# The e-ASTROGAM gamma-ray space mission

#### A sensitive wide-field observatory for the MeV / sub-GeV band

#### Vincent Tatischeff On behalf of the e-ASTROGAM Collaboration

## e-ASTROGAM The MeV/sub-GeV domain

- Worst covered part of the electromagnetic spectrum (only a few tens of steady sources detected so far between 0.2 and 30 MeV)
- Many objects have their peak emissivity in this range (GRBs, blazars, pulsars...)

V. Tatischeff for the e-ASTROGAM Collaboration

## e-ASTROGAM Observational challenges

- Photon interaction probability reaches a minimum at ~ 10 MeV
- ➢ Three competing processes of interaction, Compton scattering being dominant around 1 MeV ⇒ complicated event reconstruction

 The MeV range is the domain of nuclear γ-ray lines (radioactivity, nuclear collision, positron annihilation, neutron capture)

Strong instrumental background from activation of spaceirradiated materials

New Astronomies: gravitational waves neutrinos

 Need for a sensitive, wide-field γ-ray space observatory operating at the same time as facilities like SKA and CTA, as well as eLISA and neutrino detectors, to get a coherent picture of the transient sky and the sources of gravitational waves and high-energy neutrinos

V. Tatischeff for the e-ASTROGAM Collaboration

## e-ASTROGAM Gamma-ray polarization

- γ-ray polarization in objects emitting jets (GRBs, Blazars, X-ray binaries) or with strong magnetic field (pulsars, magnetars) ⇒ magnetization and content (hadrons, leptons, Poynting flux) of the outflows + radiation processes
- γ-ray polarization from cosmological sources (GRBs, Blazars) ⇒ fundamental questions of physics related to Lorentz Invariance Violation (vacuum birefringence)
- e-ASTROGAM will measure the γ-ray polarization of ~ 100 GRBs per year (promising candidates for highly γ-ray polarized sources)

## e-ASTROGAM Angular resolution

6 Angular resolution (degree) Angular resolution needs to be Fermi/LAT COMPTEI improved close to the physical limits (Doppler broadening, nuclear recoil) Compton Pair e-ASTROGAM Cygnus region in the 1 - 3 MeV energy band 10 with the e-ASTROGAM PSF (extrapolation of the 3FGL source spectra to low energies) 10 10 10 10 10 Gamma-ray energy (MeV) 15 COMPTEL 1-30 MeV 10 -Gal. latitude (deg) -10-15VPs 1-522 ! 95 90 85 80 75 70 65 Maximum entropy imaging Gal. longitude (deg) Neighted sum 1-3. 3-10. and 10-30 MeV Hans Bloemen SBON

<sup>6&</sup>lt;sup>th</sup> RICAP Conference

- Tracker Double sided Si strip detectors (DSSDs) for excellent spectral resolution and fine 3-D position resolution
- Calorimeter High-Z material for an efficient absorption of the scattered photon
   ⇒ CsI(TI) scintillation crystals readout by Si Drift Diodes for better energy resolution
- Anticoincidence detector to veto charged-particle induced background ⇒ plastic scintillators readout by Si photomultipliers
- V. Tatischeff for the e-ASTROGAM Collaboration

#### of e-ASTROGAM

#### Payload

Detail of the detector-ASIC bonding in the AGILE Si Tracker

Tracker: 56 layers of 4 times 5×5 DSSDs (5600 in total) of 500 μm thickness and 240 μm pitch

- DSSDs bonded strip to strip to form 5×5 ladders
- Light and stiff mechanical structure
- Ultra low-noise front end electronics

- **Calorimeter**: 33 856 CsI(Tl) bars coupled at both ends to low-noise Silicon Drift Detectors
- ACD: segmented plastic scintillators coupled to SiPM by optical fibers
- Heritage: AGILE, Fermi/LAT, AMS-02, INTEGRAL, LHC/ALICE...

