Measurements of $pp, p\Lambda, p\Xi^-$ Correlation Functions at 3 GeV Au+Au Collisions at RHIC-STAR

Friday, 10 November 2023 12:00 (15 minutes)

Two particle correlation function in heavy ion collisions mainly depends on the phase space of the emitting source, and the final-state interactions. So it is widely used to investigate the source size after collision, and also provide an effective experimental approach to study the nucleon-nucleon and hyperon-nucleon interactions, which are crucial to understand the inner structure of compact stars.

In this work, we will present the results of baryon correlation functions for the pairs of $pp, p\Lambda, p\Xi^-$ in Au+Au collisions at $\sqrt{s_{NN}} = 3$ GeV recorded by the fixed target program at STAR. The correlation functions are obtained after corrections for purity and feed-down effects and considering momentum resolution, track merging and splitting effects. The source size r_G of different pairs for different centrality and strong interaction parameters scattering length f_0 and effective range d_0 of the pairs are extracted. UrQMD and CRAB models are used to calculate the correlation function theoretically to compare with the experimental result.
