

# First results from the **FASER** experiment and overview of **Forward Physics Facility**

Akitaka Ariga, Prof. Dr.  
University of Bern / Chiba University  
On behalf of the FASER Collaboration

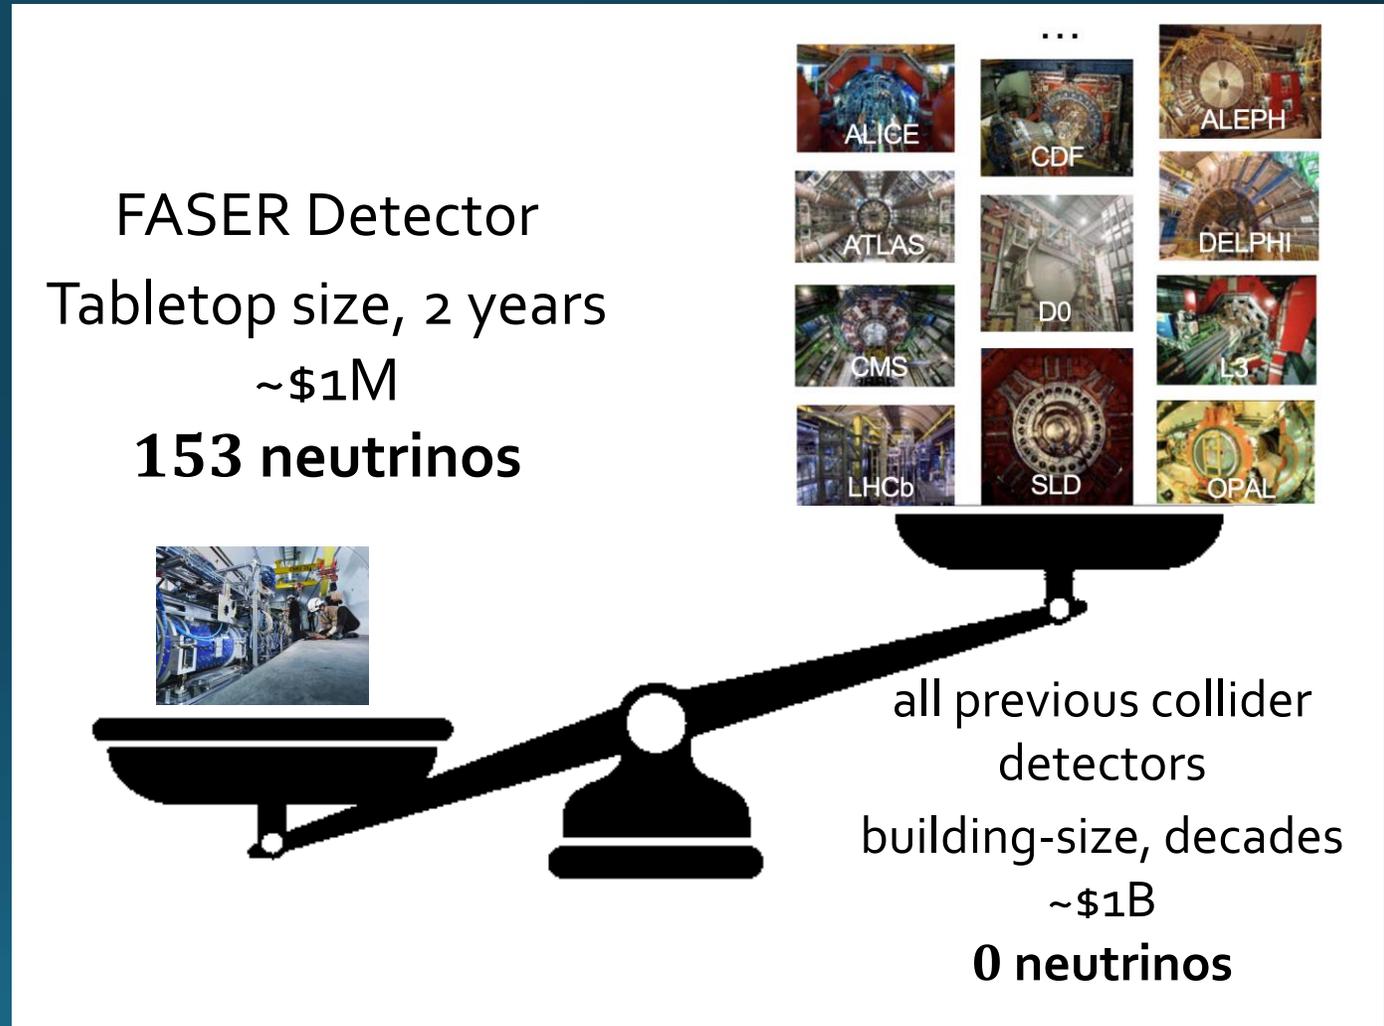

FASER is supported by

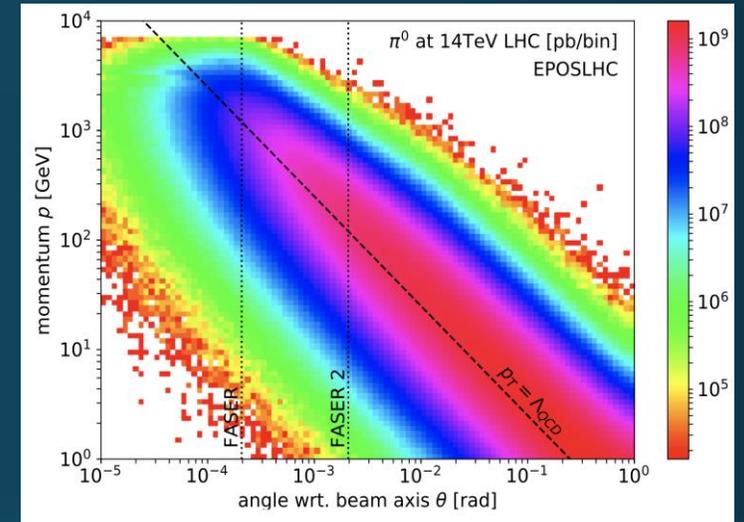

# Consideration from “collider neutrinos”

- **No neutrino detected** by any collider experiments till recently
- In 2018, new initiatives have started
- → Collider neutrinos were detected in 2023
- Important to have a proper setup for a certain type of particles
- New opportunities for dark sector searches, as well as high energy neutrinos!

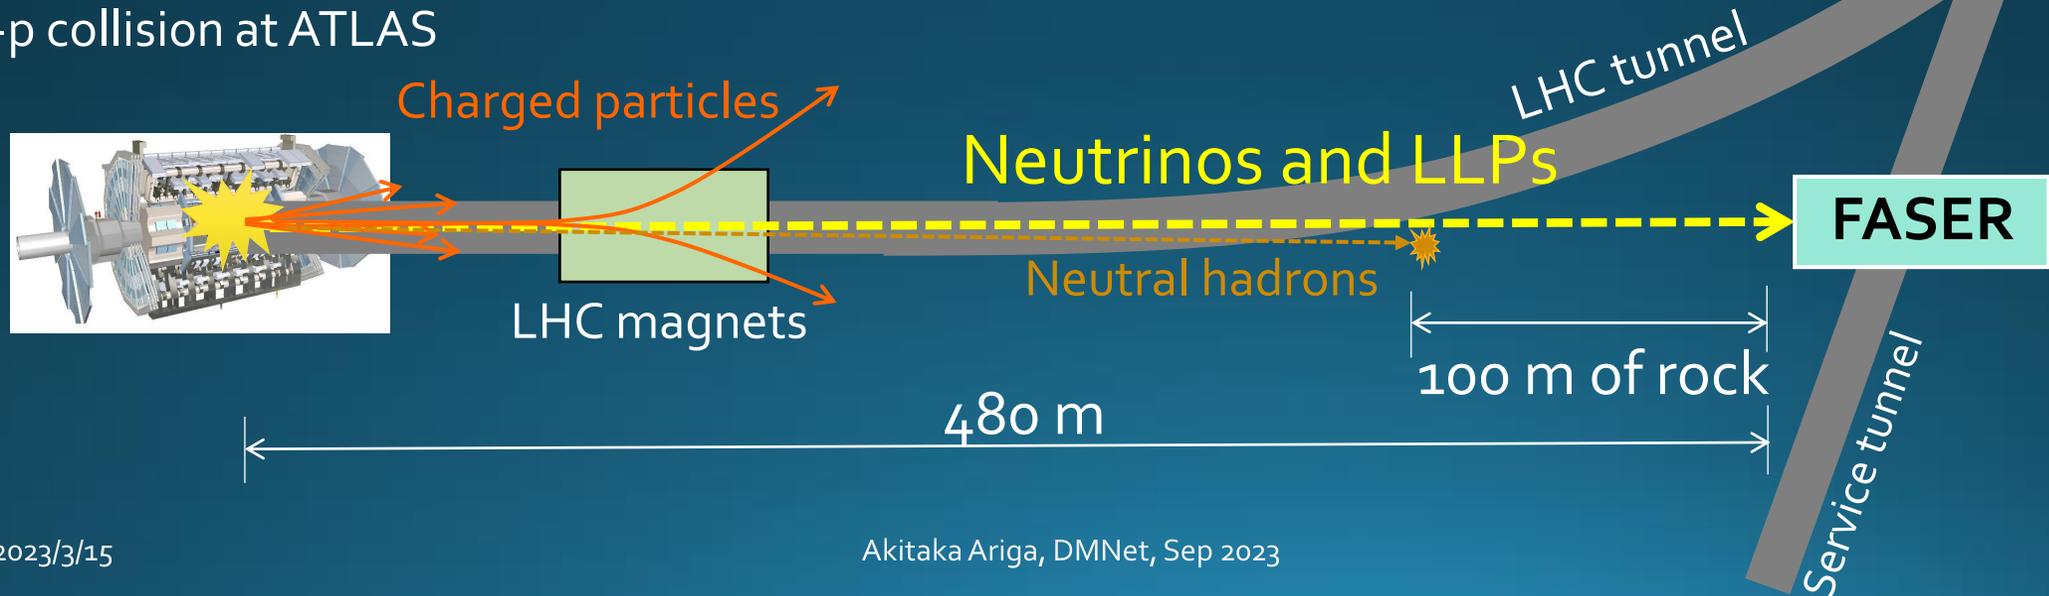

# The FASER experiment

- FASER is a new forward LHC experiment
  - Targets long-lived BSM particles (e.g.  $A'$ , ALPs) and neutrinos
  - Exploiting large LHC collision rate + forward-peaked production
- Located 480 m downstream of ATLAS interaction point
  - LHC magnets and 100 m of rock shield most background

arXiv:1901.04468

p-p collision at ATLAS

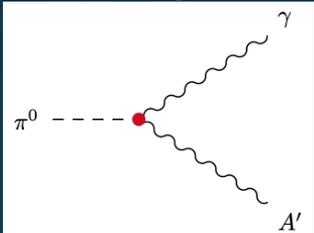

# Dark Photon ( $A'$ ) properties

- Dark photon is a common feature of hidden sector models
  - Weakly coupling to SM via kinetic mixing ( $\epsilon$ ) with SM photon

$$\mathcal{L} \supset \frac{1}{2} m_{A'}^2 A'^2 - \epsilon e \sum_f q_f \bar{f} A' f$$

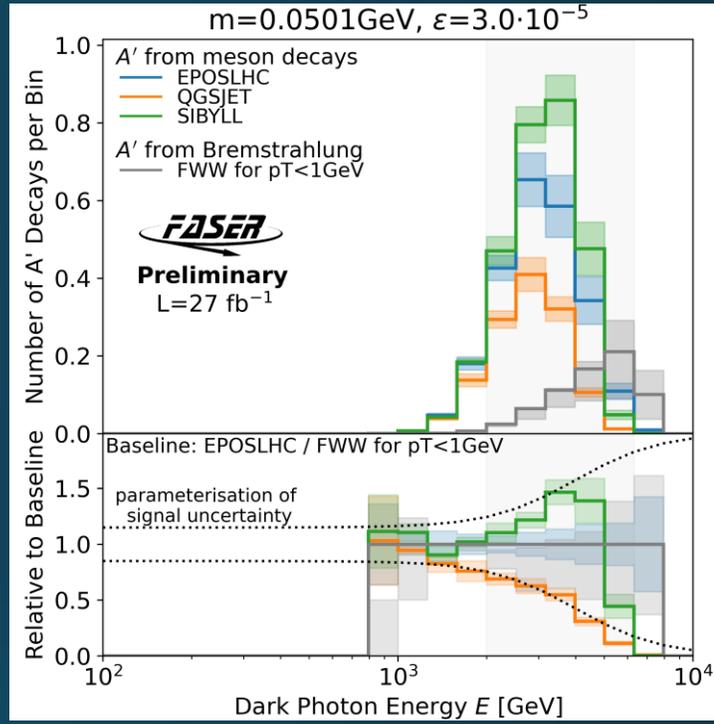

- MeV  $A'$ 's produced mainly in meson decays at LHC

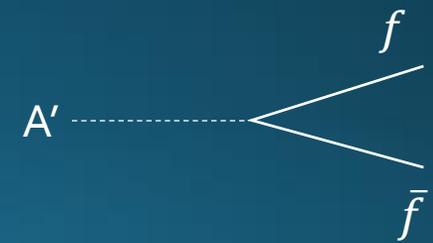

$$B(\pi^0 \rightarrow A' \gamma) = 2\epsilon^2 \left(1 - \frac{m_{A'}^2}{m_{\pi^0}^2}\right)^3 B(\pi^0 \rightarrow \gamma \gamma)$$

- Travels long distances through matter without interacting, decays to charged fermion pairs, e.g.  $e^+e^-$ ,  $\mu^+\mu^-$ ,  $q\bar{q}$

$$L = c\beta\tau\gamma \approx (80 \text{ m}) \left[\frac{10^{-5}}{\epsilon}\right]^2 \left[\frac{E_{A'}}{\text{TeV}}\right] \left[\frac{100 \text{ MeV}}{m_{A'}}\right]^2 \quad E_{A'} \gg m_{A'} \gg m_e$$

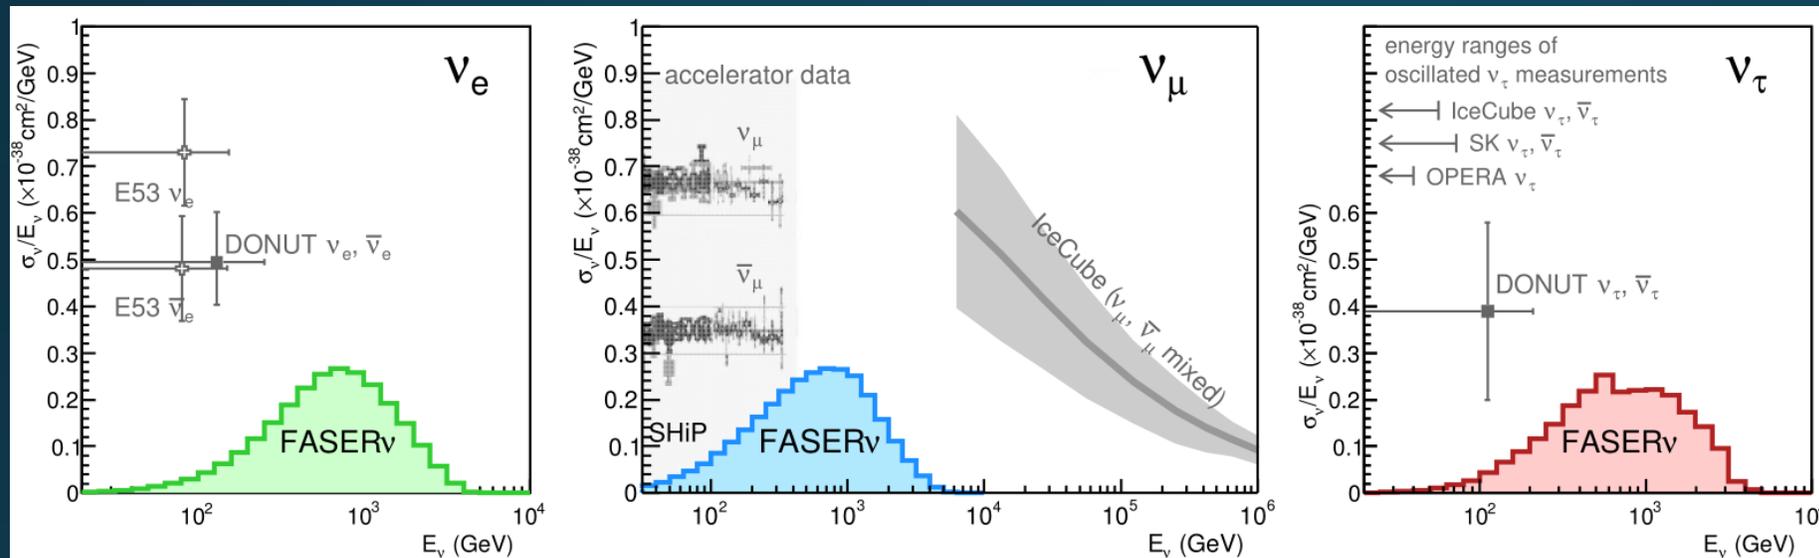

\* [arXiv:2105.07077](https://arxiv.org/abs/2105.07077)

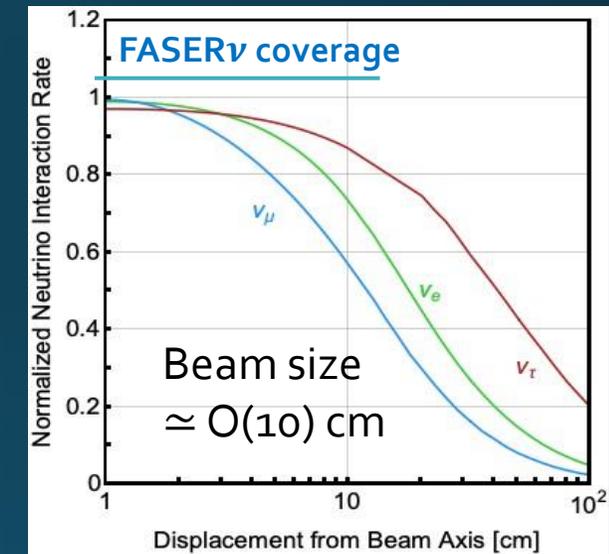

- If  $m_{A'}' < 2m_{\mu}$ ,  $A'$  has 100% decay to  $e^+e^-$  pair. Typically  $E_{A'}' \sim 1 \text{ TeV}$

