

Coupled-channels meson electroproduction

Tuesday, June 6, 2023 5:20 PM (25 minutes)

Data on the photo- and electroproduction of different hadrons provide access to the spectrum of excited baryons. The amplitudes and resonance properties obtained through this phenomenological analysis can serve as a point of comparison for theories and models of excited baryons and their dynamics. Recent results from the Jülich-Bonn-Washington model will be presented, including extensions to the electroproduction of pions and eta mesons.
