

Asymmetries in Extended Dark Sectors: A Cogenesis Scenario

Juan Herrero-García, GL, Drona Vatsyayan

[2301.13238]

Giacomo Landini

14/09/2023

Dark Matter is five times more abundant than baryonic matter

 $\rho_{\rm DM} \simeq 5 \rho_B$

Cosmic coincidence

• A common origin for baryons and DM?

Standard (symmetric) production

Freeze-out: DM is in thermal equilibrium with the SM

Freeze-in: DM is **not** in thermal equilibrium with the SM

Dark Matter is symmetric (?)

 $Y_{\chi} = Y_{\bar{\chi}}$

Asymmetric Dark Matter

The Baryon abundance is set by an asymmetry $\eta_B = Y_b - Y_{\overline{b}} = 0.88 \times 10^{-11}$

The nature of DM could also be asymmetric!

,

$$\eta_D = Y_\chi - Y_{\bar{\chi}}$$

$$\frac{\rho_{\rm DM}}{\rho_B} = \frac{m_{\rm DM}\eta_D}{m_p\eta_B} \simeq 5$$

Attractive scenario: $\eta_D \simeq \eta_B \longrightarrow m_{\rm DM} \simeq 5 m_p \simeq 5 \text{ GeV}$

Asymmetry and Fractional asymmetry

 $\eta_D = Y_{\chi} - Y_{\bar{\chi}} \qquad r = Y_{\bar{\chi}} / Y_{\chi}$

Asymmetry generation

Asymmetry and Fractional asymmetry

 $\eta_D = Y_{\chi} - Y_{\bar{\chi}} \qquad r = Y_{\bar{\chi}} / Y_{\chi}$

Asymmetry and Fractional asymmetry

$$\eta_D = Y_{\chi} - Y_{\bar{\chi}} \qquad r = Y_{\bar{\chi}} / Y_{\chi}$$

7

Asymmetry and Fractional asymmetry

 $\eta_D = Y_{\chi} - Y_{\bar{\chi}} \qquad r = Y_{\bar{\chi}} / Y_{\chi}$

Asymmetric freeze-in?

Asymmetry and Fractional asymmetry

 $\eta_D = Y_{\chi} - Y_{\bar{\chi}} \qquad r = Y_{\bar{\chi}} / Y_{\chi}$

Asymmetric DM out of equilibrium (tiny couplings, freeze-in) ? (How to erase the symmetric component?)

9

Asymmetric freeze-in?

Asymmetry and Fractional asymmetry

 $\eta_D = Y_{\chi} - Y_{\bar{\chi}} \qquad r = Y_{\bar{\chi}} / Y_{\chi}$

Idea: late decays of an asymmetric species after symmetric population has been erased¹⁰

Early vs Late decays

Early vs Late decays

A Cogenesis scenario

Falkowski, Ruderman, Volansky [1101.4936]

Dark asymmetry generation

 $\eta_{\chi} = \eta_S \sim \eta_B$

 $\bar{\chi}\chi$, $S^{\dagger}S$ annihilations erase symmetric components

A Cogenesis scenario

A Cogenesis scenario

This scenario can explain neutrino masses, baryon asymmetry and (FIMP) Dark Matter!

Neutrino masses $M_{N_1} \propto \langle \sigma \rangle = v_{B-L} \longrightarrow m_{\nu} = -m_D M_N^{-1} m_D^T$

16

 $S \to \bar{\psi} + \bar{\nu}$ or $\psi \to S^{\dagger} + \nu$ are allowed but suppressed

Both cosmologically stable

Multicomponent DM

DM production (Fermion)

DM production (Scalar)

DM production (Scalar)

DM production (Scalar)

Scenarios

Sc.	ψ population	\boldsymbol{S} population	$10^{-10} y_{\phi} / \sqrt{\eta_D / \eta_B}$	R	$T_D^{(S)}/T_*^{(S)}$
1	Asymmetric	Asymmetric	≤ 0.06	$\ll 1$	Any
2	Asymmetric	Partially Asymmetric	≤ 0.06	$\mathcal{O}(1)$	< 1
1 - 2	Asymmetric	Asymmetric	≤ 0.06	$\mathcal{O}(1)$	> 1
3	Partially Asymmetric	Asymmetric	0.06 - 2	$\ll 1$	Any
4	Partially Asymmetric	Partially Asymmetric	0.06 - 2	$\mathcal{O}(1)$	< 1
3-4	Partially Asymmetric	Asymmetric	0.06 - 2	$\mathcal{O}(1)$	> 1
5	Symmetric	Asymmetric	$\gtrsim 2$	$\ll 1$	Any
6	Negligible	Symmetric	$y_\phi \lesssim 5 imes 10^{-7}$	$\gtrsim O(10)$	< 1

Scenarios

Phenomenology

Freeze-in: small couplings, suppressed DD $y_\phi \ll 1 ~~g_X \ll 1$

ADM: suppressed ID + annihilations in dark sectors

Large B - L scale: no collider searches $v_{B-L} \gtrsim 10^{11} \text{ GeV}$ DD of scalar DM through Higgs portal $\lambda_{HS}(H^{\dagger}H)(S^{\dagger}S)$

ID of scalar DM when S is symmetric

Enhanced ID signal for Scenario 6 $Y_S = Y_{S^{\dagger}} = \eta_S$ $m_S = 2.5 \text{ GeV}$ $\sigma v > \sigma v_{\text{WIMP}}$

+ neutrino line!

Smoking gun: neutrino line $\mathcal{O}_6 = \bar{L}\tilde{H}S\phi^{\dagger}\psi$

generated at $E \ll m_{\chi} \ll M_{N_1}$

 $S - O_6 \qquad \psi \\ m_S > m_{\psi} \\ \nu$

(analogous process if $m_{\psi} > m_S$)

$$\Gamma(S \to \bar{\psi} + \nu) = \frac{|y_S|^2 y_\phi^2 m_S}{32\pi} \left(\frac{v_\phi}{m_\chi}\right)^2 \left(\frac{m_\nu}{M_{N_1}}\right) \left(1 - \frac{m_\psi^2}{m_S^2}\right)$$

Neutrino line peaked at $E_{\nu} \simeq m_S/2 \longrightarrow \mathcal{O}(\text{GeV})$

Experimental bound $\tau > 10^{23} \ {
m sec}$

Future neutrino telescopes? $\tau \sim 10^{24-25}$ sec

[Palomares-Ruiz 2008, Garcia-Cely et al. 2017, Coy et al. 2021]

Уø

Scenario 6: 1 DM

Enhanced Indirect Detection signals may be present $\sigma v > \sigma v_{\text{WIMP}}$

Scenario 6: 1 DM

- Asymmetric DM models needs large annihilations cross section: thermalization
- Asymmetric FIMP DM can be realized through late decays of asymmetric particle
- The framework naturally needs an extended dark sector: multicomponent DM, baryogenesis, neutrino masses
- Late DM decays can be constrained by neutrino experiments
