Gravity

General Relativity provides the best available theoretical description of gravity and spacetime

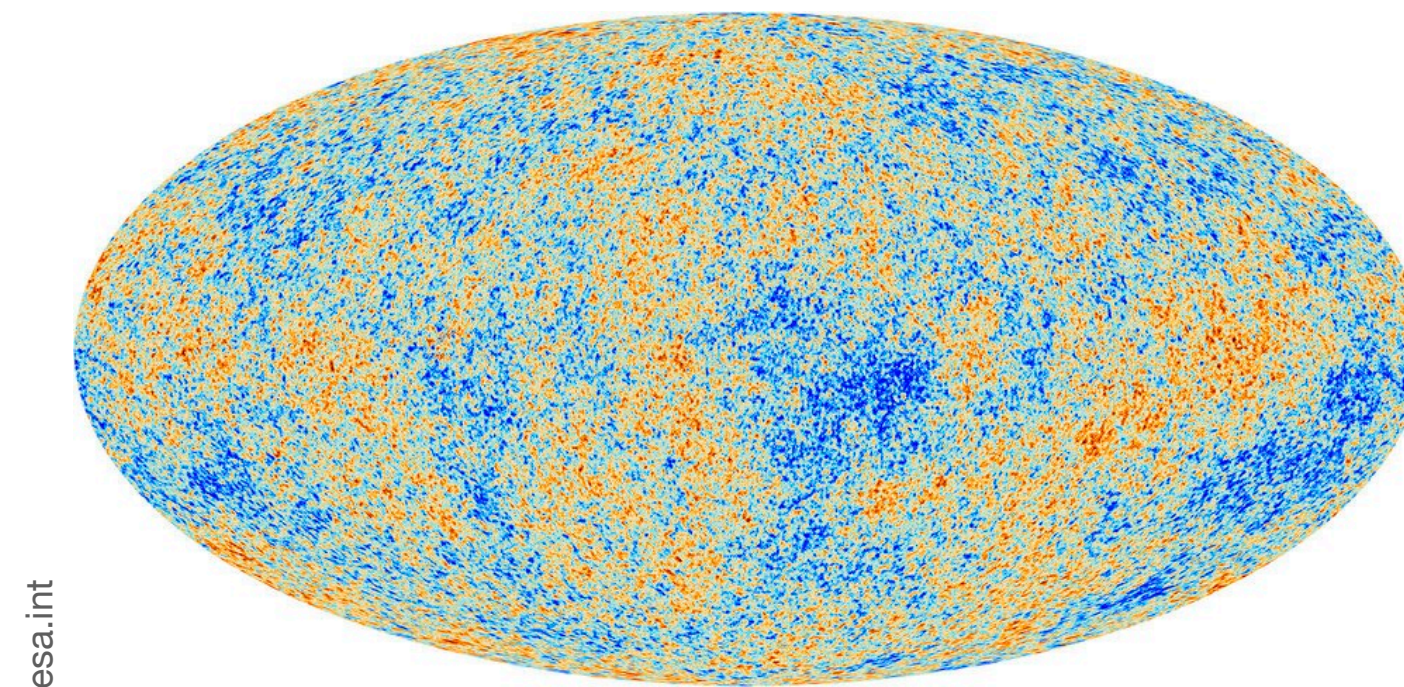

Its predictions have been successfully tested, including the recent measurements of [gravitational waves](#) and observation of [black holes](#)

Quantum Gravity?

A complete description needs to take into account **quantum mechanical effects**

These become essential in a number of situations including the physics of Black Holes and the description of early phases of our Universe

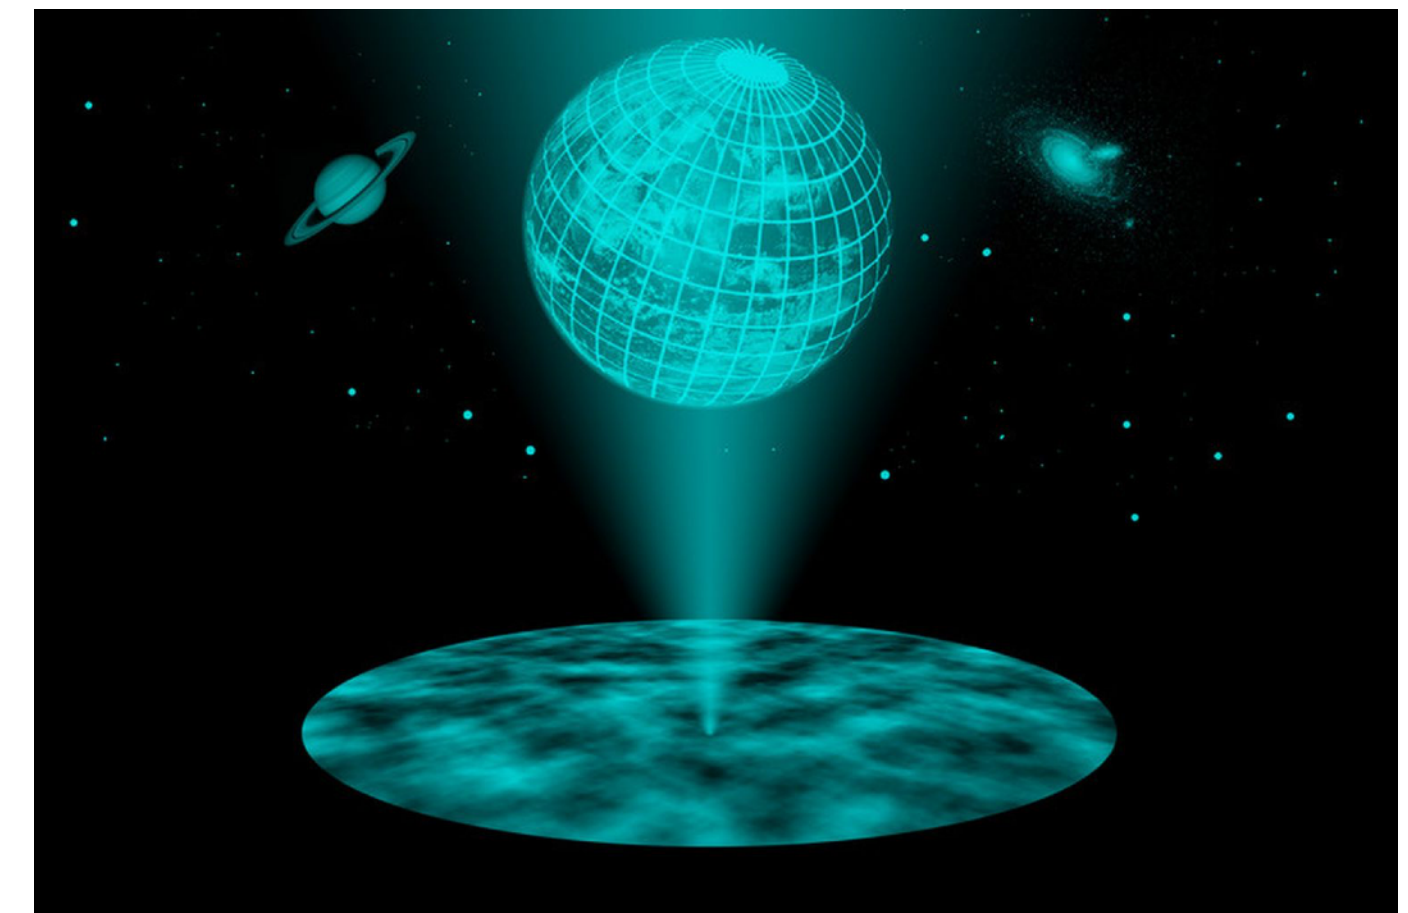

From the theoretical point of view this remains a major open problem

Holographic Principle

Advances in the study of black hole thermodynamics and string theory have led to propose that **gravity and spacetime emerge from** the collective behaviour of non-gravitational **degrees of freedom in lower dimensions**

Gravity and spacetime as we experience them can be regarded as an effective description resulting from the physics of a lower dimensional theory, as in an hologram

The **AdS/CFT correspondence** gives a concrete realization of the holographic principle and provides a unique framework to study this idea

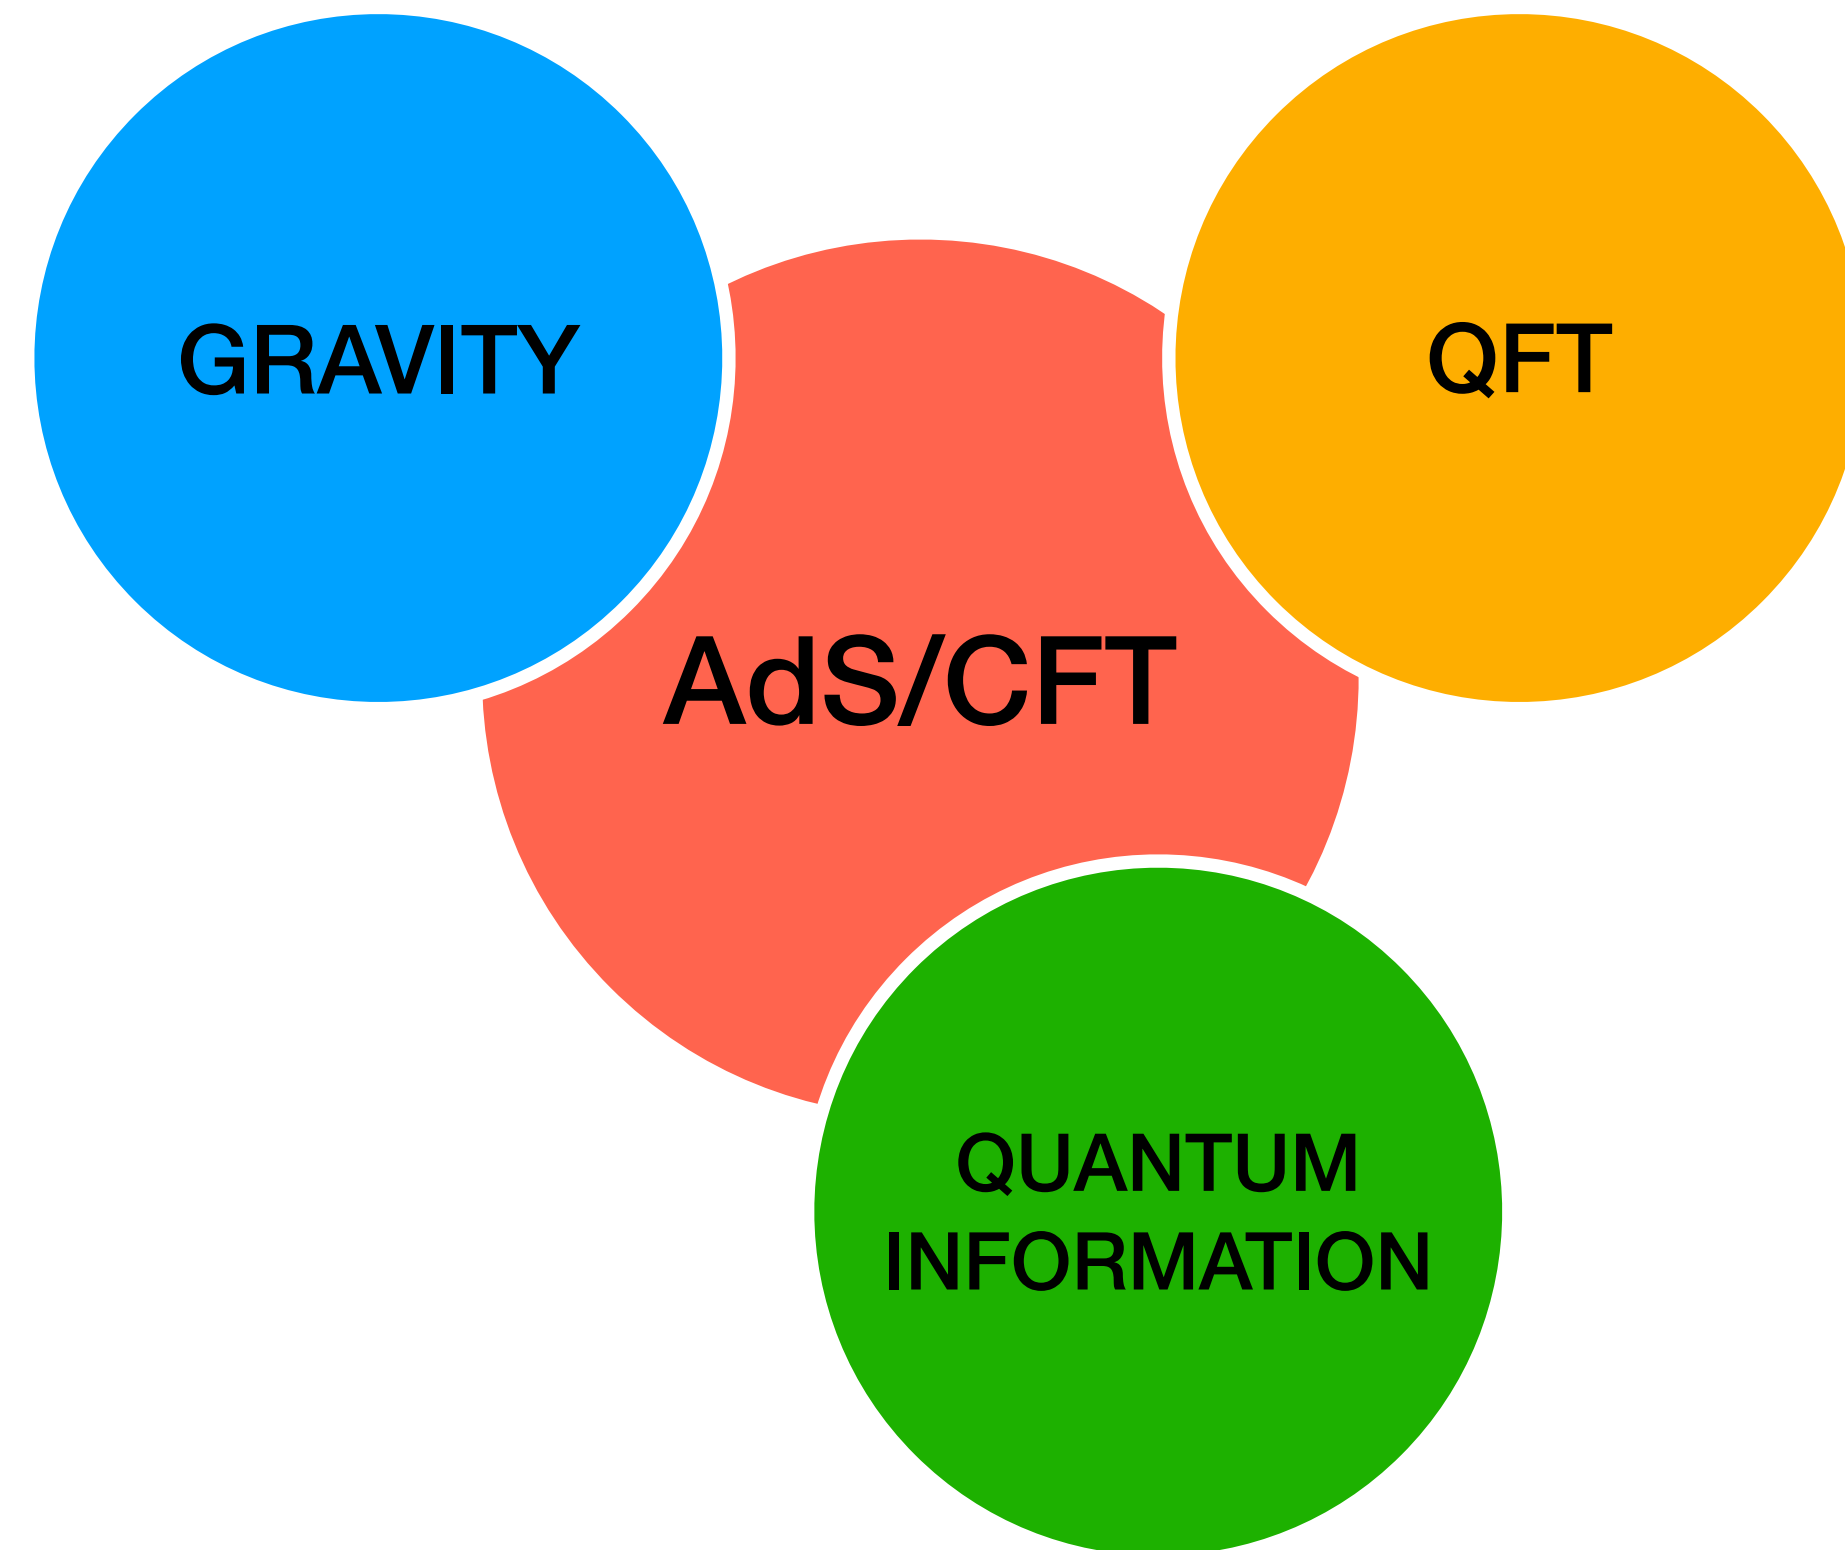

Quantum Information

Quantum information theory has emerged as a powerful language and organizing principle to structure our thinking about many deep questions in QFT and gravity

Study of entanglement bolstered by the prospect of using it a quantum resource and to perform quantum computations has led to a fruitful across-disciplines dialogue involving quantum information theory, QFT and gravity

