

FITS MAPS: A MULTIMESSENGER APPROACH FOR ANTARES AND KM3NET

Lizeth Morales Gallegos
Antonio De Benedettis
Antonio Marinelli

DATA FILES TYPES. MAIN CATEGORIES

CLASSIC TABLES

PRO: Readable with text editor, excel, etc.

CON: Subjected to the original format

CON: Difficult to store metadata

CON: Slow, large

CON: Must read the whole file

BINARY BASED

CON: Looks weird as first sight

PRO: Can be easily manipulated

PRO: Made to store metadata

PRO: Fast, small

PRO: Can read just what you want

WHY FITS?

Standard format in Astronomy
Used by all Telescopes!

Many platforms to read these
files:

astropy

Aladin

FITS4WIN2

NASA FITS

...

BINARY BASED

One of this is the **FITS** format

**Flexible
Image
Transport
System**

WHY FITS?

Standard format in Astronomy
Used by all Telescopes!

Many platforms to read these
files:

astropy

Aladin

FITS4WIN2

NASA FITS

...

ADVANTAGES:

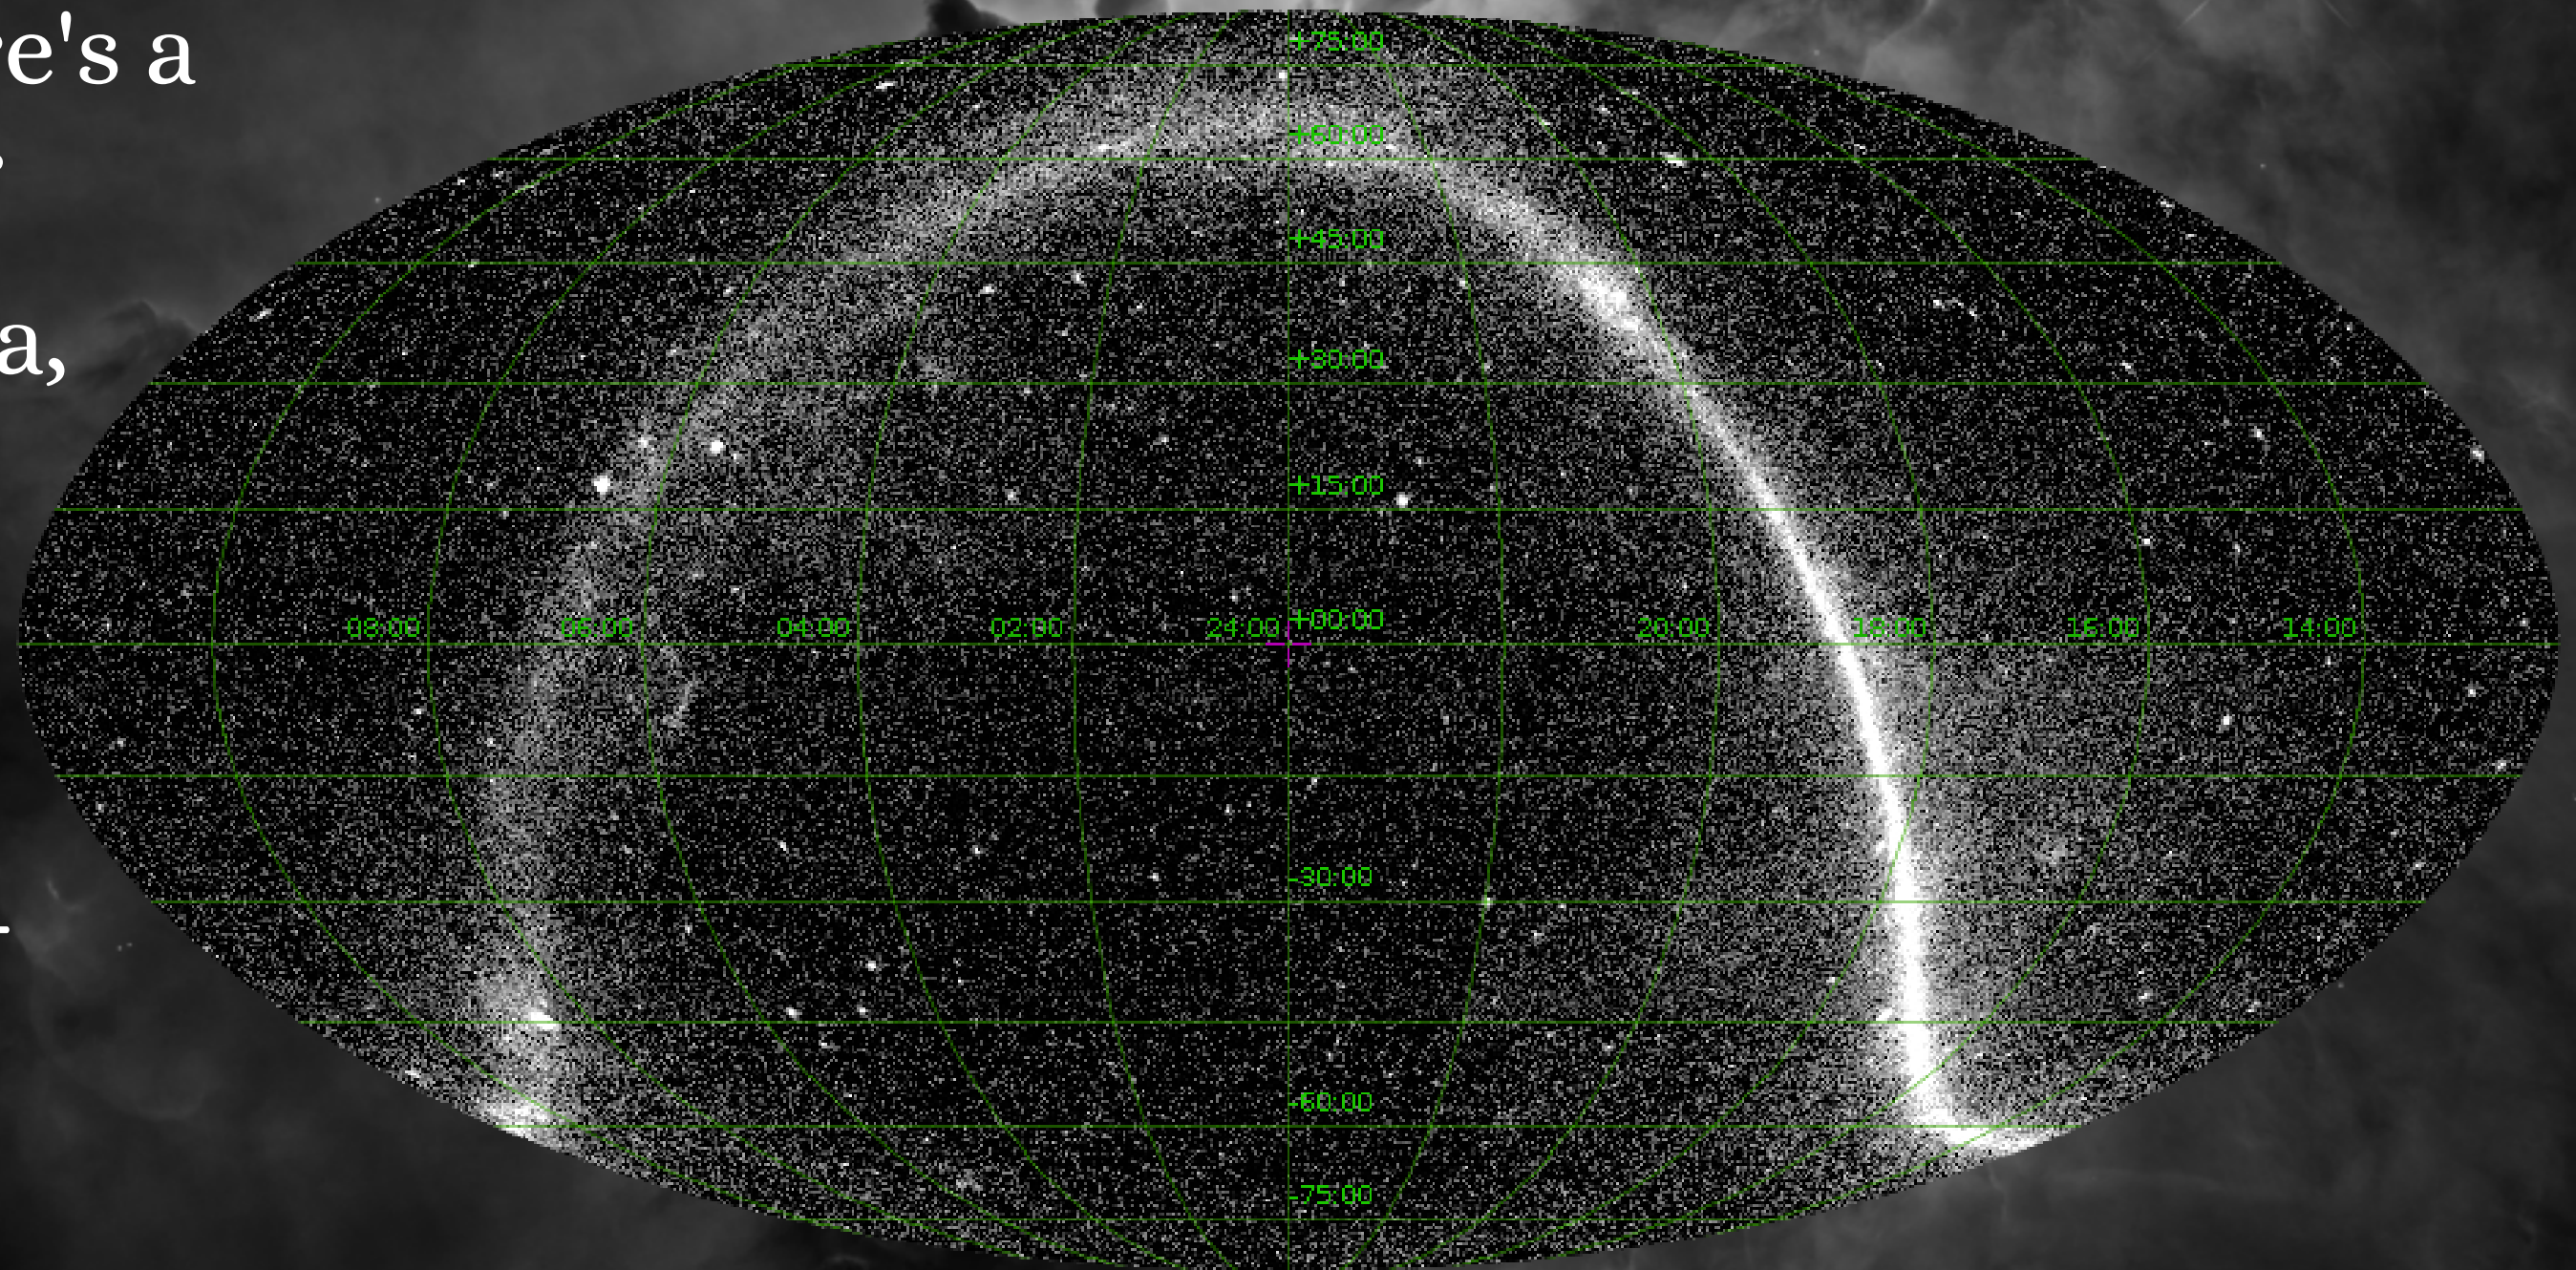

- Quicker targeted statistical analysis
- Faster comparisons
- Fast and easy visual checks between complete and partial skymaps

ALADIN...

From Fermi Telescope.

Tried this, there's a huge library of maps in gamma, UV, X-rays...