# Neutrino studies at FASER

Unexplored energy regime for all three flavors

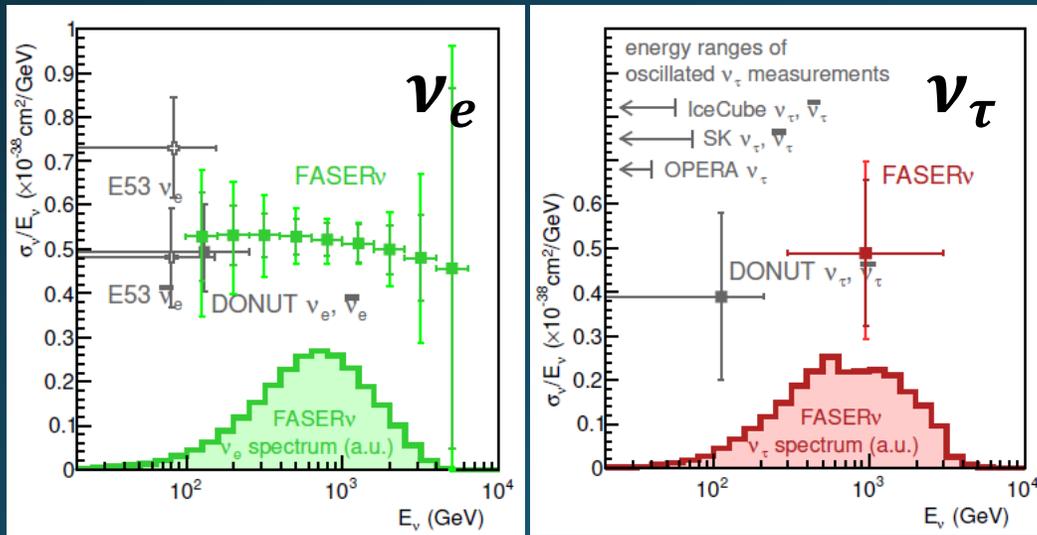

Collimated beam

- Neutrinos by **collider method** = **High energy frontier** ~ TeV
- Study of production, propagation and interactions of high energy neutrinos
- **Dominant BG for dark photon search**

# FASER $\nu$ physics potential

## (1) Study high-energy neutrino interactions

- Cross sections of different flavors at TeV energies: **FASER probes unexplored energy range.**
- Neutrino CC interactions with charm production ( $\nu N \rightarrow l N' c$ )
- Lepton Universality test in neutrino scattering

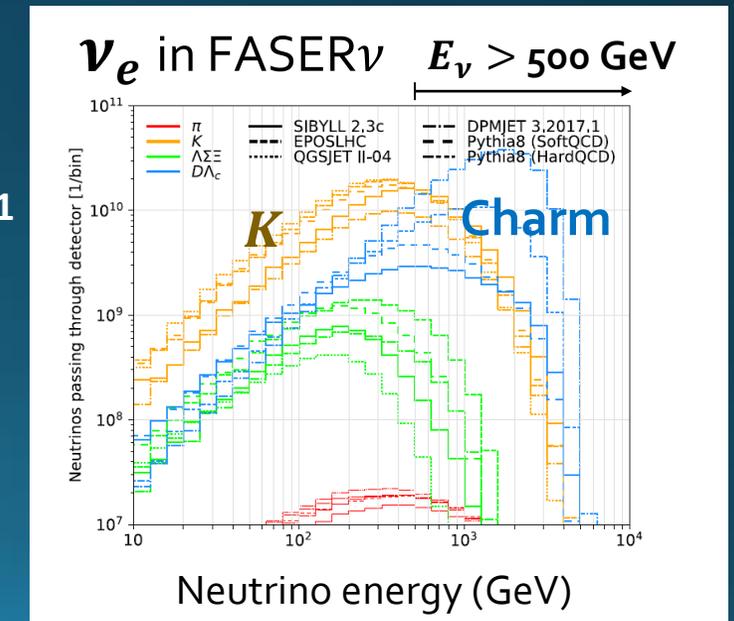

Projected cross section sensitivities

## (2) Use neutrinos as probe of forward hadron production

- Neutrinos produced by the forward meson decays; pions, kaons, and charm particles.
- FASER $\nu$ 's measurements provide novel input to **QCD (low-x PDFs, intrinsic charm, saturation) and astroparticle physics (prompt atmospheric neutrinos, cosmic ray muon puzzle)**
- First data on forward charm, hyperon, and kaon