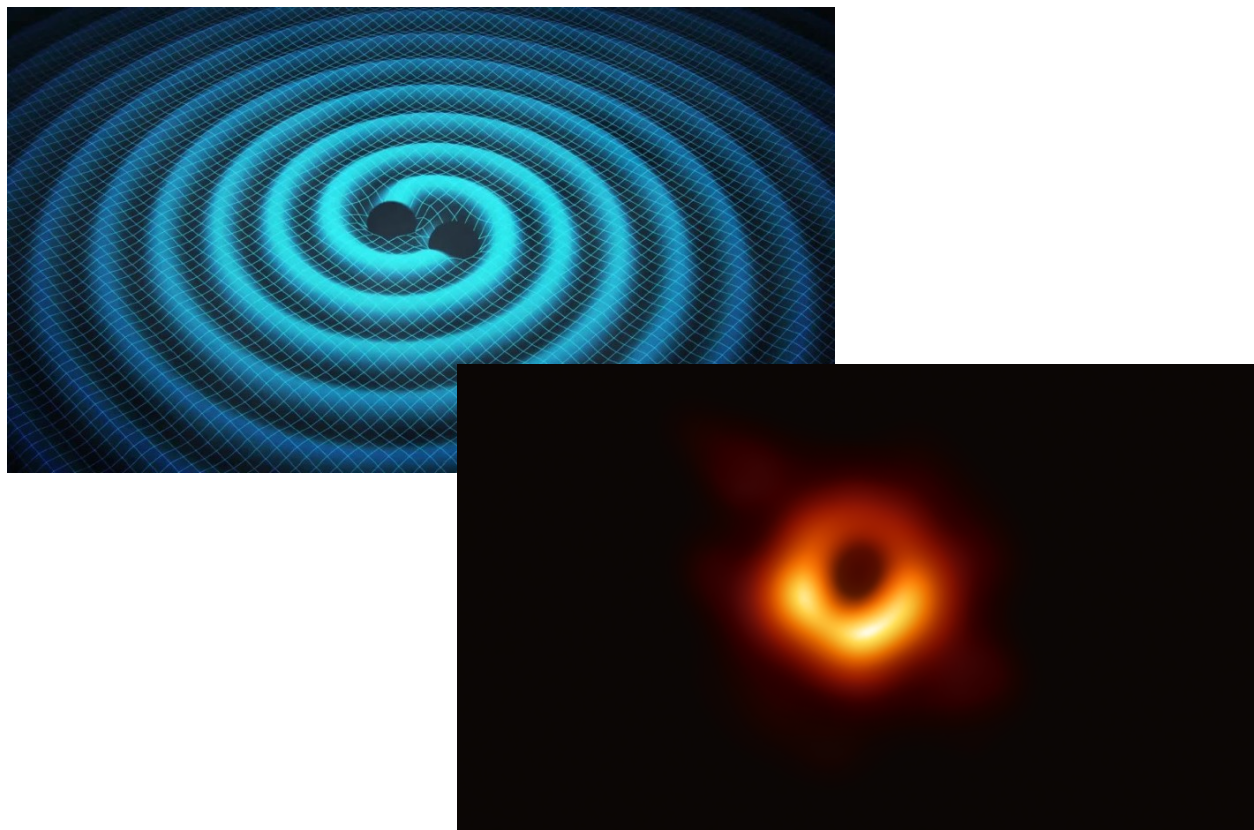

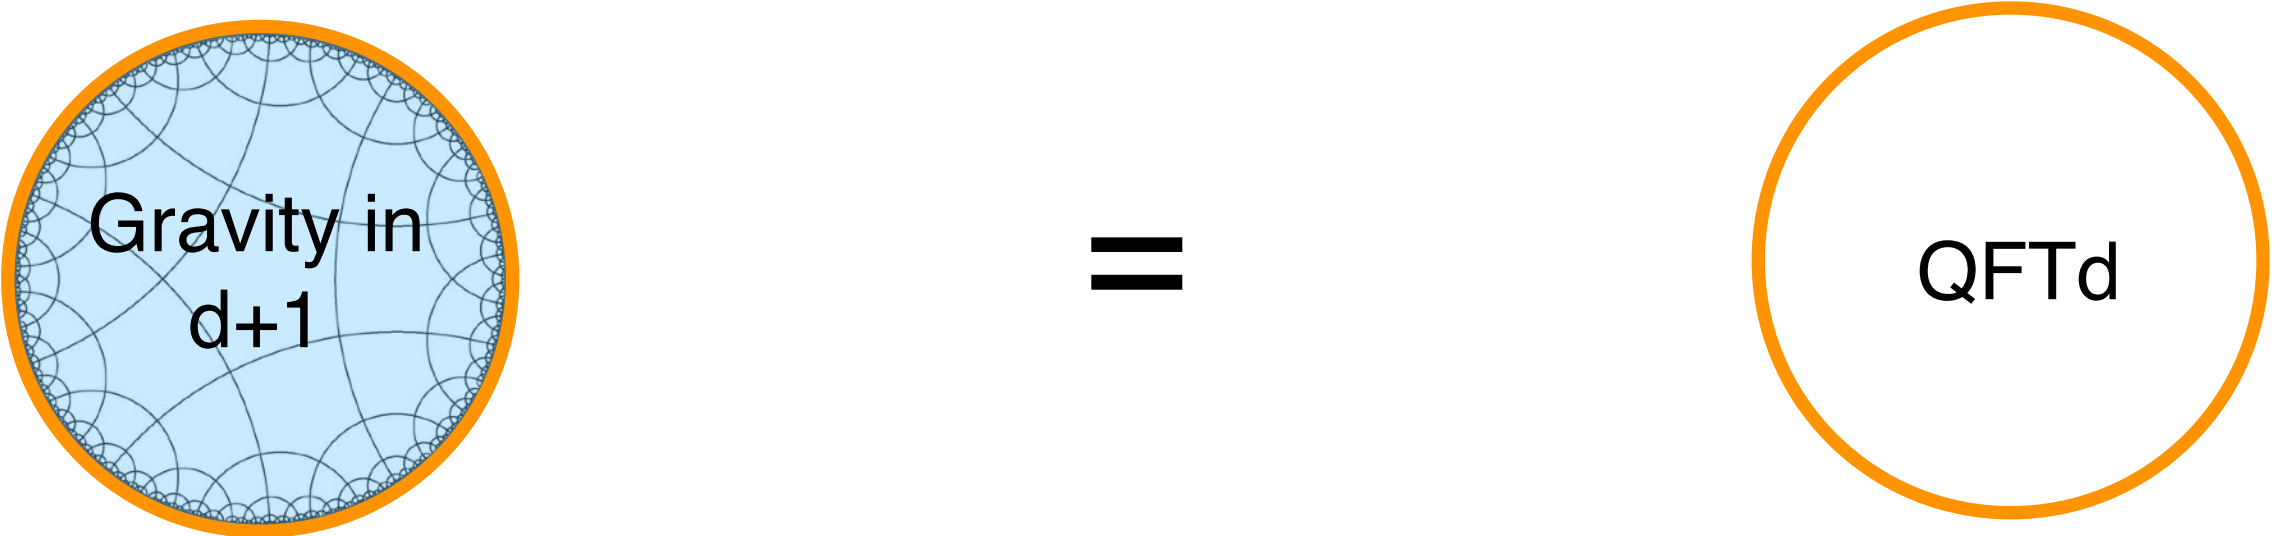

Entanglement entropy and other quantum information measures have evolved from being a probe to study and characterize new phases of matter to represent an indispensable theoretical tool for understanding fundamental properties of field theory and gravity

Introduction

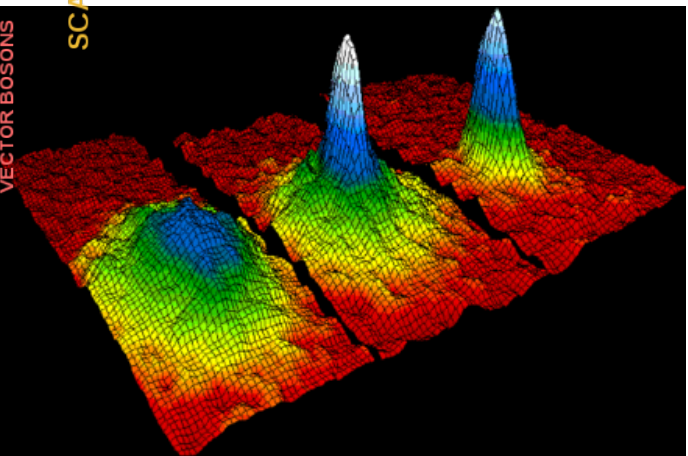

AdS/CFT Correspondence

Conjectured **mathematical equivalence** between two different theories: quantum field theories in d spacetime dimension and quantum gravity theories in $d+1$ spacetime dimensions

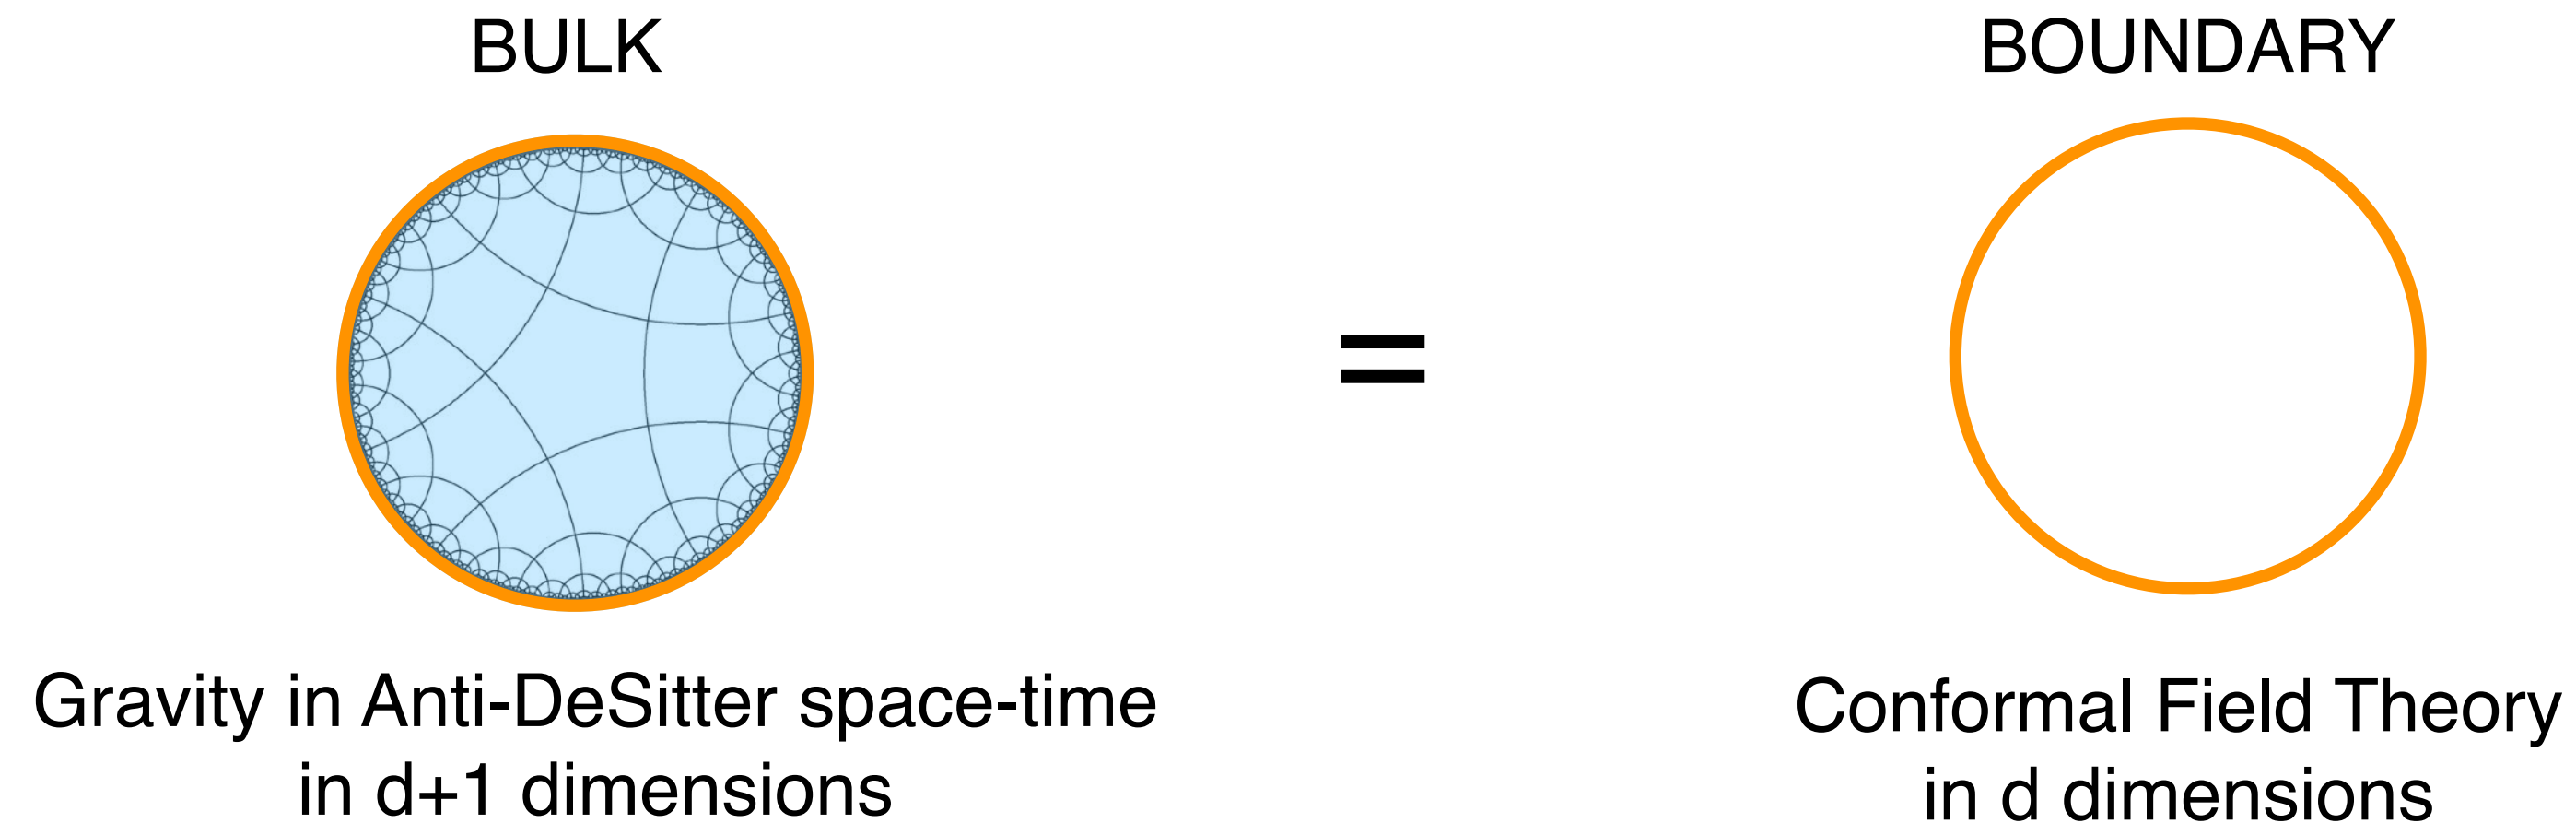

Standard Model of Elementary Particles

three generations of matter (fermions)			interactions / force carriers (bosons)	
I	II	III		
mass charge spin	$\approx 2.2 \text{ MeV}/c^2$ $\frac{2}{3}$ $\frac{1}{2}$	$\approx 1.28 \text{ GeV}/c^2$ $\frac{2}{3}$ $\frac{1}{2}$	$\approx 173.1 \text{ GeV}/c^2$ $\frac{2}{3}$ $\frac{1}{2}$	$\approx 124.97 \text{ GeV}/c^2$ 0 0

AdS/CFT Correspondence

Conjectured **mathematical equivalence** between two different theories: quantum field theories in d spacetime dimension and quantum gravity theories in $d+1$ spacetime dimensions

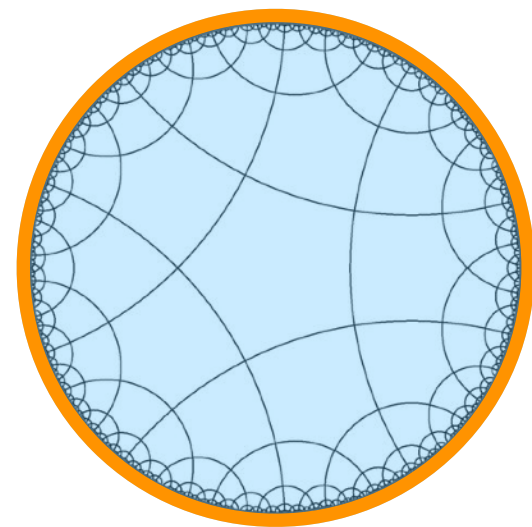

Originally formulated in string theory, but understood to be more general

Concrete realization of the **holographic** principle

Weak-Strong Coupling

Allows to recast difficult problems on one side in simpler terms using the dual description:
non-perturbative **strongly coupled** regime of **QFT** described **in terms of classical gravity**

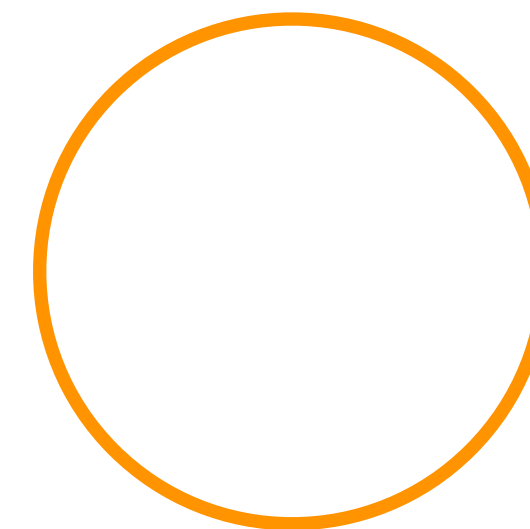

compute here...