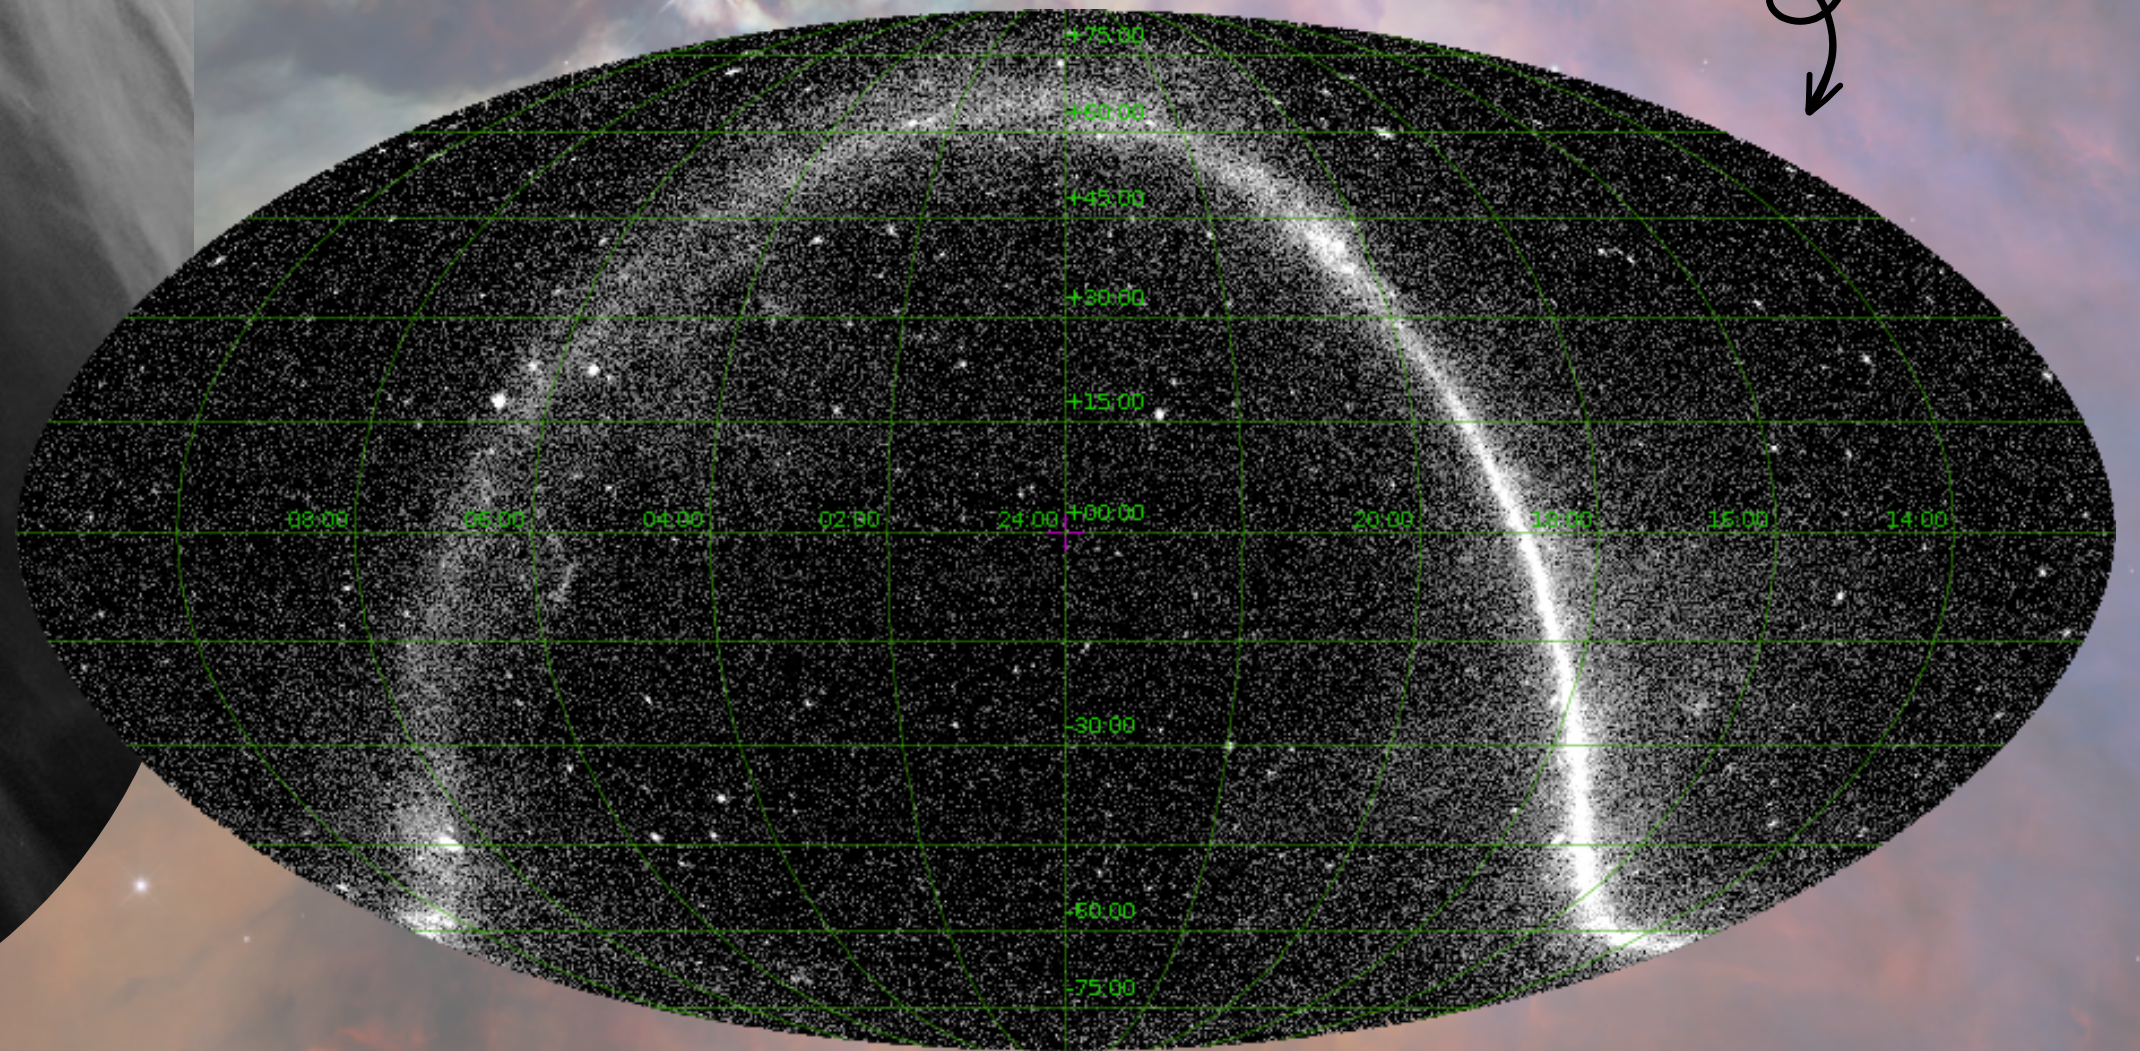

Stars, nebula, galaxies, LIGO-VIRGO maps, Fermi, etc...

Convert data to the FITS format

HEALPix to the Rescue!!

FERMI used HEALPix for this!

FIRST STEP

Hierarchical Equal-Area and isoLatitude Pixelization

HEALPix...

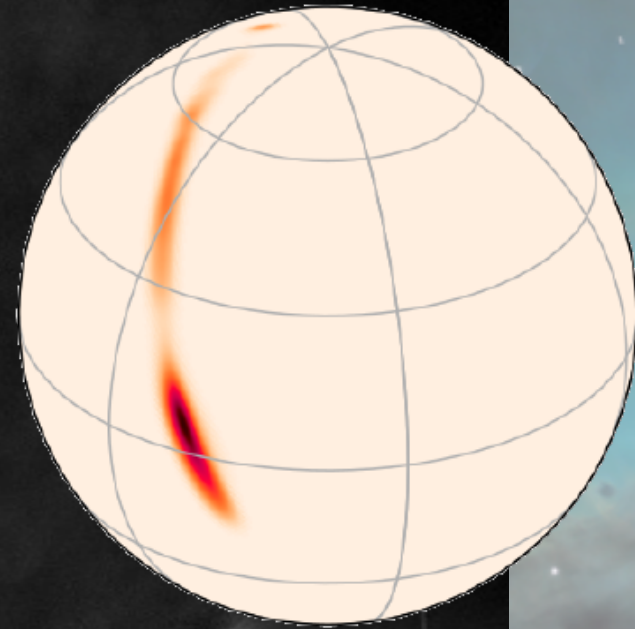

Is an **all-sky map projection** and a **spatial indexing method**. Divides and covers the unit sphere with equal-area tiles.

May be thought of as a tree in which each node except for the root node has four children.

Pixel density roughly
proportional to probability
density

HAWC FITS file map:
Flux & Significance.

HEALPix...

FROM DATA TO FITS

- We know what we want to do.
- We know how a FITS should be.
- We might know how to do it.
- Can we?

First try:

ANTARES public data

<https://antares.in2p3.fr/publicdata2017.html>

dec	RA	nhit	beta	time
-----	----	------	------	------

Need more info to get a map!

HANDS ON!

To have a map that can be used in multimessenger astronomy, we need information such as the Flux of the detected events

Using some information contained in the public data table (**declination**, number of hits **nhit** and **beta**)

A "cumulative" function of **nhit** (using **beta** as error bars) as a function of the **declination** was fit with a 7 degree polynomial function.

