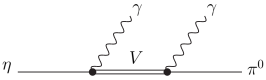
$\eta \to \pi^0\gamma\gamma$ decays: Theoretical motivation

- **SM motivation**:

Reference	$\Gamma(\eta \to \pi^0\gamma\gamma)$ [eV]
$\mathcal{O}(p^2)$, $\mathcal{O}(p^4)$ tree-level χPT	0
$\pi + K$ loops at $\mathcal{O}(p^4)$	1.87×10^{-3}
Experimental value (pdg)	0.34(3)

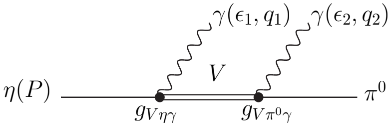
  - 1^{st} sizable contribution comes at $\mathcal{O}(p^6)$, but LEC's are not well known
  - To **test ChPT** and a wide range of chiral models, *e. g.* VMD and LσM



- **BSM motivation**: search for a B boson via $\eta \to B\gamma \to \pi^0\gamma\gamma$

Vector meson exchange contributions

- Six **diagrams** corresponding to the exchange of $V = \rho^0, \omega, \phi$



$$\mathcal{A}^{\rm VMD}_{\eta\to\pi^0\gamma\gamma} = \sum_{V=\rho^0,\omega,\phi} g_{V\eta\gamma} g_{V\pi^0\gamma} \left[\frac{(P\cdot q_2 - m_\eta^2)\{a\} - \{b\}}{D_V(t)} + \left\{ \begin{array}{c} q_2 \leftrightarrow q_1 \\ t \leftrightarrow u \end{array} \right\} \right] ,$$

- Mandelstam variables and Lorentz structures given by:

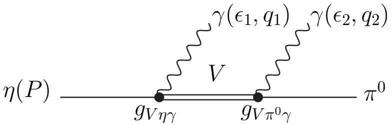
$$t, u = (P - q_{2,1})^2 = m_\eta^2 - 2P\cdot q_{2,1} \ ,$$

$$\{a\} = (\epsilon_1\cdot\epsilon_2)(q_1\cdot q_2) - (\epsilon_1\cdot q_2)(\epsilon_2\cdot q_1) \ ,$$

$$\{b\} = (\epsilon_1\cdot q_2)(\epsilon_2\cdot P)(P\cdot q_1) + (\epsilon_2\cdot q_1)(\epsilon_1\cdot P)(P\cdot q_2) - (\epsilon_1\cdot\epsilon_2)(P\cdot q_1)(P\cdot q_2) - (\epsilon_1\cdot P)(\epsilon_2\cdot P)(q_1\cdot q_2)$$

$\eta \to \pi^0\gamma\gamma$ decays: VMD calculation

- Six **diagrams** corresponding to the exchange of $V = \rho^0, \omega, \phi$



$$\mathcal{A}^{\text{VMD}}_{\eta\to\pi^0\gamma\gamma} = \sum_{V=\rho^0,\omega,\phi} g_{V\eta\gamma}g_{V\pi^0\gamma}\left[\frac{(P\cdot q_2 - m_\eta^2)\{a\} - \{b\}}{D_V(t)} + \left\{\begin{array}{c} q_2 \leftrightarrow q_1 \\ t \leftrightarrow u \end{array}\right\}\right] ,$$

- $g_{VP\gamma}$ **couplings**:
  - Model-based:

$$\mathcal{L}_{VVP} = \frac{G}{\sqrt{2}}\epsilon^{\mu\nu\alpha\beta}\text{tr}\left[\partial_\mu V_\nu \partial_\alpha V_\beta P\right] , \quad \mathcal{L}_{V\gamma} = -2egf_\pi^2 A^\mu \text{tr}\left[QV_\mu\right] ,$$

  - Empirical: measured $\Gamma^{\text{exp}}_{V(P)\to P(V)\gamma}$ widths

- The decays $\eta' \to \{\pi^0, \eta\}\gamma\gamma$ are formally identical: $g_{V\eta\gamma}g_{V\pi^0\gamma} \to g_{V\eta'\gamma}g_{V\{\pi^0,\eta\}\gamma}$