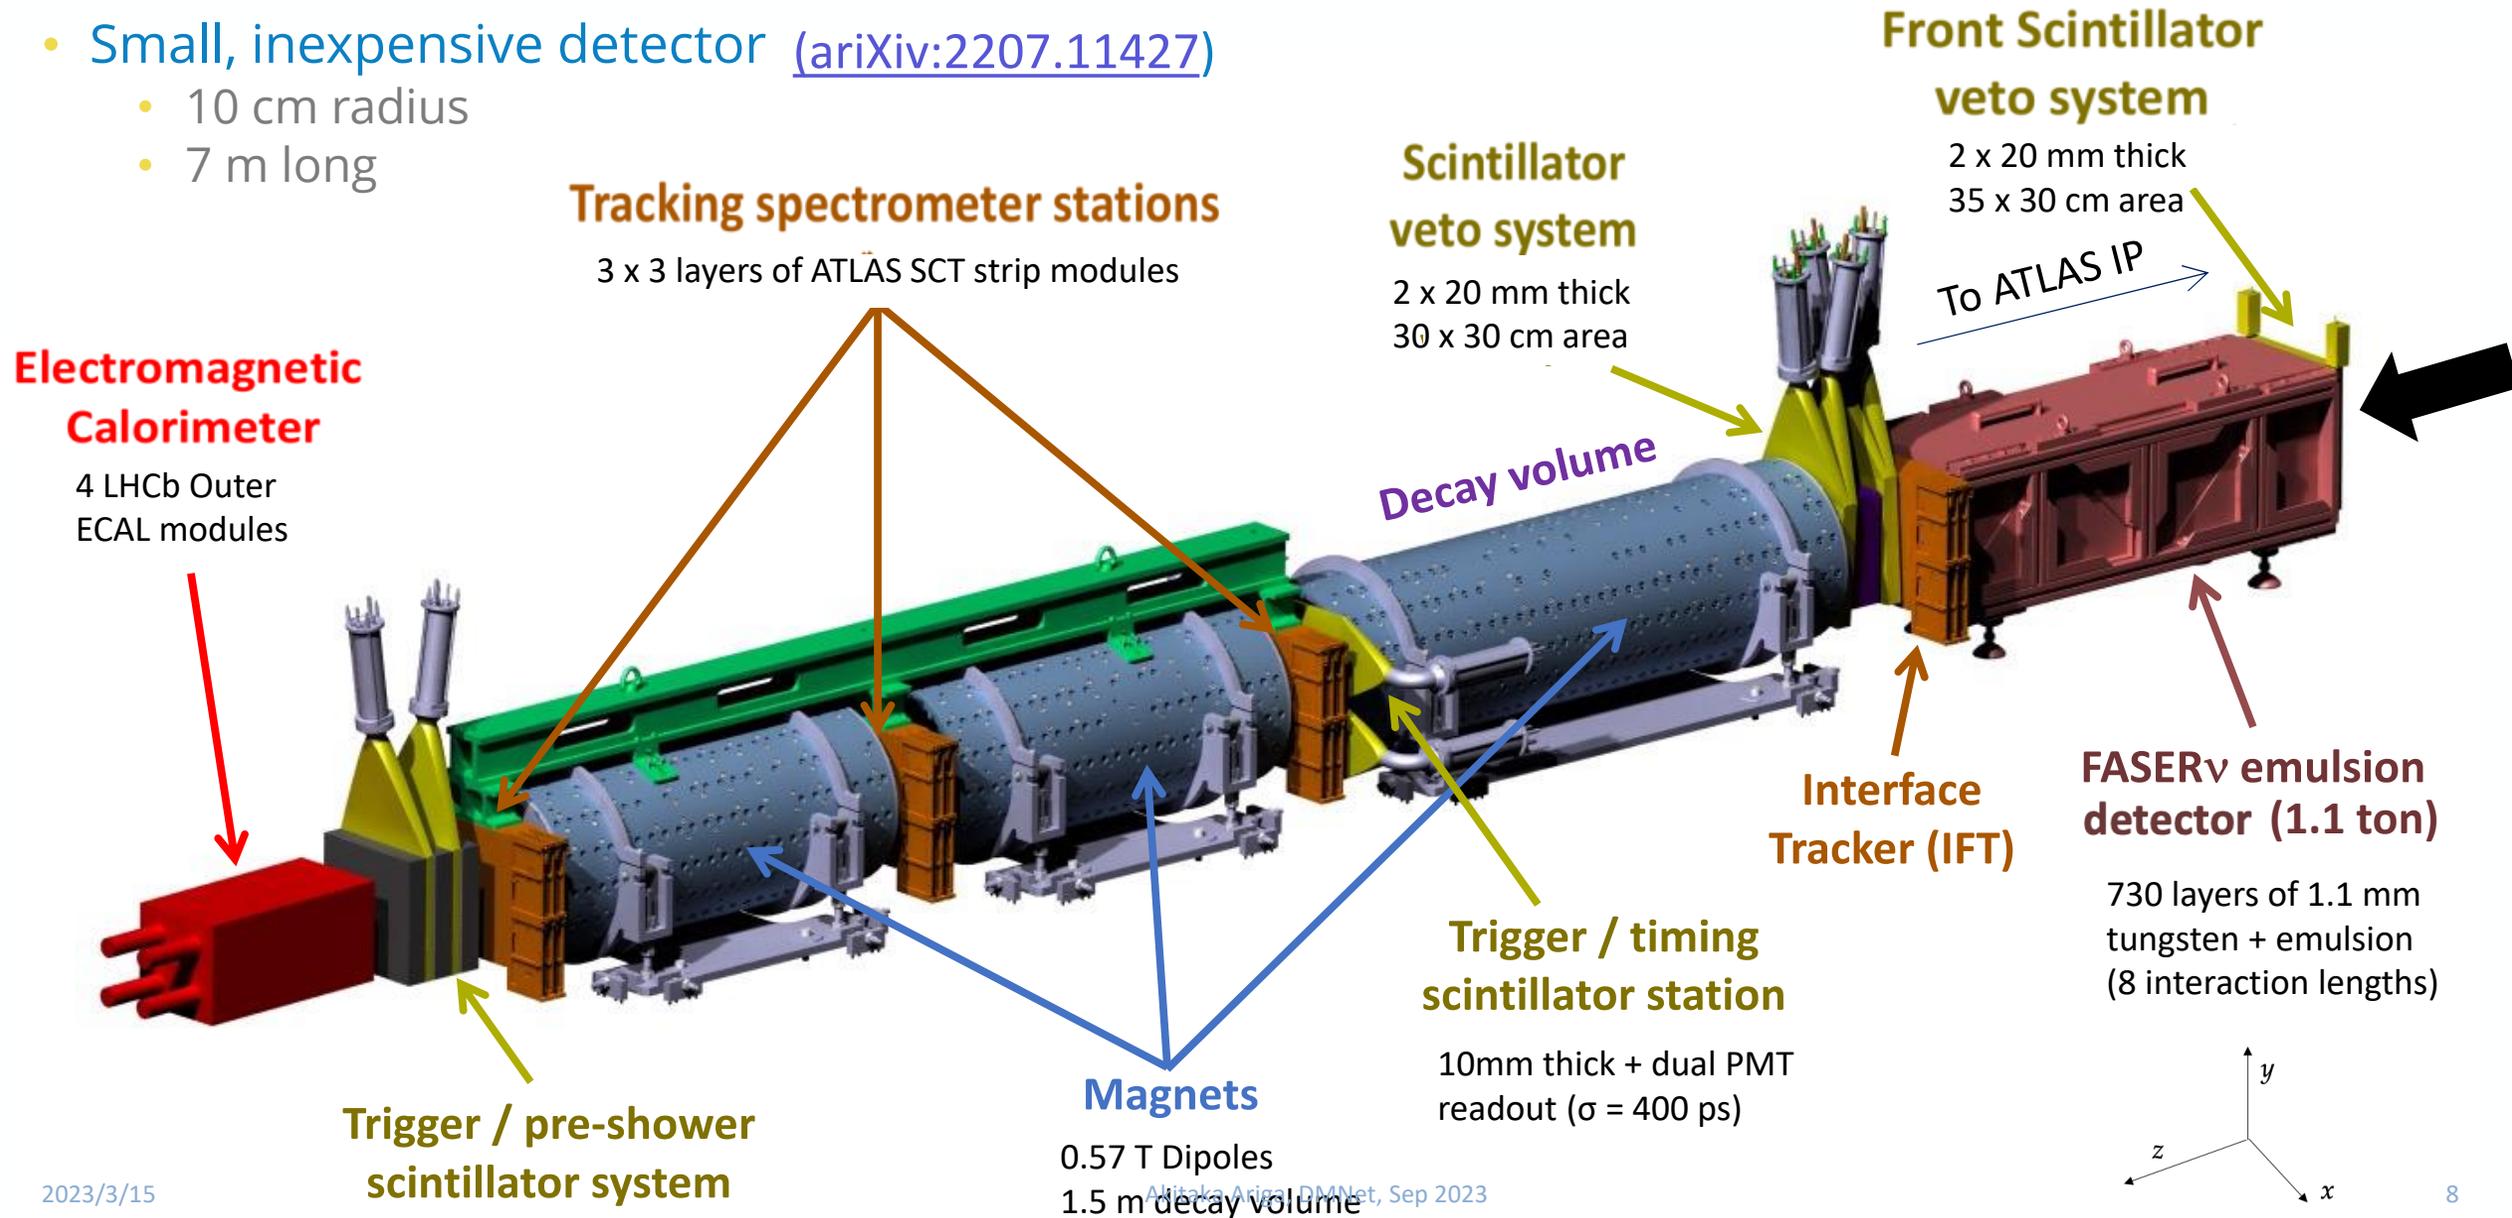

Neutrinos from charm decay dominates above 1 TeV for  $\nu_e$  and  $\nu_\tau$

- (3)... more

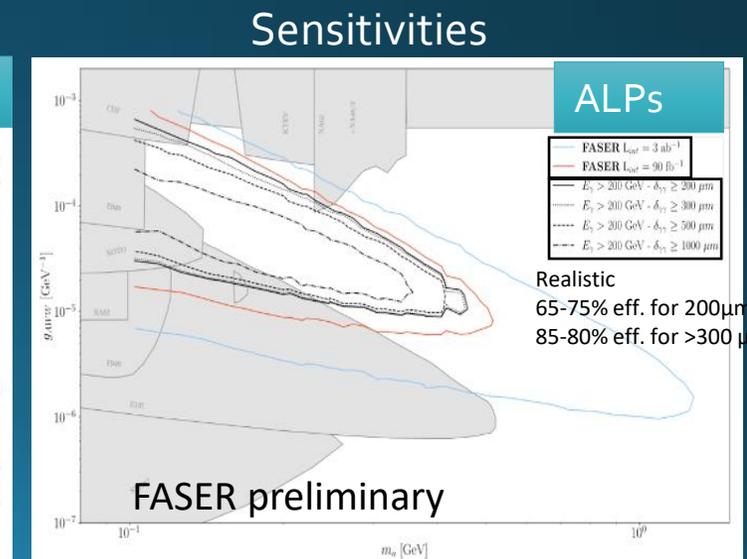

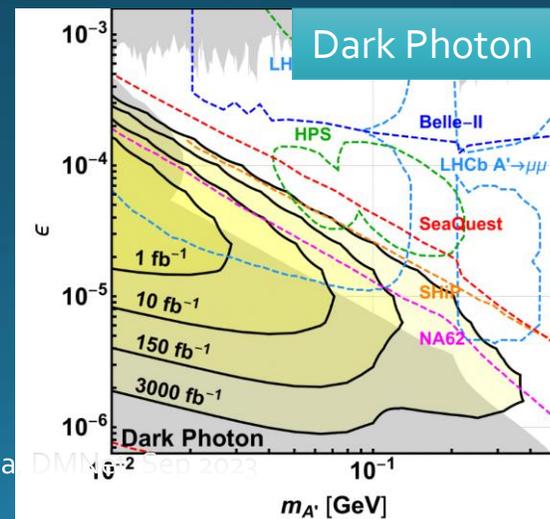

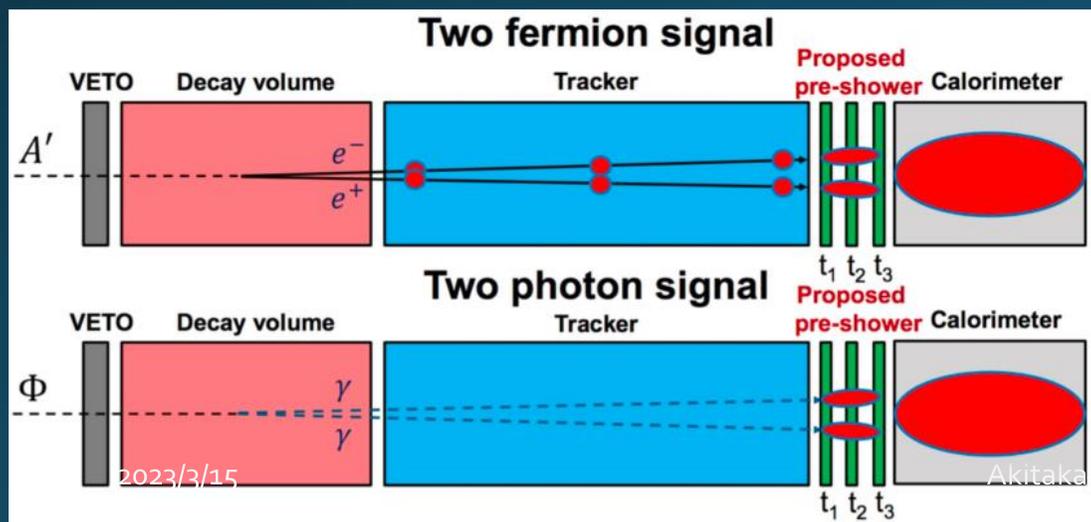

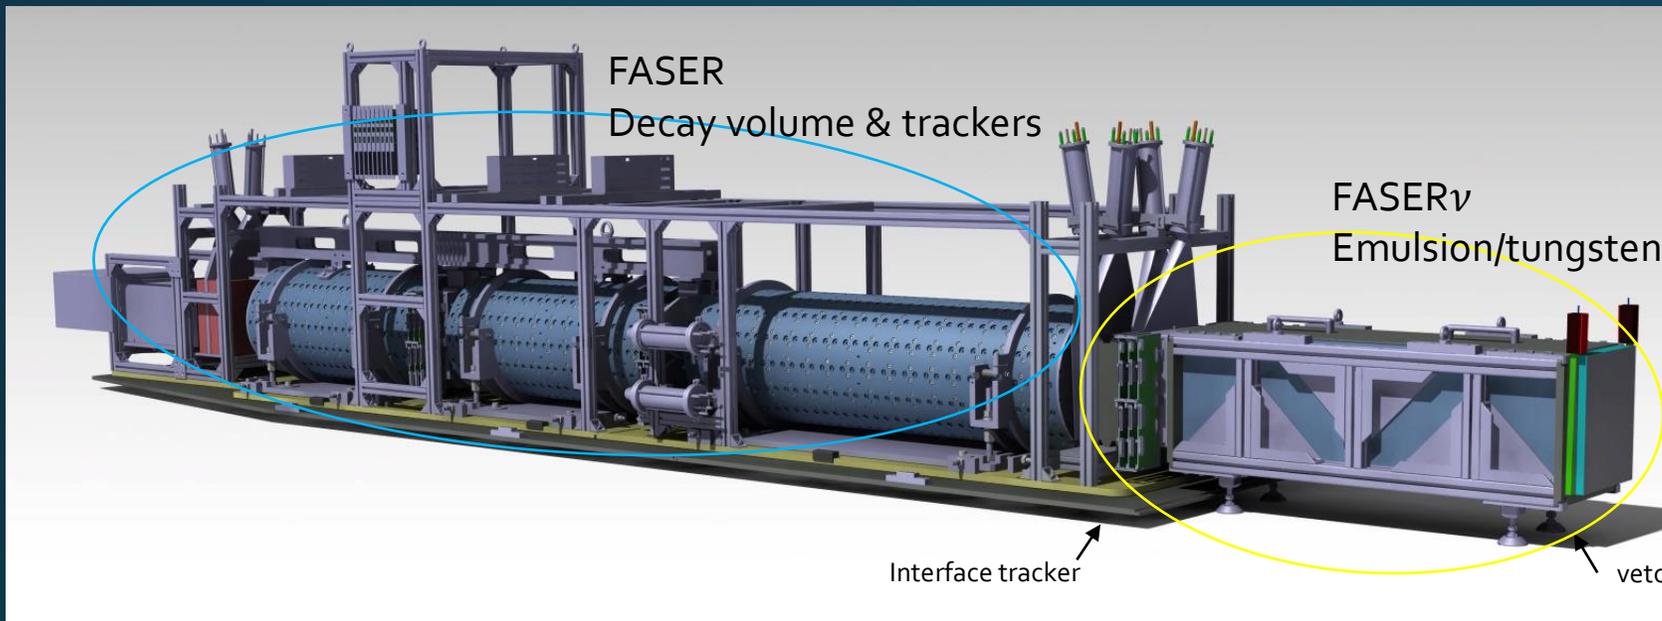

# FASER Detector

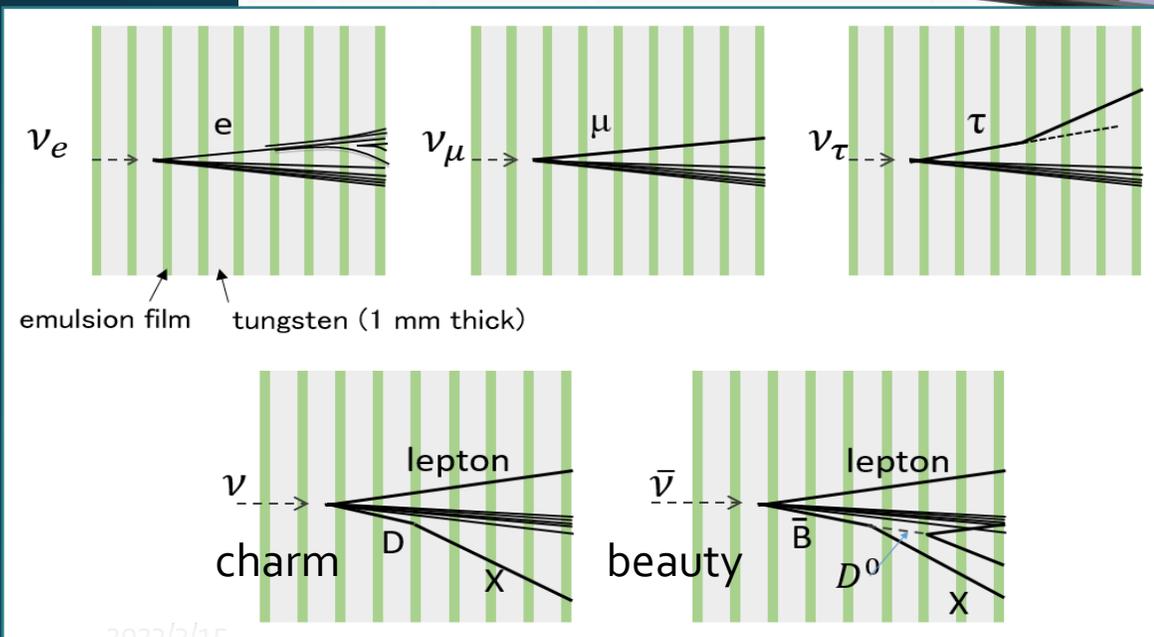

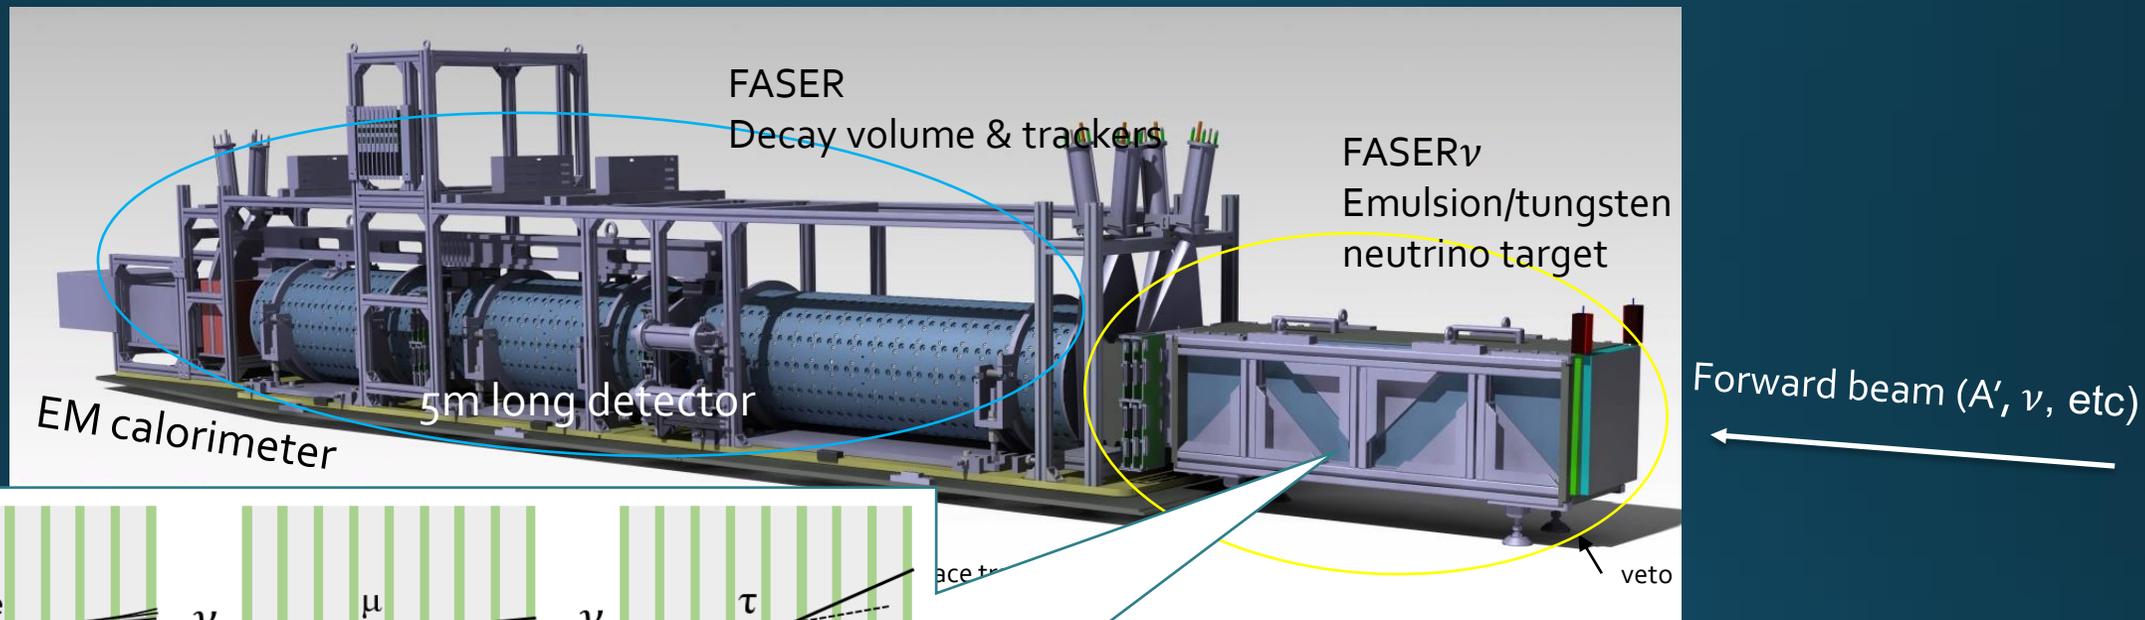

- Small, inexpensive detector ([arXiv:2207.11427](https://arxiv.org/abs/2207.11427))
  - 10 cm radius
  - 7 m long

# LLP signals with FASER detector

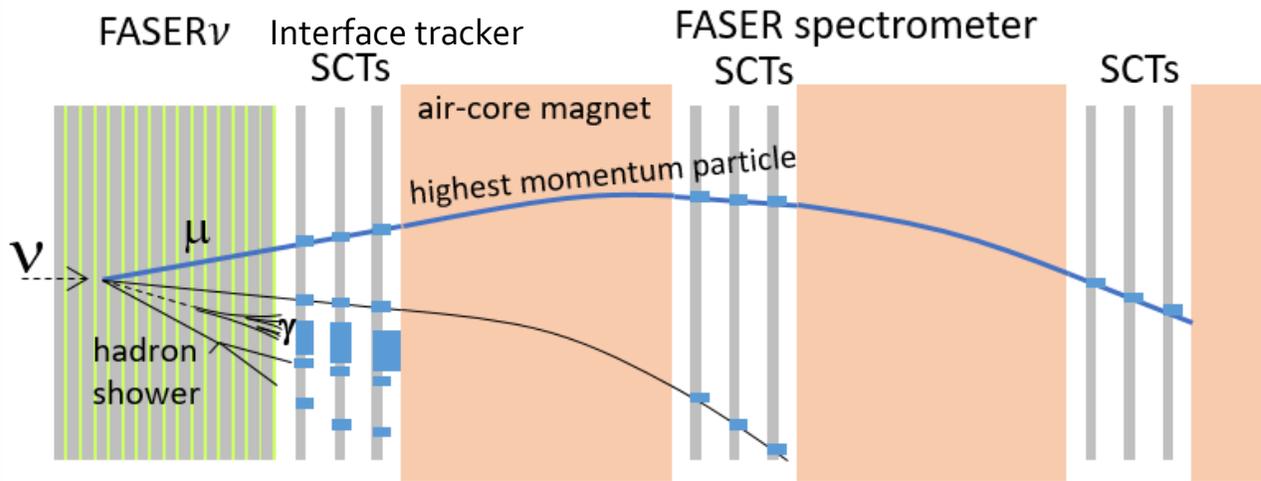

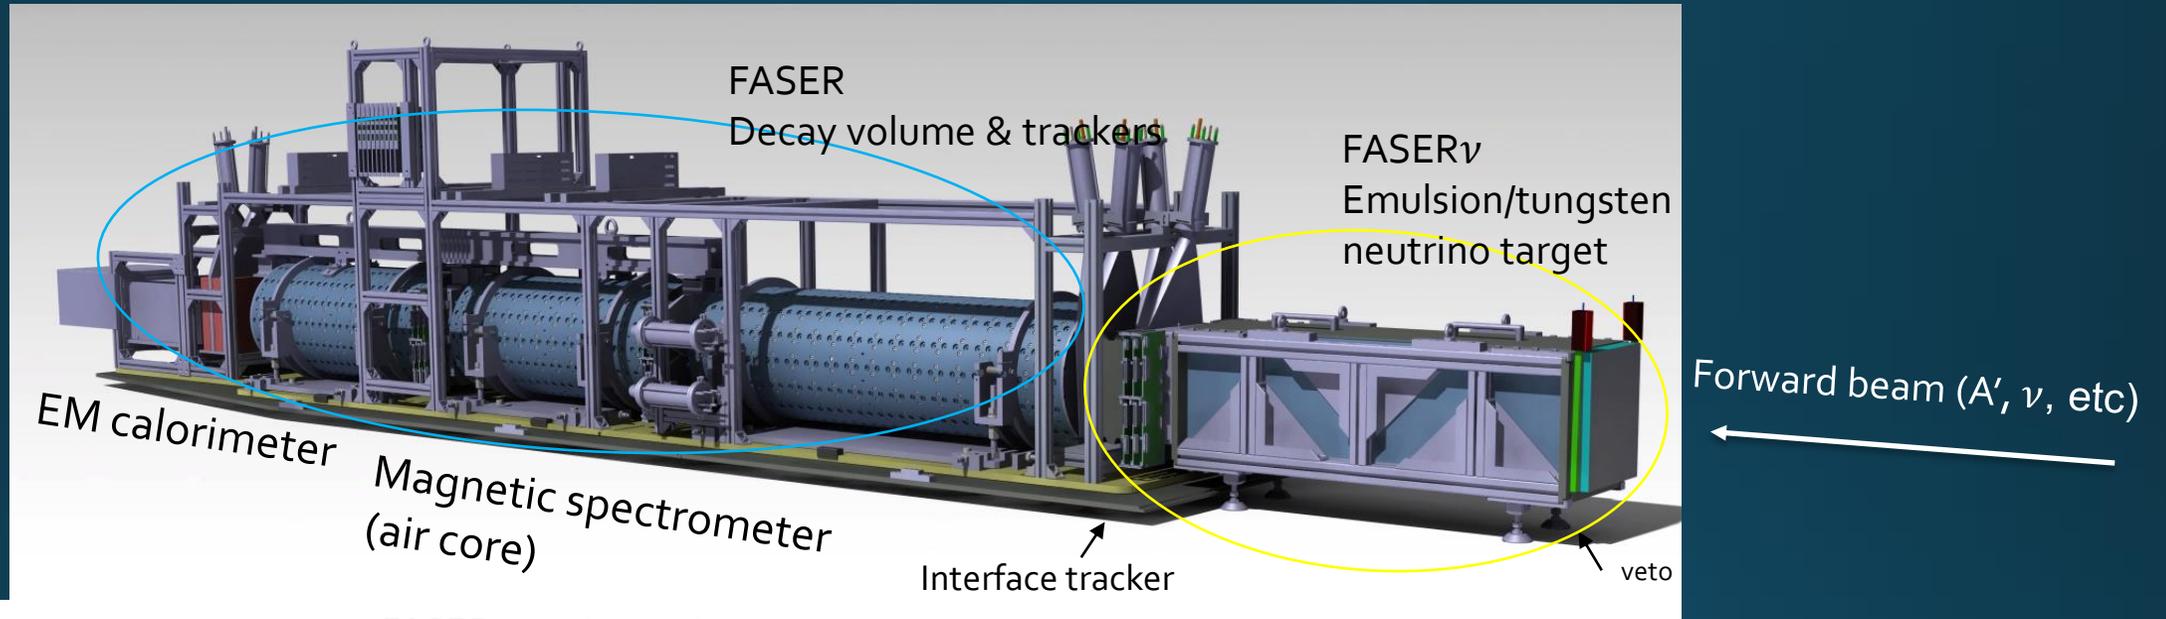

# FASER+FASER $\nu$ detector in Run3 (2022-2025)

- Emulsion films = trackers with sub-micron spatial resolution,  $\sigma_{intrinsic} \approx 50 \text{ nm}$ ,  $\sigma_{practical} \approx 0.3 \mu\text{m}$
- 730 1.1-mm-thick tungsten target and emulsion films
- $25 \times 30 \text{ cm}^2$ , 1.1 m, 1.1 tons ( $8 \lambda_{int}$ ,  $220 X_0$ )
- Sensitive to 3 flavor neutrinos
- Muon ID in track length in tungsten
- Replace emulsions 3 times a year

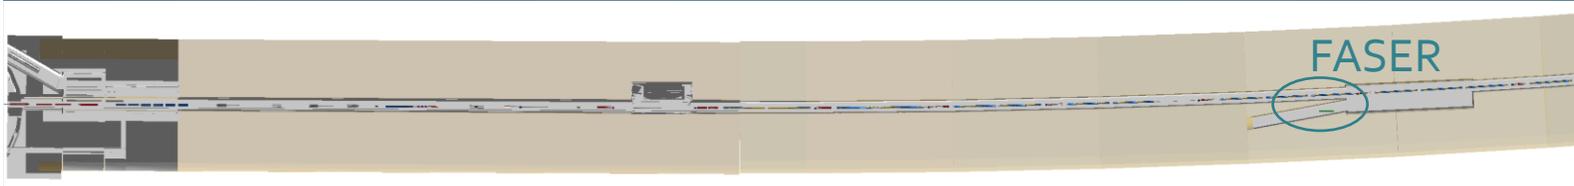

# FASER+FASER $\nu$ detector in Run3 (2022-2025)

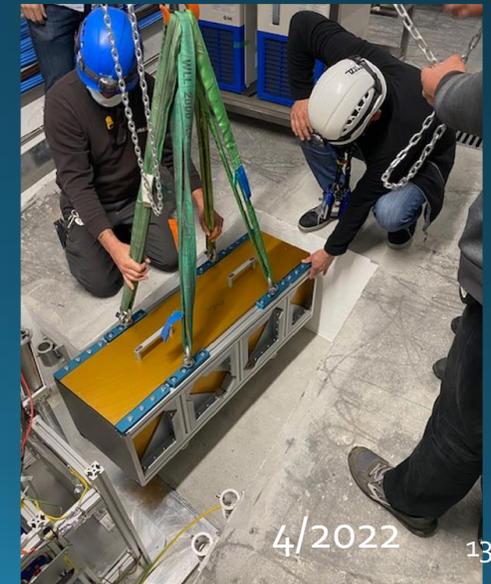

- Global reconstruction with FASER spectrometer  
 $\rightarrow$  muon charge identification  
 $\rightarrow \nu_\mu / \bar{\nu}_\mu$  separation
- Improve energy resolution

# FASER 2022 Operations

- Successfully operated throughout 2022
  - All detector components working as expected
  - Up to 1.3 kHz
- Recorded  $37 \text{ fb}^{-1}$  of data
  - Dead-time of 1.3%
- 3 emulsion detectors
  - Needed to manage occupancy
  - First box only partially filled