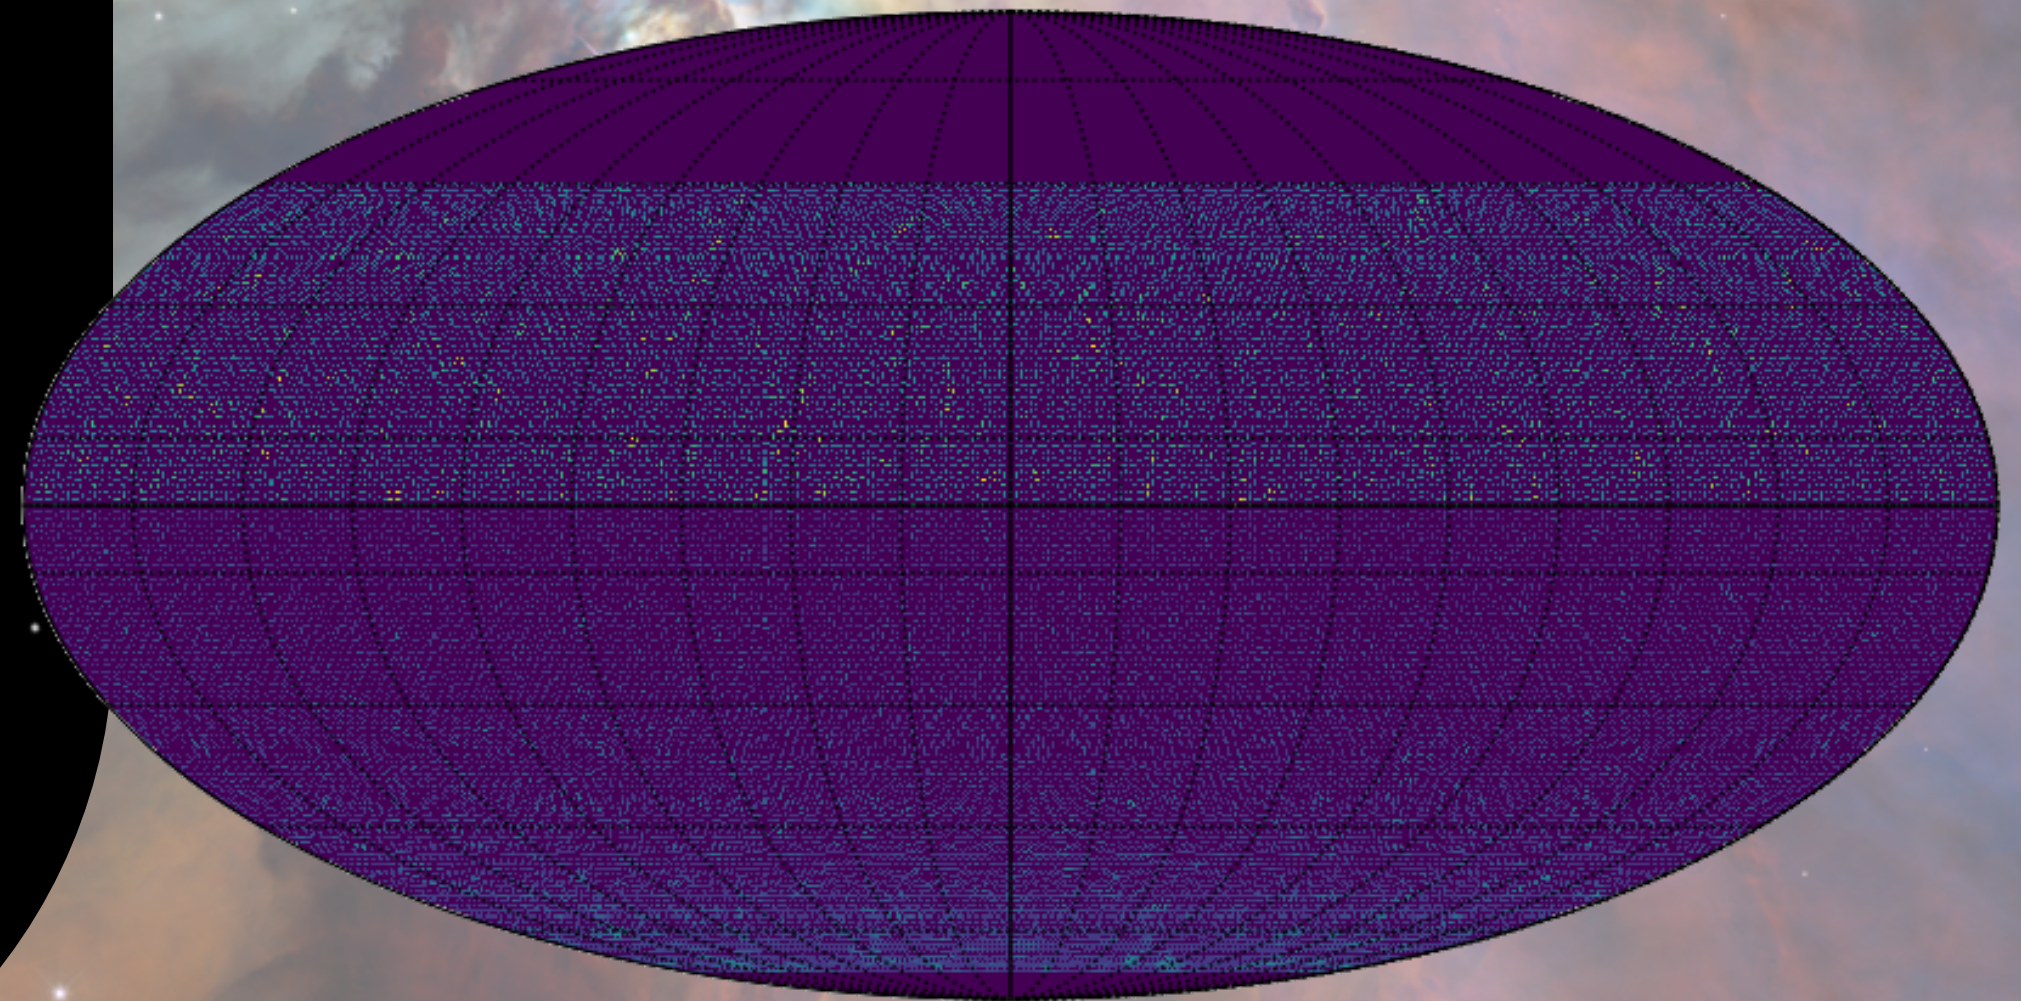

HANDS ON!

Using the fit parameters and ANTARES script (based on Feldman Cousins statistical approach), we computed:

Background
Observed events
Flux Upper Limit

Using Healpix, Matplotlib,
Numpy, Astropy, Healpy and a
lot of other pys
A FITS file was prepared,
written and read

FITS FILE
PRODUCTION...

FITS FILE PRODUCTION...

We are now able to produce FITS
files with whatever information we
want to show/share
Partial or complete!

What can we modify?

Nside (resolution of pixelization)

Ordering (way of writing a map)