(semi)-classical
gravity in AdS

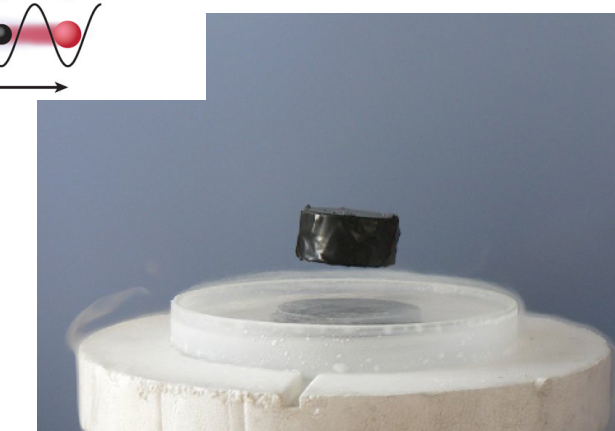

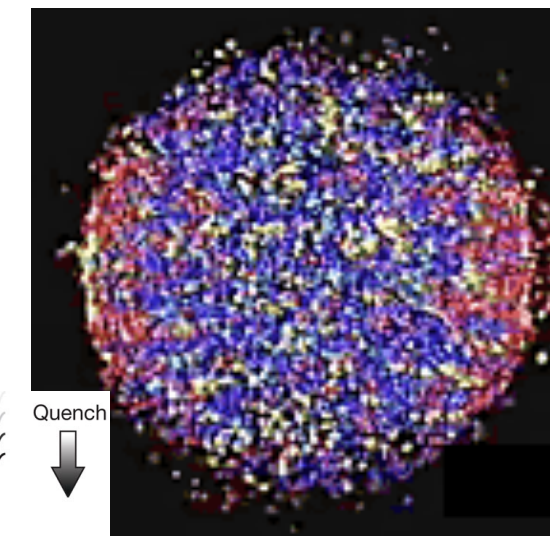

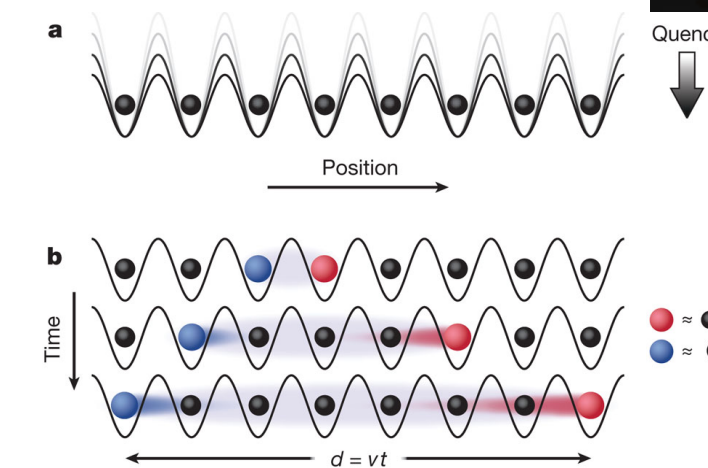

=

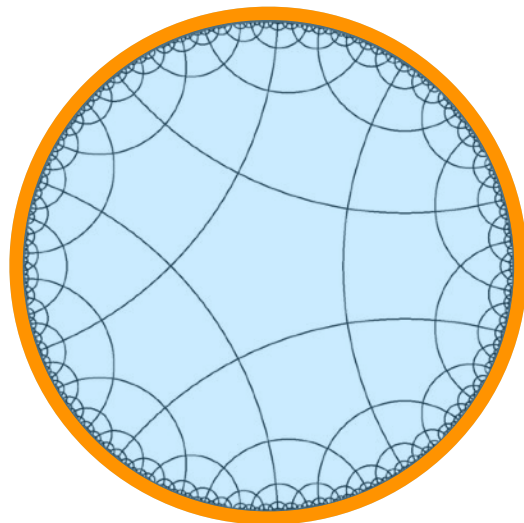

QFT at
strong coupling

...to answer questions here

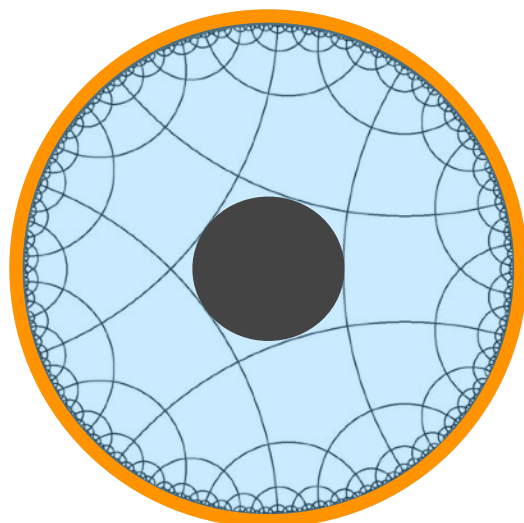

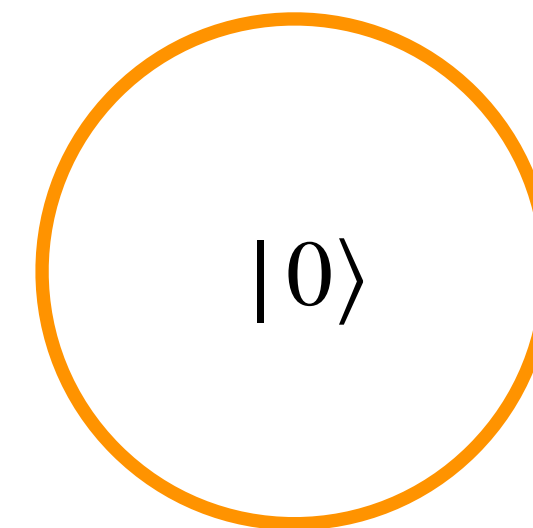

Holographic Dictionary

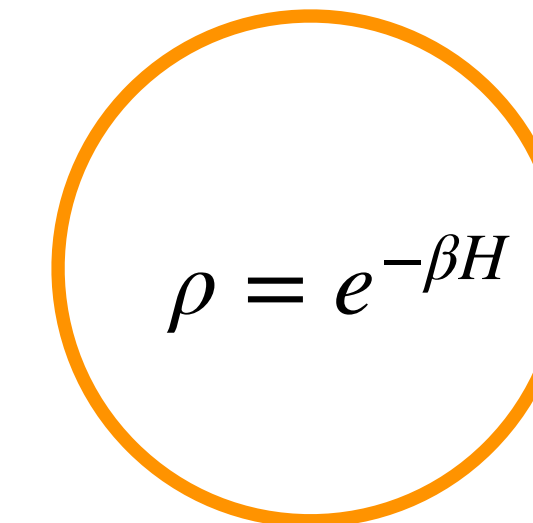

There exists a “dictionary” relating quantities on the two sides of the duality

Empty AdS = CFTs in its vacuum state

Black holes in AdS = CFTs at finite temperature

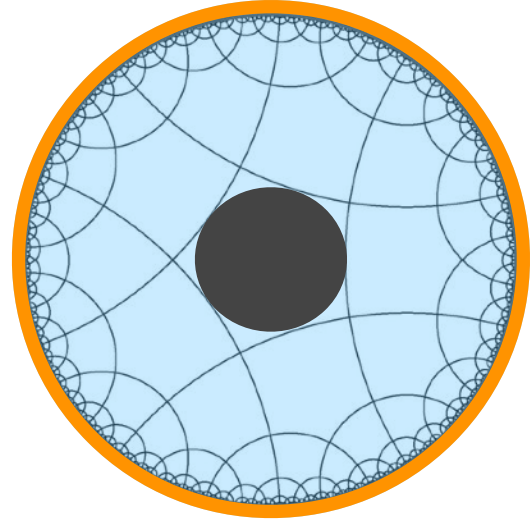

Φ

Fields in AdS

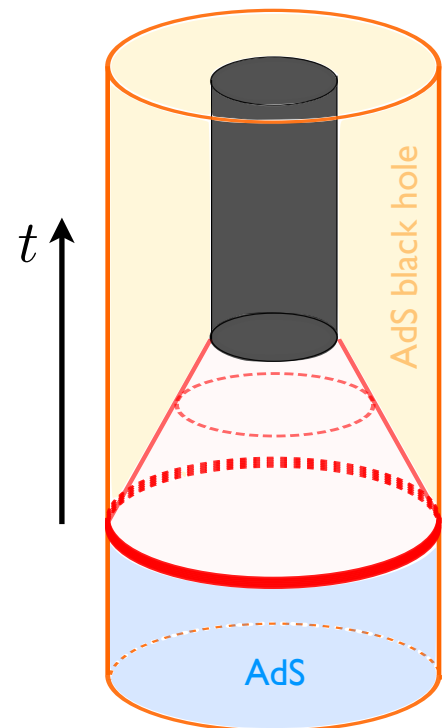

Operators

\mathcal{O}

Holographic Predictions

Falling into a black hole = dissipation process in a thermal plasma

Black holes creation in AdS = thermalization/equilibration process

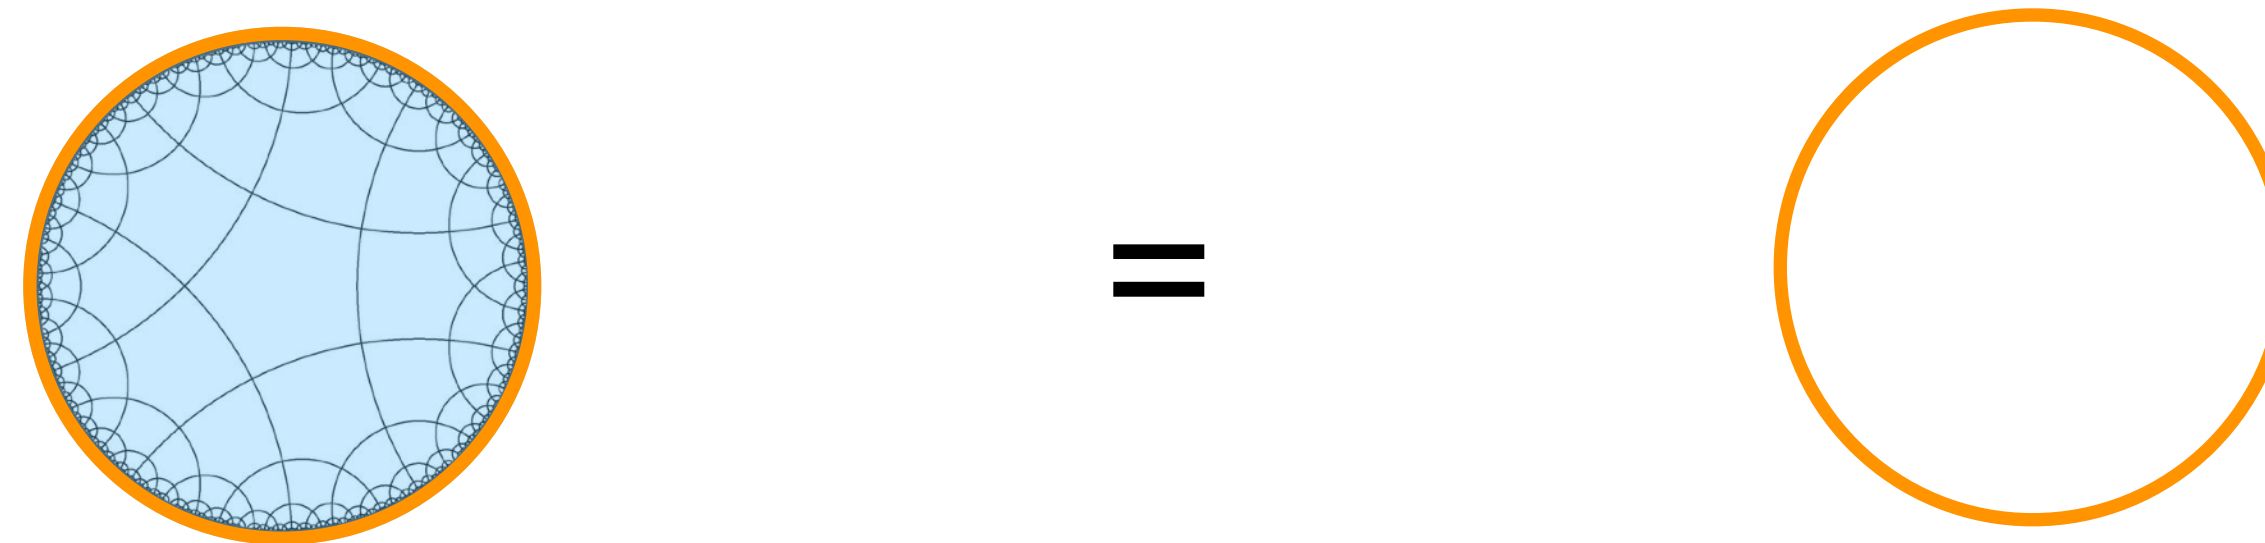

Gravitational predictions:

- ➔ Hydrodynamics has very low viscosity $\frac{\eta}{s} = \frac{1}{4\pi}$ [Kovtun, Son, Starinets 01]
- ➔ Thermalization proceeds maximally fast [Balasubramanian, Bernamonti, deBoer, Craps et al. 11]

Ever growing dictionary, new entries as we understand better the duality

Emergent Gravity

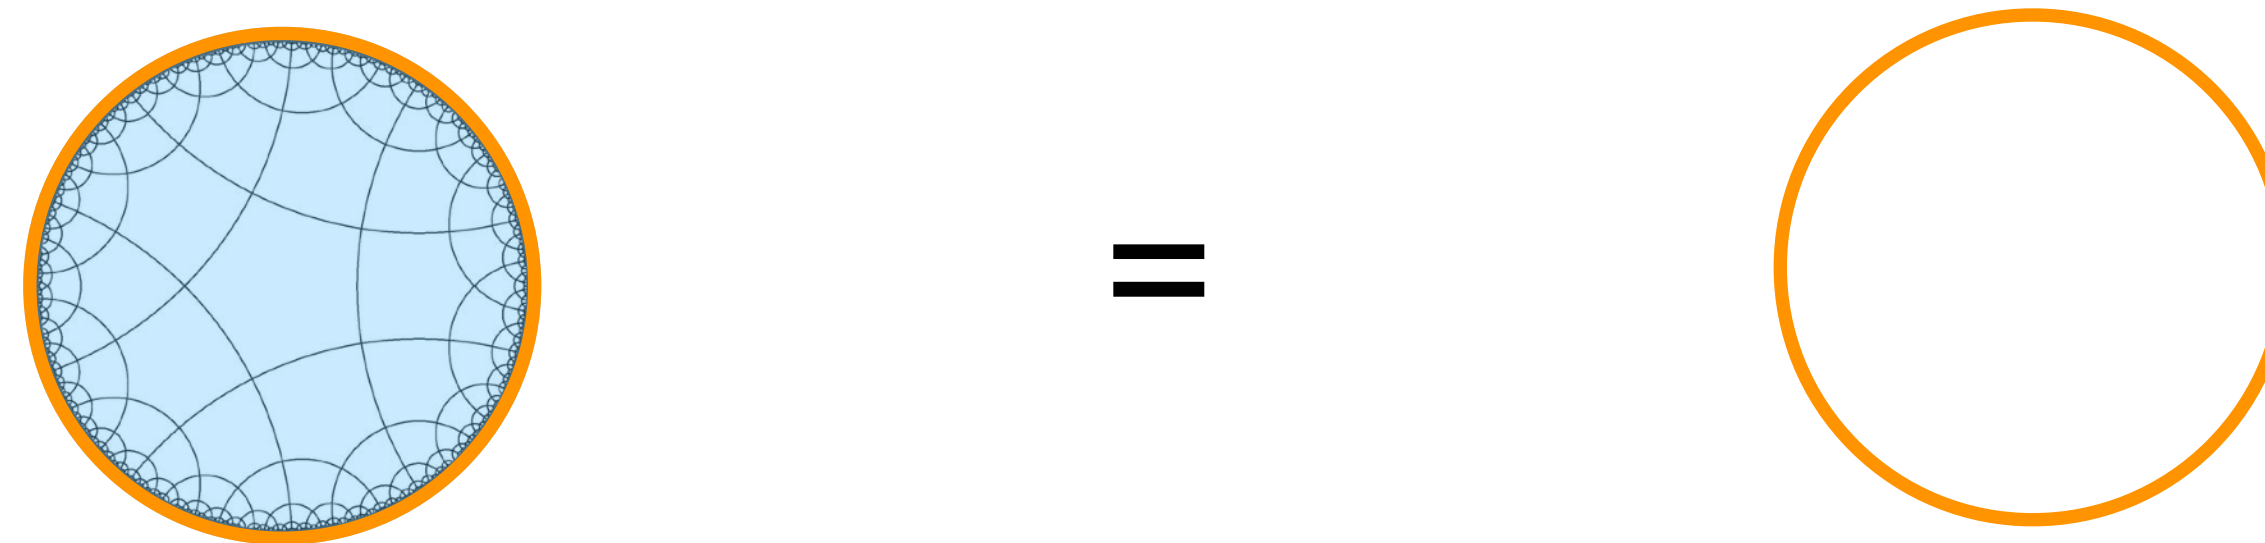

A further reaching implication of the AdS/CFT correspondence linked to its **holographic** character: a complete microscopic description of gravity in AdS should be contained in the dual field theory

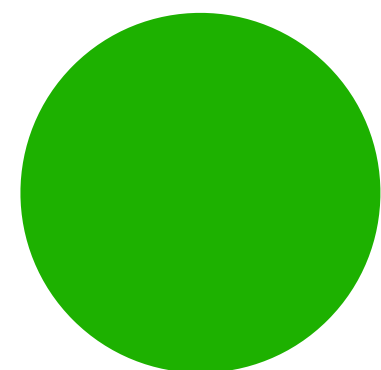

How gravity and spacetime geometry are encoded in the boundary CFT degrees of freedom?

Emergent Gravity

A further reaching implication of the AdS/CFT correspondence linked to its **holographic** character: a complete microscopic description of gravity in AdS should be contained in the dual field theory

How gravity and spacetime geometry are encoded in the boundary CFT degrees of freedom?

Quantum Information: promising framework to try and answer this question and gain a deeper understanding of holography

Entanglement

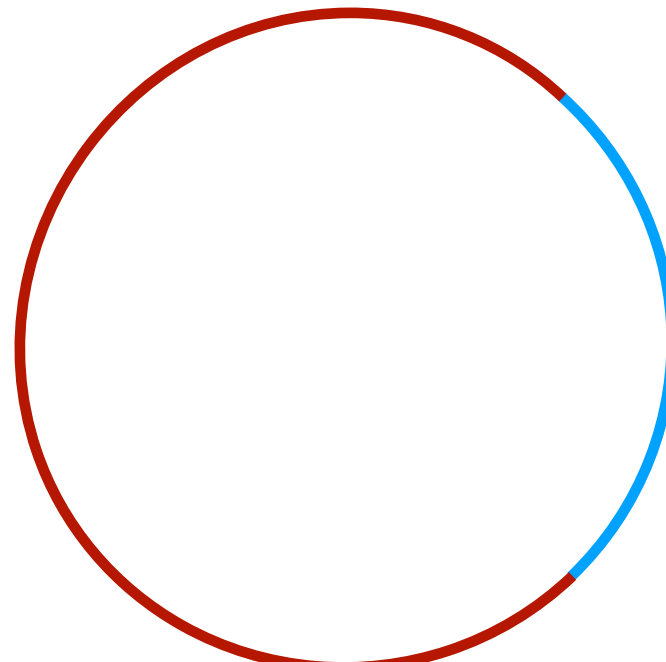

Key role played by the notion of entanglement and its measure in terms of **entanglement entropy**:

QFT in a state $\rho = |\psi\rangle\langle\psi|$

Entanglement entropy of a **spatial subsystem** A with its complement

$$S(A) = -\text{Tr}_A \rho_A \log \rho_A$$

$$\rho_A = \text{Tr}_{\bar{A}} \rho$$

A circle representing a spatial system, divided into two regions: A (red arc) and B (blue arc).

$$|\psi\rangle = \frac{1}{\sqrt{2}} (|0\rangle_A |0\rangle_B + |1\rangle_A |1\rangle_B)$$

Measures the amount of entanglement between d.o.f. in A and the rest (for a pure state)

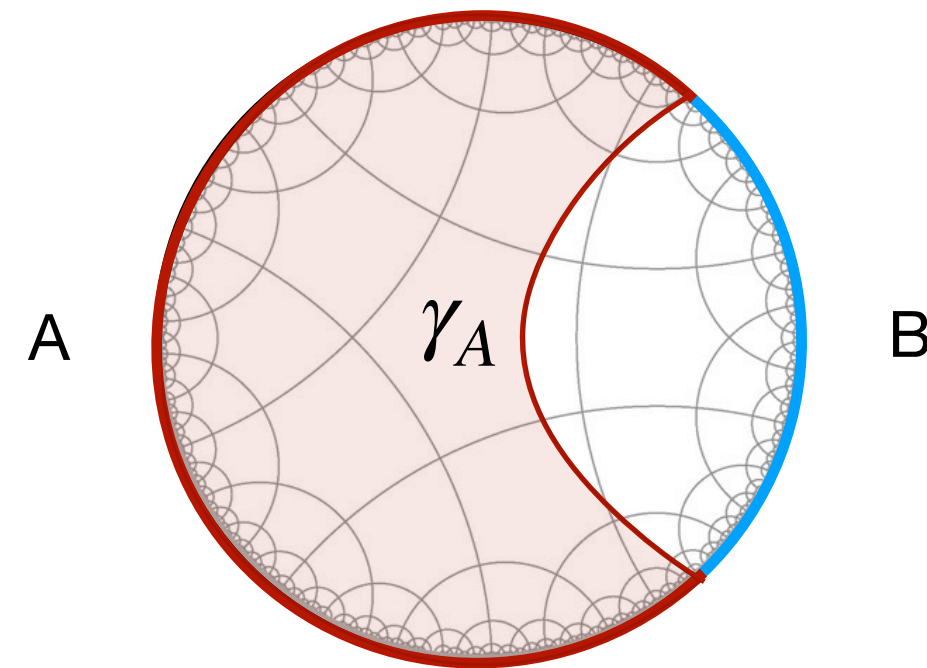

$S(A) \sim$ number of Bell pairs that entangle A and B

Encodes interesting information about the QFT (state, number of degrees of freedom...)

Holographic Entanglement Entropy

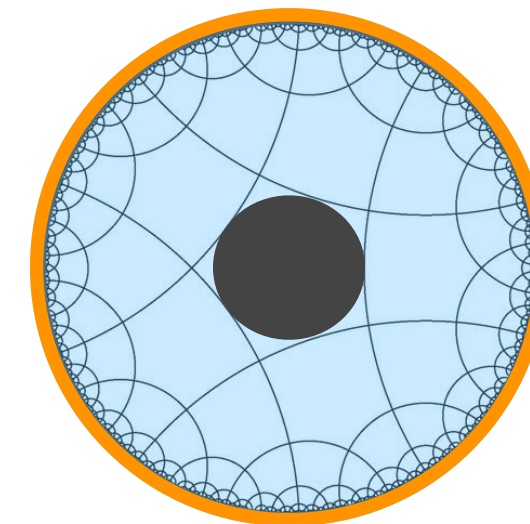

Entanglement entropy for a region A in CFT = Minimal area surface extending in AdS

[Ryu, Takayanagi 06]

$$S(A) = \frac{\text{Min}(\text{Area}_{\gamma_A})}{4G_N}$$

Microscopic generalization of the black hole entropy formula

$$S_{\text{BH}} = \frac{\text{Area}(\text{horizon})}{4G_N}$$

[Bekenstein, Hawking 73]

➔ Direct connection between bulk geometry and quantum correlation structure of states in the dual field theory on the boundary

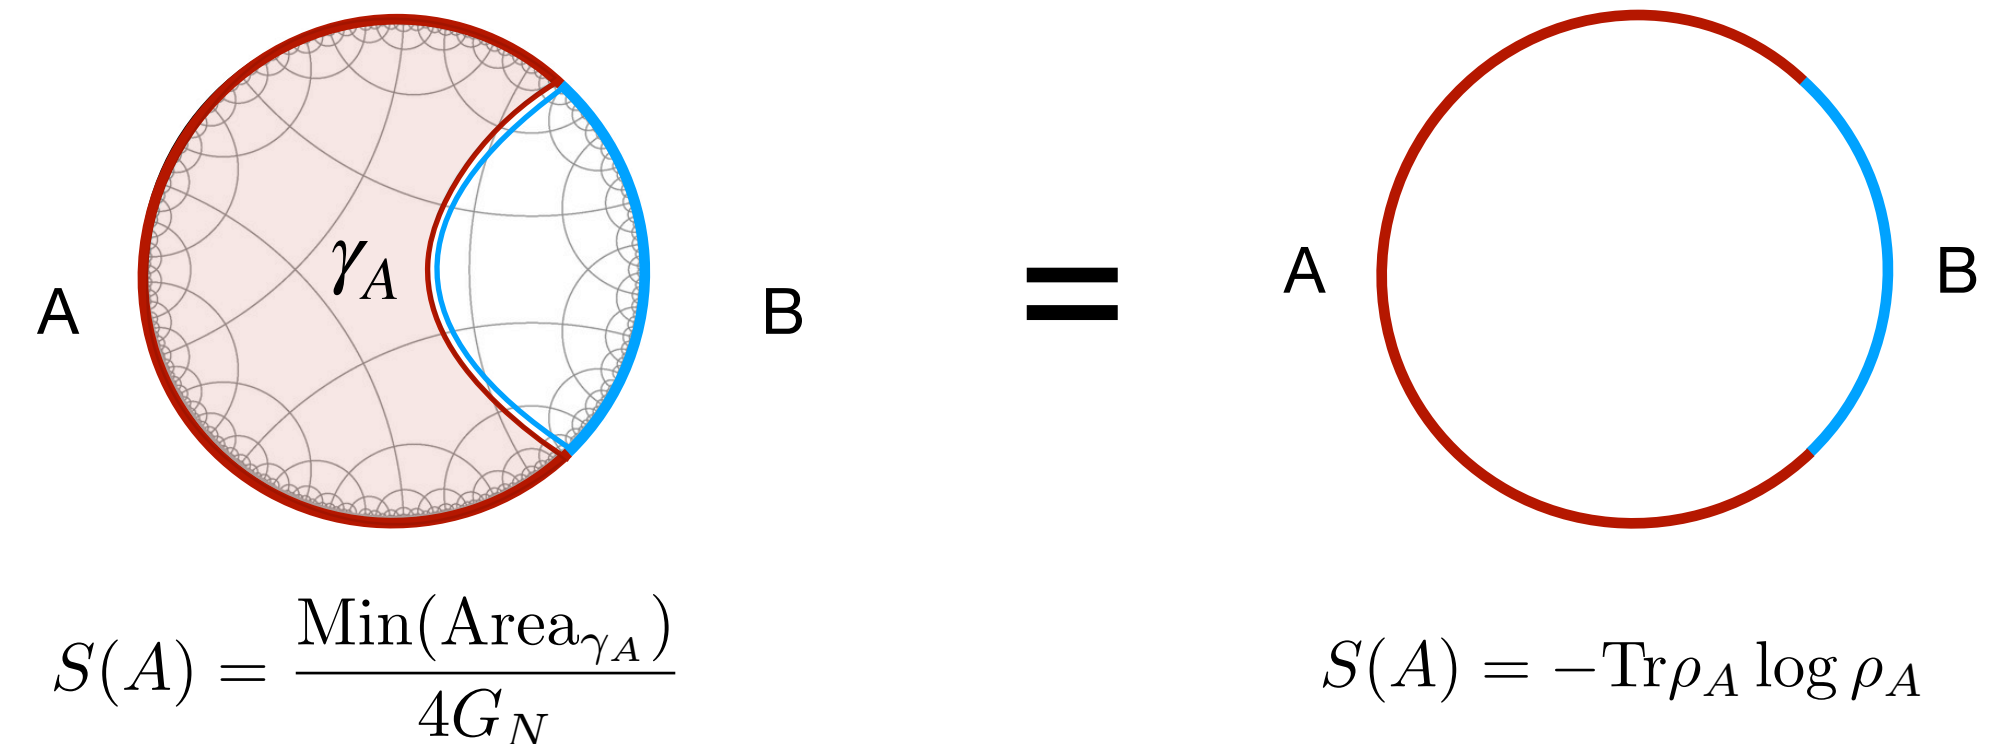

Quantum Information Constraints

First law of entanglement entropy: for an infinitesimal variation of the state $\rho_A + \delta\rho_A$

$$\delta S(A) = \delta \langle H(A) \rangle \quad \text{quantum version of the 1st law of thermodynamics}$$