# FASER 2022 Operations (2)

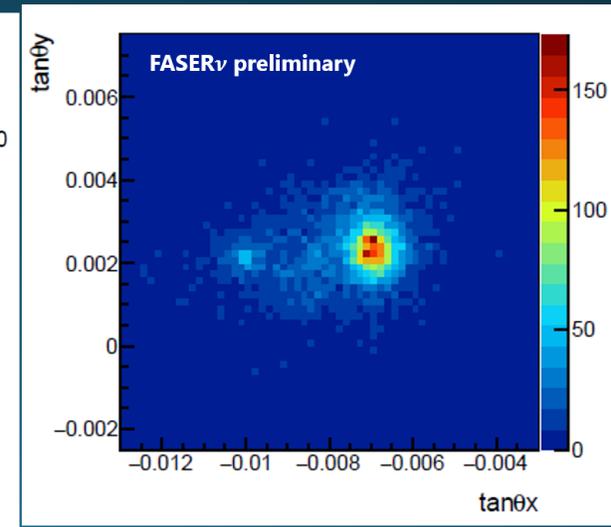

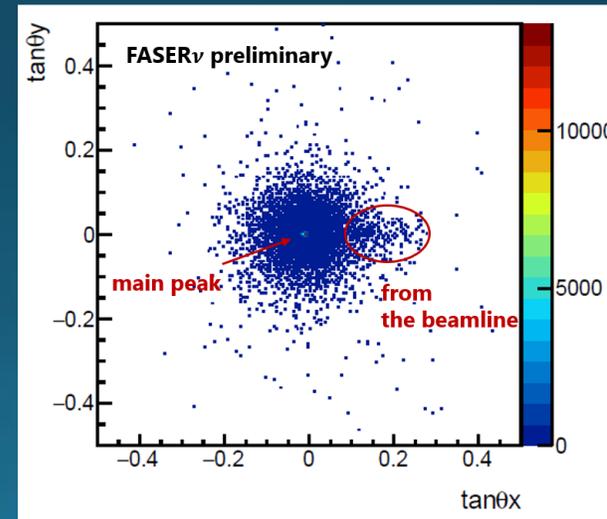

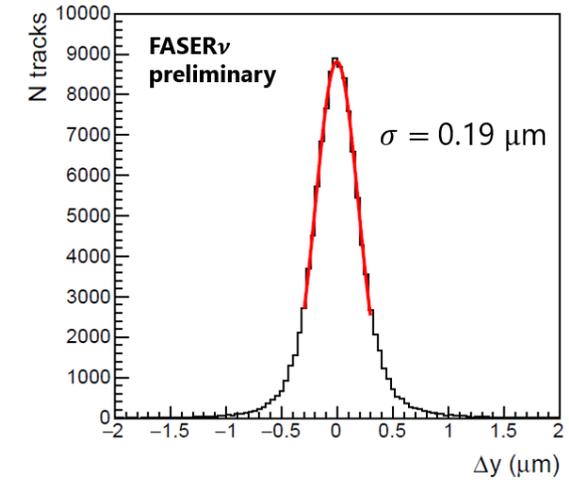

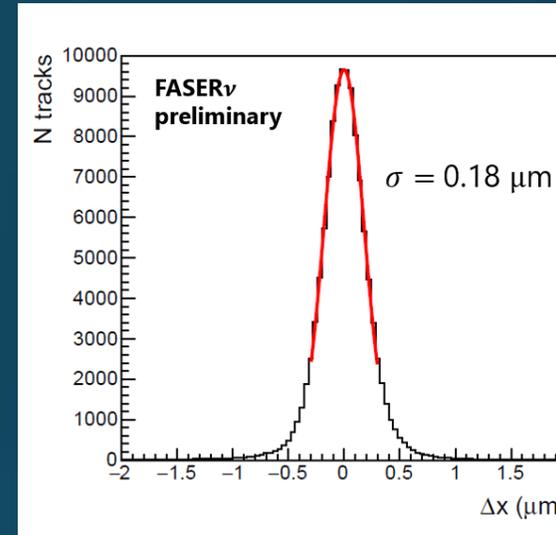

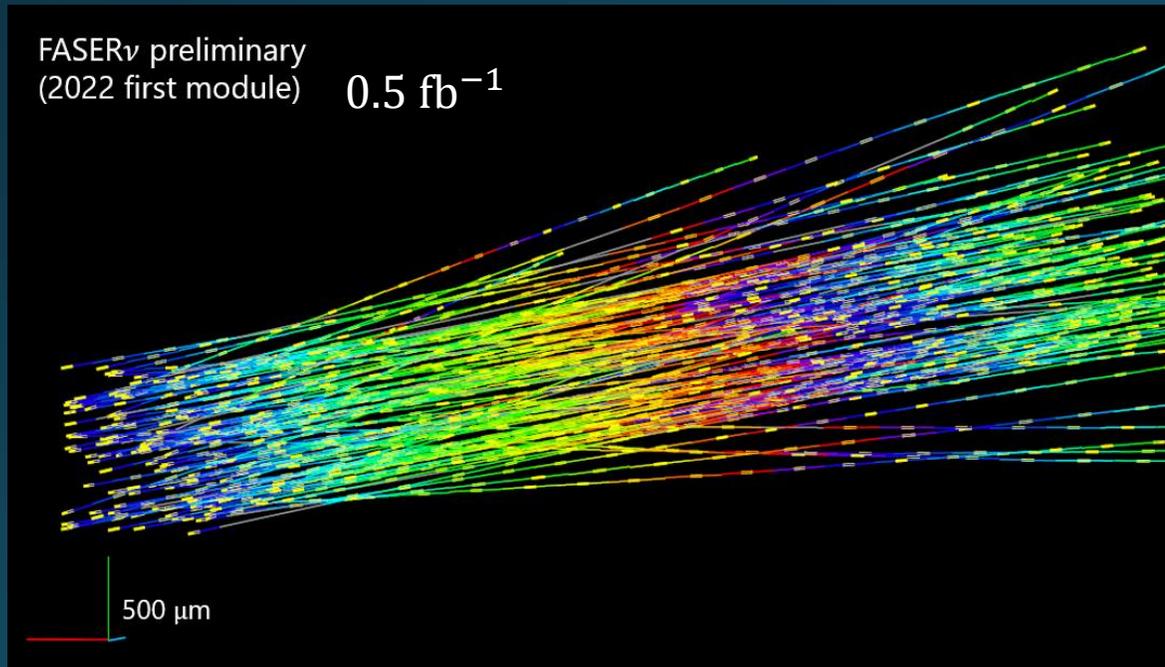

- All detector components performing excellently
- More than 350M single-muon events recorded
  - Example: muon leaving track passing through full detector + scintillator/calorimeter deposits consistent with MIP

**FASER**  
Run 8336

**The Forward Physics Facility at the High-Luminosity LHC**

High energy collisions at the High-Luminosity Large Hadron Collider (LHC) produce a large number of particles along the beam collision axis, outside of the acceptance of existing LHC experiments. The proposed Forward Physics Facility (FPF), to be located several hundred meters from an LHC interaction point and shielded by concrete and rock, will host a suite of experiments to probe standard model processes and search for physics beyond the standard model (BSM). In this report, we review the status of the civil engineering plans and the experiments to explore the diverse physics signals that can be uniquely probed in the forward region. FPF experiments will be sensitive to a broad range of BSM physics through searches for new particle scattering or decay signatures and deviations from standard model expectations in high statistics analyses with TeV neutrinos in this low-background environment. High statistics neutrino detection will trace back to fundamental topics in perturbative and non-perturbative QCD and in weak interactions. Experiments at the FPF will enable synergies between forward particle production at the LHC and astroparticle physics to be exploited. We report here on these physics topics, on infrastructure, detector and simulation studies, and on future directions to realize the FPF's physics potential.

# FPF in Snowmass

The FPF was prominently featured in many Snowmass Reports  
(Thanks to the efforts of many of you!)

*Additionally, auxiliary experiments and facilities are proposed to take advantage in far forward kinematic regions. Forward physics facilities allow to further extend the breadth of the HL-LHC physics: they can study regions of parameter phase space for BSM, for example in LLPs and DM searches, that would otherwise remain uncovered, and can perform novel QCD and neutrino measurements in the very forward region*

Vision Section of [Energy Frontier Report](#)

*Auxiliary forward-physics facilities will further extend the physics potential of the HL-LHC both for SM measurements and BSM discoveries. In view of all these considerations, the EF supports continued strong U.S. participation in the success of the LHC, and the HL-LHC construction, operations, and physics programs, including auxiliary experiments.*

Energy Frontier Section of [Snowmass Summary Report](#)

# FPF in Snowmass

## Executive Summary (10 pages)

**The Energy Frontier (Science Drivers 1 – 3 & 5):** The Energy Frontier currently has a top-notch program with the Large Hadron Collider (LHC) and its planned High Luminosity upgrade (HL-LHC) at CERN, which sets the basis for the Energy Frontier vision. The fundamental lessons learned from the LHC thus far are that a Higgs-like particle exists at 125 GeV and there is no obvious and unambiguous signal of BSM physics. This implies that new physics either occurs at scales higher than we have probed, must be weakly coupled to the SM, or is hidden in backgrounds at the LHC. The immediate goal for the Energy Frontier is to continue to take and analyze the data from LHC Run 3, which will go on for about three more years, and carry out the 2014 P5 recommendations to complete the HL-LHC Upgrade and execute its physics program. The HL-LHC will measure the properties of the Higgs Boson more precisely, probe the boundaries of the SM further, and possibly observe new physics or point us in a particular direction for discovery.

A new aspect of the proposed LHC program is the emergence of a variety of auxiliary experiments that can use the interactions already occurring in the existing collision regions during the normal LHC and HL-LHC running of the ATLAS, CMS, LHCb, and ALICE experiments to explore regions of discovery space that are not currently accessible. These typically involve observing particles in the far forward direction or long-lived particles produced at larger angles but decaying far outside the existing detectors. These are mid-scale detectors in their own right and provide room for additional innovation and leadership opportunities for younger physicists at the LHC. The EF supports continued strong U.S. participation in the success of the LHC, and the HL-LHC construction, operations, and physics programs, including auxiliary experiments.

New colliders are the ultimate tools to extend the EF program into the next two decades thanks to the broad and complementary set of measurements and searches they enable. With a combined strategy of precision measurements and high-energy exploration, future lepton colliders starting at energies as low as the Z-pole up to a few TeV can shed substantial light on some of these key questions. It will be crucial to find a way to carry out experiments at higher energy scales, directly probing new physics at the 10 TeV energy scale and beyond. The EF supports a fast start for the construction of an  $e^+e^-$  Higgs Factory (linear or circular), and a significant R&D program for multi-TeV colliders (hadron and muon). The realization of a Higgs Factory will require an immediate, vigorous, and targeted accelerator and detector R&D program, while the study towards multi-TeV colliders will need significant and long-term investments in a broad spectrum of R&D programs for accelerators and detectors.

Finally, the U.S. EF community has expressed renewed interest and ambition to develop options for an energy-frontier collider that could be sited in the U.S., while maintaining its international collaborative partnerships and obligations with, for example, CERN.

*A new aspect of the proposed LHC program is the emergence of a variety of auxiliary experiments that can use the interactions already occurring in the existing collision ... to explore regions of discovery space that are not currently accessible. These typically involve observing particles in the far forward direction or long-lived particles ... decaying far outside the existing detectors. These are mid-scale detectors in their own right and provide room for additional innovation and leadership opportunities for younger physicists at the LHC. The EF supports continued strong U.S. participation ... including auxiliary experiments.*

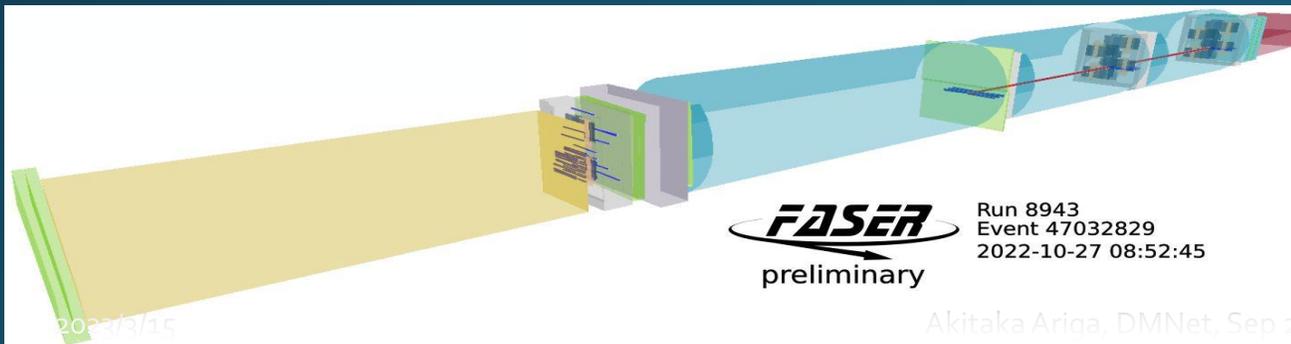

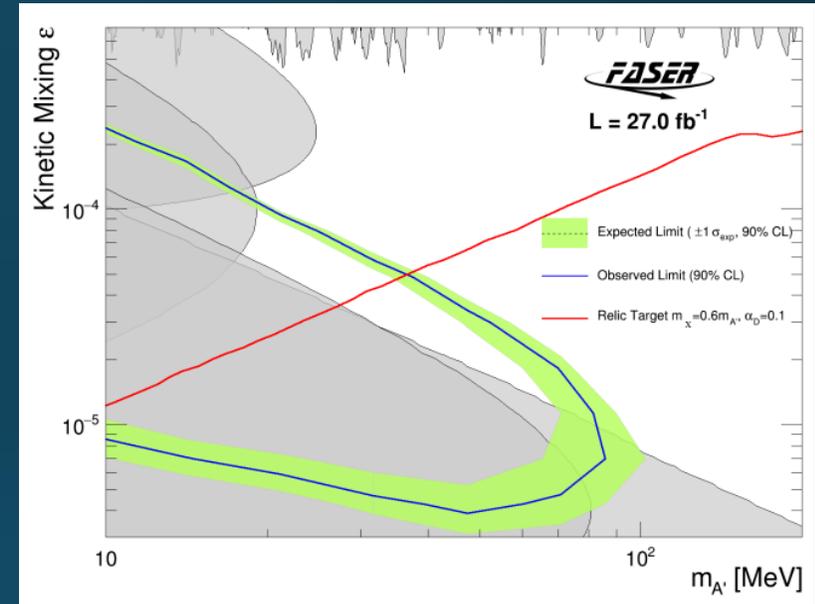

LHC

future collider

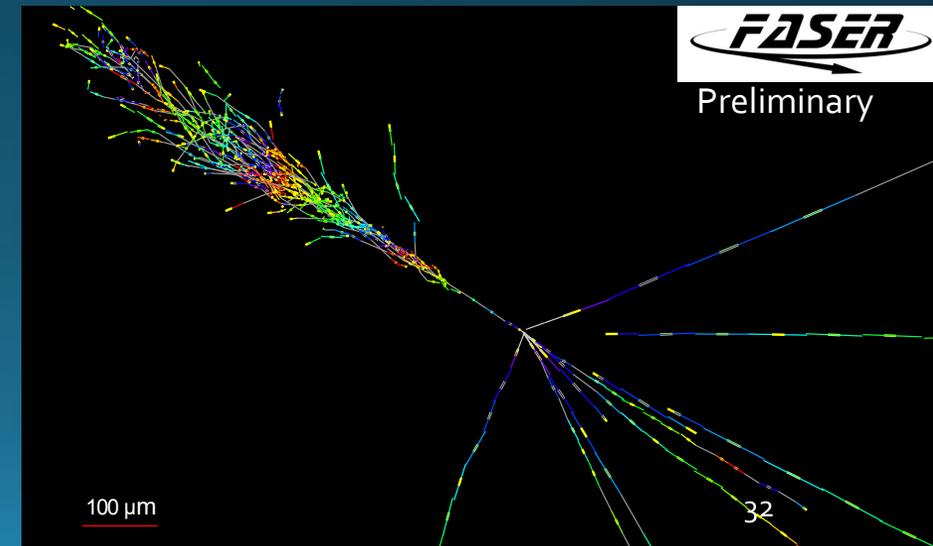

# Summary

- FASER successfully took data in first year of Run 3
  - Running with fully functional detector and very good efficiency
- Detected  $\sim 150$   $\nu_\mu$  CC interactions in spectrometer
  - **First direct detection of collider neutrinos!**
  - Opens new window for high-energy  $\nu$  study
- **Detected  $\nu_e$  CC interactions in FASER $\nu$** 
  - Emulsion analysis is being accelerated
- **Excluded  $A'$  in region of low mass and kinetic mixing**
  - Probes new territory in interesting thermal-relic region
- Forward Physics Facility (FPF) is gaining momentum!
  - With HL-LHC, x 20 luminosity, high sensitive detectors

More results are coming!

Study at colliders originally proposed by Rújula and Rückl in 1984!