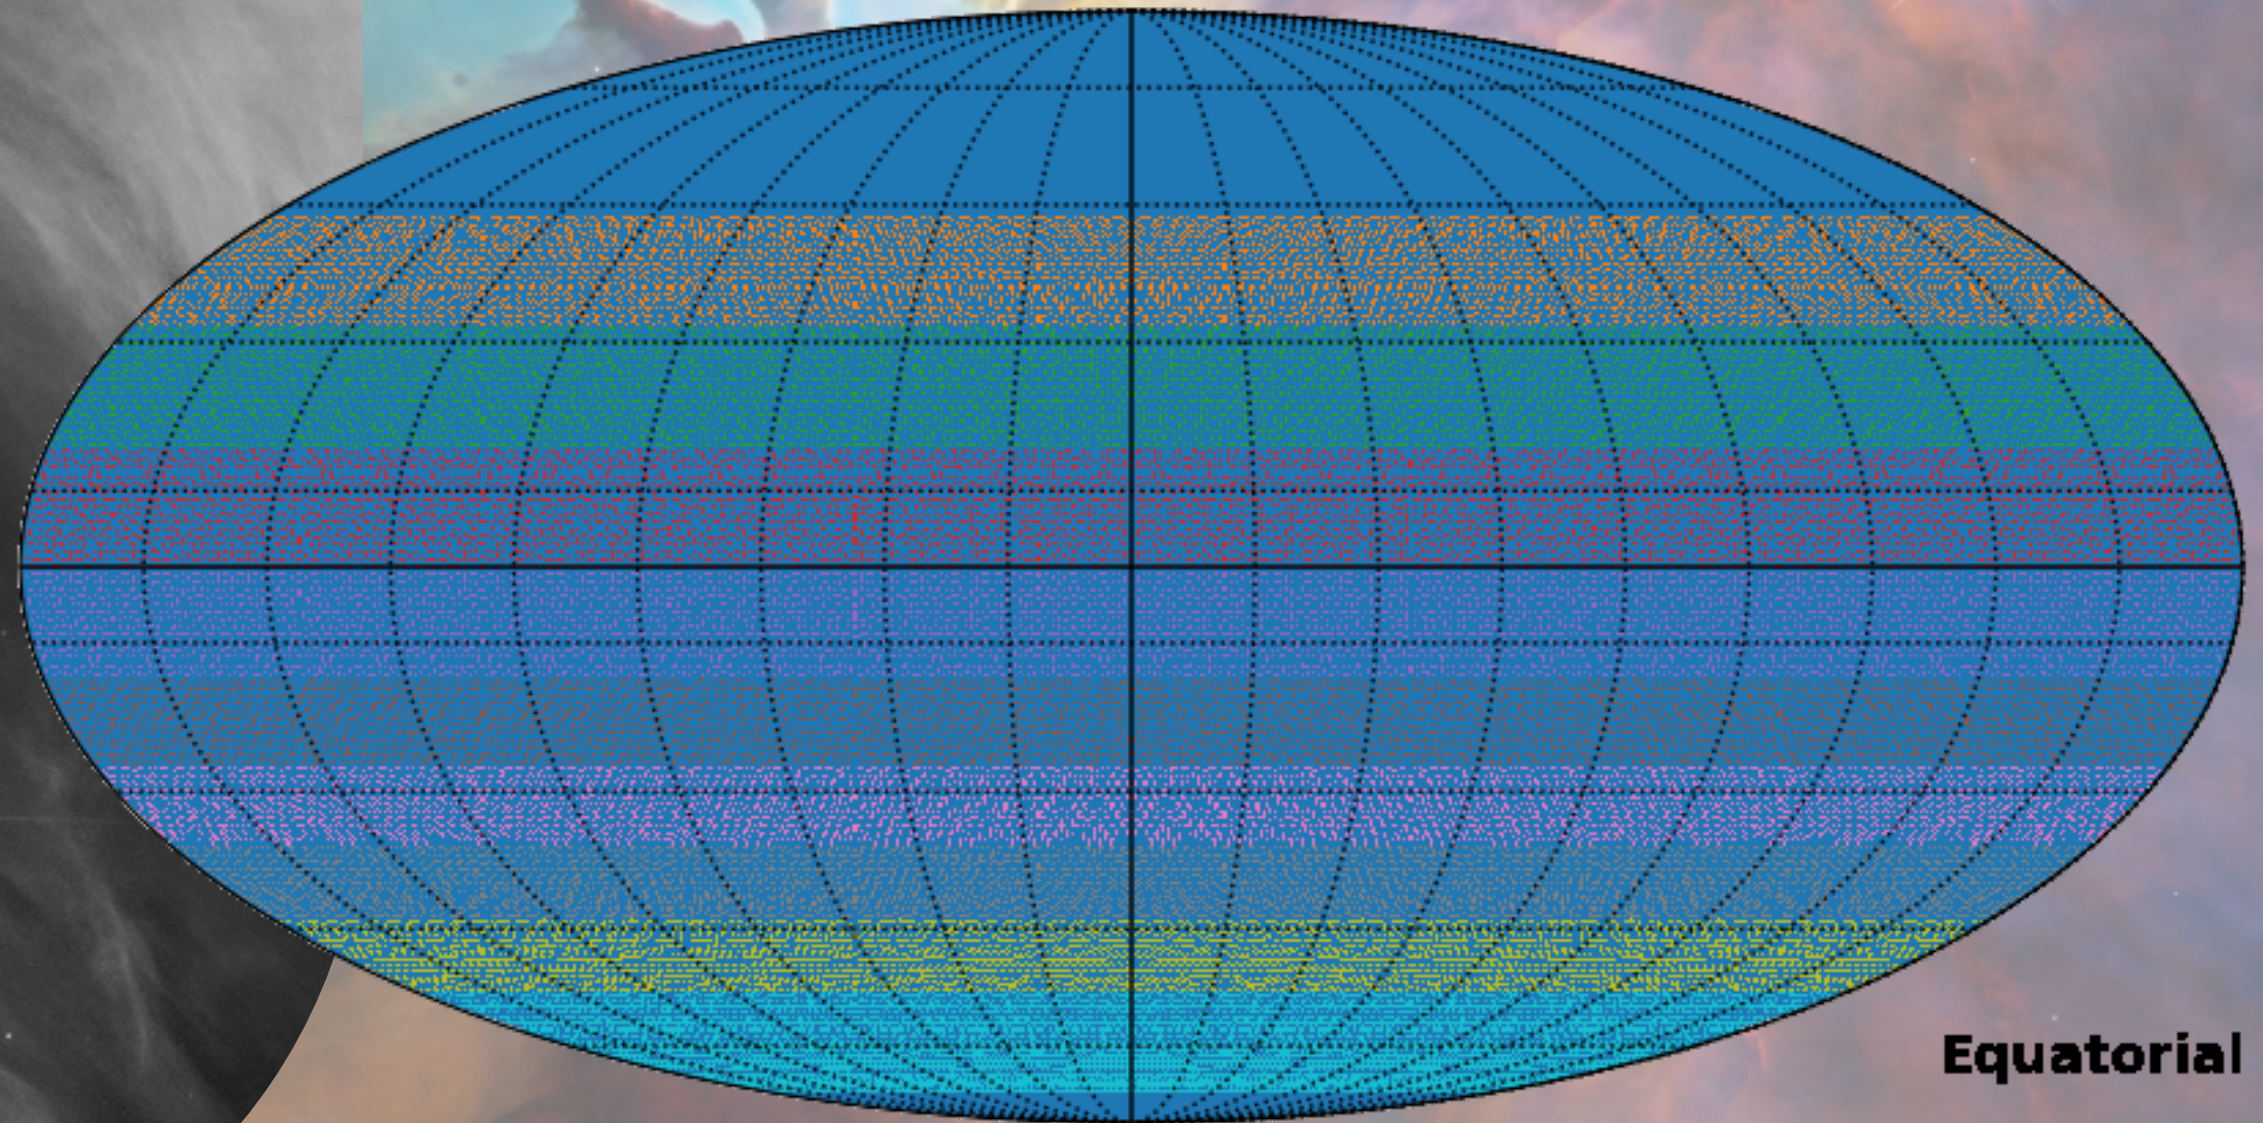

Coordinate system

BACKGROUND

Different skymaps for all the
information available

$n_{\text{side}}=128$

**ANTARES 2017
DATA ANALYSIS**

EVENTS OBSERVED

Different skymaps for all the
