very complex systems but ...

(Leptonic)One zone models are surprisingly successful!

We can obtain rather interesting clues one particle acceleration, evolution etc...

Lepto-Hadronic models suggested by neutrino data but still need improvements