# First direct observation of $\nu_\mu$ interactions at the LHC

by the FASER electronic detectors

Phys. Rev. Lett. 131, 031801 (2023)

## Event selection

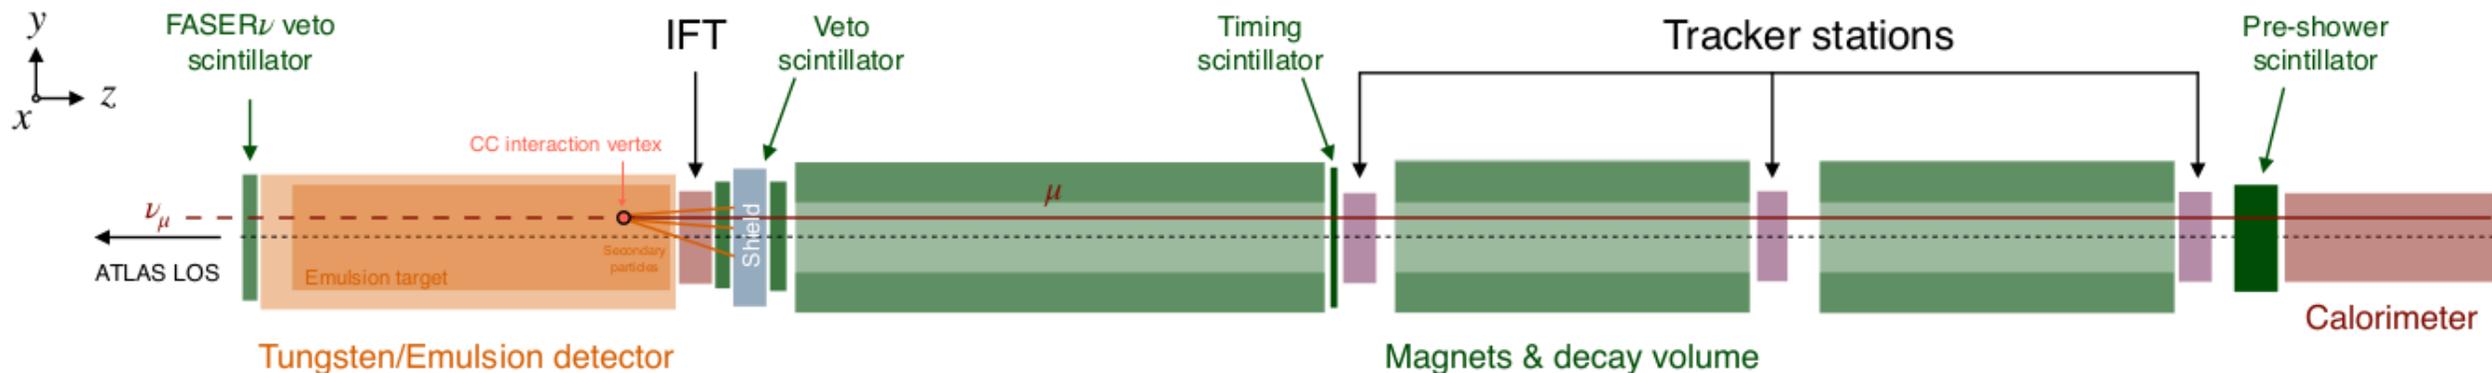

- Collision event with good data quality ( $35.4 \text{ fb}^{-1}$ )
- No signal in two front veto scintillators** ( $<40 \text{ pC} \sim 0.5 \text{ MIP}$ )
- Signal in last two veto layers
- Signal and pre-shower scintillators consistent with  $\geq 1 \text{ MIPs}$
- Exactly **one good quality spectrometer track with  $p > 100 \text{ GeV}$**
- Track in fiducial tracking volume,  $r < 95 \text{ mm}$
- Track extrapolate to  $r < 120 \text{ mm}$  in front veto scintillator
- Track polar angle less than  $25 \text{ mrad}$

## Signal expectation

- $151 \pm 41$  events
- Uncertainty from DPMJET vs SIBYLL

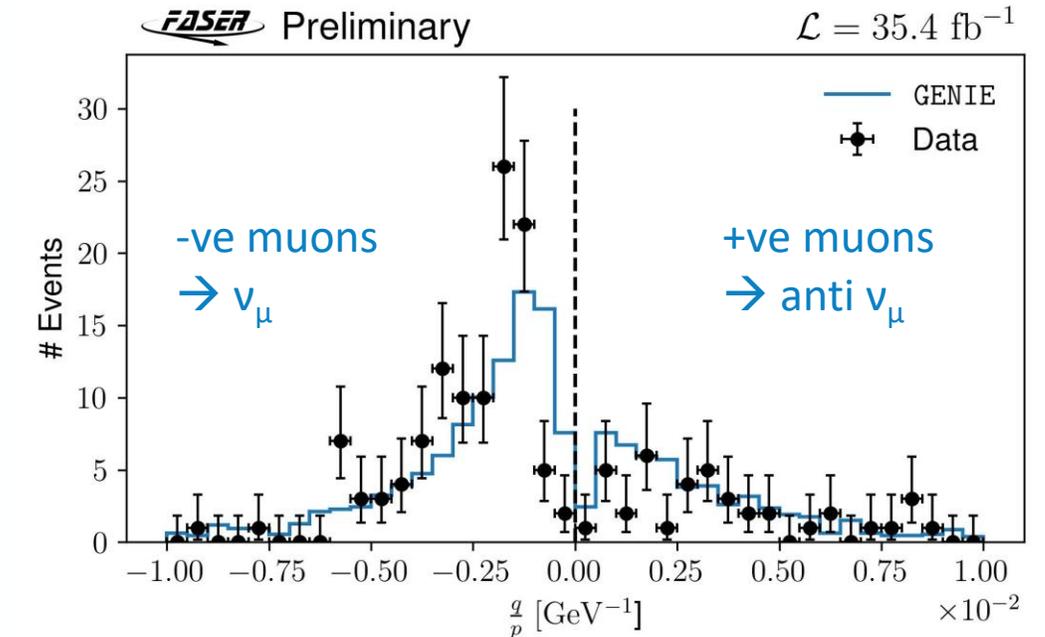

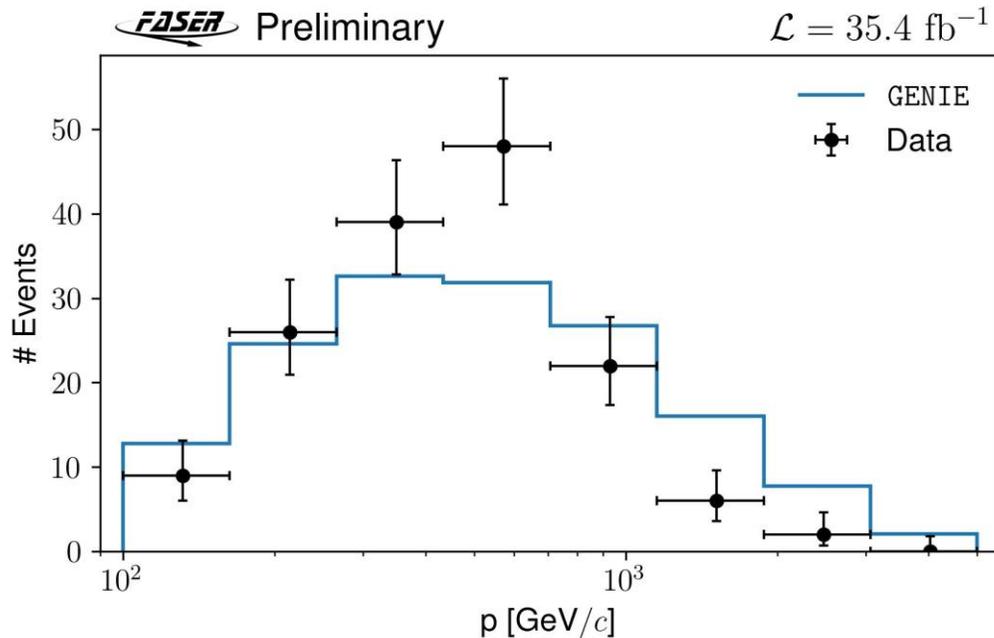

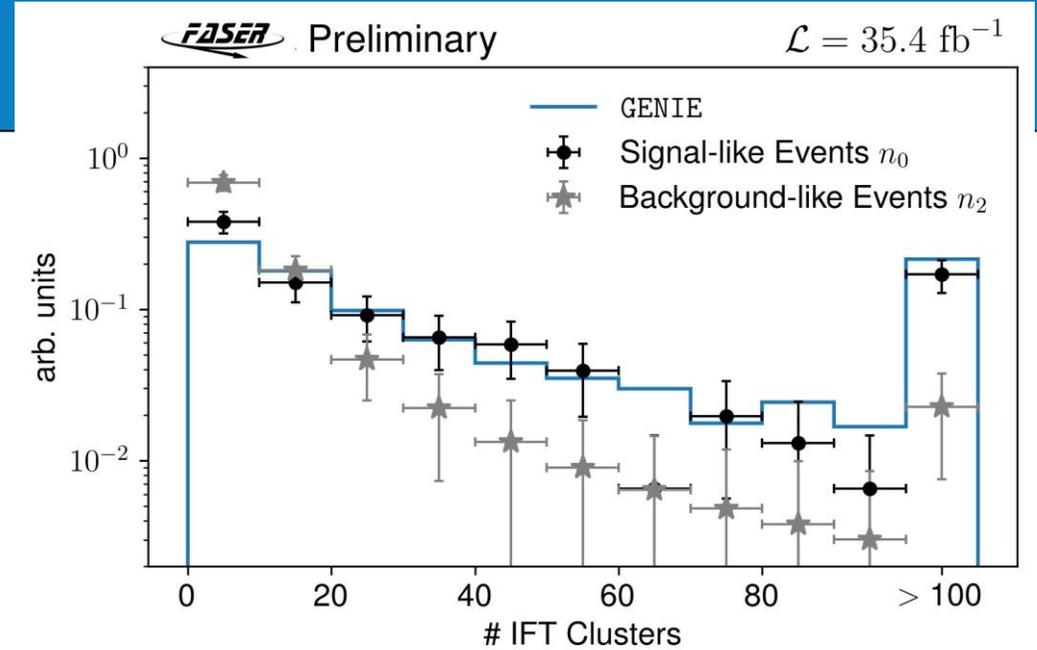

## Background estimate

- Neutral hadrons:  $0.11 \pm 0.06$  events
- Scattered muons:  $0.08 \pm 1.83$  events
- Front veto inefficiency: negligible

# Neutrino Characteristics

- Candidate neutrino events match expectation from signal
  - High occupancy in front tracker station
  - Most events have high  $\mu$  momentum
  - More  $\nu_\mu$  than anti- $\nu_\mu$
- Note: no acceptance corrections nor any systematic uncertainties in these plots

# Neutrino results from FASER $\nu$

## FASER $\nu$ Preliminary

|              | Expected background                                      |                 | Expected signal     | Observed |
|--------------|--|-----------------|---------------------|----------|
|              | Hadron int.  | $\nu$ NC int.   |                     |          |
| $\nu_e$ CC   | 0.002<br>$\pm 0.002(\text{stat}) \pm 0.002(\text{syst})$ | -               | $1.2^{+4.0}_{-0.6}$ | 3        |
| $\nu_\mu$ CC | 0.32<br>$\pm 0.15(\text{stat}) \pm 0.16(\text{syst})$    | $0.19 \pm 0.15$ | $4.4^{+4.2}_{-1.4}$ | 4        |

$$p = 1.6 \times 10^{-7} \text{ (} 5.1\sigma \text{)}$$

$$p = 5.2 \times 10^{-3} \text{ (} 2.5\sigma \text{)}$$

3  $\nu_e$  CC candidate events are observed.

→ Probability to be explained by background is  $1.6 \times 10^{-7}$ , corresponding to  $5\sigma$  exclusion of the background-only hypothesis.

## First direct observation of electron-neutrino CC interactions at the LHC

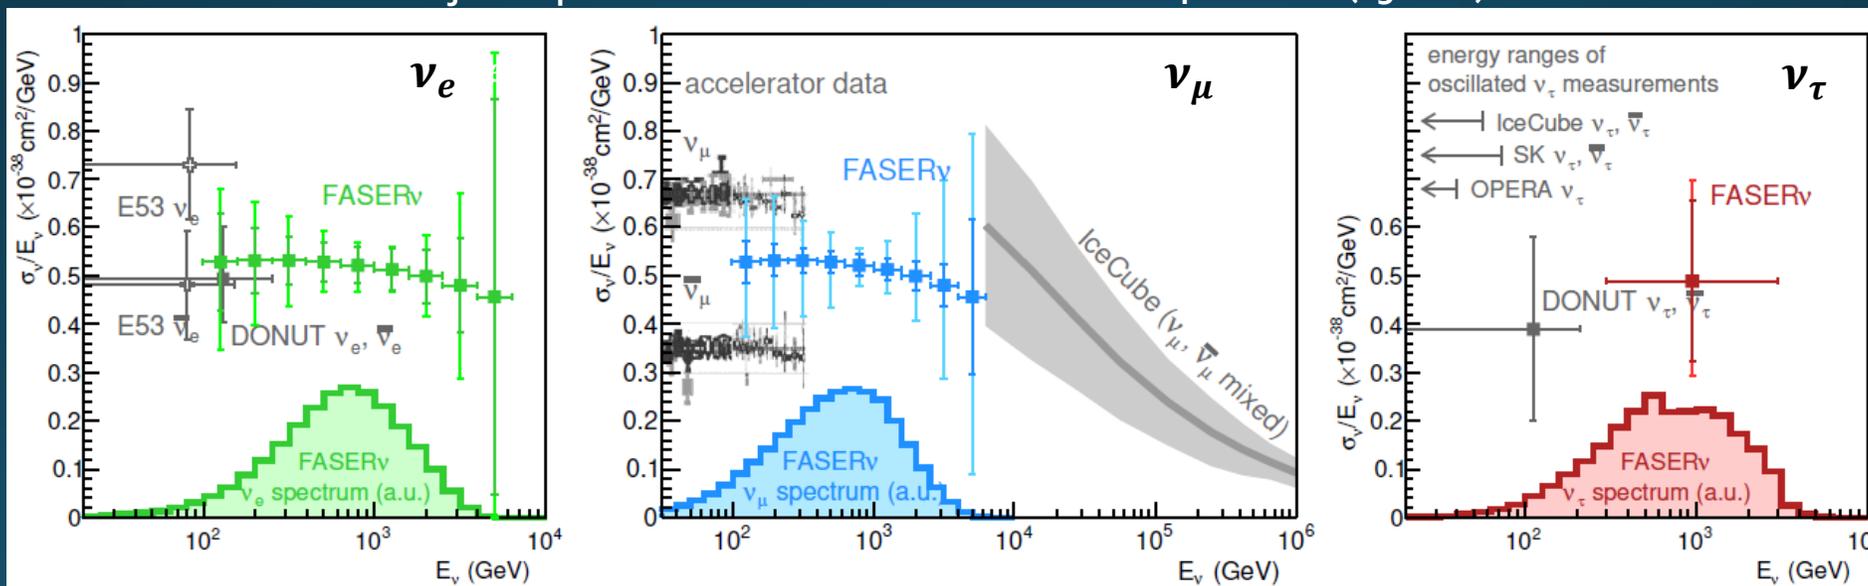

The performance of  $\nu_\mu$  detection will be improved in future analysis using a longer range for  $\mu$  ID.

# Physics studies in the LHC Run 3 (1): Cross sections

FASER Collaboration,  
Eur. Phys. J. C 80 (2020) 61,  
arXiv:1908.02310

- Neutrino cross section measurement at unexplored energy range
  - $\nu_e, \nu_\tau$  at the highest energy
  - Fill the gap between accelerator and cosmic data for  $\nu_\mu$

Projected precision of FASER $\nu$  measurement at 14-TeV LHC (150 fb $^{-1}$ )

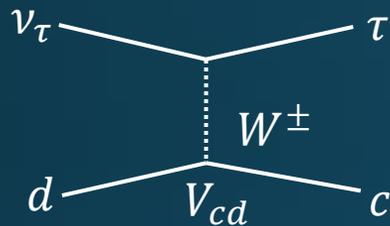

inner error bars: statistical uncertainties, outer error bars: uncertainties from neutrino production rate corresponding to the range of predictions obtained from different MC generators.

# Physics studies in the LHC Run 3 (2):

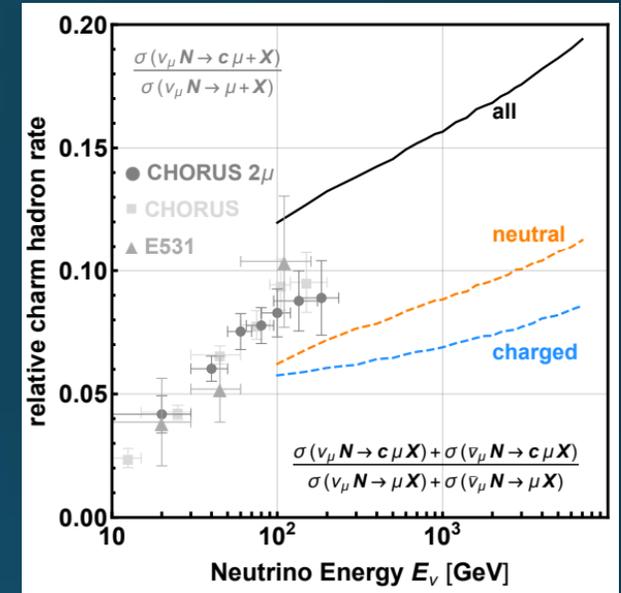

## Heavy-flavor-associated channels

- **Measure charm** production channels

- Large rate  $\sim 10\%$   $\nu$  CC events,  $\mathcal{O}(1000)$  events
- First measurement of  $\nu_e$  induced charm prod.