information available

$n_{\text{side}}=128$

**ANTARES 2017
DATA ANALYSIS**

FLUX LOWER LIMIT

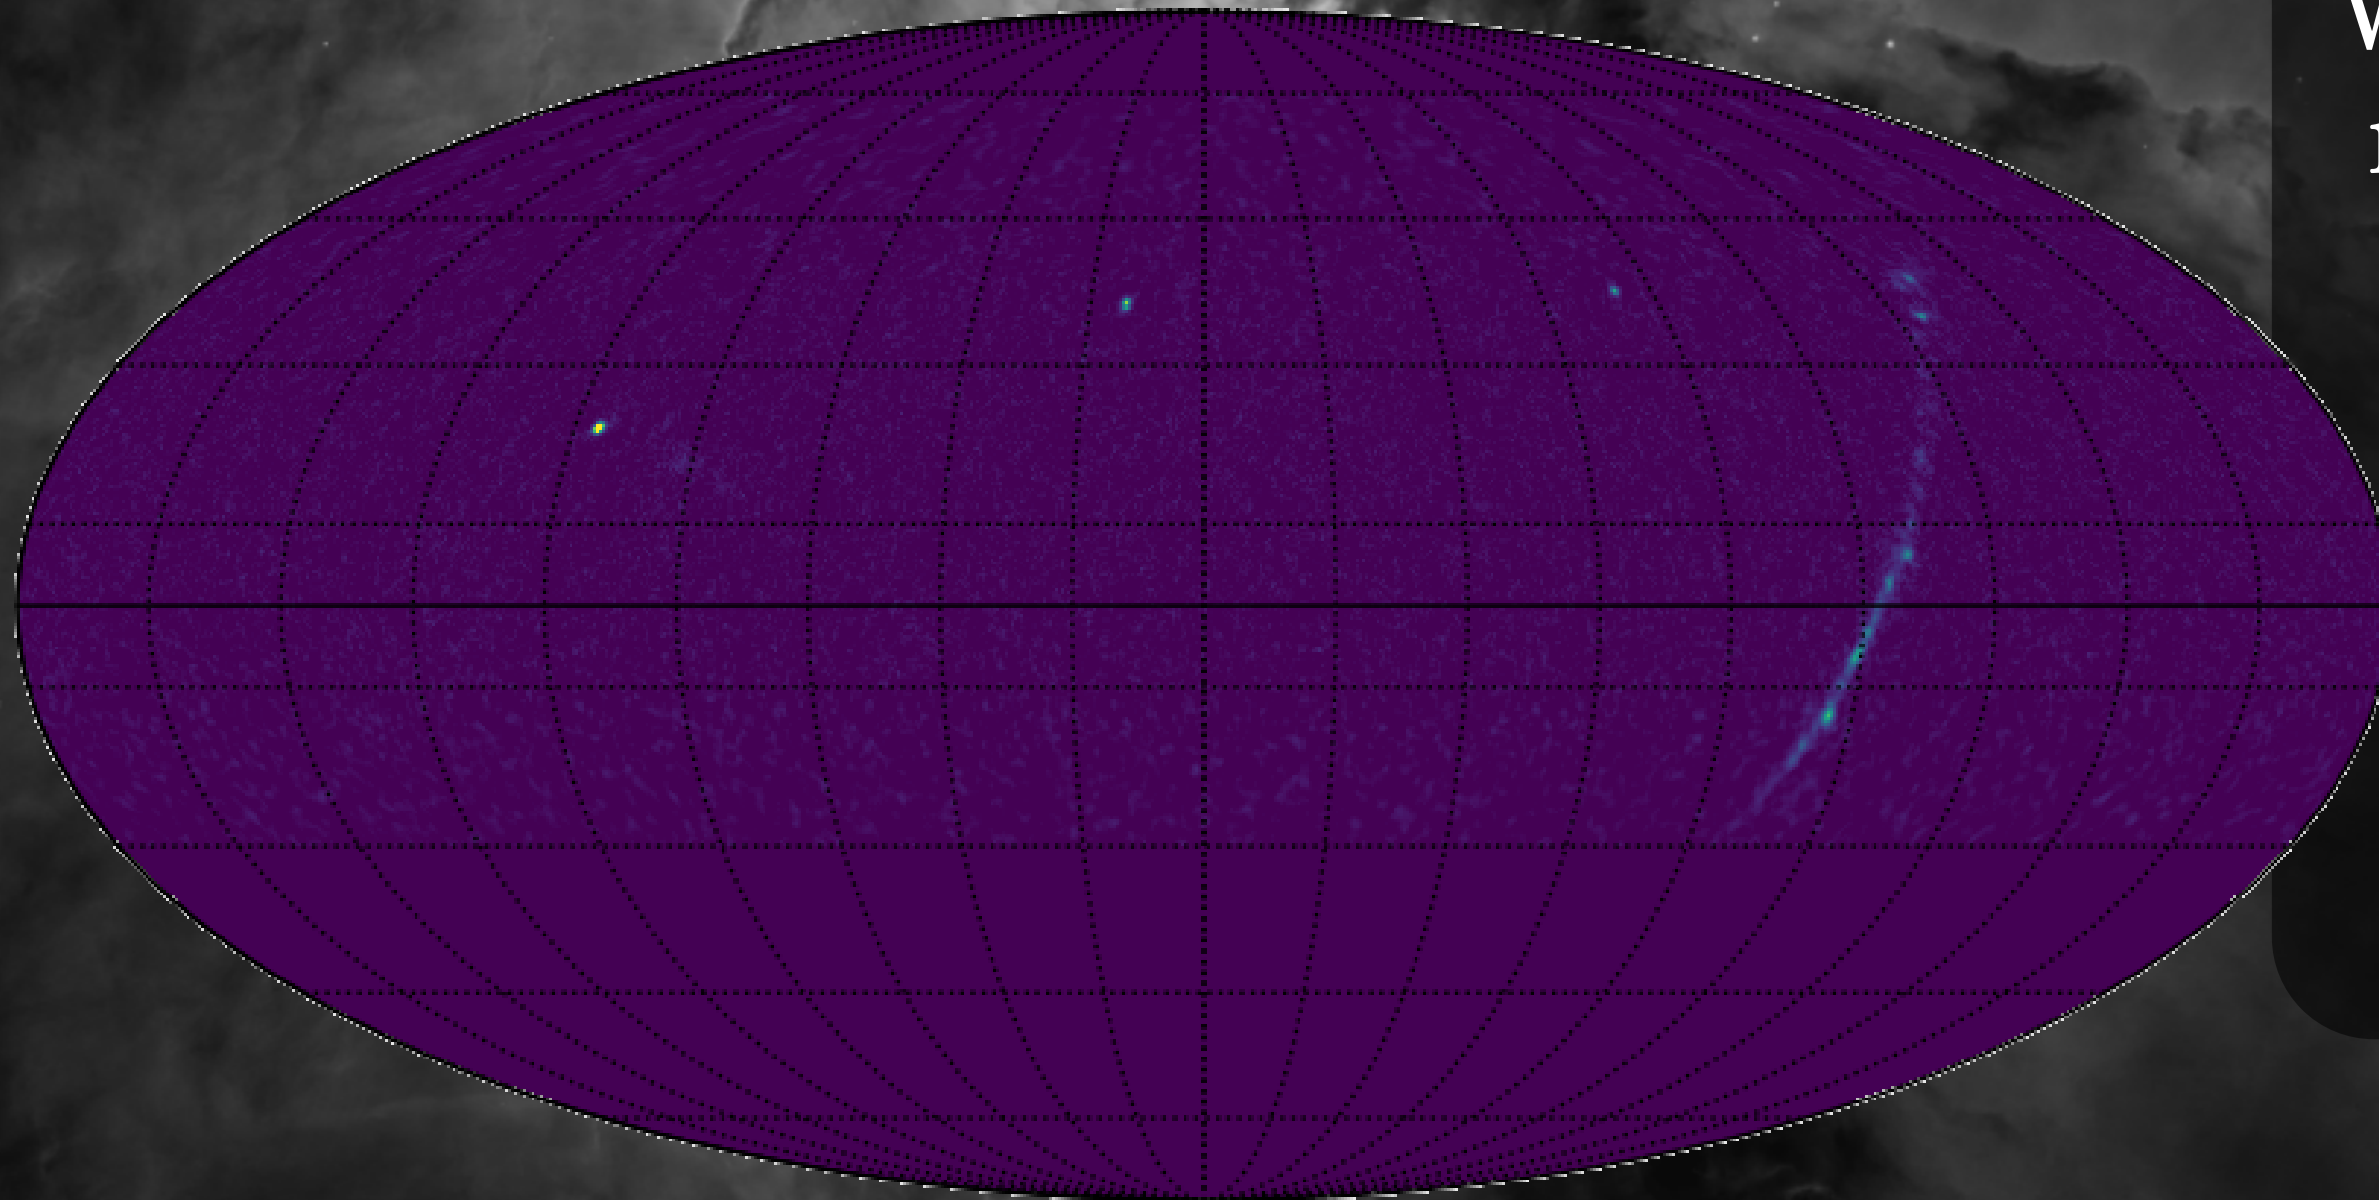

Different skymaps for all the
information available

$n_{\text{side}}=128$

