

# The progress of Super Tau Charm Facility in China

*Thursday, June 8, 2023 4:30 PM (25 minutes)*

The proposed STCF is a symmetric electron-positron beam collider designed to provide  $e^+e^-$  interactions at a center-of-mass energy from 2.0 to 7.0 GeV. The peaking luminosity is expected to be  $0.5 \times 10^{35} \text{ cm}^{-2} \text{ s}^{-1}$ . STCF is expected to deliver more than  $1 \text{ ab}^{-1}$  of integrated luminosity per year. The huge samples could be used to make precision measurements of the properties of XYZ particles; search for new sources of CP violation in the strange-hyperon and tau-lepton sectors; make precise independent measurements of the Cabibbo angle to test the unitarity of the CKM matrix; search for anomalous decays with sensitivities extending down to the level of SM-model expectations and so on. In this talk, the physics interests and the recent progress on the STCF project R&D will be introduced.