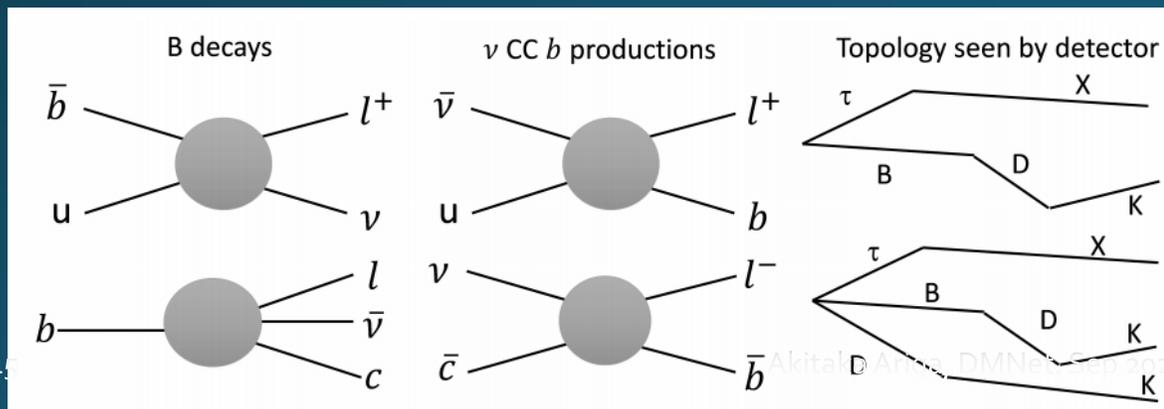

$$\frac{\sigma(\nu_\ell N \rightarrow \ell X_c + X)}{\sigma(\nu_\ell N \rightarrow \ell + X)} \quad \ell = e, \mu$$

- **Search for Beauty** production channels

- Expected SM events ( $\nu_\mu$  CC  $b$  production) are  $\mathcal{O}(0.1)$  events in Run 3, due to CKM suppression,  $V_{ub}^2 \simeq 10^{-5}$

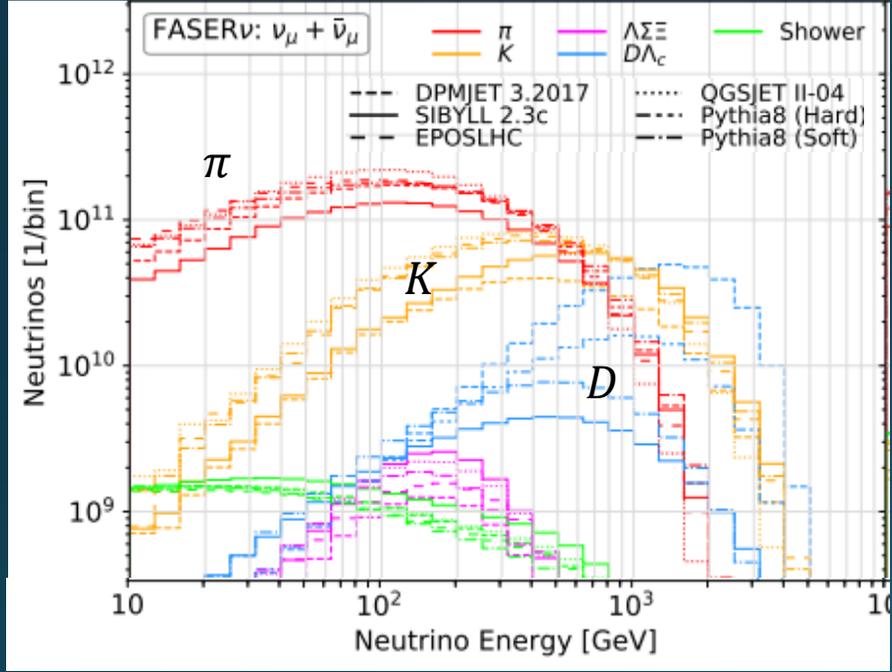

$$\bar{\nu} N \rightarrow \ell \bar{B} X$$

$$\nu N \rightarrow \ell B D X$$

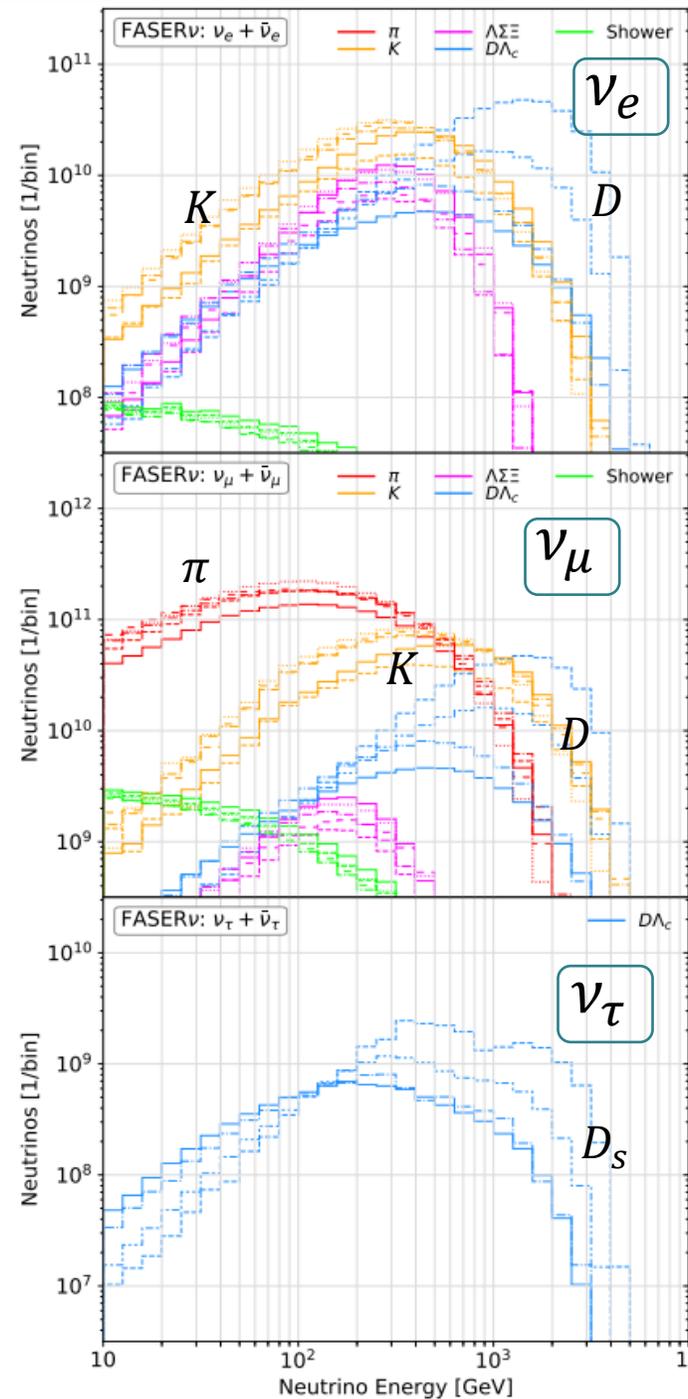

# Neutrinos = proxy of forward hadron production

- Pion, Kaon, charm contribute to different part of rapidity and energy spectra and flavor

$\nu_\mu$

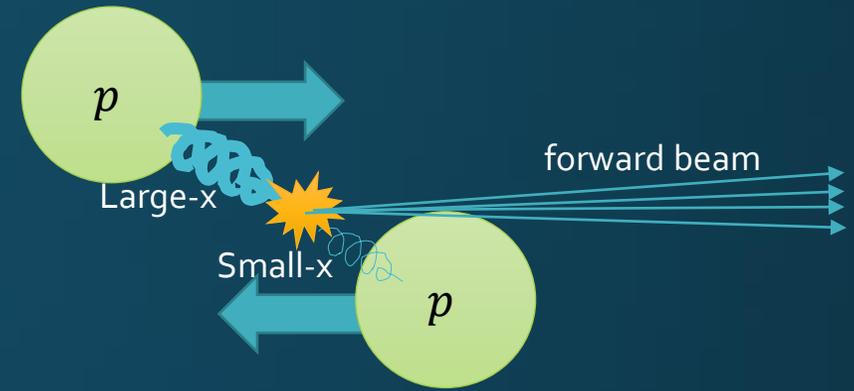

- FASER $\nu$  provides important inputs to validate/improve generators  $\rightarrow$  **Muon excess, prompt neutrinos**

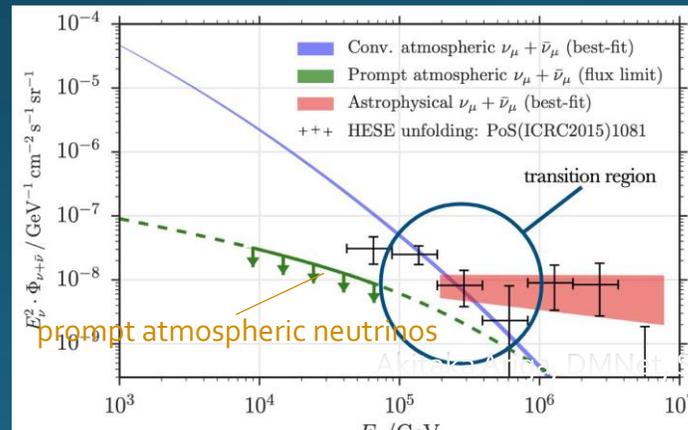

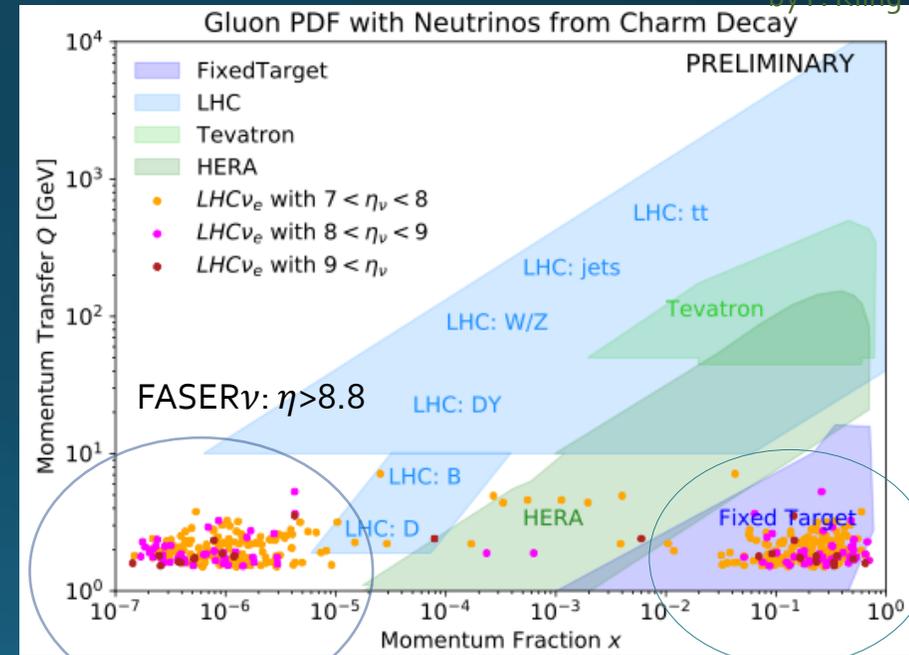

# Physics studies in the LHC Run 3 (2): Further insights on QCD

- Asymmetric gluon-gluon interaction
  - $\text{small-}x \times \text{large-}x$ .
- **Neutrinos from charm decay** could allow to test transition to small- $x$  factorization, probe intrinsic charm. Contributing to QCD
- Deep understanding of **atmospheric prompt neutrinos** is essential for astrophysical neutrino observations

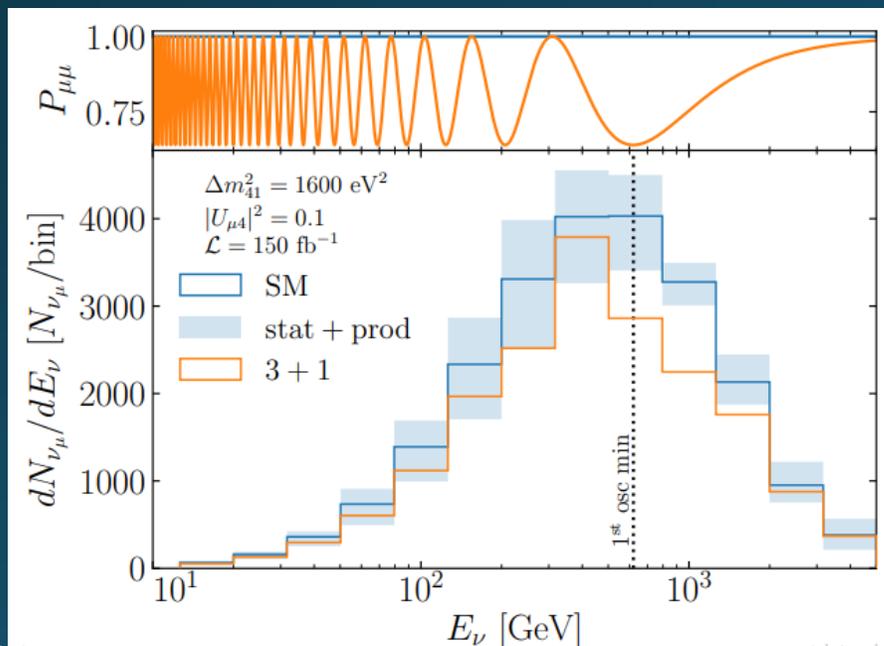

by F. Kling

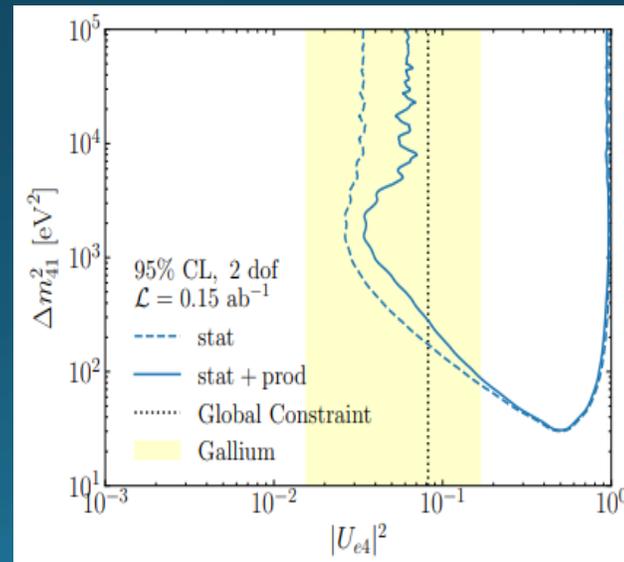

# Sterile neutrino oscillation

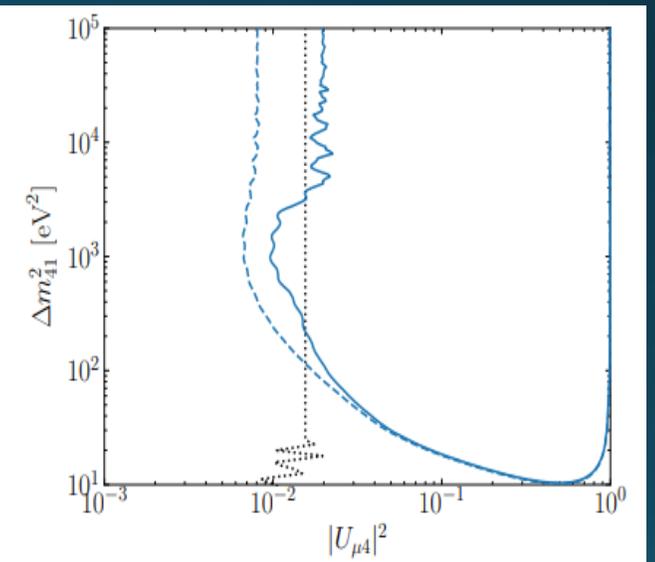

- Due to unique energy and baseline ( $L/E \sim 10^{-3}$  m/MeV), FASER $\nu$  is sensitive to large  $\Delta m^2 \sim 10^3$  eV<sup>2</sup>.
- Neutrino spectrum deformation
- Competitive in disappearance channels.

$\nu_e$  disappearance

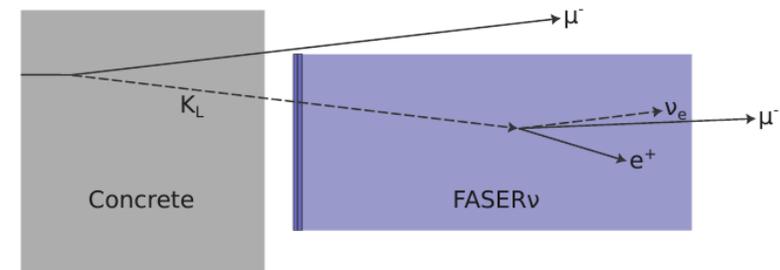

$\nu_\mu$  disappearance

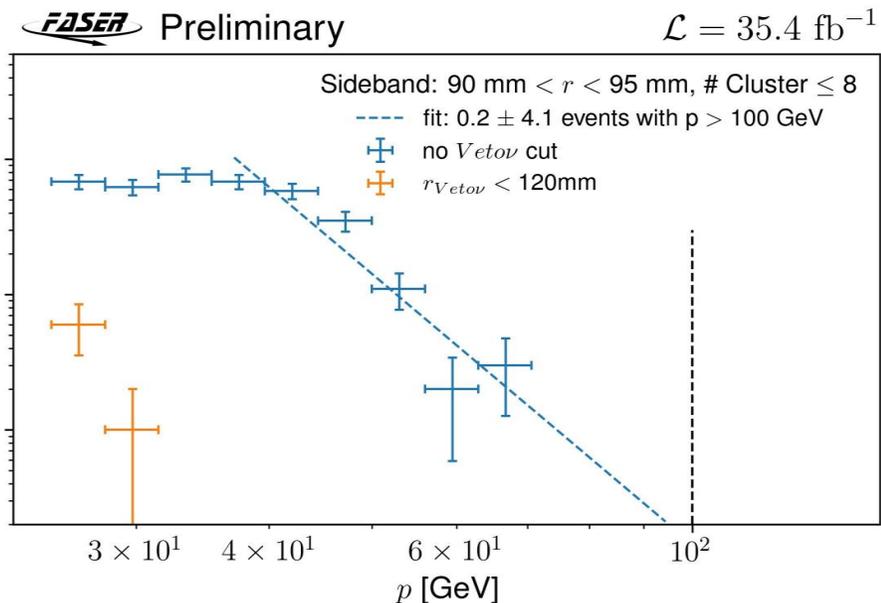

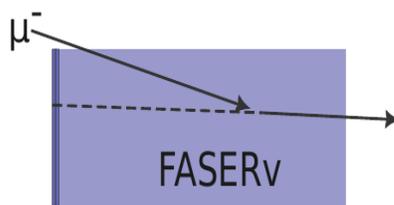

# Neutrino Backgrounds

- Neutral hadrons estimated from 2-step simulation
  - Expect ~300 neutral hadrons with  $E > 100$  GeV reaching FASERv
    - Most accompanied by  $\mu$  but conservatively assume missed
  - Estimate fraction of these passing event selection
    - Most are absorbed in tungsten with no high-momentum track
  - Predict  $N = 0.11 \pm 0.06$  events

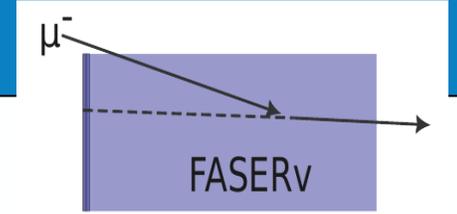

- Scattered muons estimated from data SB
  - Take events w/o front veto radius requirement and single track segment in first tracker station with  $90 < r < 95$  mm
    - Fit to extrapolate to higher momentum
  - Scale by # events with front veto cut
    - Use MC to extrapolate to signal region
  - Predict  $N = 0.08 \pm 1.83$  events
    - Uncertainty from varying selection

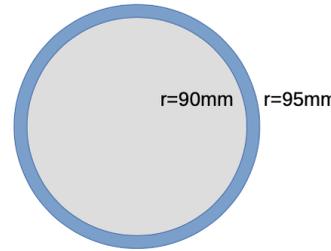

- Veto inefficiency estimated from final fit
  - Fit events with 0 (SR) and also 1 (1<sup>st</sup> or 2<sup>nd</sup>) or 2 front veto layers firing
  - Final negligible background due to very high veto efficiency