**ANTARES 2017
DATA ANALYSIS**

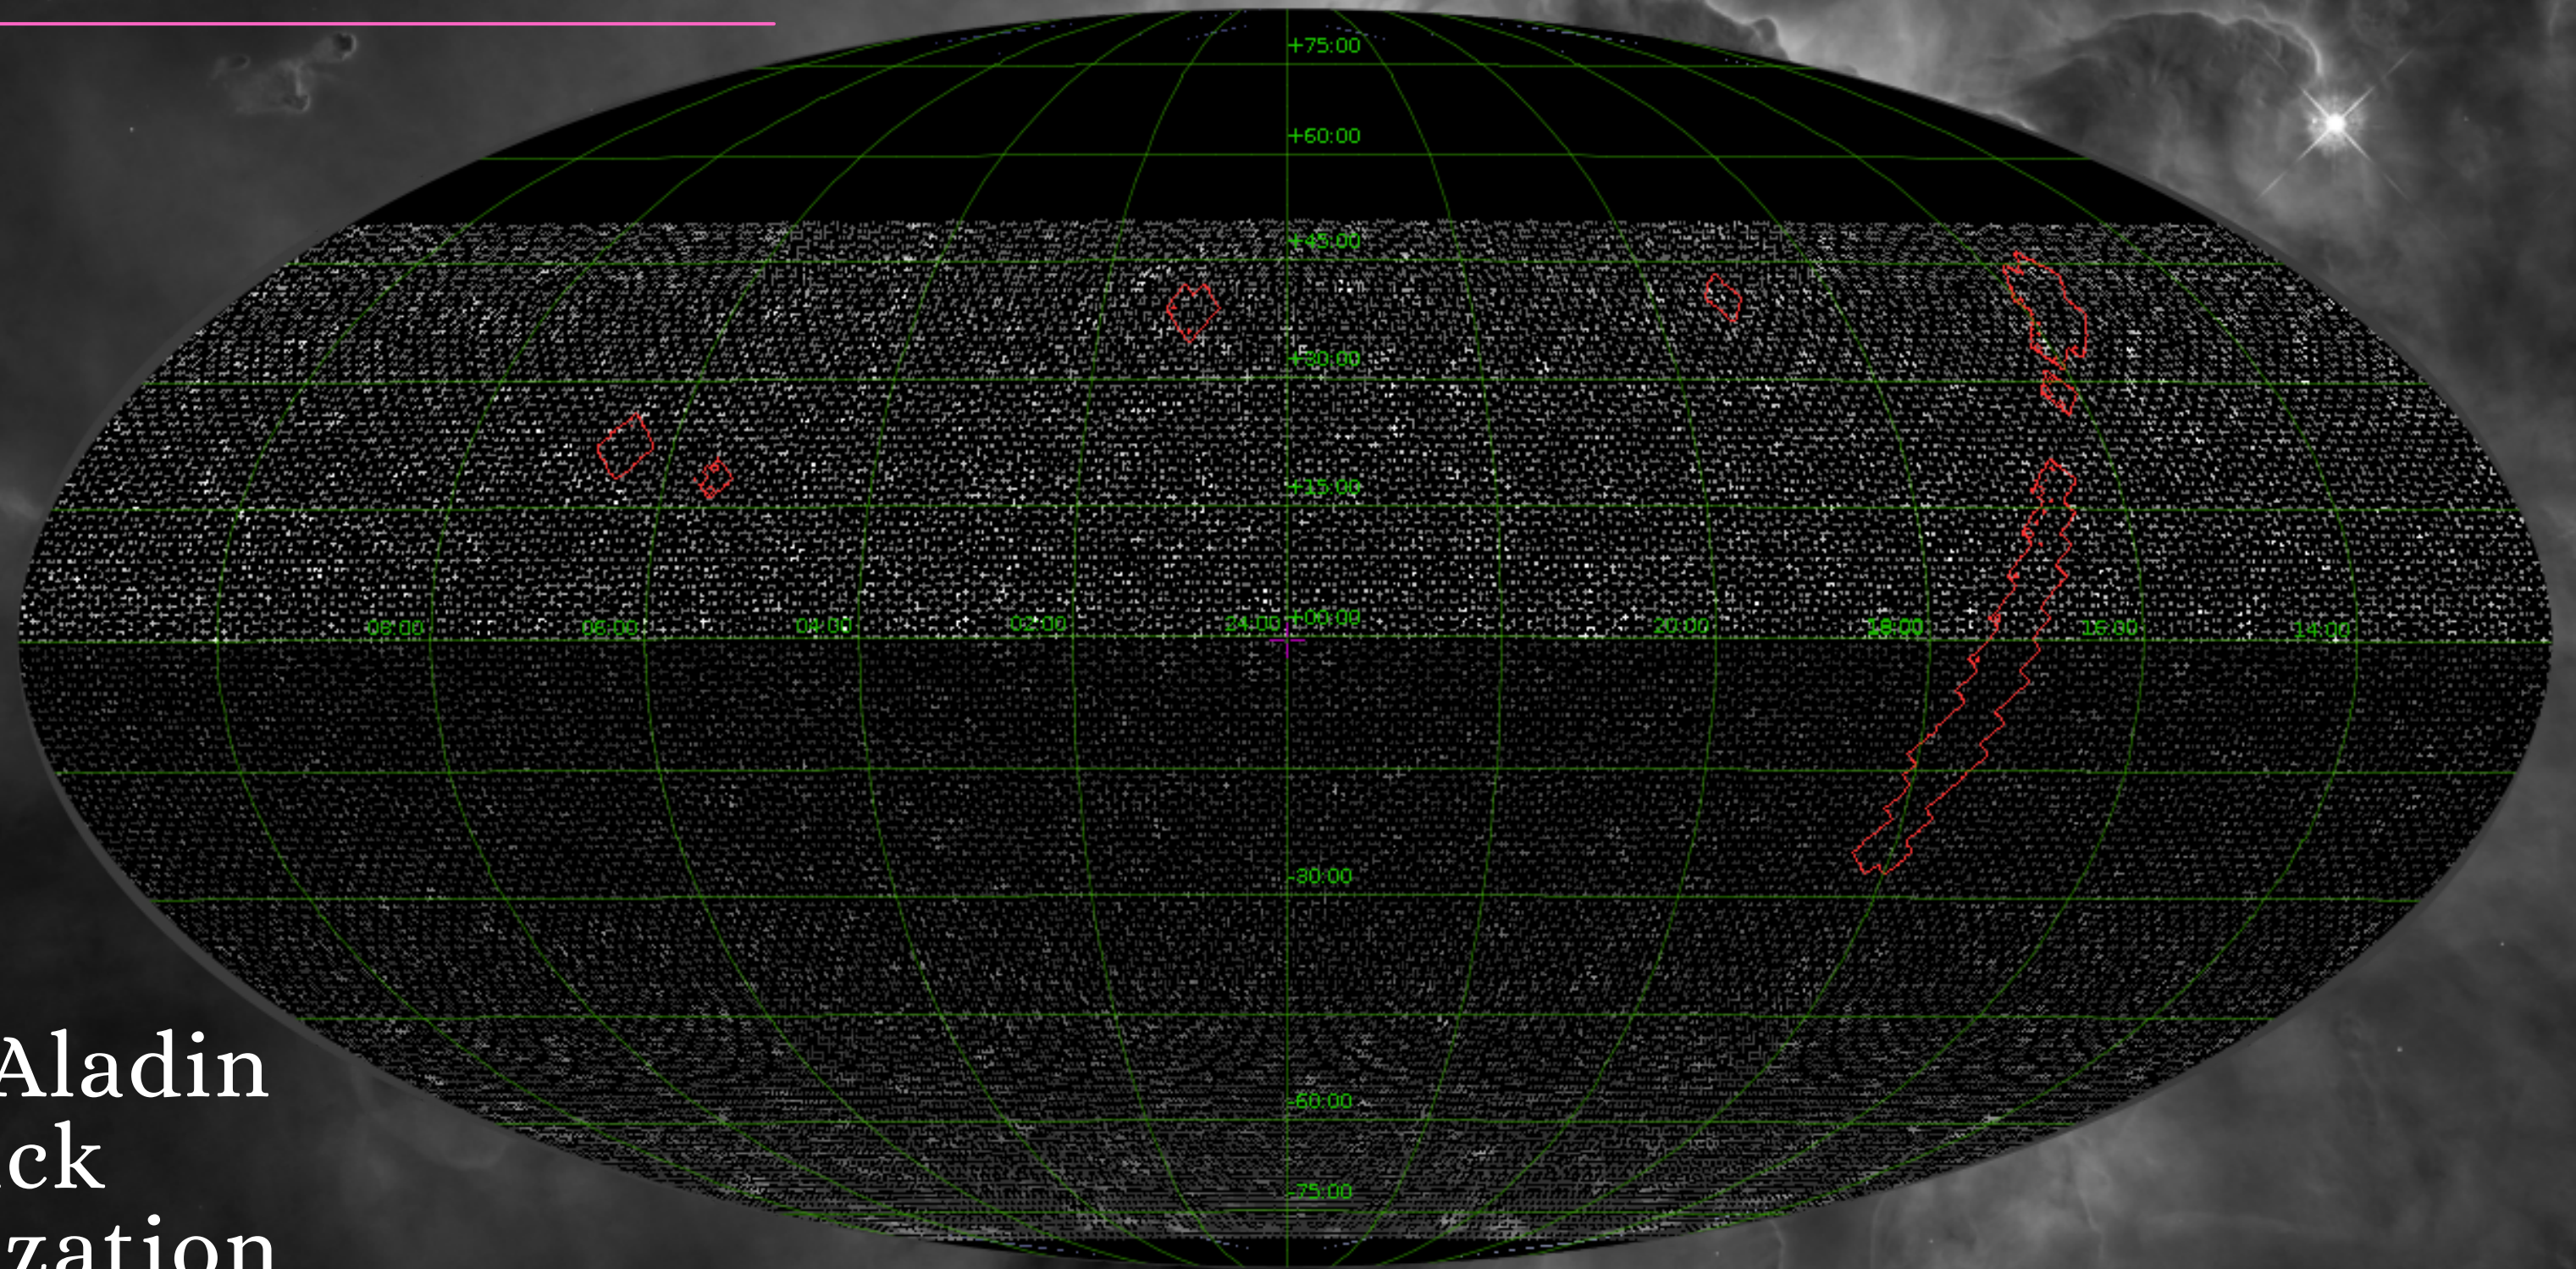

READY FOR MULTIMESSENGER ASTRONOMY!

We don't know how much of this FLUX is actual signal. Need to compare with some real signal. Used HAWC's for this

