

# Pseudoscalar meson contributions to the Hadronic Light-by-Light scattering in the muon $g-2$

Wednesday, 15 February 2023 12:10 (20 minutes)

The error budget of the theory calculation of the muon  $g-2$  is dominated by two hadronic contributions: the Hadronic Vacuum Polarization (HVP) and the Hadronic Light-by-Light (HLbL) scattering. Reducing the error on these contributions is essential to match the future experimental precision.

In this talk, we present a lattice calculation of the three light pseudoscalar meson ( $\pi_0$ ,  $\eta$  and  $\eta'$ ) transition form factors. We compare our results for the form factors with the experimental measurements. These form factors are an important input for the determination of the pseudoscalar-pole contributions to HLbL scattering in the muon  $g-2$  ( $a_{\text{HLbL}}^{\text{p-pole}}$ ). We compute  $a_{\text{HLbL}}^{\text{p-pole}}$  and compare it to the other current estimates.