Completely general property following in a simple way from the definition of $S(A)$

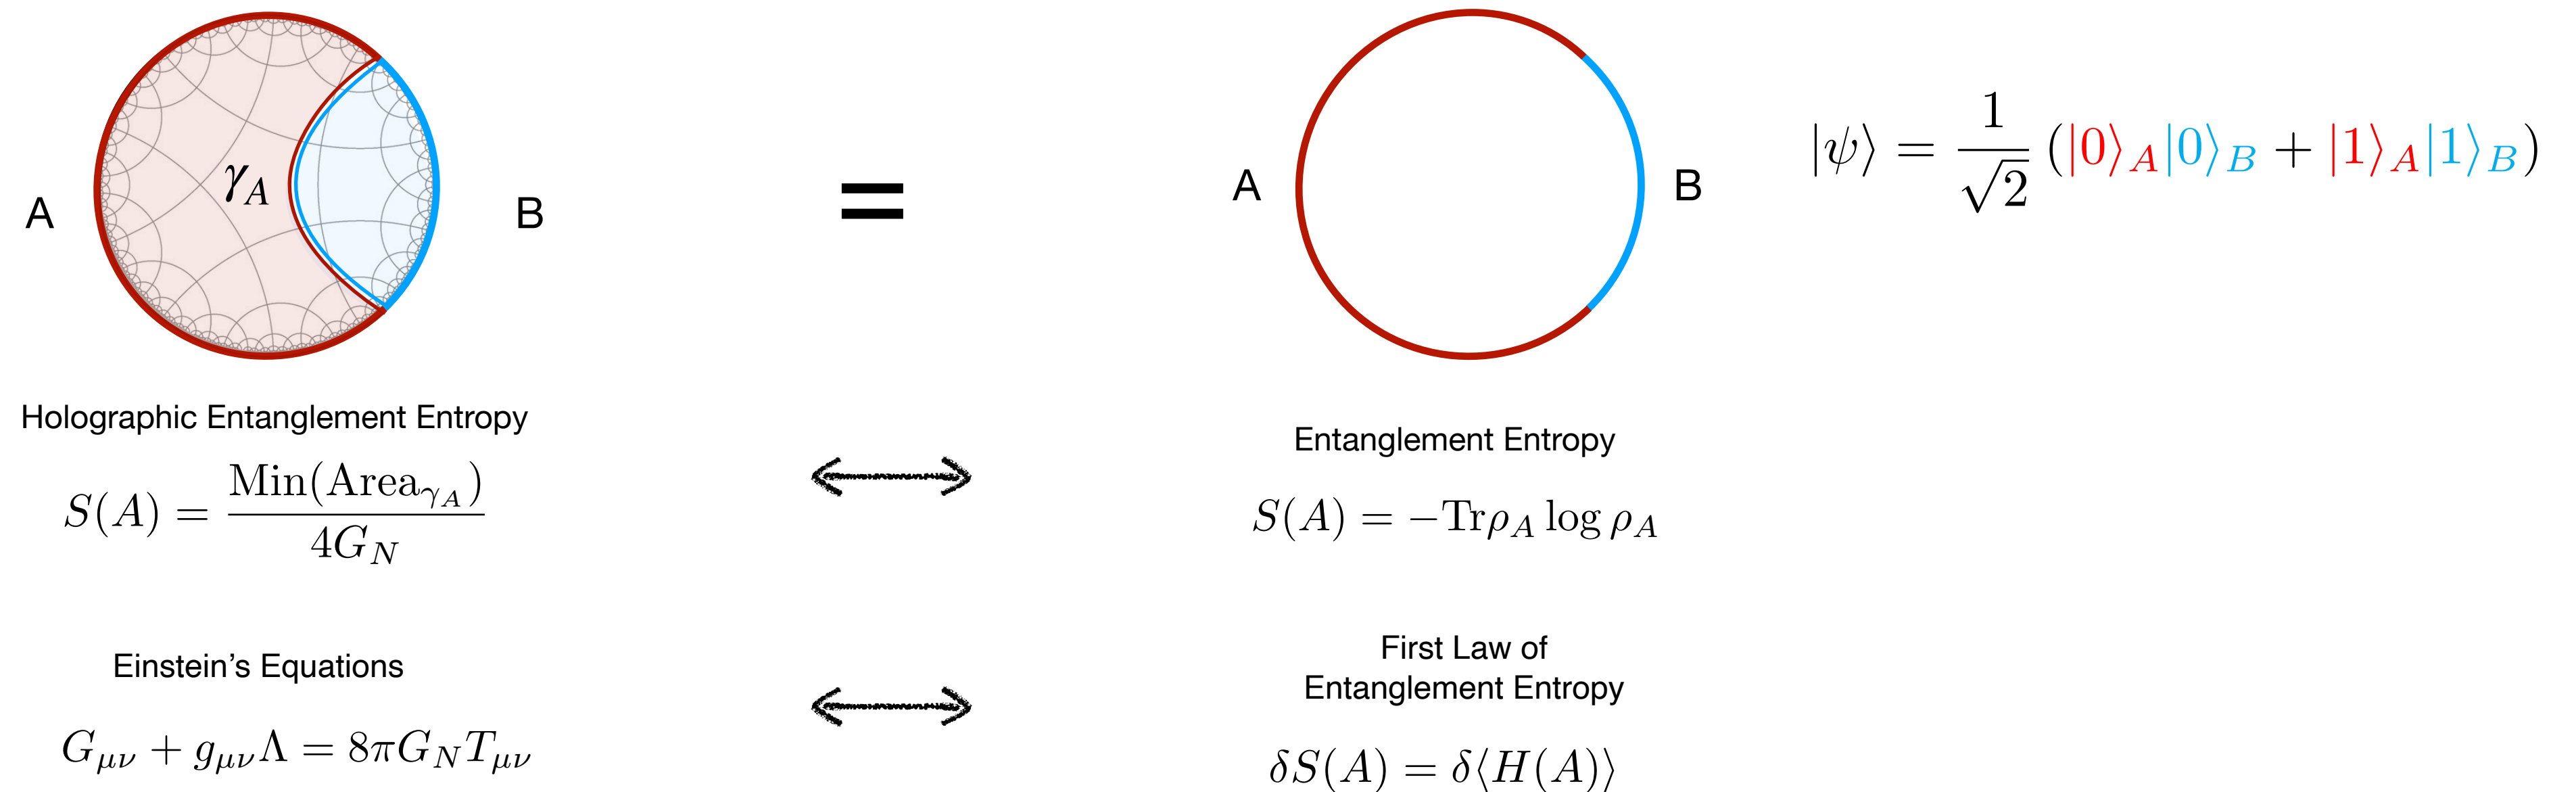

Assuming the holographic entropy formula

$$S(A) = \frac{\text{Min}(\text{Area}_{\gamma_A})}{4G_N} \quad = \quad S(A) = -\text{Tr} \rho_A \log \rho_A$$

➔ The first law of entanglement on the boundary implies linearized Einstein's equations in the AdS bulk! [Faulkner, Guica, Hartman, Myers, VanRaamsdonk 14]

Geometry from Entanglement

Concrete connection between spacetime geometry and entanglement

Can spacetime and gravity be described in quantum information theoretical terms and as emerging from the underlying quantum correlations structure?

Take-Home Message

AdS/CFT correspondence gives a concrete realization of the holographic principle and offers a framework to explore the idea of emergent gravity and spacetime in a controlled setting

Gravity geometrizes quantum information measures and concepts

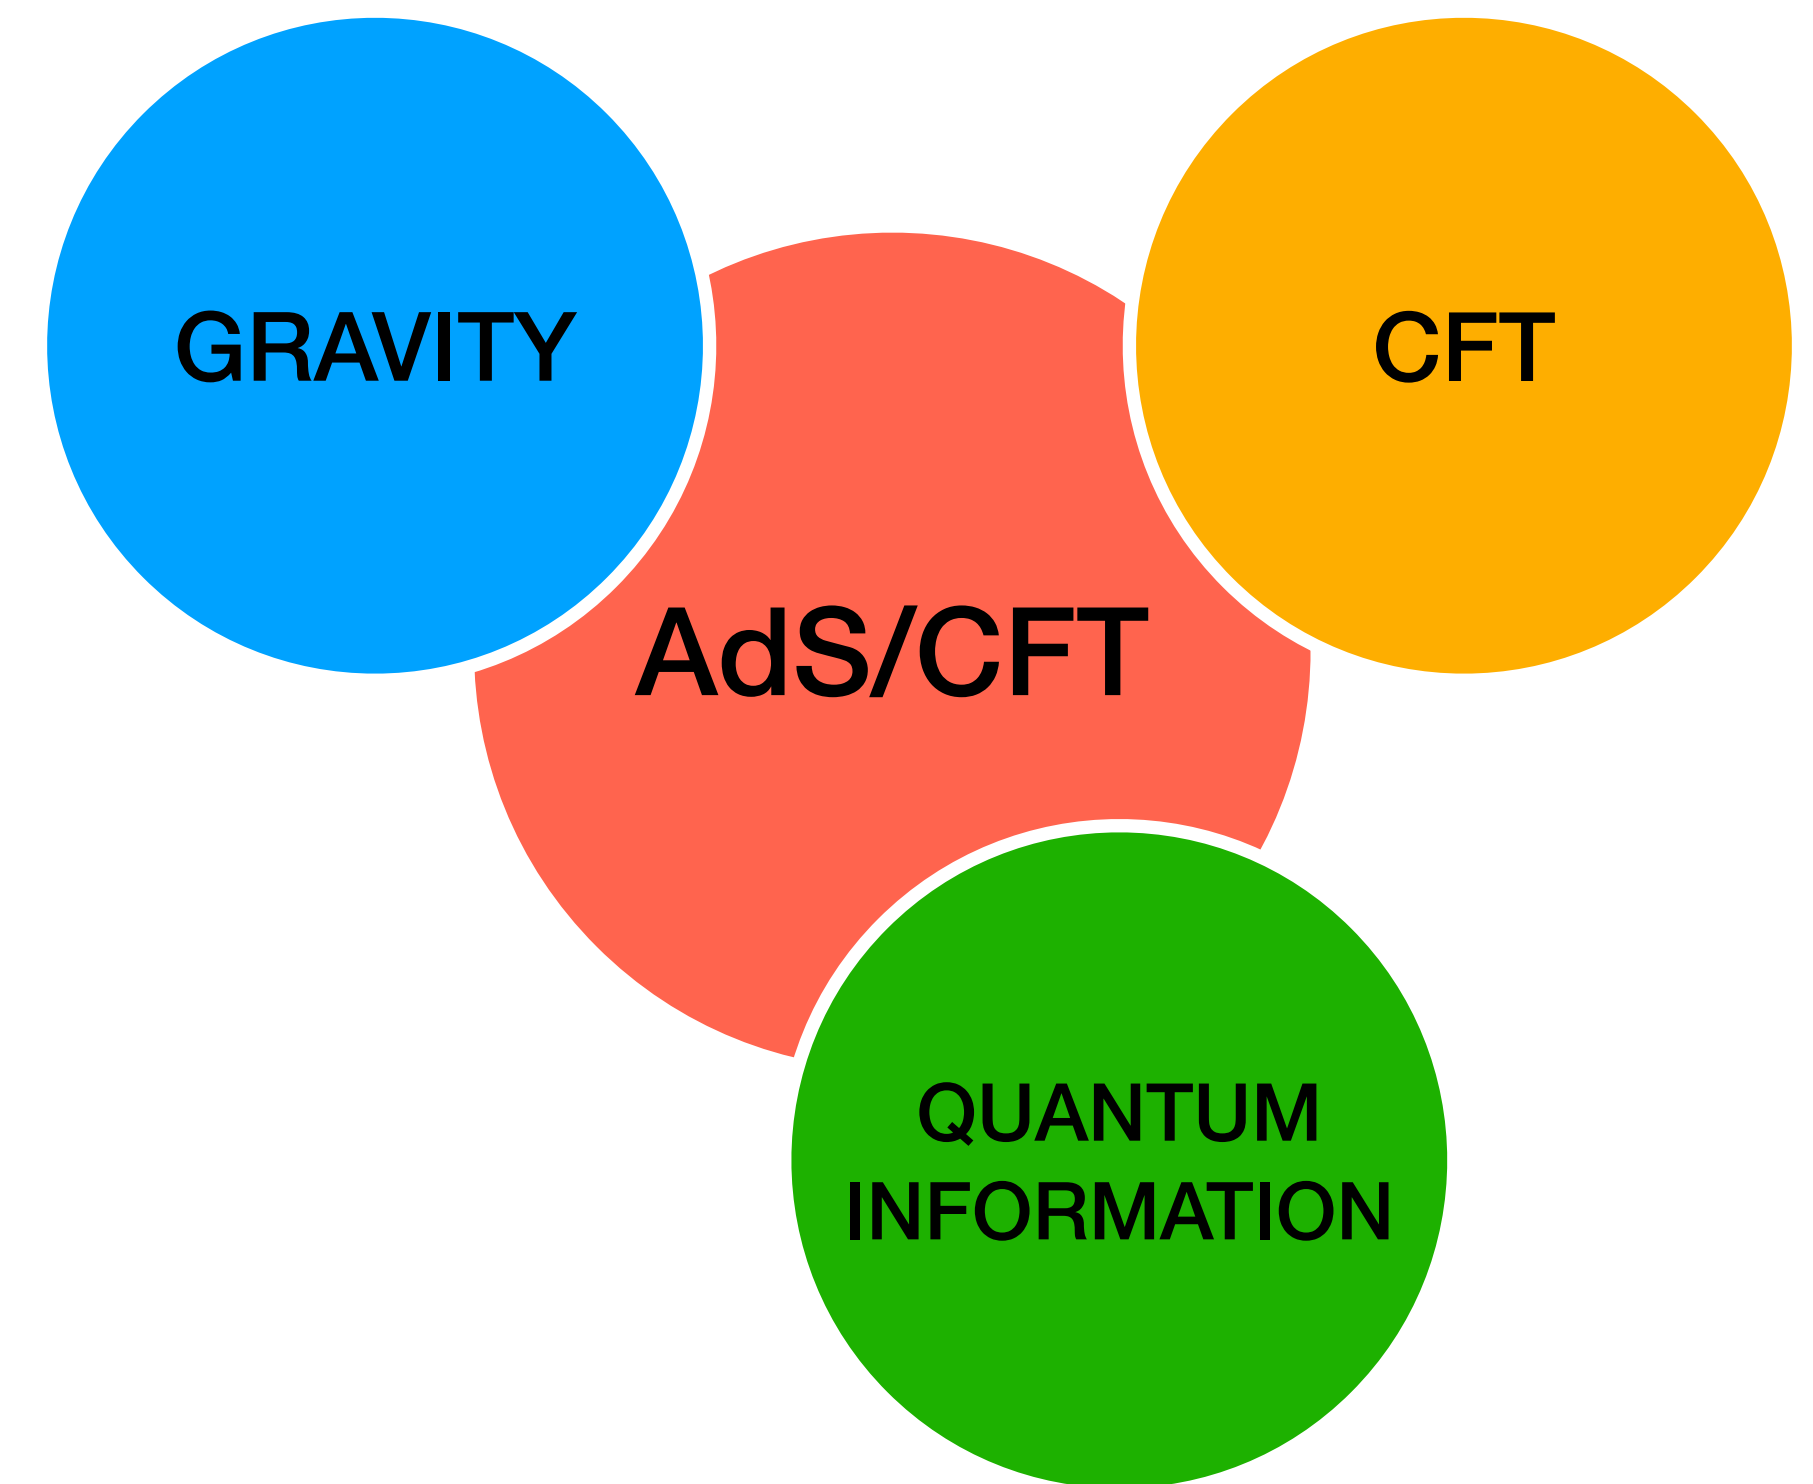

Thinking in terms of entanglement and quantum correlations gives a novel perspective on quantum field theory and gravity

Promising avenue to explore in order to gain a deeper understanding of holography

My Fellini Project

How holographic spacetime emerges from the underlying non-gravitational degrees of freedom?

- Explore further the interplay between quantum information and holography
- Understand the structure of quantum correlations in states of CFT with a gravity dual
- Characterize CFTs that admit holographic dual and how they encode gravitational structures
- Draw lessons beyond the AdS/CFT context?

- Quantum information **measures**: complementary information to the one given by entanglement entropy
- Quantum information **constraints**: have a general character and can act as a guiding principle to get new insight both for holography, and for gravity and QFT
- **New** instances of the **holographic duality**: help refine our understanding of the duality and extract new lessons

Quantum Circuit Complexity

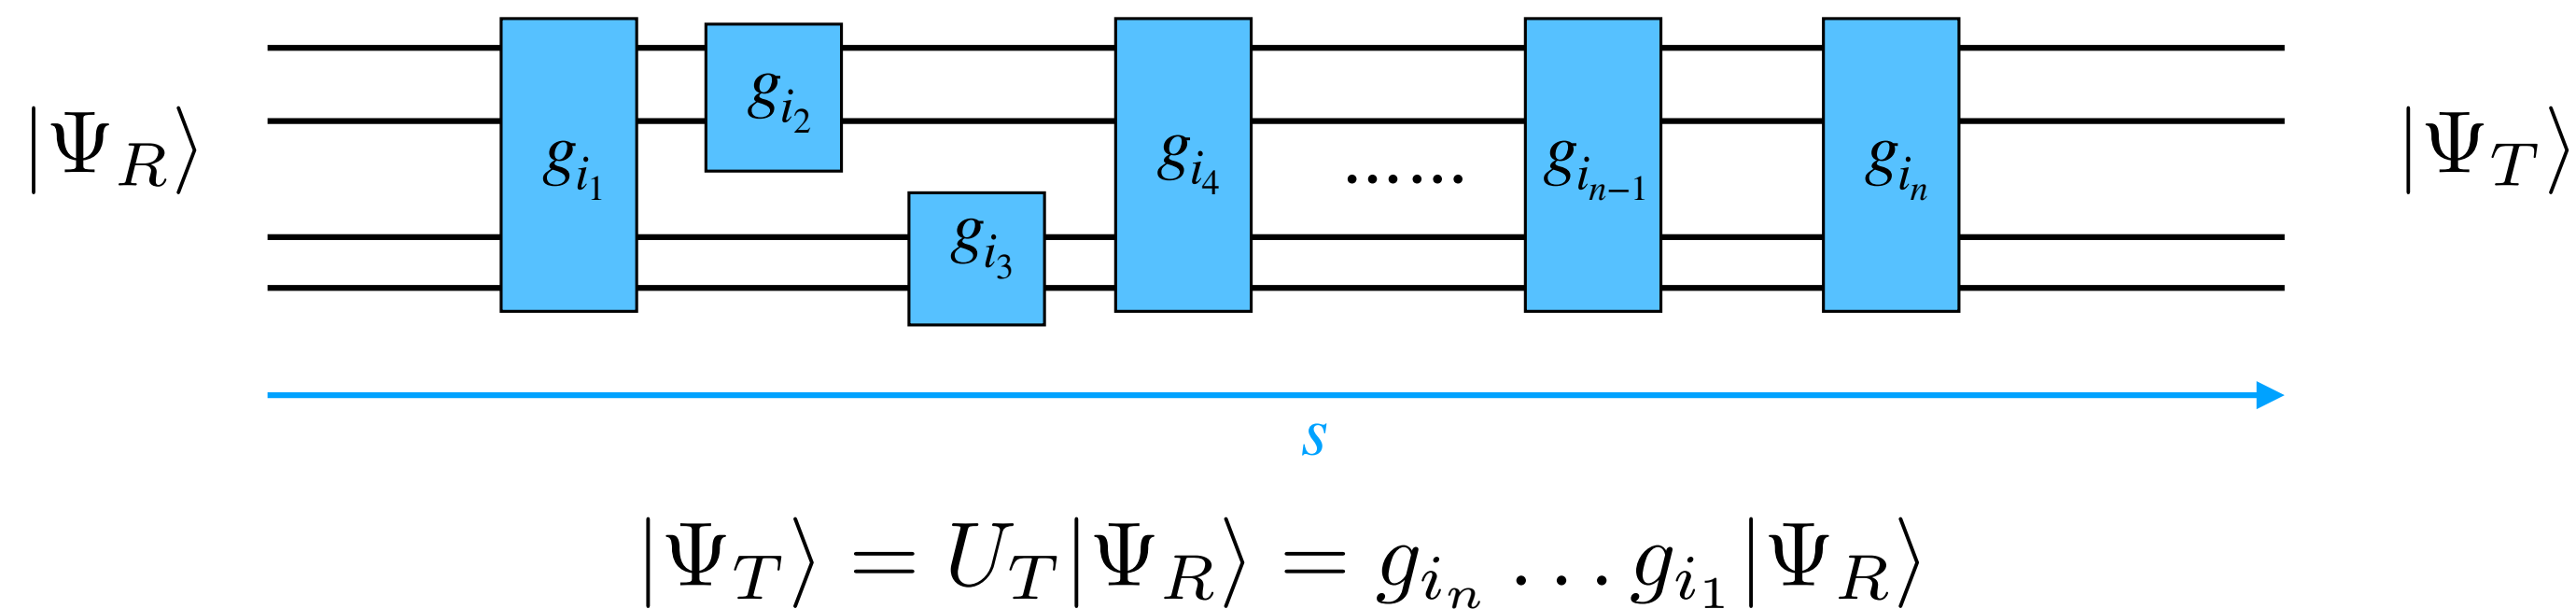

A. Bernamonti, FG, J. Hernandez, R. Myers, S. Ruan and J. Simón
PRL 2019 & J. Phys. A: Math. Theor. 2020

A. Bernamonti, F. Bigazzi, D. Billo, L. Faggi and FG JHEP 2021

Quantum Circuit Complexity

How difficult is it to prepare a particular state?

