

Kaonic atom optical potential by the high precision data of Kaonic He atoms

Tuesday, June 6, 2023 5:20 PM (20 minutes)

We investigate the constraints on the kaonic atom optical potential deduced from the latest extremely high precision data of the 2p states of the kaonic ^3He and ^4He atoms [1].

In our analyses, we consider the phenomenological optical potentials proportional to the nuclear density distributions, and the potentials inspired by the theoretical studies of the chiral unitary model and the χ^2 fitting to the previous data. We find that the data in Ref. [1] together with the previous data of heavier kaonic atoms could provide the relevant constraints to the kaonic atom optical potential [2].