Input for the $g_{VP\gamma}$ couplings

- $g_{VP\gamma}$ couplings fixed from the measured widths $(P = \pi^0, \eta, \eta')$

$$\Gamma^{\text{exp}}_{V\to P\gamma} = \frac{1}{3}\frac{g^2_{VP\gamma}}{32\pi}\left(\frac{m_V^2 - m_P^2}{m_V}\right)^3 , \quad \Gamma^{\text{exp}}_{P\to V\gamma} = \frac{g^2_{VP\gamma}}{32\pi}\left(\frac{m_P^2 - m_V^2}{m_P}\right)^3 ,$$

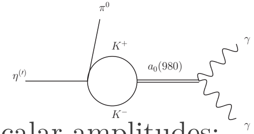
LσM for the scalar resonance contributions

- χPT loops complemented by the exchange of scalar resonances, $a_0(980)$, κ, σ, $f_0(980)$, e.g.:



$$\mathcal{A}^{\mathrm{L}\sigma\mathrm{M}}_{\eta^{(\prime)}\to\pi^0\gamma\gamma} = \frac{2\alpha}{\pi}\frac{1}{m^2_{K^+}}L(s_K)\{a\}\times\mathcal{A}^{\mathrm{L}\sigma\mathrm{M}}_{K^+K^-\to\pi^0\eta^{(\prime)}}\ ,$$

- Scalar amplitudes:

$$\mathcal{A}^{\mathrm{L}\sigma\mathrm{M}}_{K^+K^-\to\pi^0\eta^{(\prime)}} = \frac{1}{2f_\pi f_K}\Bigg\{(s-m^2_{\eta^{(\prime)}})\frac{m_K^2-m_{a_0}^2}{D_{a_0}(s)}\cos\varphi_P+\frac{1}{6}\Big[(5m^2_{\eta^{(\prime)}}+m_\pi^2-3s)\cos\varphi_P - \sqrt{2}(m^2_{\eta^{(\prime)}}+4m_K^2+m_\pi^2-3s)\sin\varphi_P\Big]\Bigg\}\ ,$$

- Complete one-loop propagator for the scalar resonances:

$$D_R(s)=s-m_R^2+\mathrm{Re}\Pi(s)-\mathrm{Re}\Pi(m_R^2)+i\mathrm{Im}\Pi(s)\ ,$$

- Summary

Leptophobic B boson model

- **New** boson arising from a new $U(1)_B$ gauge symmetry

$$\mathcal{L}_{\text{int}} = \left(\frac{1}{3} g_B + \varepsilon Q_q e\right) \bar{q}\gamma^\mu q B_\mu - \varepsilon e \bar{\ell}\gamma^\mu \ell B_\mu \,,$$

  — Couples (predominantly) to quarks

  — g_B new gauge (universal?) coupling, $\alpha_B = g_B^2/4\pi$

  — Preserves QCD symmetries (C, P, T)

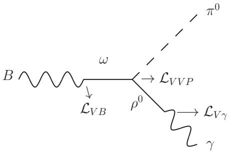
  — B is a singlet under isospin:
  $I^G(J^{PC}) = 0^-(1^{--}) \Rightarrow B$ is ω **meson** like

  — $\varepsilon = e g_B/(4\pi)^2$: (subleading) γ-like coupling to fermions

- Searches depend on the mass m_B and decay channels
- Searches on meson decays are gaining attention
  — $\phi \to \eta B \to \eta\pi^0\gamma$ (KLOE-II), $\eta \to \pi^0\gamma\gamma$ (JEF), $\eta \to \pi^+\pi^-\gamma$ (Belle-II)

Calculation of hadronic processes

- Following the conventional **VMD picture**, $\mathcal{L}_{V\gamma} \to \mathcal{L}_{VB}$
  - — $A^\mu \to B^\mu$, $e \to g_B$ and $Q = 1/3$, $\mathcal{L}_{VB} = -2\frac{1}{3} g_B g f_\pi^2 B^\mu \mathrm{tr}\,[V^\mu]$,



$$\Gamma_{B\to\pi^0\gamma} = \frac{\alpha_B \alpha_{em} m_B^3}{96\pi^3 f_\pi^2}\left(1 - \frac{m_\pi^2}{m_B^2}\right)^3 |F_\omega(m_B^2)|^2 ,$$