Given a simple reference state, how hard it is to prepare a target state acting with a unitary constructed from a set of generators of elementary gates

Complexity quantifies the cost of the optimal circuit generating U_T

Nielsen's geometric approach

[Nielsen et al.]

Continuous representation of unitary transformations

$$U(\sigma) = \overleftarrow{\mathcal{P}} \exp \left[-i \int_0^\sigma ds H(s) \right] \quad H(s) = \sum Y^I(s) \mathcal{O}_I$$

Associates a cost to each trajectory in the space of unitaries

$$\mathcal{C}(|\Psi_T\rangle) \equiv \text{Min} \int_0^1 ds F(U, Y^I)$$

Complexity: **globally cost-minimizing trajectory** in the space of unitaries.

Classical mechanics problem with the cost function F playing the role of the Lagrangian

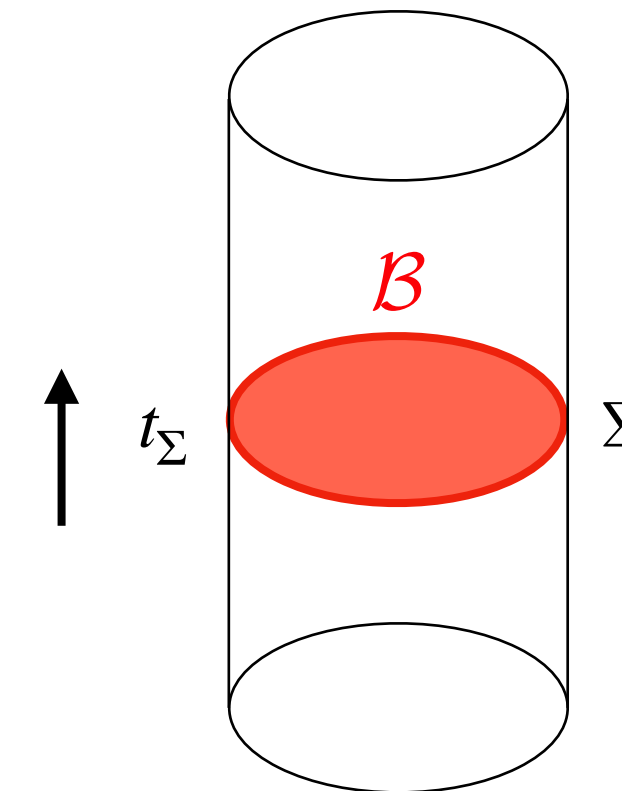

This approach has been used to define complexity in QFT in a number of cases

Holographic Complexity Proposal

Different **gravitational observables** in AdS have been proposed as the holographic dual of the complexity of a target state $|\Psi_T\rangle$ on a boundary Cauchy slice Σ

Maximal-**Volume** bulk hypersurface \mathcal{B} anchored at the boundary on Σ

$$\mathcal{C}_V = \max_{\partial\mathcal{B}=\Sigma} \frac{V(\mathcal{B})}{G_N \ell_{\text{bulk}}}$$

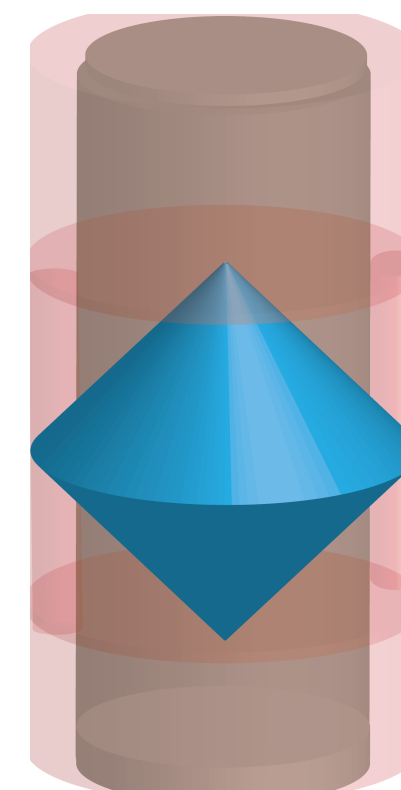

Complexity=Volume

[Susskind, Stanford 15]

Gravitational Action evaluated on the Wheeler-DeWitt patch associated to Σ

$$\mathcal{C}_A(\Sigma) = \frac{I_{\text{WDW}}}{\pi}$$

Complexity=Action

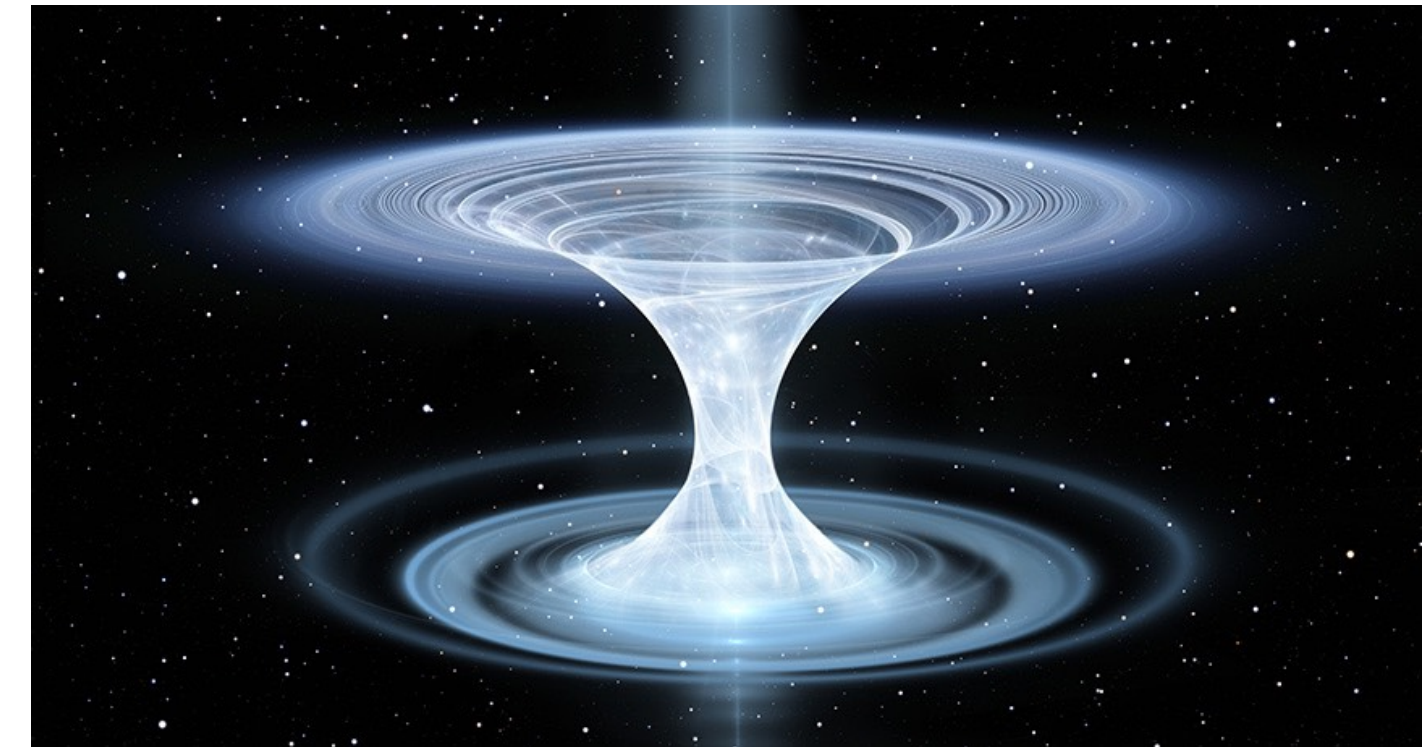

WDW patch: domain of causal dependence of a bulk slice anchored to Σ

[Brown, Roberts, Susskind, Swingle, Zhao 16]

Why Complexity?

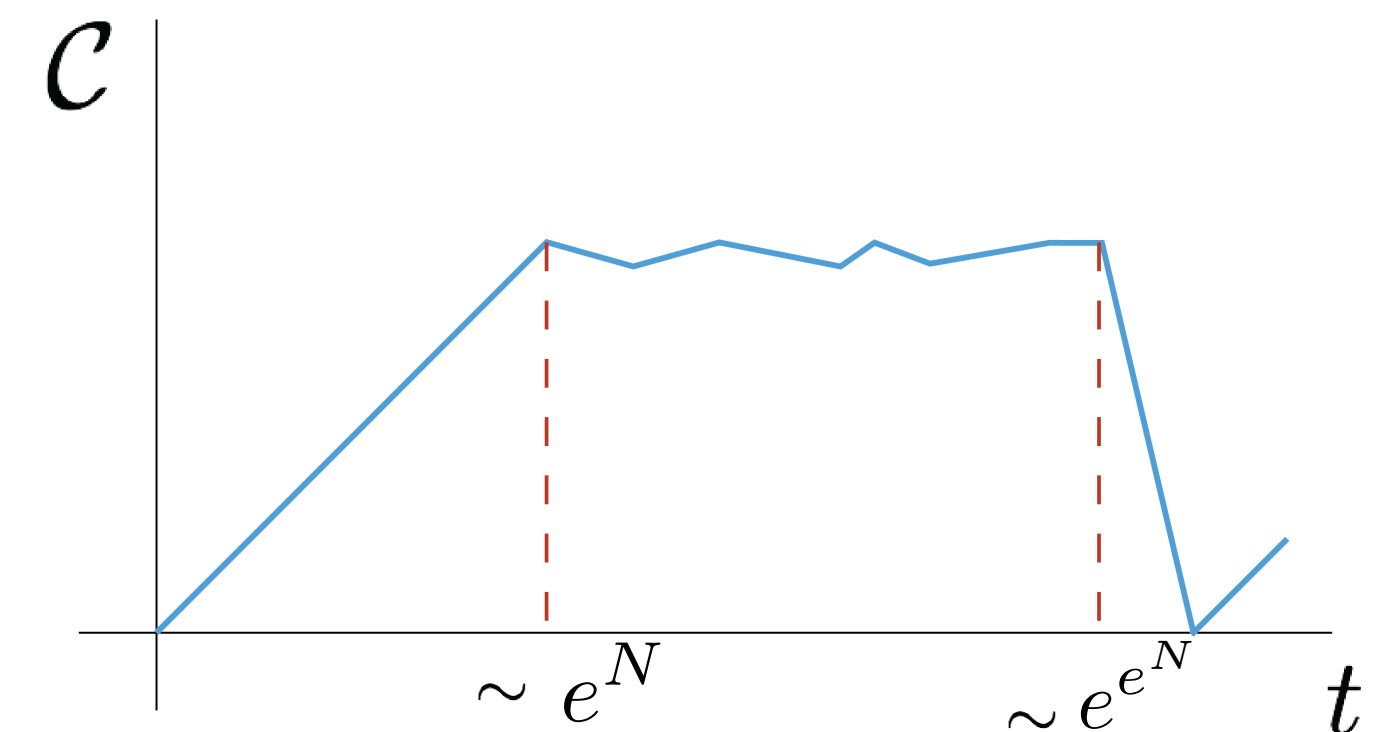

Main evidence comes from the study of AdS Black holes

Black holes grows forever: even though from the outside they appear to stay constant in size, their interior geometry keeps growing (wormhole linear growth)

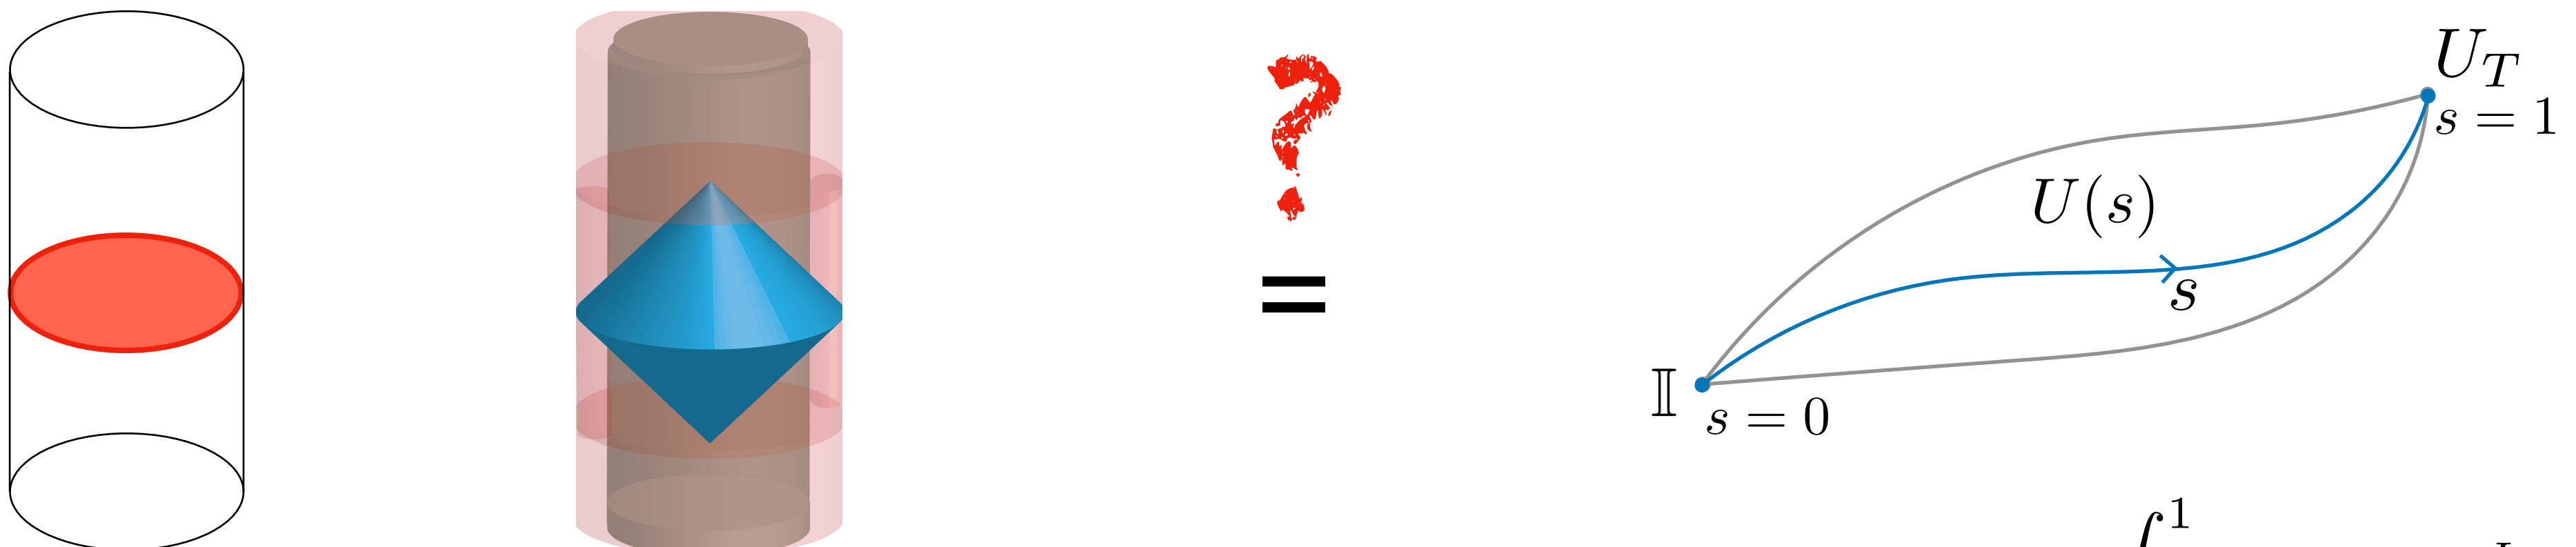

Standard observables (e.g. correlators) in holographic theories thermalize in $t \sim \log N$

Holographic complexity captures internal black hole growth and **grows linearly** for times $t \sim e^N$ as expected for complexity

Holographic Complexity?

$$\mathcal{C}_V = \max_{\partial \mathcal{B} = \Sigma} \frac{V(\mathcal{B})}{G_N \ell_{\text{bulk}}}$$

$$\mathcal{C}_A(\Sigma) = \frac{I_{\text{WDW}}}{\pi}$$

$$\mathcal{C}(|\Psi_T\rangle) \equiv \text{Min} \int_0^1 ds F(U, Y^I)$$

Still have a very partial understanding:

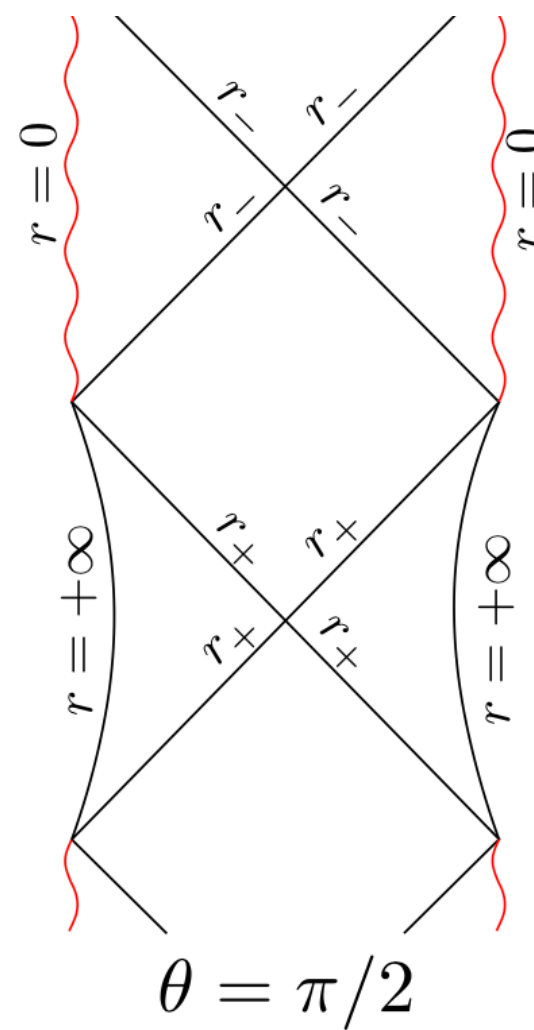

- Understanding of holographic observables far from being exhaustive
- General QFT results are still lacking (mostly free QFT computations)
- Incomplete map between the two sides

Complexity of States with Rotation

Can we gain a deeper understanding of the holographic proposals?