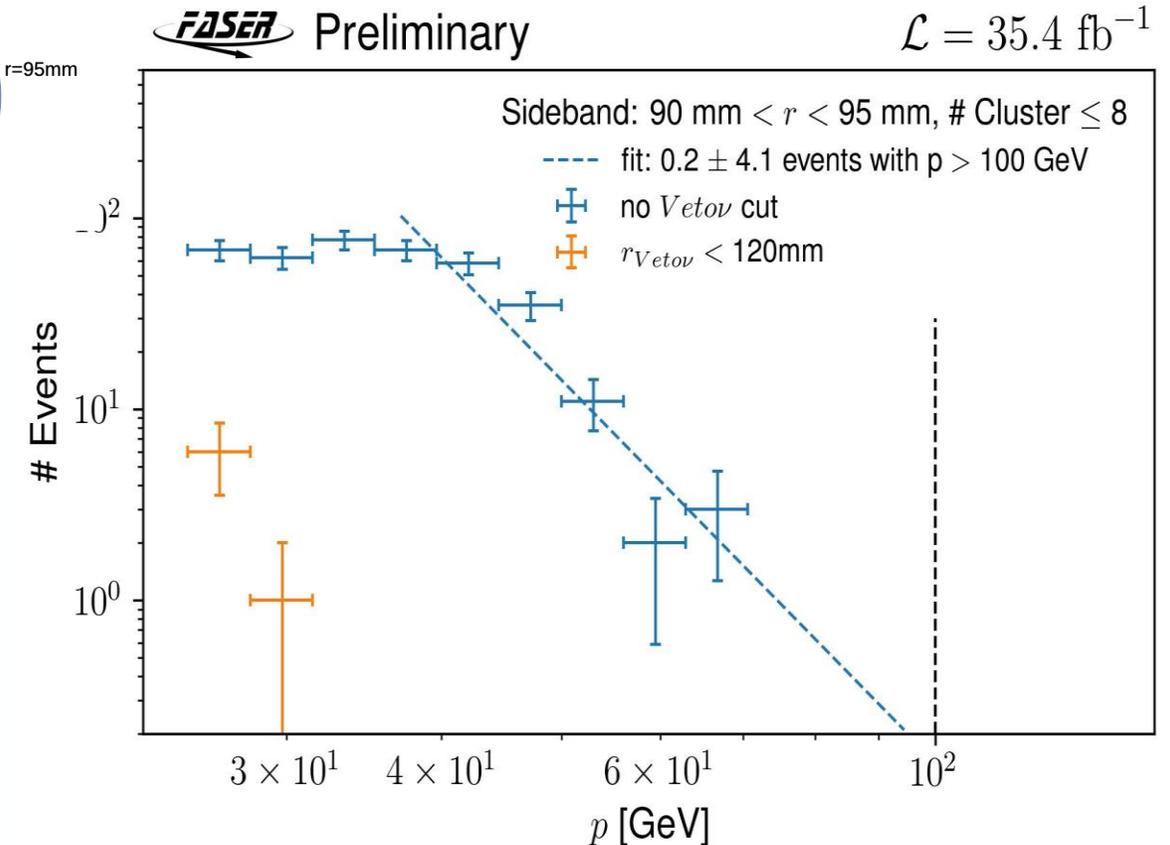

# Neutrinos: Geometric Background

- Measure geometric background by counting # events in SB and scale to SR
- SB defined to enhance muons missing FASERν veto that still give a track in the spectrometer
  - Single IFT segment in  $90 < r < 95$  mm annulus
  - Loosened momentum requirement
  - No FASERν veto radius requirement
  - Negligible neutrino background

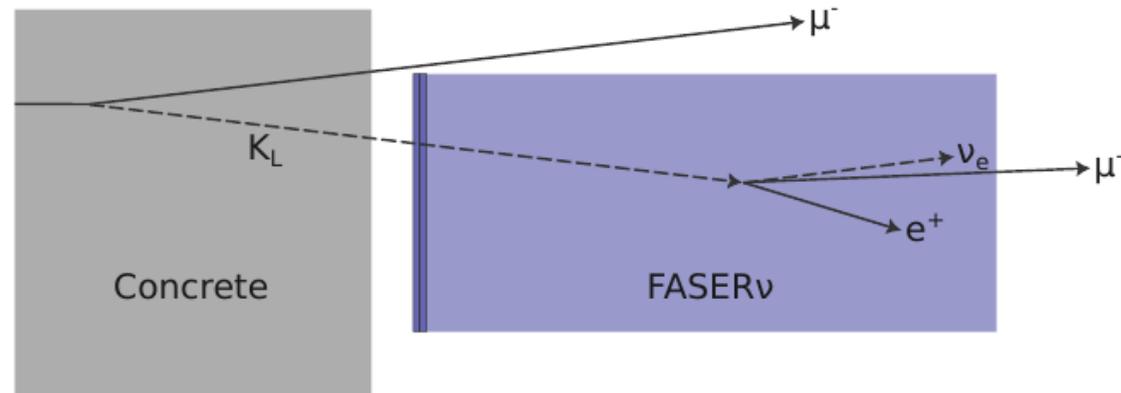

- Fit mom. to extrapolate to  $p > 100$  GeV
- Scale to rate of events with  $r_{VetoNu} < 120$  mm
  - 0 events so use 5.9 events as  $3\sigma$  upper limit
- Scale from annulus to full acceptance
  - Using large angle muon simulation
- Expect  $0.08 \pm 1.83$  events

# Neutrinos: Neutral Hadron Background

- Simulated  $10^9$   $\mu^+$  and  $\mu^-$  events
  - Start from FLUKA Spectra
  - G4 propagation through last 8 m of rock
  - Number of hadrons with  $p > 100$  GeV reaching FASER  $\approx 300$ .
- Estimate fraction of these passing event selection
  - Simulate kaons ( $K_S/K_L$ ) and neutrons with  $p > 100$  GeV following expected spectra
  - Most are absorbed in tungsten with no high-momentum track  $\rightarrow$  only small fraction pass

- Scale neutral hadrons produce by muons reaching FASER by fraction passing selection
  - Predicts  $N = 0.11 \pm 0.06$  events

# Neutrinos: fit

- Fit to events with 0, 1 or 2 front veto hits
  - Splitting those were 1 hit is in 1<sup>st</sup>/2<sup>nd</sup> layer
- Construct likelihood as product of Poissons
  - With additional 3 Gaussian constraints for Neutral hadron background, Geometric background and the extrapolation factor

$$\mathcal{L} = \prod_i^4 \mathcal{P}(n_i | \nu_i) \cdot \prod_j^3 \mathcal{G}_j$$

obs
exp

- Determine number of in each category
  - Along with inefficiencies of 2 forward vetos, which are found to be close to expected vals.

**Inefficiencies:**       $1 - p_1 = 99.999994(3)\%$   
 $6 / 9 \times 10^{-8}$        $1 - p_2 = 99.999991(4)\%$

$n_0$ : A neutrino enriched category from events that pass all event selection steps.

$n_{10}$ : Events for which the first layer of the FASER $\nu$  scintillator produces a charge of  $>40$  pC in the PMT, but no signal with sufficient charge is seen in the second layer.

$n_{01}$ : Analogous events for which more than 40 pC in the PMT was observed in the second layer, but not in the first layer.

$n_2$ : Events for which both layers observe more than 40 pC of charge.

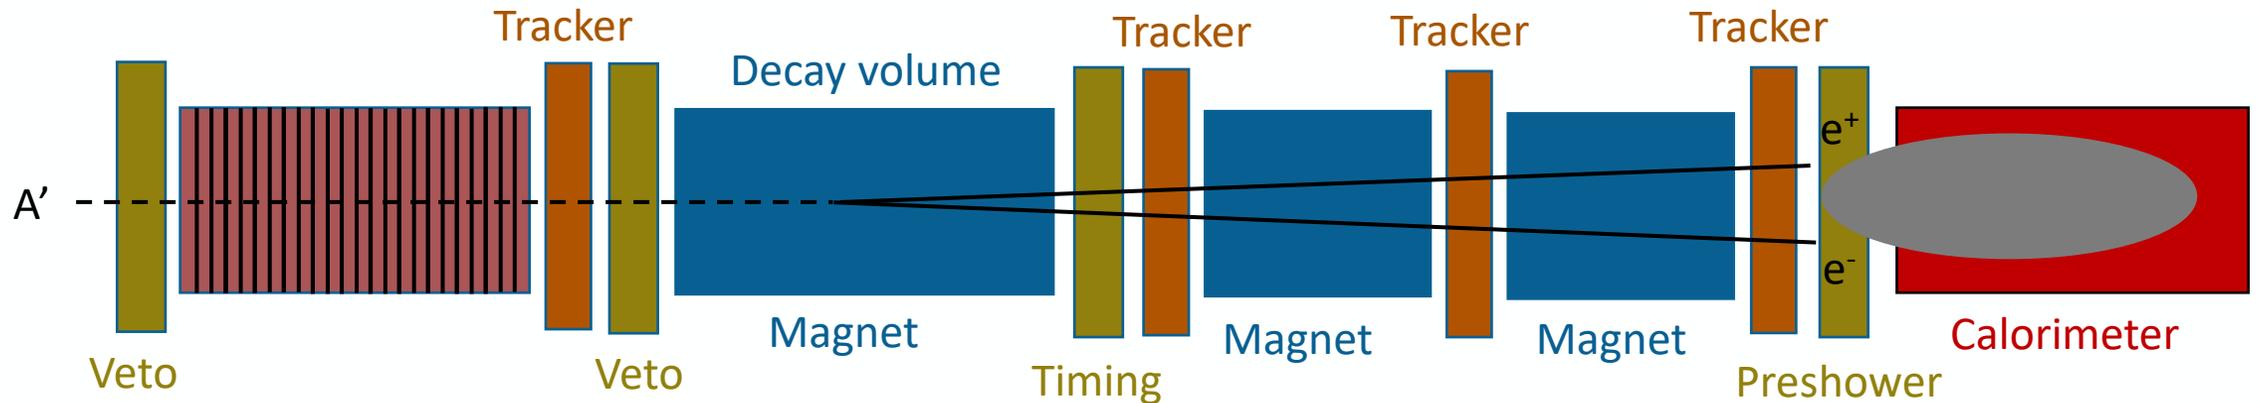

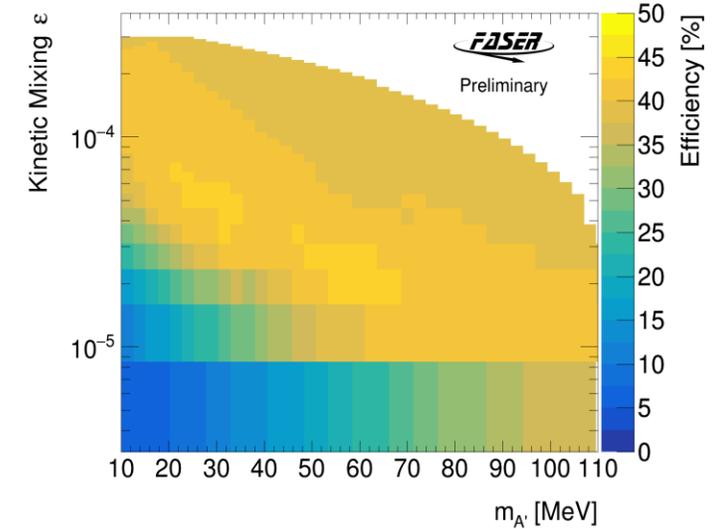

| Category | Events   | Expectation   |
|----------|----------|---|
| $n_0$    | 153      | $\nu_\nu + \nu_b \cdot p_1 \cdot p_2 + \nu_{\text{had}} + \nu_{\text{geo}} \cdot \eta_{\text{geo}}$ |
| $n_{10}$ | 4        | $\nu_b \cdot (1 - p_1) \cdot p_2$   |
| $n_{01}$ | 6        | $\nu_b \cdot p_1 \cdot (1 - p_2)$   |
| $n_2$    | 64014695 | $\nu_b \cdot (1 - p_1) \cdot (1 - p_2)$   |

# Dark Photon Selection

- Simple and robust  $A' \rightarrow e^+e^-$  selection, optimised for discovery
  - Blind events with no veto signal and  $E(\text{calo}) > 100 \text{ GeV}$
  - Efficiency of  $\sim 40\%$  across region sensitive to

1. Collision event with good data quality

3. Timing and preshower consistent with  $\geq 2$  MIPs

2. No signal ( $< 40 \text{ pc}$ ) in any veto scintillator

4. Exactly 2 good fiducial tracks

5. Calo  $E > 500 \text{ GeV}$

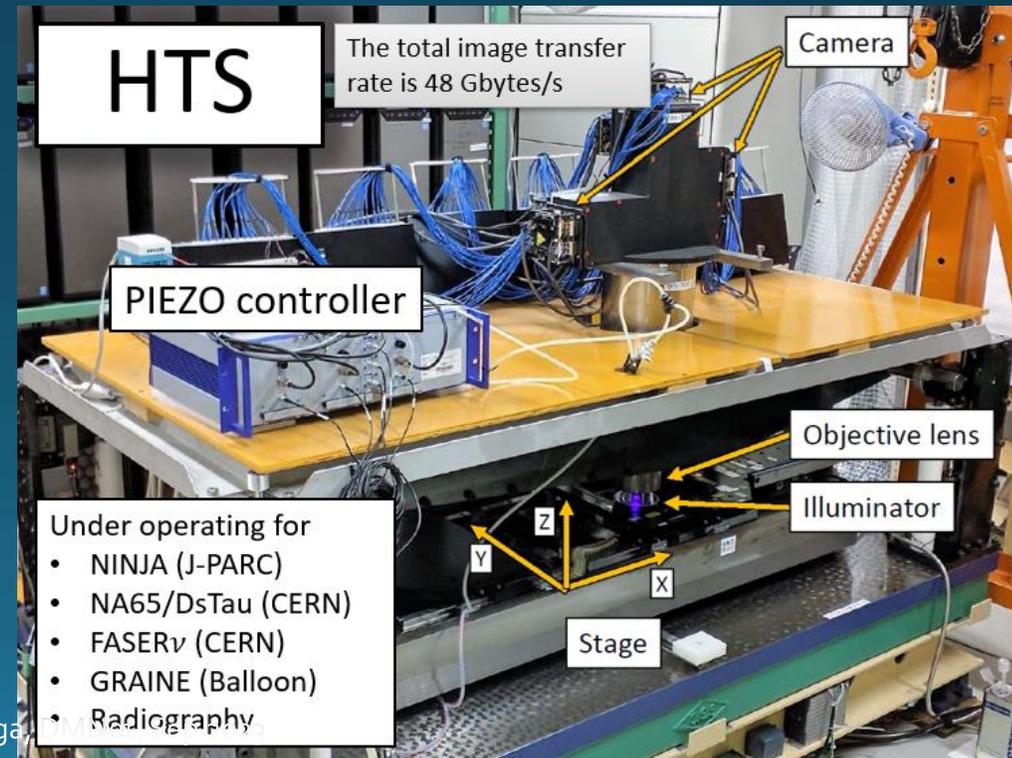

- $p > 20 \text{ GeV}$  and  $r < 95 \text{ mm}$
- Extrapolating to  $r < 95 \text{ mm}$  at vetos