V. Tatischeff for the e-ASTROGAM Collaboration

### e-ASTROGAM

- Orbit Equatorial (inclination *i* < 2.5°, eccentricity *e* < 0.01) low-Earth orbit (altitude in the range 550 600 km)</li>
- Launcher Ariane 6.2
- Satellite communication –
  ESA ground station at Kourou
  + ASI Malindi station (Kenya)
- Data transmission via X-band (available downlink of 10 Mbps)
- Observation modes (i) zenith-pointing sky-scanning mode, (ii) nearly inertial pointing, and (iii) fast repointing to avoid the Earth in the field of view
- In-orbit operation 3 years duration + provisions for a 2+ year extension

#### A e-ASTROGAM Performance assessment

- - e-ASTROGAM performance evaluated with MEGAlib (Zoglauer et al. 2006) and Bogemms (Bulgarelli et al. 2012) – both tools based on Geant4 – and a detailed numerical mass model of the gamma-ray instrument

### e-ASTROGAM Core science

- 1. Jet astrophysics: a unique link to new astronomies (gravitational waves, neutrinos, ultra-high energy cosmic rays)
- 2. The high-energy mysteries of the Galactic center region
- 3. Supernovae, nucleosynthesis and Galactic chemical evolution

#### e-ASTROGAM Core science topic #1

#### Jet astrophysics in the era of new astronomies

- Launch of ultra-relativistic jets in **GRBs**? Ejecta composition, energy dissipation site, radiation processes?
- Can short-duration GRBs be unequivocally associated to gravitational wave signals?
- How does the accretion disk/jet transition occur around supermassive black holes in AGN?
- Are BL Lac blazars sources of UHECRs and high-energy neutrinos?
- With its wide field of view, unprecedented sensitivity over a large spectral band, and exceptional capacity for polarimetry, e-ASTROGAM will give access to a variety of extreme transient phenomena

V. Tatischeff for the e-ASTROGAM Collaboration

#### e-ASTROGAM Core science topic #2

#### The high-energy mysteries at the Galactic Center

- Origin of the Fermi Bubbles and of the 511 keV emission from the Galaxy's bulge? Are these linked to a past activity of the central supermassive black hole? What is causing the GeV excess emission from the center region?
- With a sensitivity and an angular resolution in the MeV GeV range significantly improved over previous missions, e-ASTROGAM will enable a detailed spectro-imaging of the various high-energy components

#### e-ASTROGAM Core science topic #3

#### Supernovae, nucleosynthesis, and Galactic chemical evolution<sup>14</sup>

- How do thermonuclear and core-collapse SNe explode? How are cosmic isotopes created in stars and distributed in the interstellar medium?
- $\checkmark$  With a remarkable improvement in  $\gamma$ -ray line sensitivity over previous missions, e-ASTROGAM 847 keV line flux  $[10^{-4} \text{ ph cm}^{-2} \text{ s}^{-1}]$ W7 (Chandrasekhar-Deflagration) should allow us to finally He-Detonation SN 2014J Merger Detonation 6 Pulsating Delayed Detonation Superluminous He-Detonation understand the progenitor (adapted from SPI Data SPI Exposure 5 Diehl et al. 2015) system(s) and explosion mechanism(s) of **Type Ia SNe** e-ASTROGAM (<sup>56</sup>Ni, <sup>56</sup>Co), the dynamics of 3 core collapse in massive star explosions (<sup>56</sup>Co, <sup>57</sup>Co), and 56Co the history of **recent SNe** in the Milky Way (<sup>44</sup>Ti, <sup>60</sup>Fe...) 50 100 150 0 Time past explosion [days]

200

#### e-ASTROGAM **Discovery space**

- Over 3/4 of the sources from the 3<sup>rd</sup> Fermi LAT Catalog (3FGL), 2415 sources over 3033, have power-law spectra ( $E_{\gamma}$  > 100 MeV) steeper than  $E_{\gamma}^{-2}$ , implying that their peak energy output is below 100 MeV

- These includes more than 1200 (candidate) blazars (mostly FSRQ), about 150 pulsars, and nearly 900 unassociated sources
- Most of these sources will be detected by e-ASTROGAM  $\Rightarrow$  large discovery space for new sources and

source classes

#### e-ASTROGAM Conclusions

- The MeV / sub-GeV gamma-ray band is potentially one of the richest energy domain of astronomy
- e-ASTROGAM will be an essential observatory to study the extreme transient sky at the era of astronomy's new messengers
- The e-ASTROGAM payload is innovative in many respects, but the technology is ready