States with rotation: rich structure and interesting limits where to test different measures

Holographically these corresponds to spinning black holes in AdS

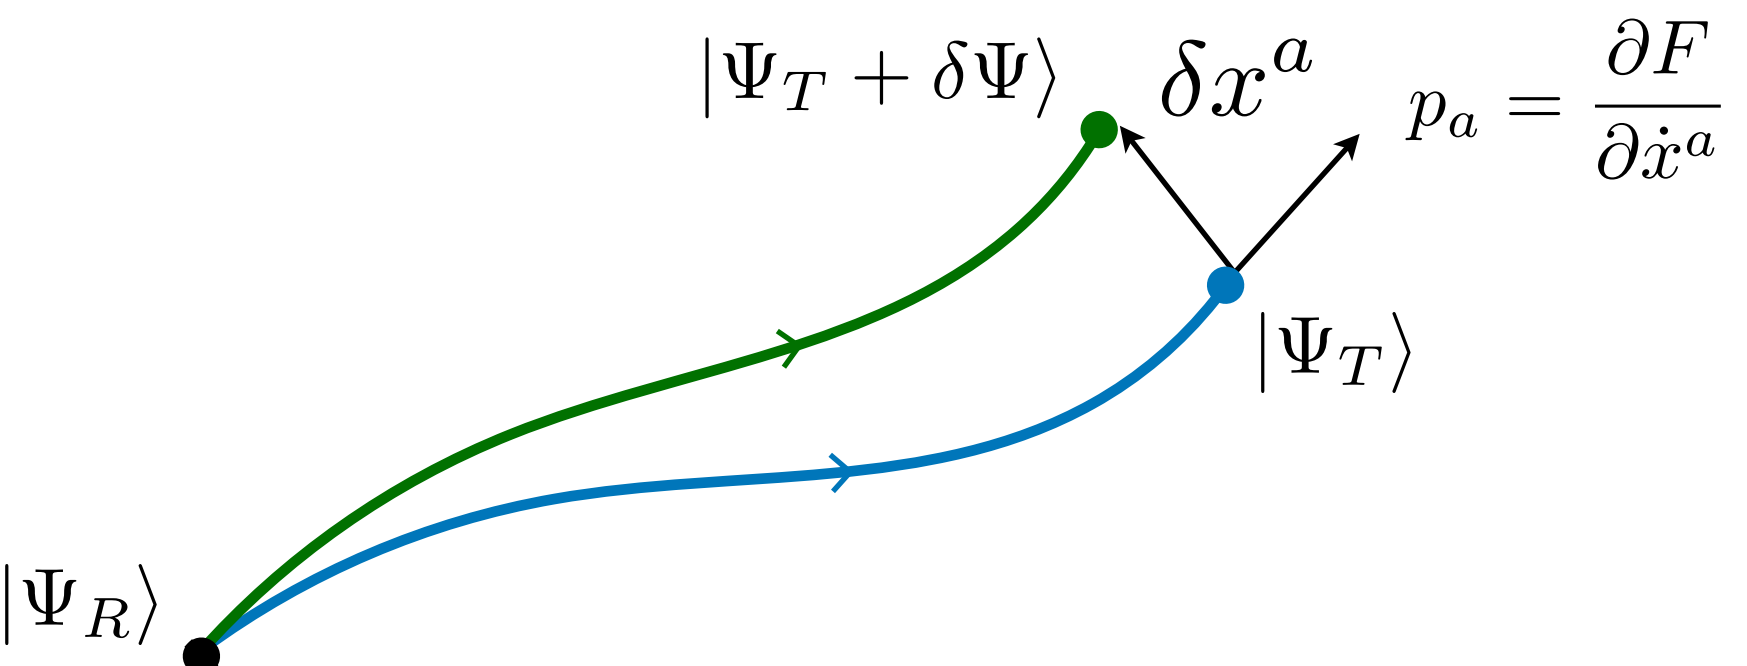

Kerr-AdS_4

- Better understanding of the gravitational observables associated with complexity: resolved some ambiguities in the definitions, clarified previous results obtained in the literature
- Critical rotation velocity, high T limit: qualitative agreement between gravitational and field theory complexity measures

First Law of Complexity

Can we build a connection between the field theory and holographic directions?

How complexity varies under a small change of the target state

$$\delta\mathcal{C} \equiv \mathcal{C}(|\Psi_T + \delta\Psi\rangle) - \mathcal{C}(|\Psi_T\rangle)$$

Using Nielsen's approach: general form of this variation

$$\delta\mathcal{C} = p_a \delta x^a \Big|_{s=1} + \frac{1}{2} \delta p_a \delta x^a \Big|_{s=1}$$

Only contributions from the **endpoints**

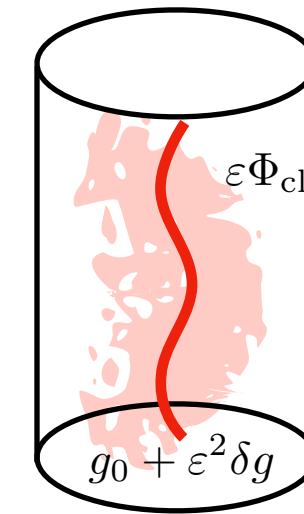

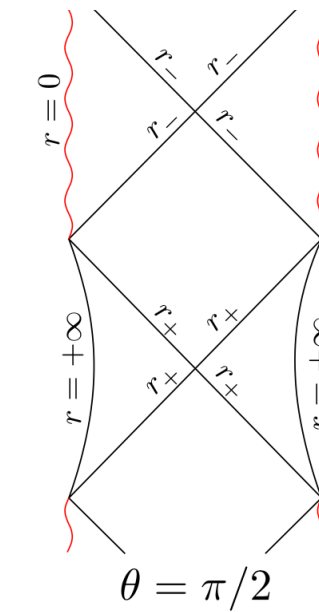

First Law of Complexity

Vacuum perturbation: - coherent scalar states

[Bernamonti, FG, Hernandez, Myers, Ruan, Simón PRL'19 & JPA'20]

- non-vanishing rotation

[Bernamonti, Bigazzi, Billo, Faggi, FG JHEP'21]

- Holographic complexity variation is second order in the amplitude of the perturbation:
coherent and rotating states orthogonal to vacuum AdS direction
- Restrictions on field theory costs compatible with holography
- Complexity=action result localized on the boundary of the WDW

Generalized Second Laws

A. Bernamonti, FG, I. Reyes and R. Myers — IN PROGRESS

A. Bernamonti, FG, R. Myers, J. Oppenheim JHEP 2018

Second Law

Second law of thermodynamics: the entropy of a closed system can never decrease

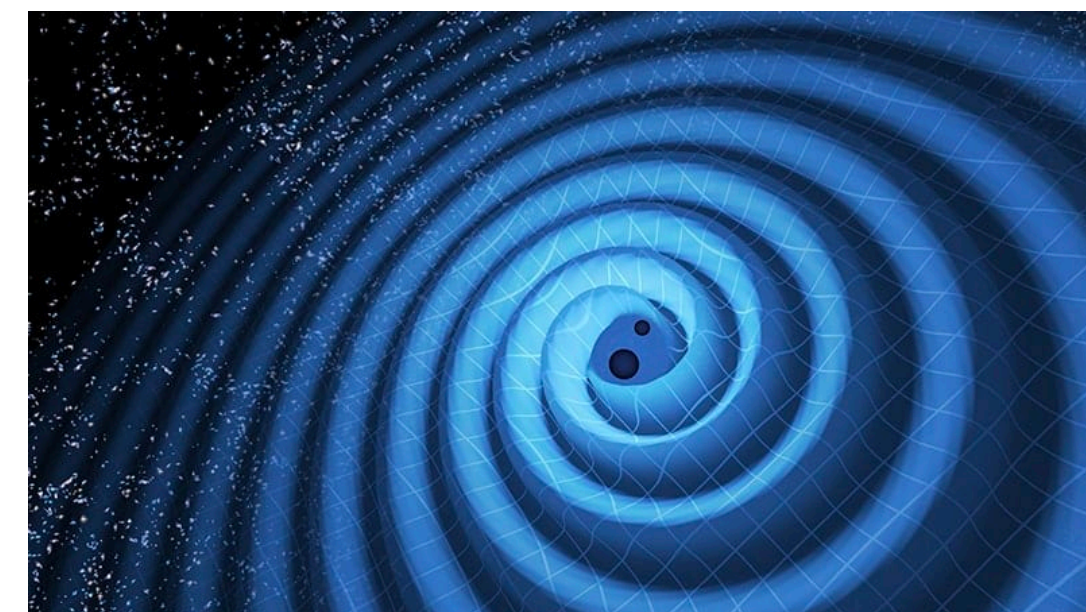

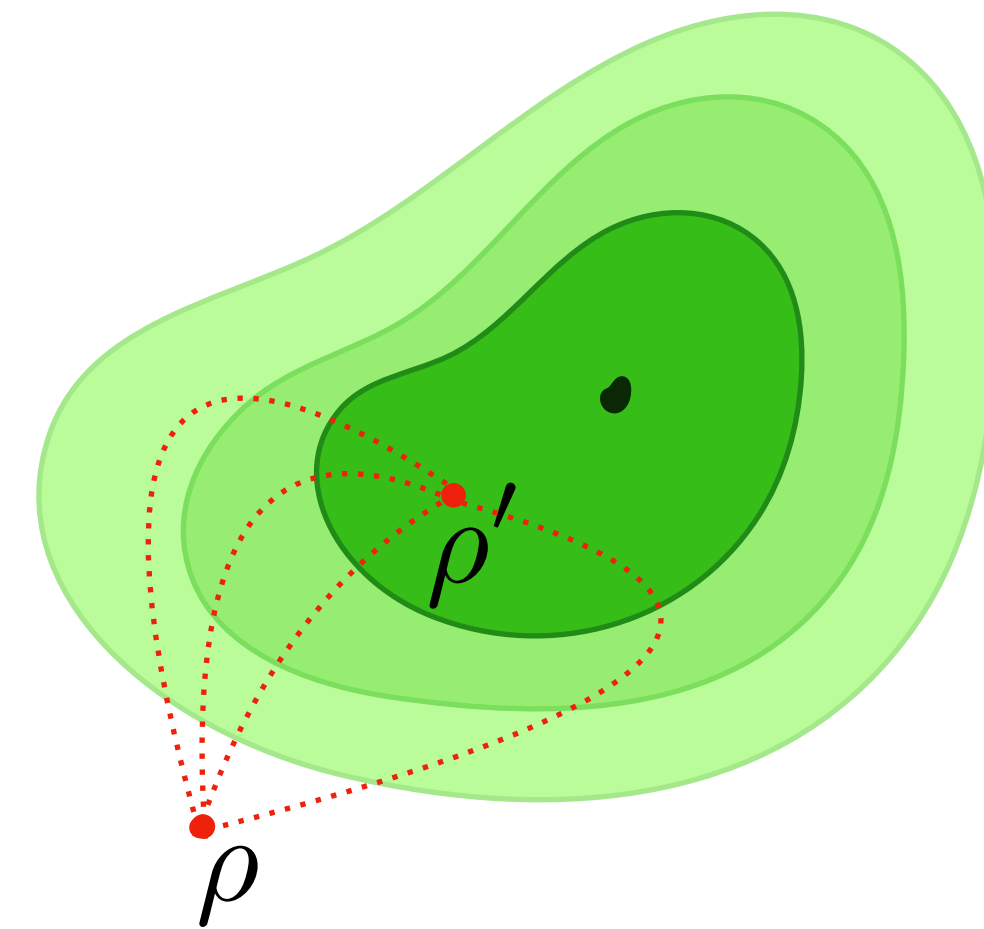

$S(0) \leq S(t)$: necessary condition for any transition
between states $\rho \longrightarrow \rho'$

Sharp geometric interpretation in gravity:

$$S_{\text{BH}} = \frac{\text{Area}(\text{horizon})}{4G_N}$$

Area theorem

Restrictions on the dynamics without solving it!

Generalized Second Laws

Additional laws?

Quantum thermodynamics: additional constraints on equilibration processes for quantum systems and macroscopic systems with long range correlations

[Horodecki, Oppenheim 11]

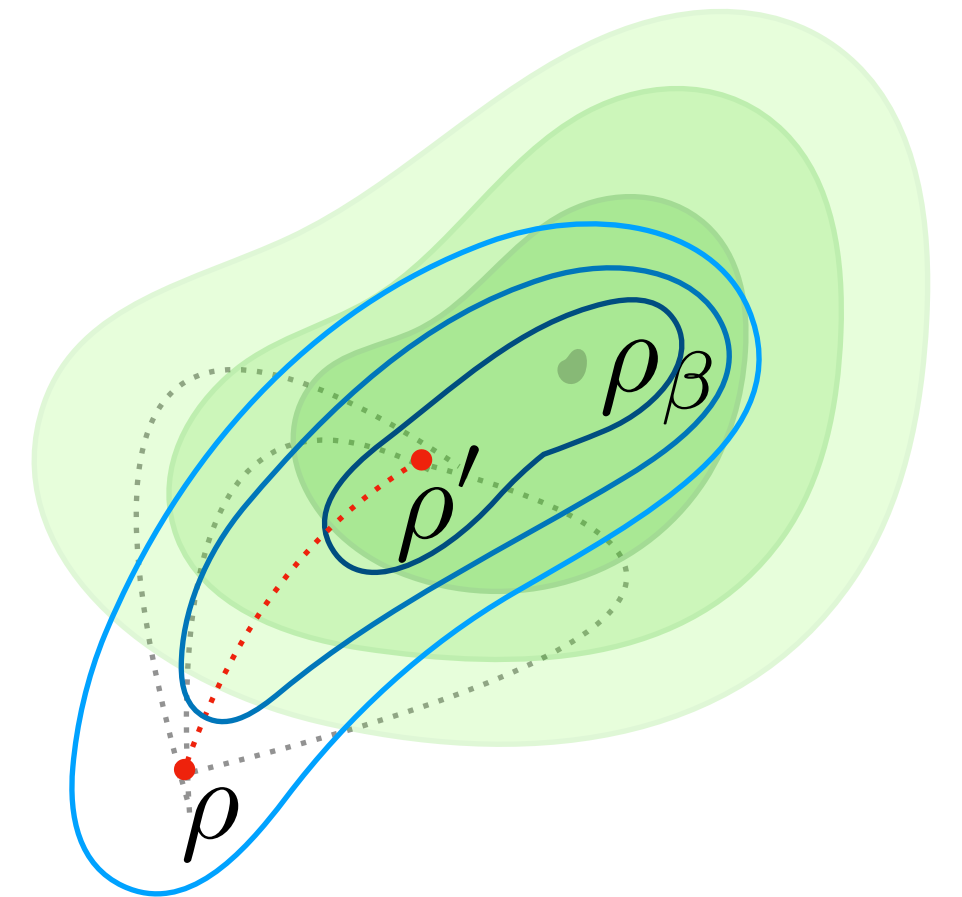

[Brandao, Horodecki, Ng, Oppenheim, Wehner 13]

...

Expressed in terms of quantities giving a notion of **distance between states** and their **monotonicity** property under **transitions**

$$D(\rho || \rho_\beta) \leq D(\rho' || \rho_\beta) \quad \text{necessary condition for } \rho \longrightarrow \rho'$$

↑
reference state

New constraints for quantum field theory and black holes, beyond the second law?