ASTRO SOFTWARE

Using Aladin
for quick
visualization

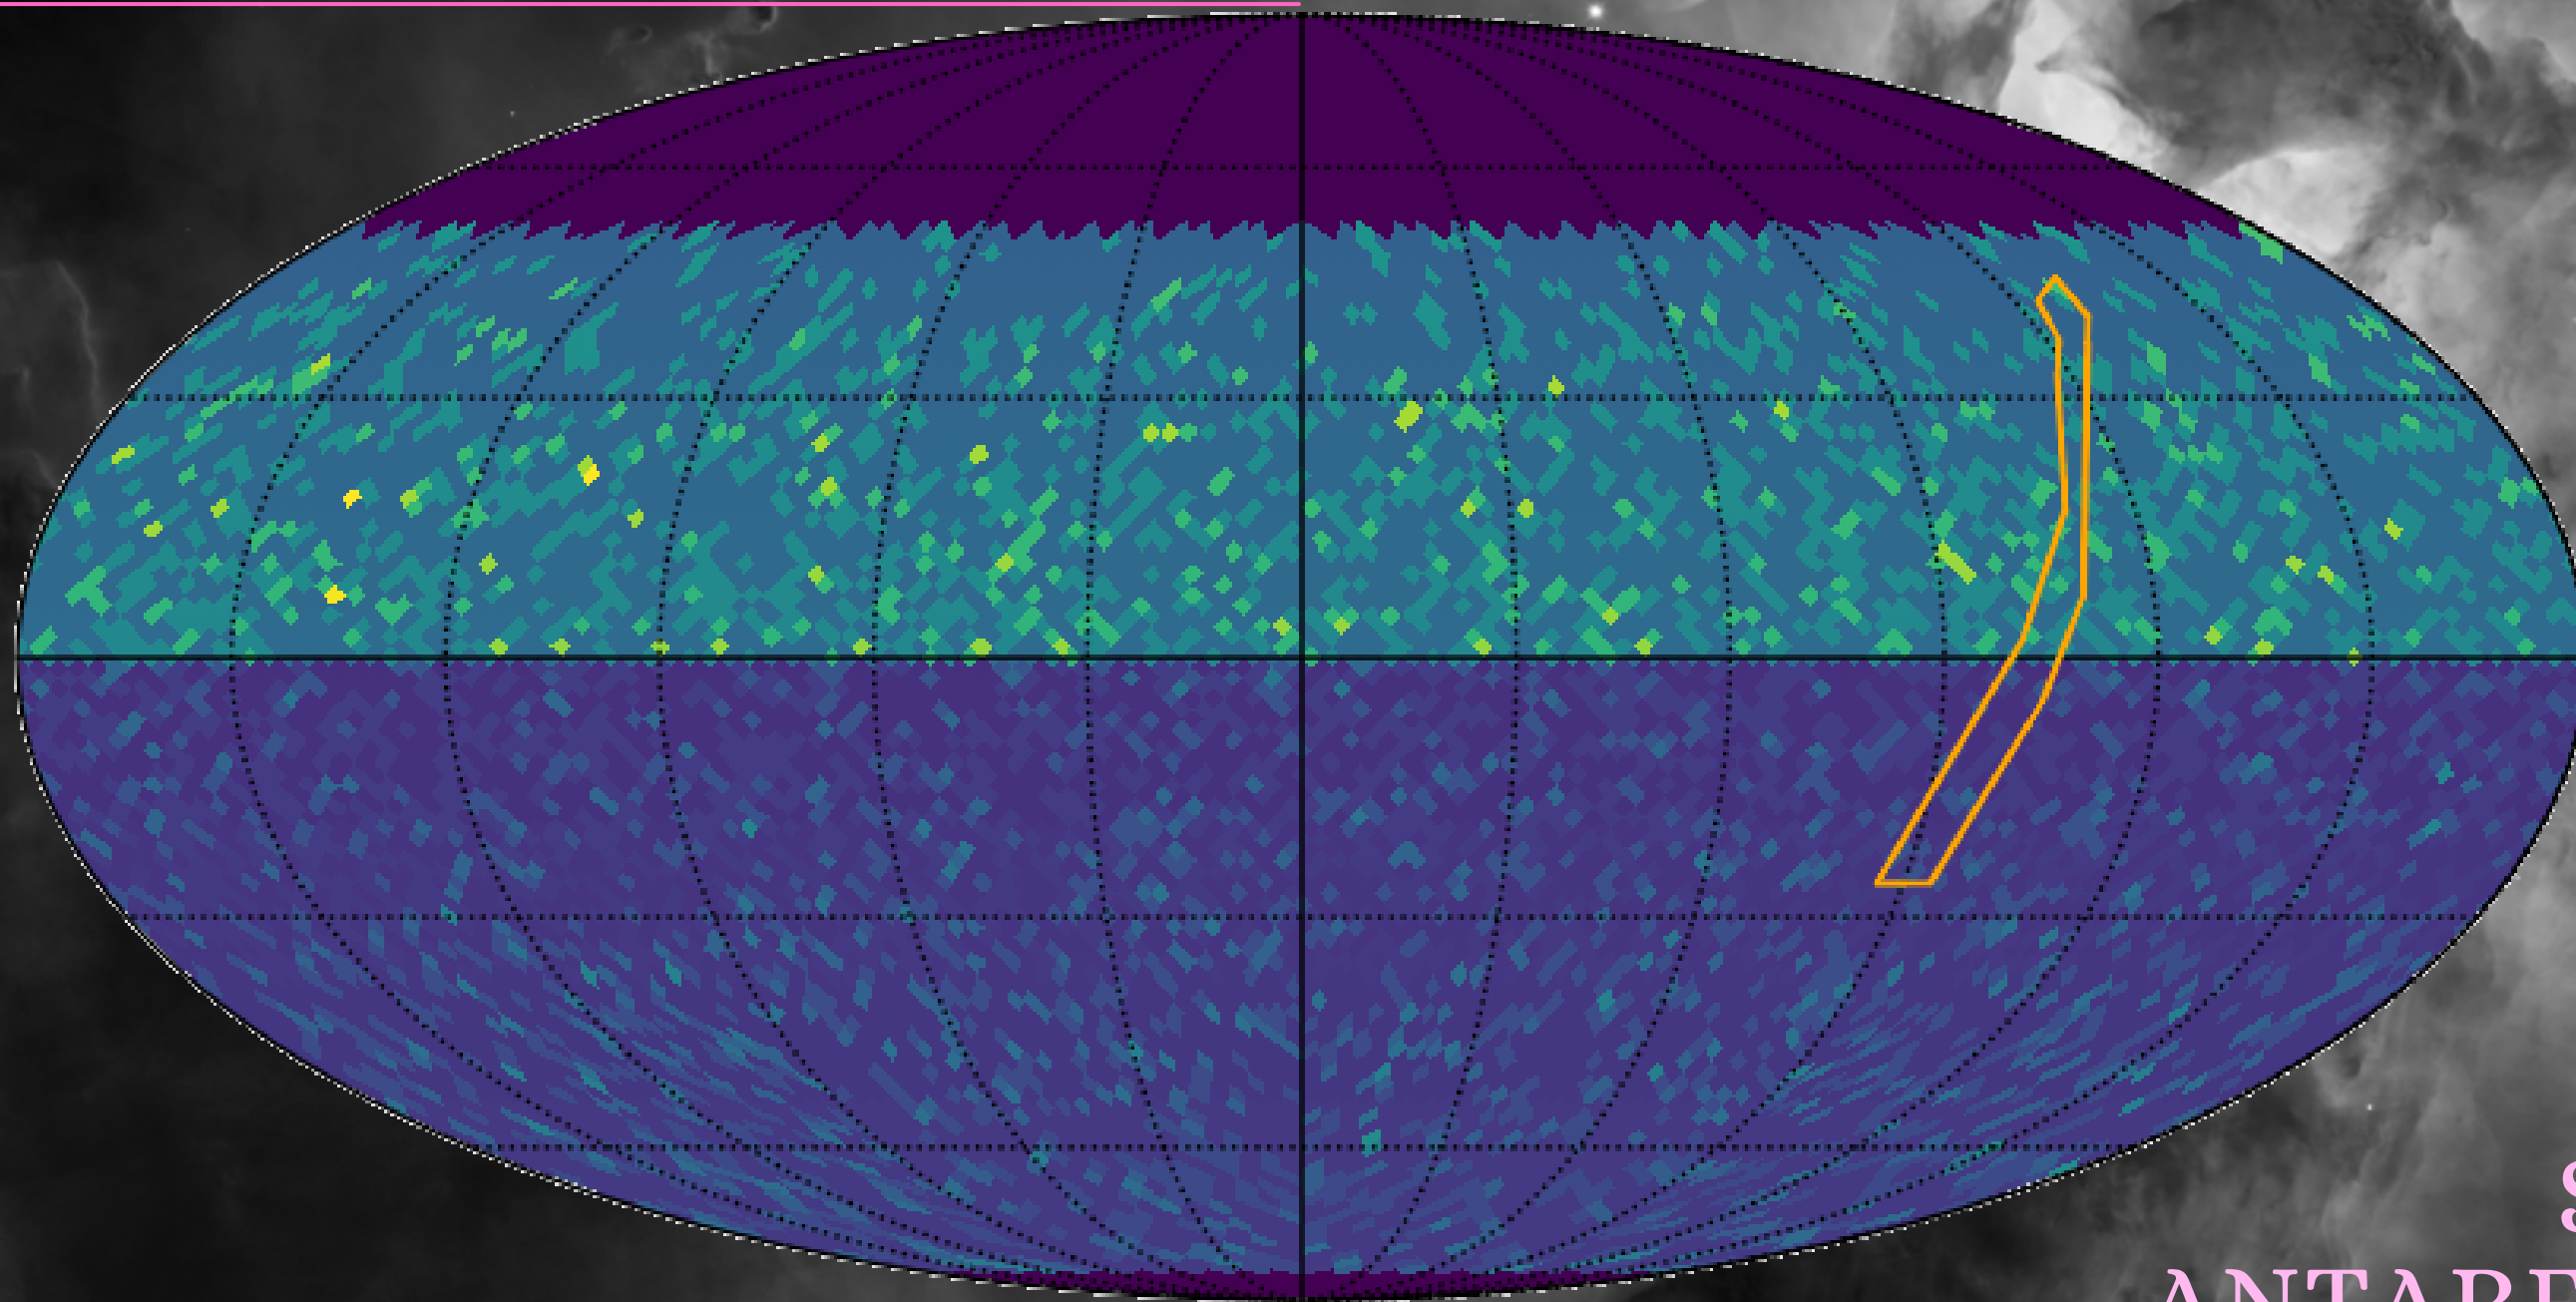

QUANTITATIVELY...

HEALPix again!
 $n_{\text{side}} = 32$ for simplicity

Step 1: Identify HAWC'S position

QUANTITATIVELY...

Step 2: Integrate
ANTARES flux e^{γ}
within HAWC's position

QUANTITATIVELY...

WARNING: This has to be done after careful conversion of coordinates to pixels.

Two tests (100 TeV):
gamma=2.7 INT=3.66e-17 [GeV cm²s]⁻¹
gamma=2.0 INT=1.25e-16 [GeV cm²s]⁻¹

This information -> Energy spectrum

...WORK IN PROGRESS...

WHAT'S NEXT?

FITS files carry so much information that a quick comparison between different telescope data can be made (using HEALPix)

Also, the FITS format can put KM3NeT under all other telescopes' light which can lead to many new collaborations (and papers!) thanks to its simplicity and versatility

Istituto Nazionale di Fisica Nucleare