# Emulsion detector technology

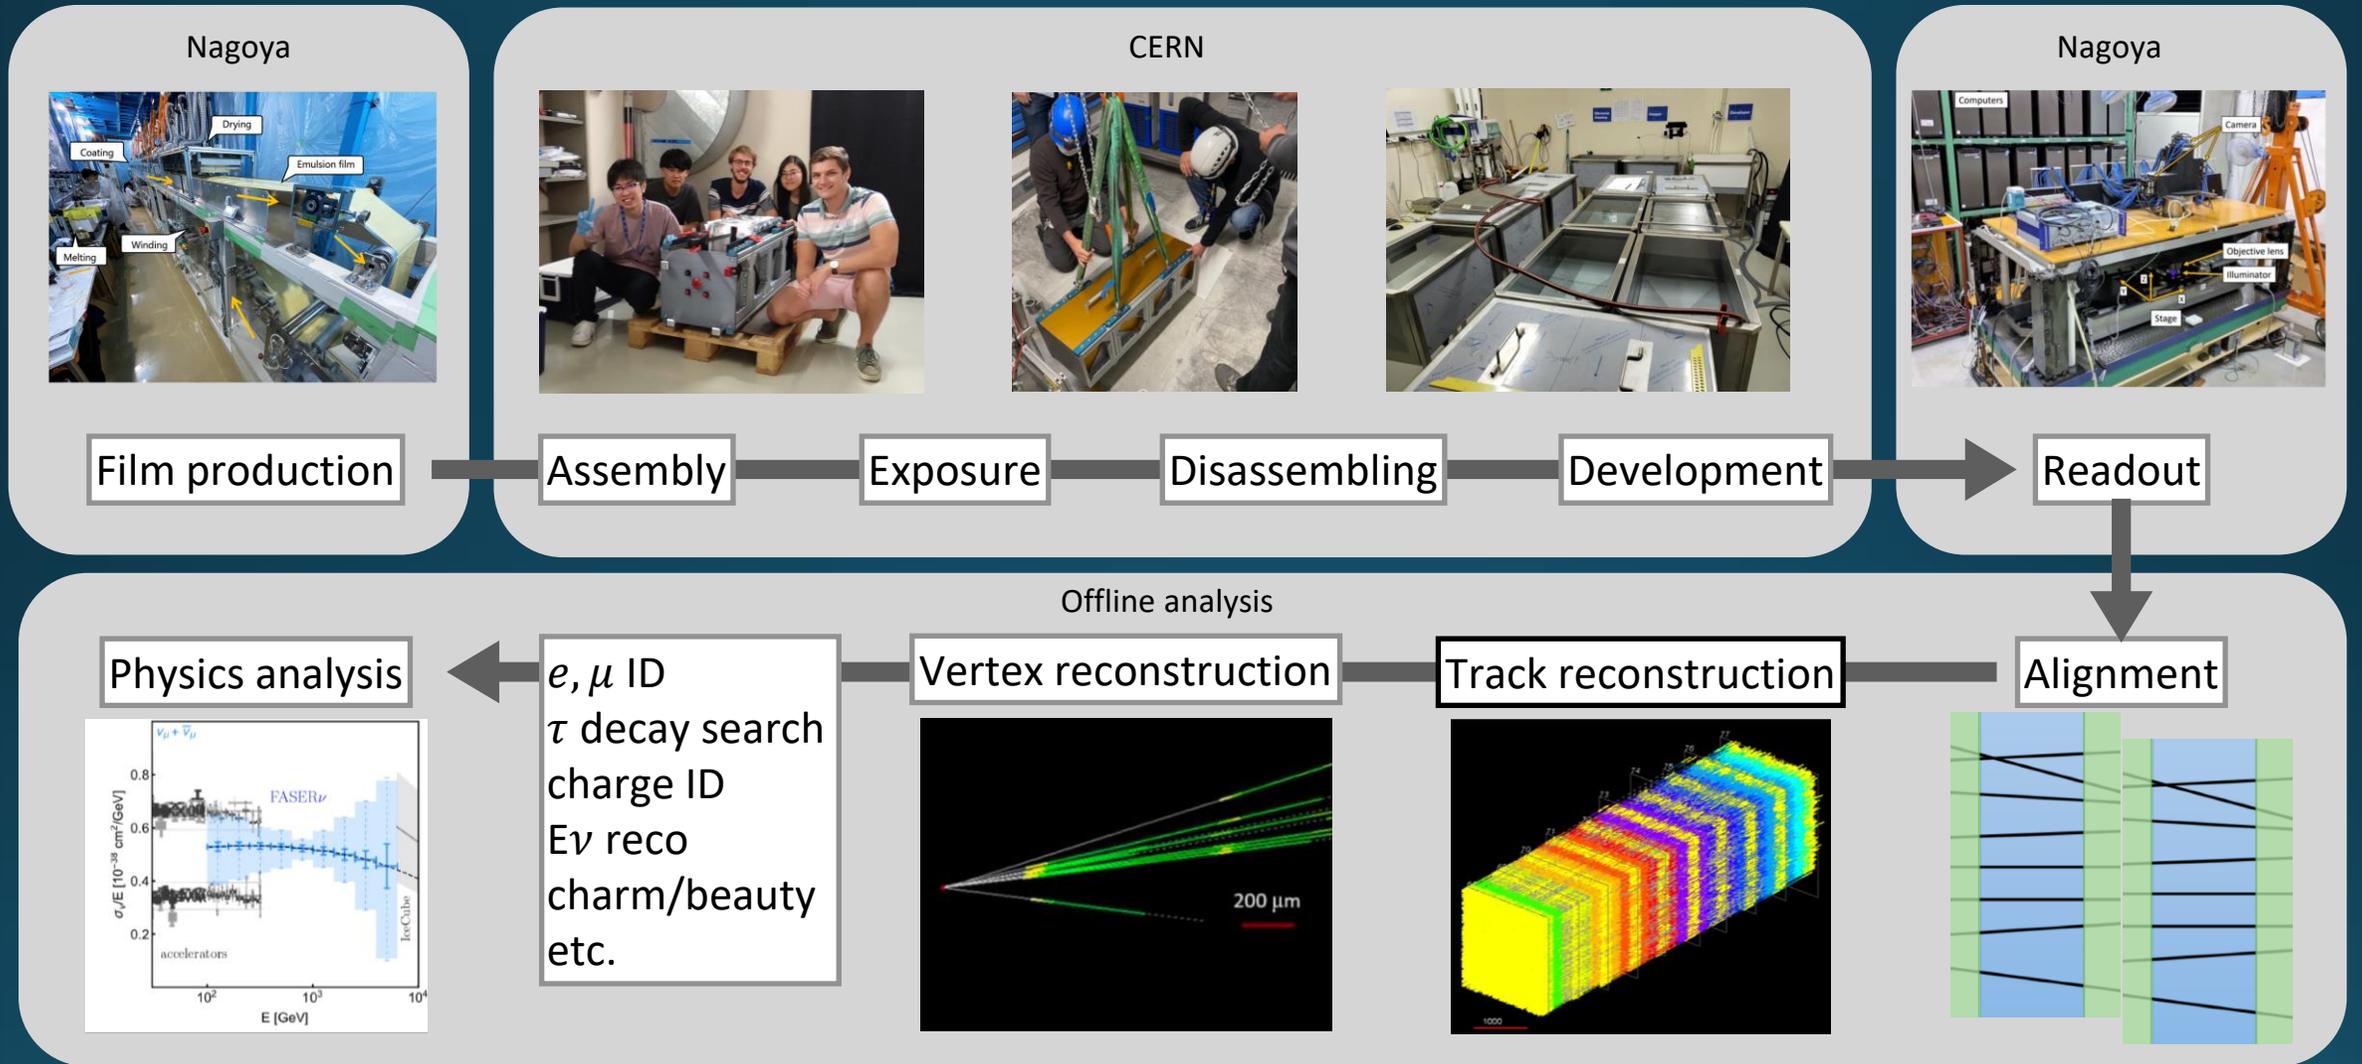

- Fast readout of emulsion films
  - Great progress in the readout speed, throughput of 48 GBytes/sec
  - ~100 times faster than OPERA
- Data readout for FASER will catch up with the irradiation at the LHC
  - 3 months irradiation at the LHC, followed by 3 months scanning for each module
  - 3 modules per year

|              | Start year  | Field of view (mm <sup>2</sup> ) | Readout speed (cm <sup>2</sup> /h/layer) |

# FASER $\nu$ steps, 3 detectors per year

# FASER/FASER $\nu$ detector

2023/3/15

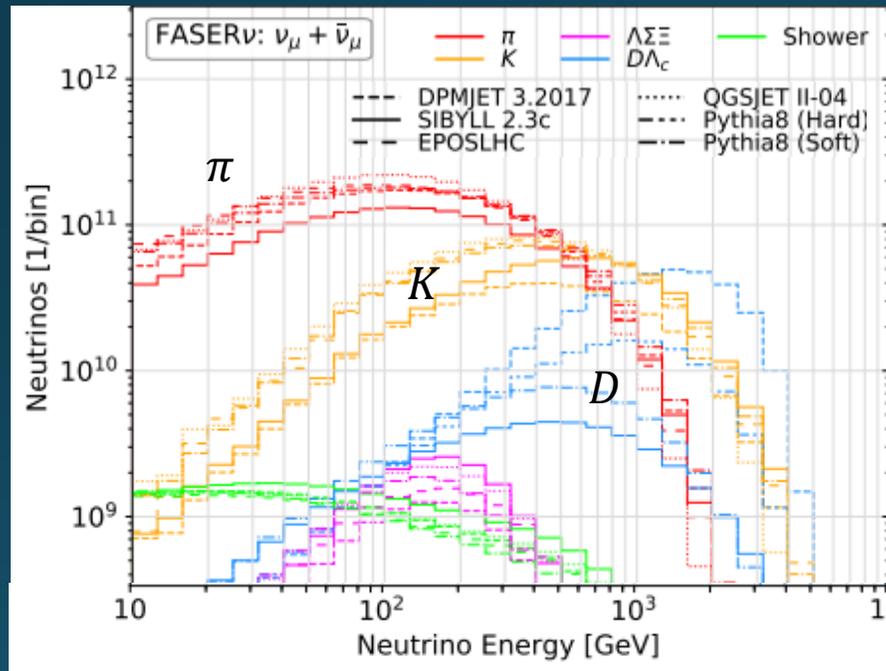

Akitaka Ariga DM-2 Sep 2023

(arXiv.org 1806.02348)

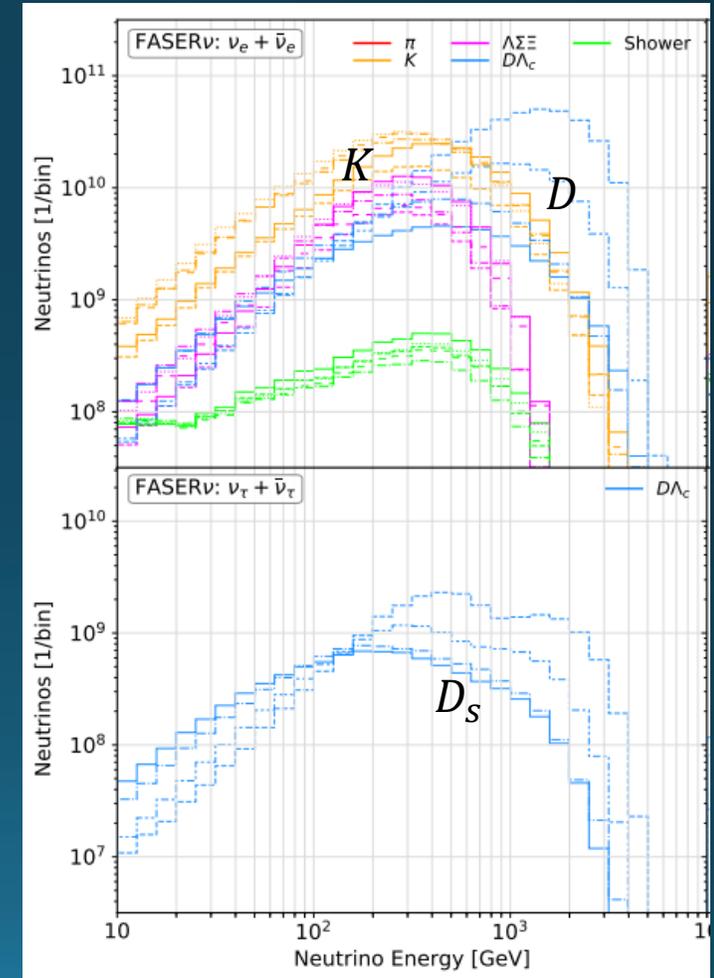

# Neutrinos = proxy of forward hadron production

- Pion, Kaon, charm contribute to different part of energy spectra and flavor

$\nu_\mu$

$\nu_e$

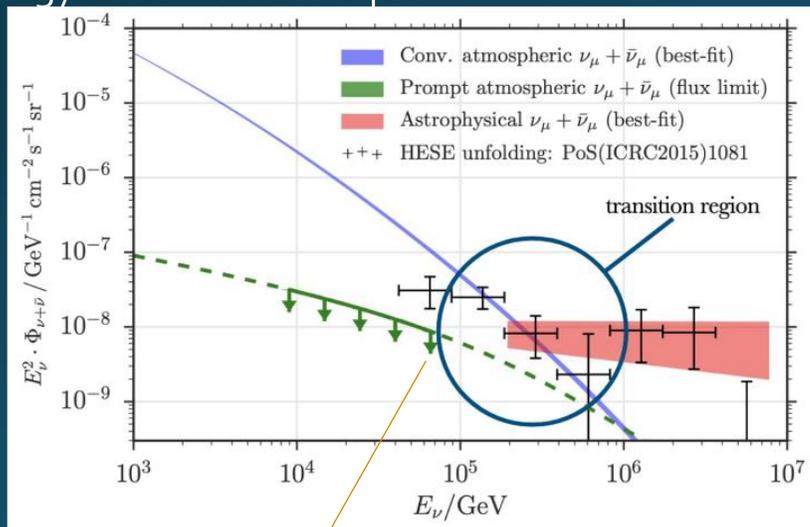

$\nu_\tau$

- **FASER $\nu$**  provides important inputs to validate/improve generators  $\rightarrow$  **Muon excess, prompt neutrinos**

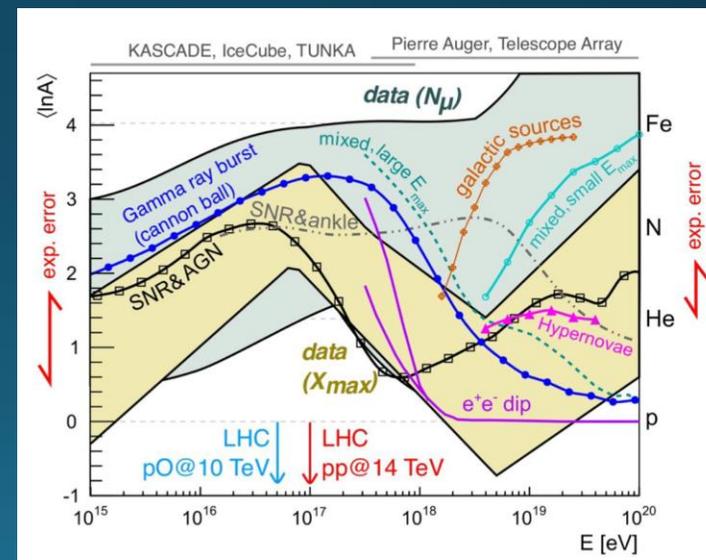

# Physics studies in the LHC Run 3 (4): Cosmic rays and neutrino

- In order for IceCube **to make precise measurements of the cosmic neutrino flux**, accelerator measurements of high energy and large rapidity charm production are needed.
- As 7+7 TeV  $p$ - $p$  collision corresponds to 100 PeV proton interaction in fixed target mode, a direct **measurement of the prompt neutrino production at FASER $\nu$**  would provide important basic data for current and future high-energy neutrino telescopes.

- Muon problem in CR physics: **cosmic ray experiments have reported an excess in the number of muons** over expectations computed using extrapolations of hadronic interaction models tuned to LHC data at the few  $\sigma$  level. **New input from LHC is crucial to reproduce CR data consistently.**

TABLE II. Expected number of charged current neutrino interaction events occurring in FASER $\nu$  and SND@LHC during LHC Run 3 with 250 fb<sup>-1</sup> integrated luminosity. Here we assume a target mass of 1.2 tons for FASER $\nu$  and 800 kg for SND@LHC;

Projected cross section sensitivities (FASER $\nu$ , plot for 150 fb<sup>-1</sup>)

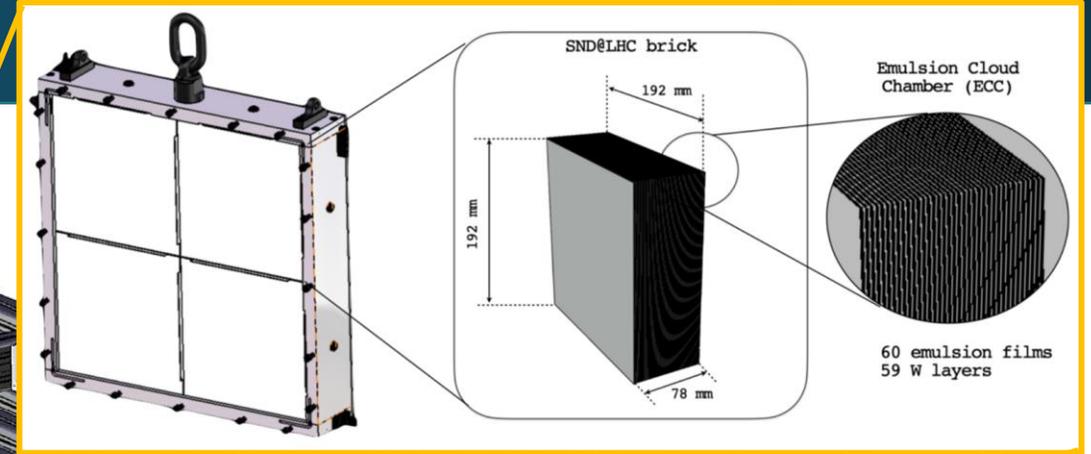

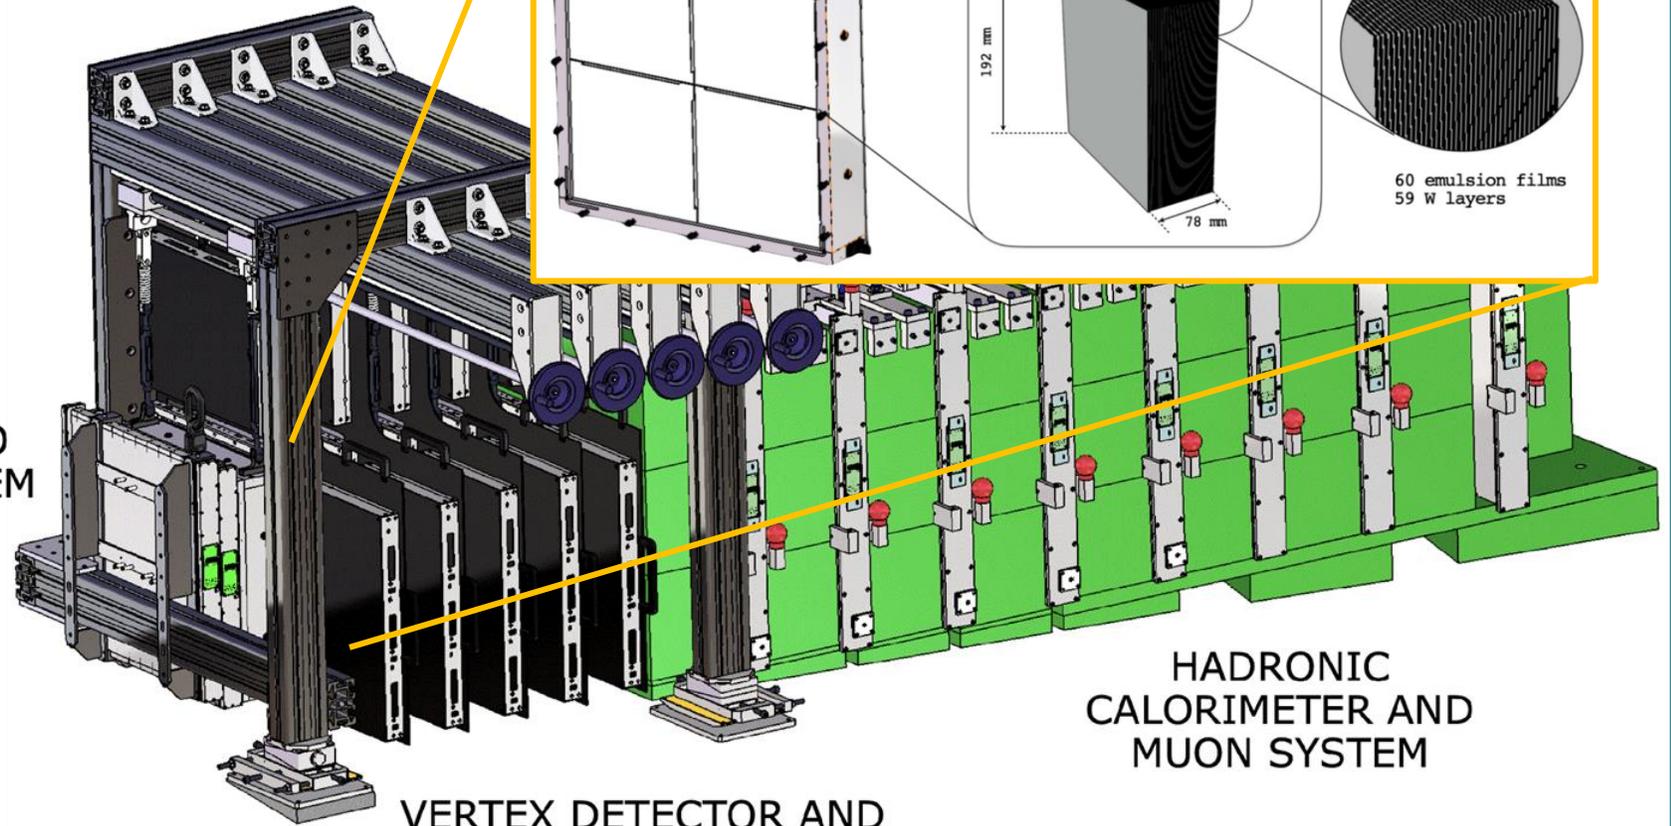

# The SND@LHC detector concept

- Hybrid detector design.
- Optimized for the identification of three neutrino flavours and feebly interacting particles.

VETO SYSTEM

HADRONIC CALORIMETER AND MUON SYSTEM

Scintillator strips + iron

VERTEX DETECTOR AND ELECTROMAGNETIC CALORIMETER

Emulsion/W target and SciFi planes

# Construction

- Despite the difficult period, both neutrino experiments were constructed in time for Run3!
- Amazingly quick works!