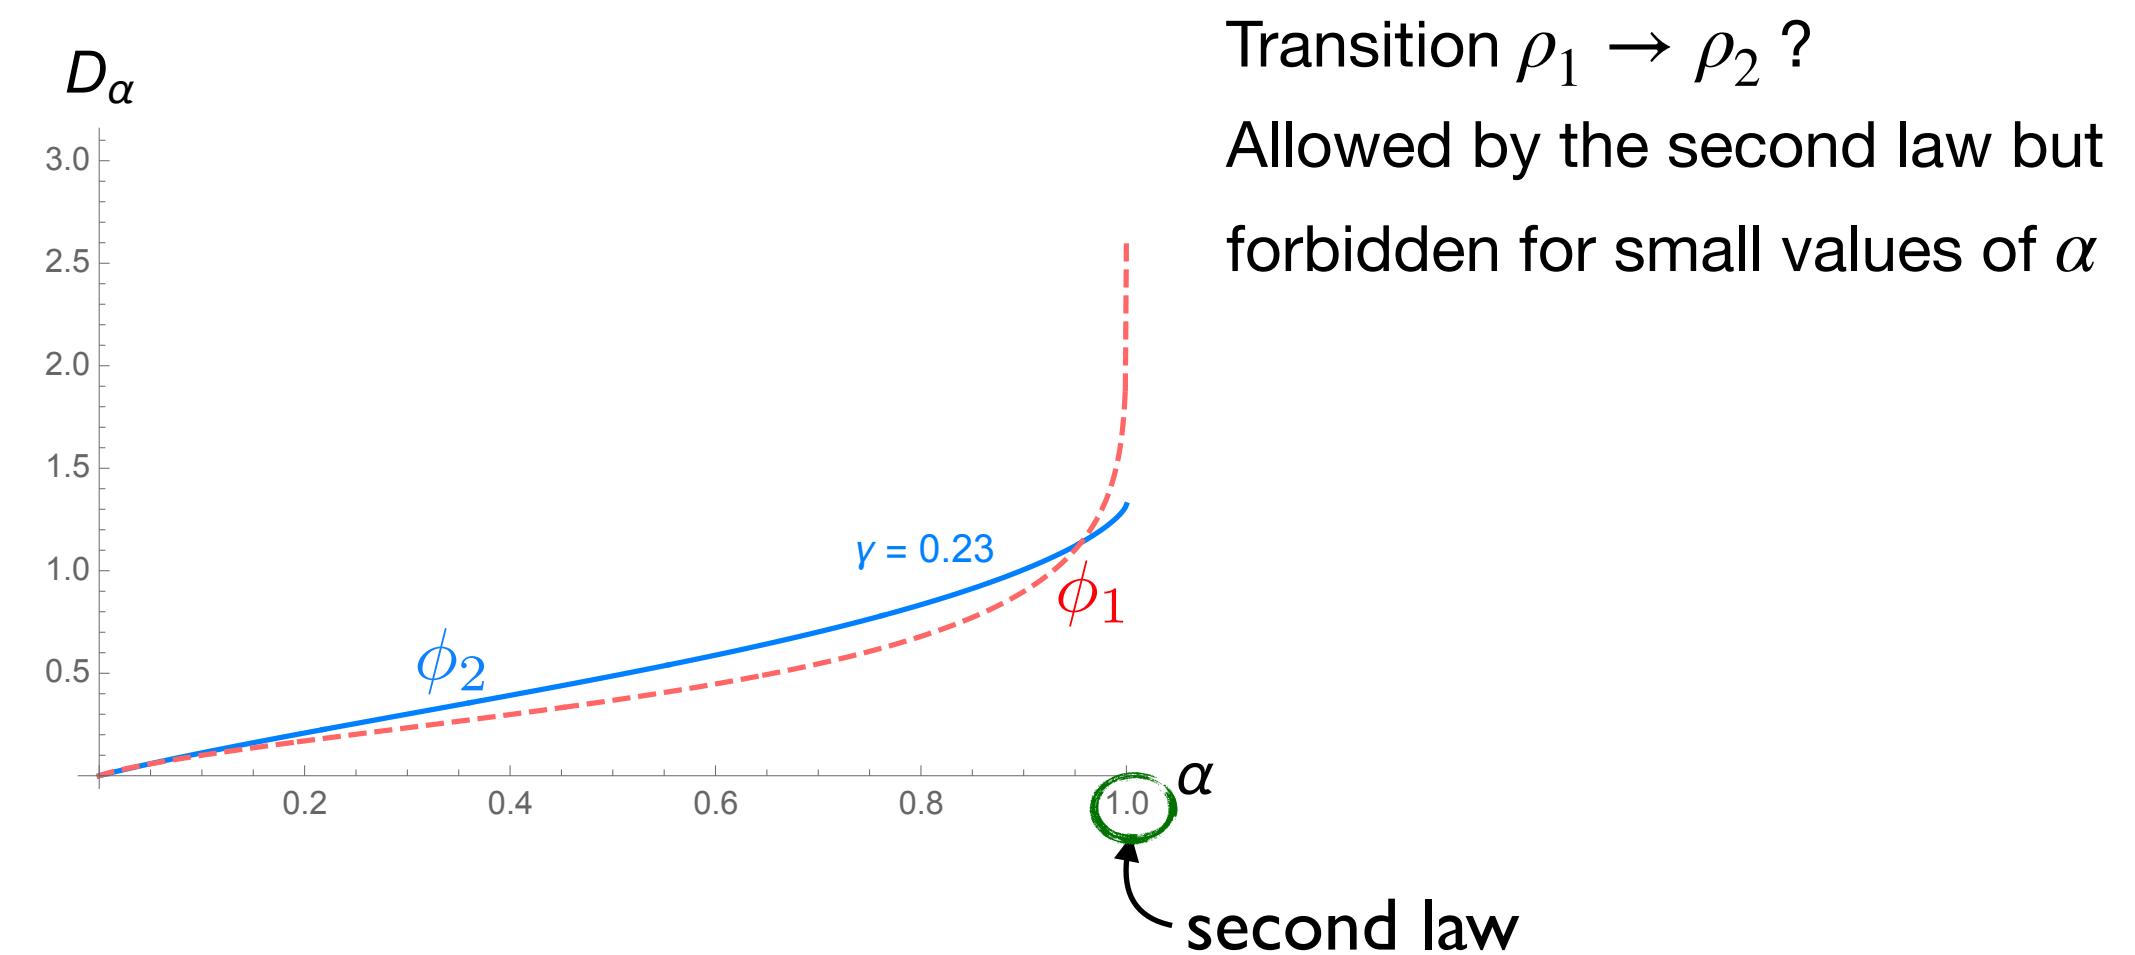

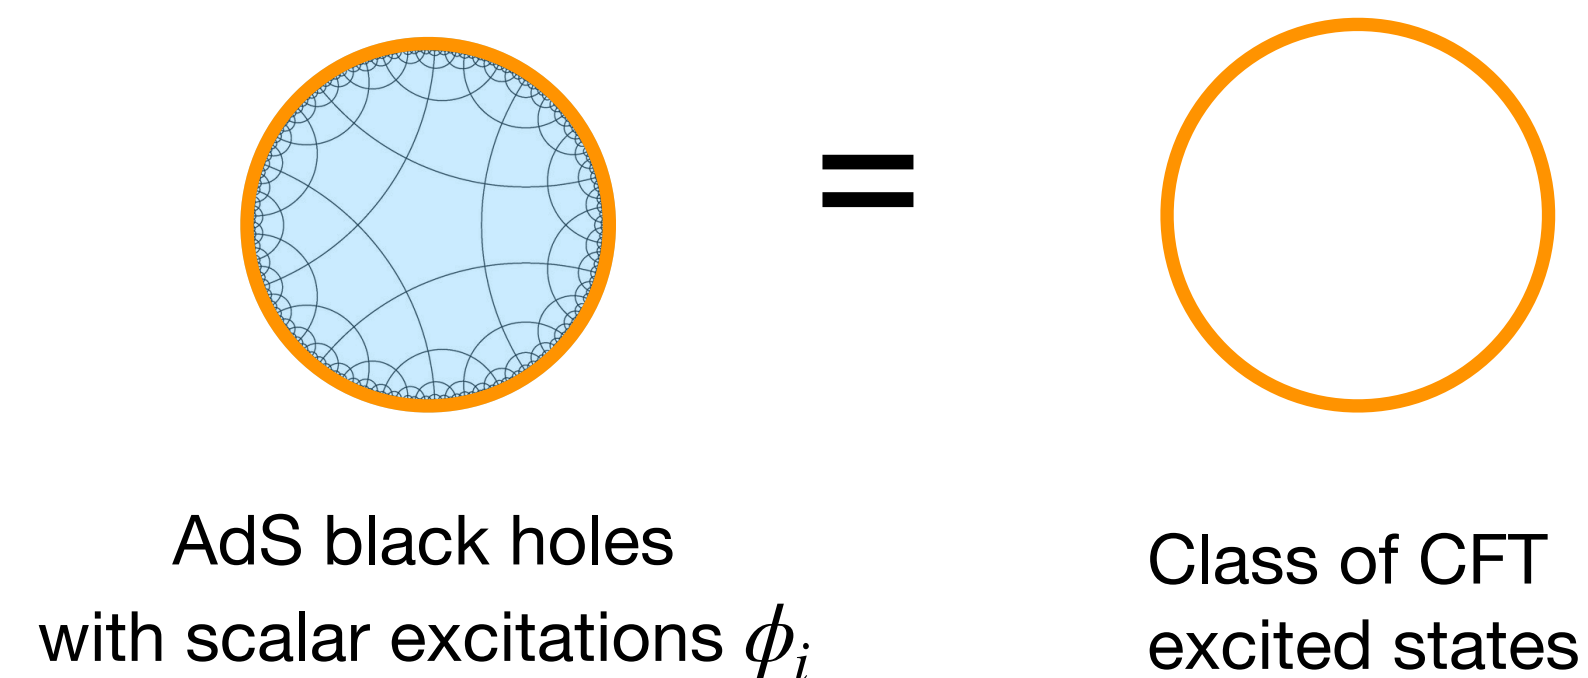

Rényi Divergences

Monotonicity of Rényi Divergences under transitions

$$D_\alpha(\rho||\rho_\beta) \equiv \frac{\text{sgn}(\alpha)}{\alpha - 1} \log \text{tr}(\rho^\alpha \rho_\beta^{1-\alpha})$$

$$D_\alpha(\rho||\rho_\beta) \geq D_\alpha(\rho'||\rho_\beta) \quad \text{necessary for } \rho \longrightarrow \rho'$$

In a holographic setup:

Non-trivial conditions in QFT and gravity!

[Bernamonti, FG, Myers, Oppenheim 18]

Rényi Entropies

Rényi Entropies also give a family of monotonicity constraints

$$S_n(\rho) = \frac{1}{1-n} \log \text{Tr} \rho^n$$

$$S(\rho) \leq S(\rho')$$

necessary for $\rho \longrightarrow \rho'$

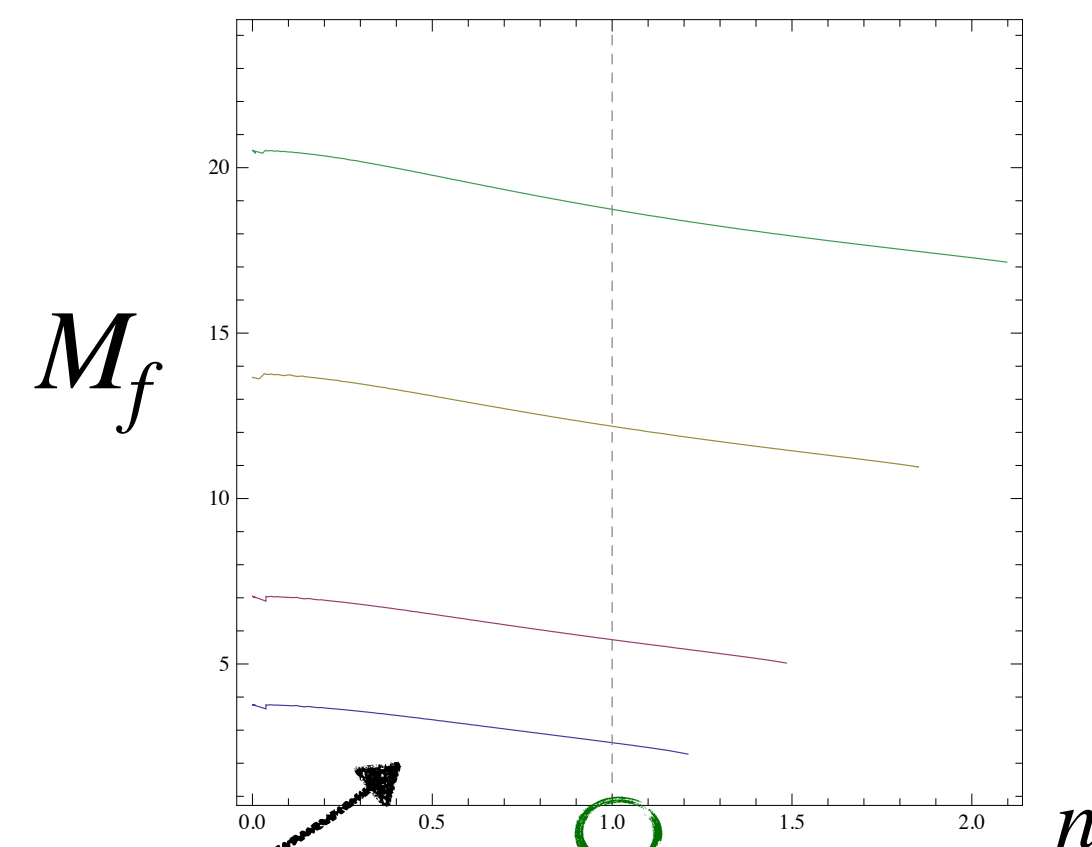

Can be computed for **black holes** and used to study **bounds** on processes like black hole mergers —just like for the usual second law

Example:

AdS4-BH mergers

$$M_i + M_i \rightarrow M_f$$

Lower bound on final mass

stronger bounds

second law

[Bernamonti, FG, Myers, Reyes IN PROGRESS]

Perspectives

- Pin down bounds in processes that are informative for numerical general relativity simulations, e.g. Kerr-AdS4 super-radiant instability

[Green,Holland,Ishibashi,Wald 15]

[Chesler 21]

- Geometric interpretation of the bounds analog to the area theorem?
- Extension to black holes in flat spacetime

Entanglement Islands and Double Holography

A. Bernamonti, R. Emparan, A. Frassino and FG — IN PROGRESS

A. Bernamonti, D. Ge, FG and D. Neuenfeld — IN PROGRESS

Entanglement Islands

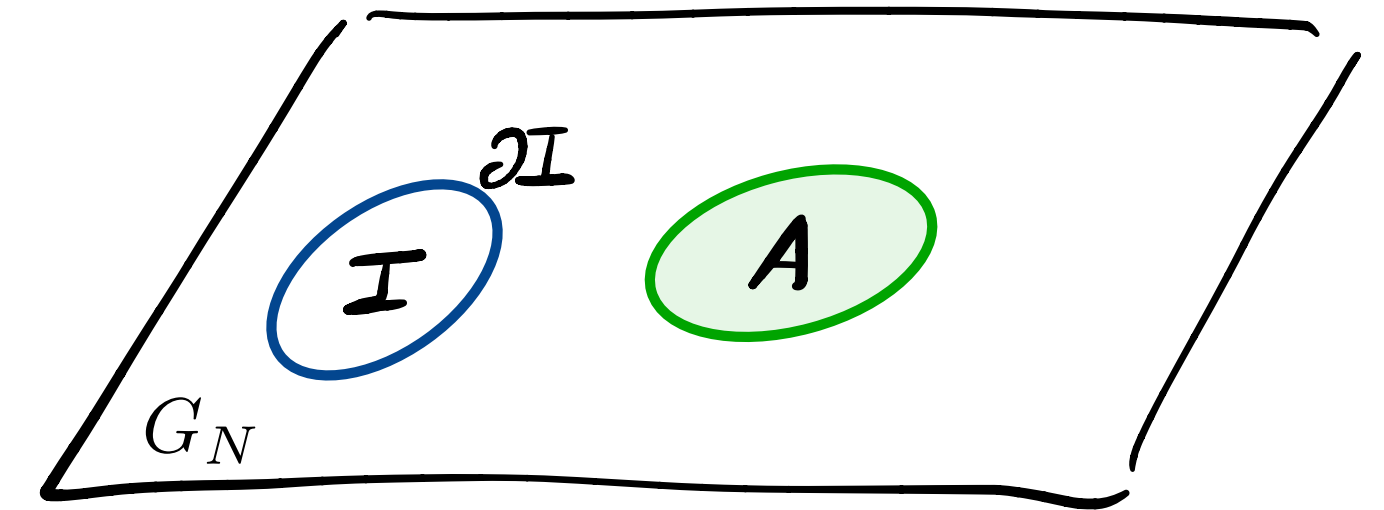

Developments in the general context described above and in the study of the entanglement entropy in gravitational systems led to the proposal that:

in a theory with **dynamical gravity** the entanglement entropy between regions is computed by the **Island Formula**

$$S_{\text{ISLAND}}(A) = \text{Min} \left\{ \text{ext}_I \left[\frac{\text{Area}(\partial I)}{4G_N} + S(A \cup I) \right] \right\}$$

geometric contribution
Bekenstein-Hawking-like

QFT entanglement
entropy

Allows for contributions from additional regions of spacetime: **islands**

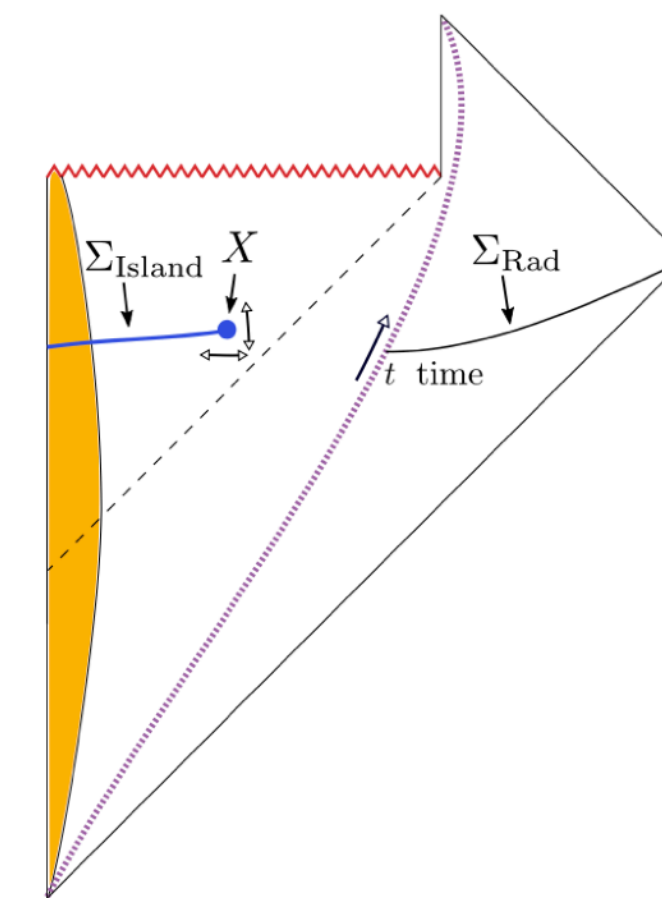

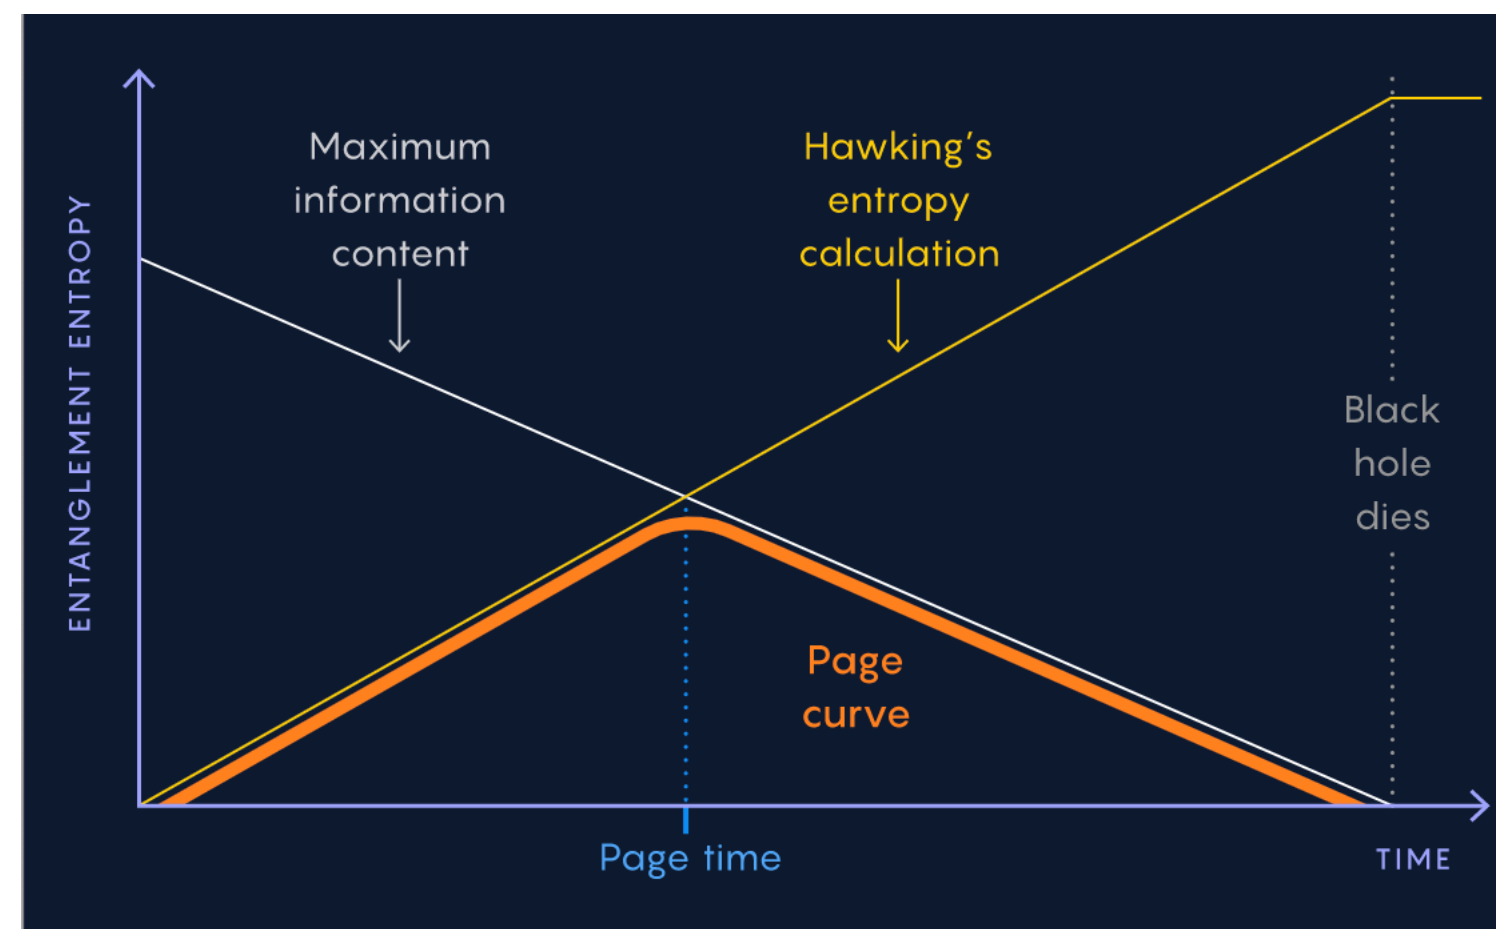

[Almheiri, Engelhardt, Marolf, Maxfield 19]

[Penington 19]

[Almheiri, Mahajan, Maldacena, Zhao 19]

Black Hole Information Paradox

Island formula yields **within semi-classical gravity** an **evolution** of the entanglement entropy for a black hole evaporation process **compatible with unitarity**

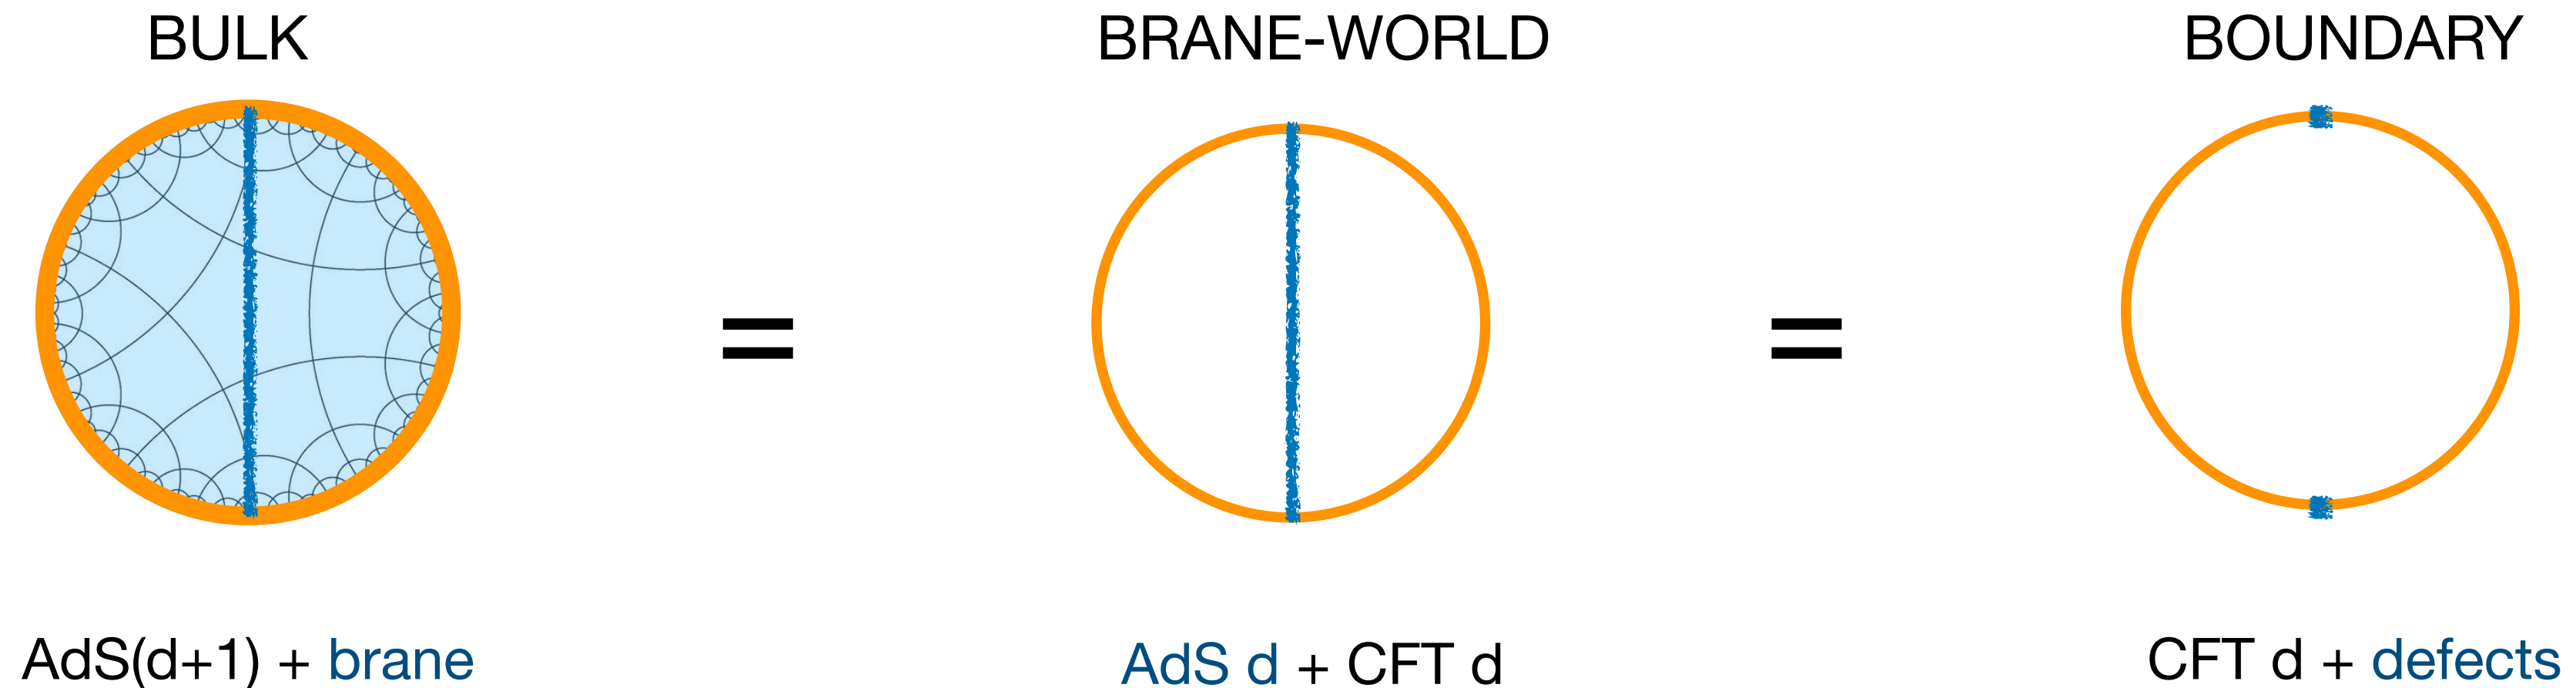

Part of the black hole interior geometry associated with the exterior “radiation” region

Holographic meaning of the island? What information exactly encodes?

Double Holography

Systems with a double holographic description allow for three complementary points of view:

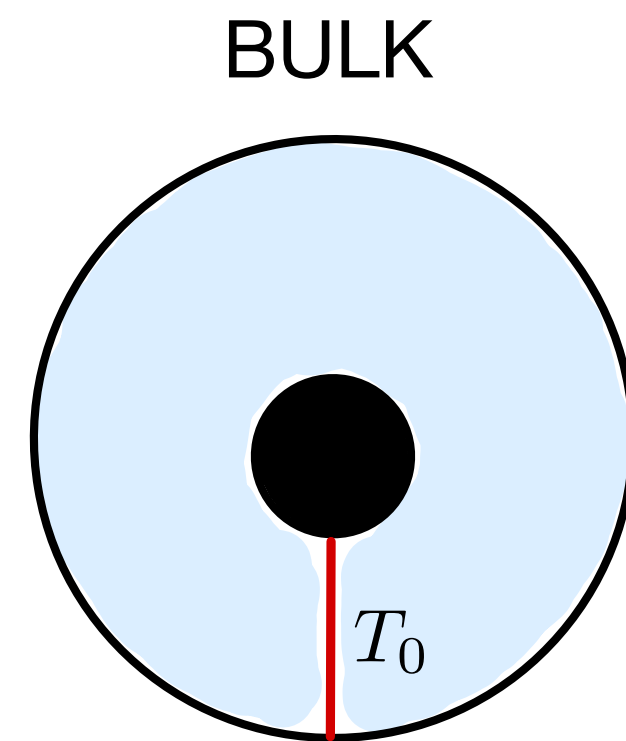

Presence of an entanglement island in the brane-world picture related to that of conformal defects on the boundary / brane in the bulk

New quantum information perspective on earlier realizations of the AdS/defect-CFT correspondence

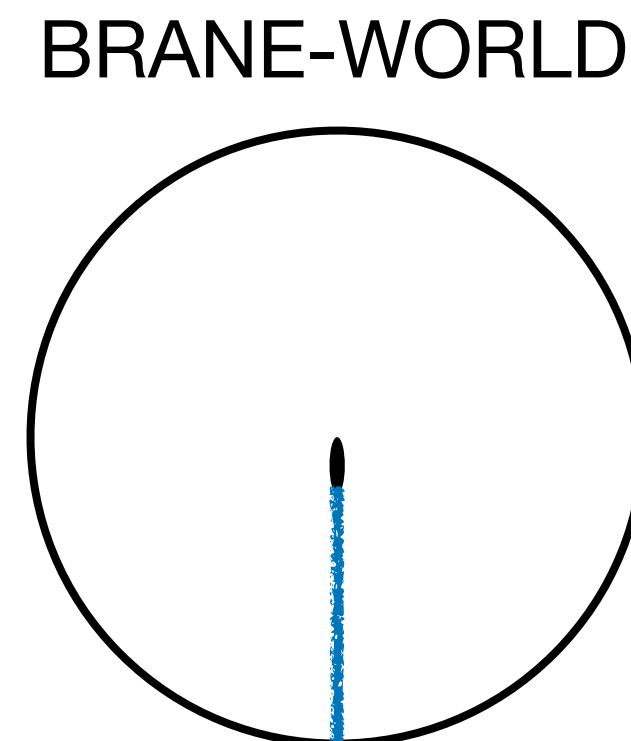

Dynamical Double Holography

Ongoing collaborations where we are building **dynamical realizations** of this kind of doubly holographic models and studying the information one can obtain using the island formula

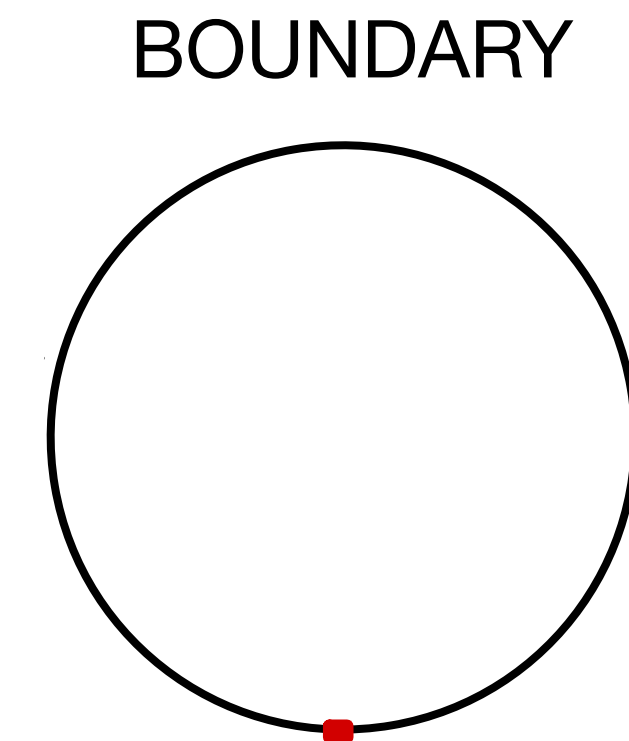

BTZ BH + brane =
Accelerated AdS3 BH

=

AdS2 BH + 2d CFT bath

=

2d CFT with a defect

$$ds^2 = -(r^2 - r_h^2)dt^2 + \frac{dr^2}{r^2 - r_h^2} + r^2 d\phi^2$$

$$S_b = -T_0 \int d^2x \sqrt{-h}$$

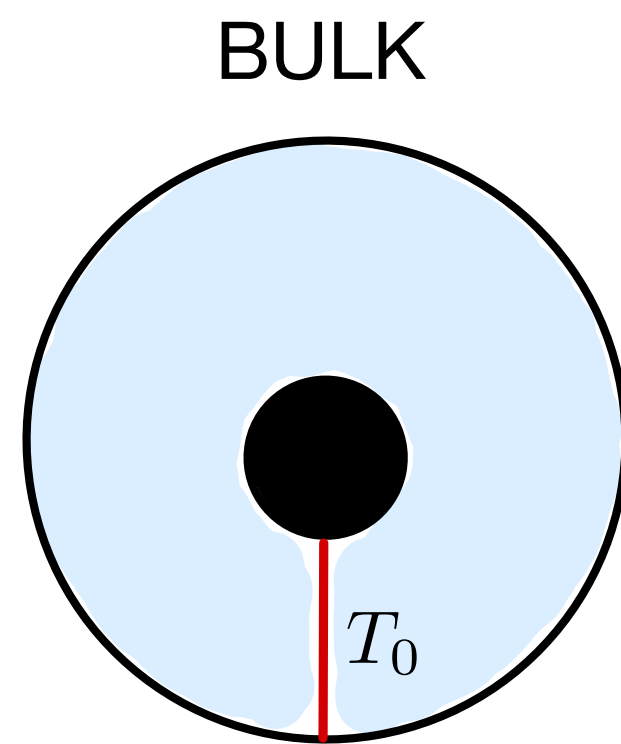

$$ds_b^2 = -\left(\frac{\rho^2}{\ell_b^2} - r_h^2\right)dt^2 + \frac{d\rho^2}{\frac{\rho^2}{\ell_b^2} - r_h^2}$$

$$\frac{\ell_b^2}{L^2} = k^2 + 1 = \frac{1}{1 - 16\pi^2 G_N^2 L^2 T_0^2}$$

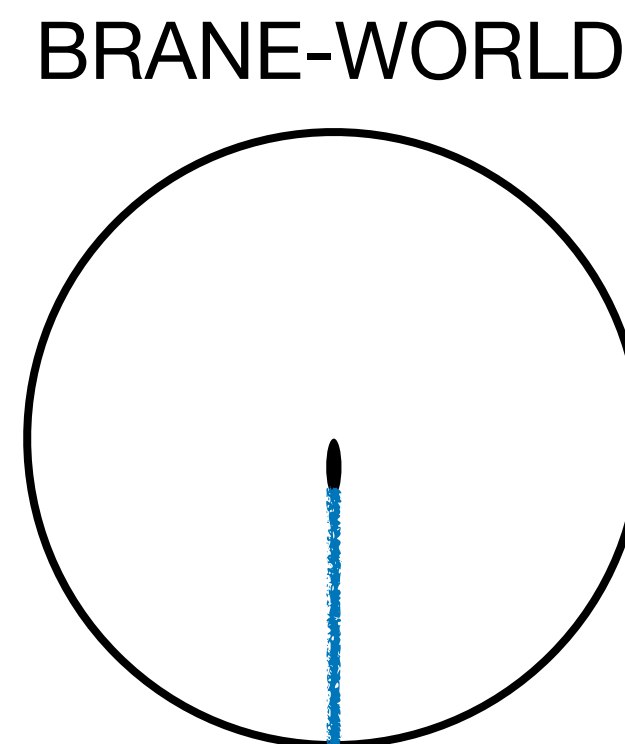

$$c_{def} = 2 \log g = \frac{c}{3} \operatorname{arcsinh} k$$

Evaporating the brane

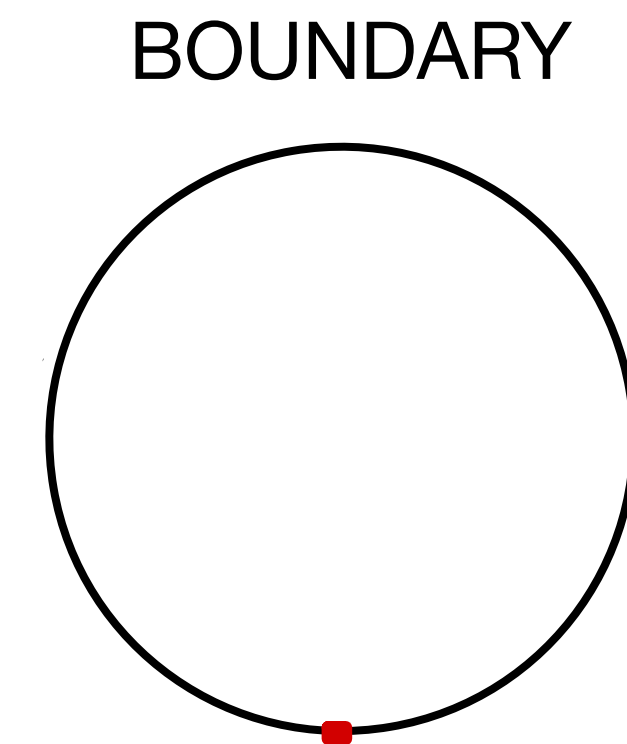

Reducing the tension T_0 parameter:

=

=

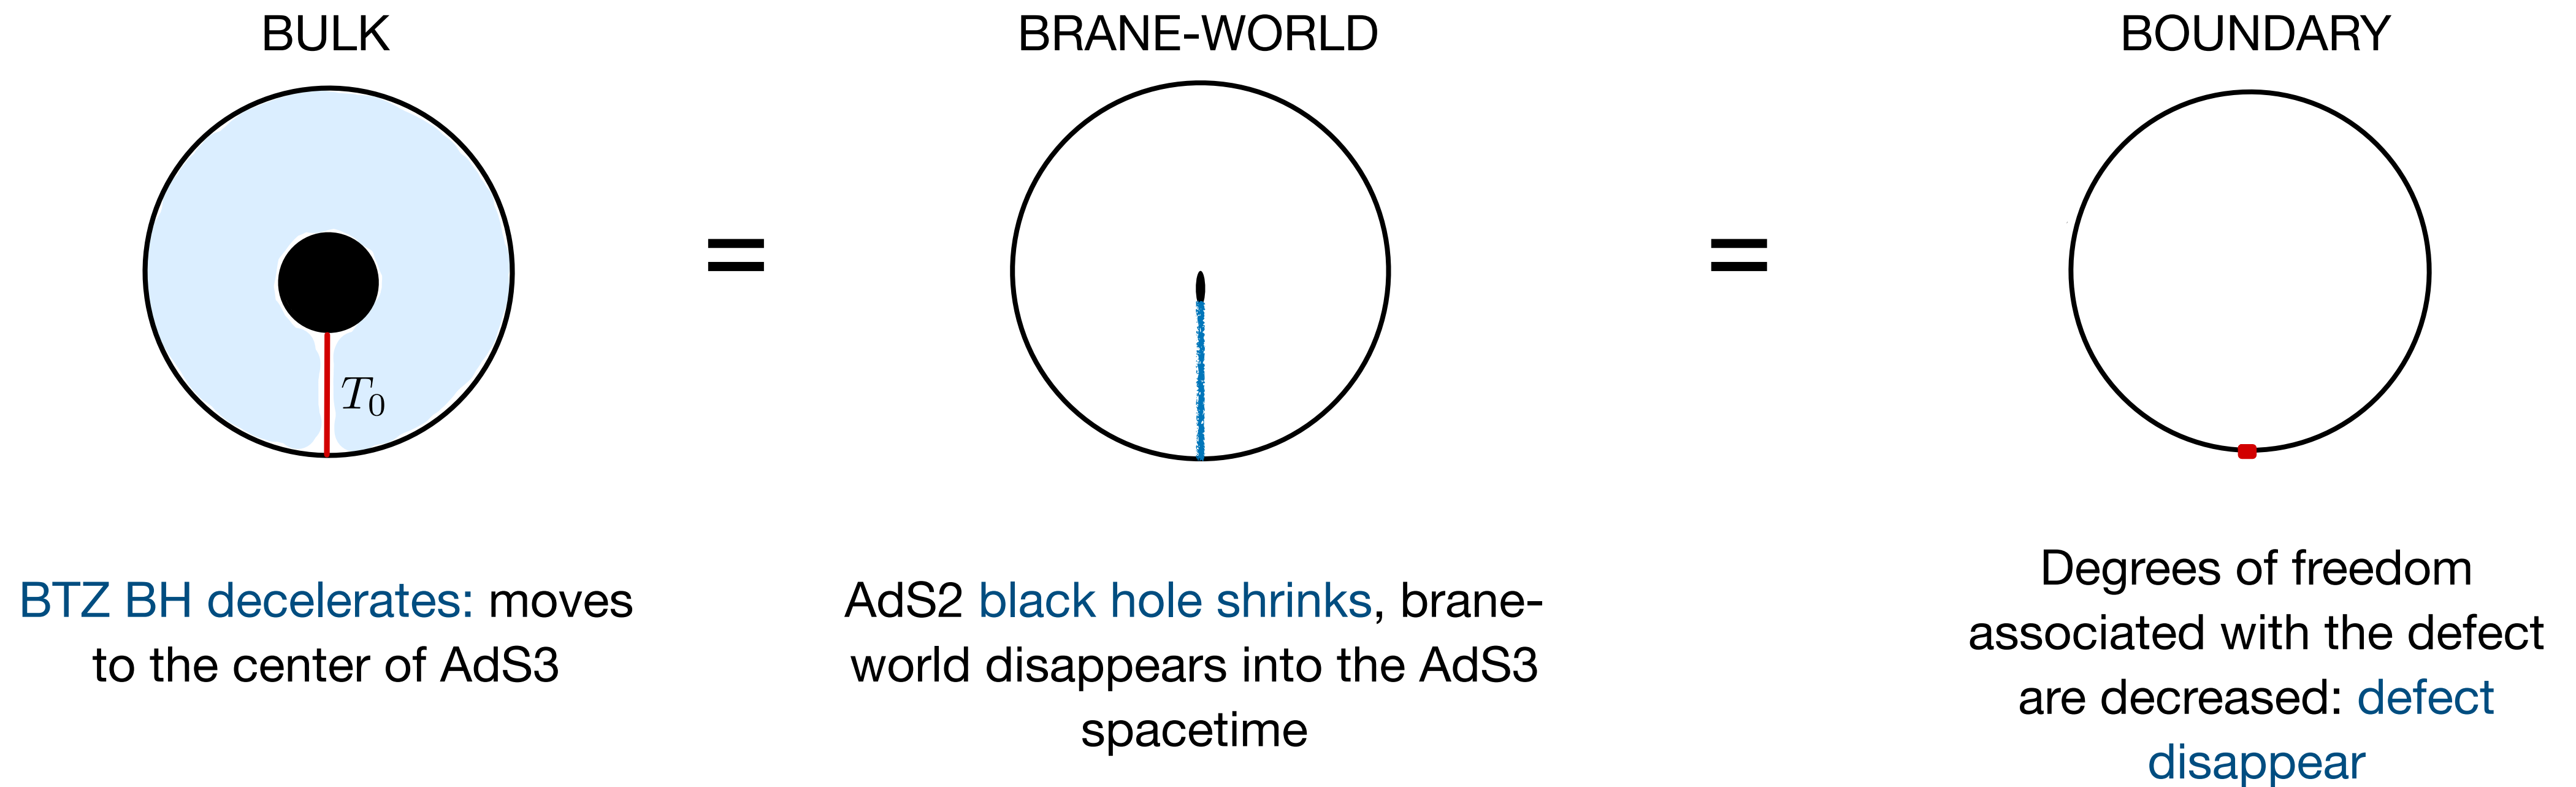

BTZ BH decelerates: moves
to the center of AdS3

AdS2 black hole shrinks, brane-
world disappears into the AdS3
spacetime

Degrees of freedom
associated with the defect
are decreased: defect
disappear

Evaporating the brane

Reducing the tension T_0 parameter:

Make it dynamical: concrete realization of a **AdS2 BH evaporation process** where to study the island formula and the information about the AdS/defect-CFT it encodes

Conclusions

Quantum Information & AdS/CFT

Holographic principle offers a framework to explore the idea of emergent gravity and spacetime in a controlled setting

Interplay with quantum information has led to a fruitful dialogue stimulating progress in our understanding of holography, gravity and field theory

Many interesting directions and lots to explore!

Thank you!
