Overview of the Telescope Array (TA) experiment

- Located in Utah, U.S. at altitude of 1400 m
- 507 SDs (3 m² area, 1.2 km spacing) covering ~700 km²
 - Largest cosmic-ray observatory in the northern hemisphere
- 3 FD stations
 - Looking over SD array for hybrid detection
- Started observation in 2008

Reconstruction by SD

2 layers of plastic scintillators
(2 m x 1.5 m, thickness: 1.2 cm)

150cm

Lateral distance [m]

TeVPA2023, 13th Sep. 2023

Reconstruction by FD

- 256 PMTs in a camera
- 12—14 telescopes in each station
- Covering 3°- 21° altitude

Hybrid reconstruction

- \cdot Simultaneous detection with FD and SD
- Better resolution
- Calibrate SD–energy with FD–energy
- to reduce systematic uncertainty of SD-energy

6

Energy spectrum

14 years of **TA SD** data (2008 –2022)

New feature in energy spectrum with a 4.0 σ significance ("instep" / "shoulder")

(Originally observed by Auger)

Pierre Auger Collaboration, Phys. Rev. Lett. **125**, 121106 (2020)

Energy spectrum

14 years of **TA SD** data (2008 –2022)

- Reconstruction with the same fluorescence yield model & missing energy model as Auger
 - Difference below 10^{19.5} eV: $9\% \rightarrow < 1\%$
- Reconstruction with CIC (which Auger uses)
 - Difference at the highest energy persists

Original TA hotspot with **5 years** of TA SD data

TA collaboration, ApJL 790 L21 (2014)

TeVPA2023, 13th Sep. 2023

Anisotropy New intermediate-scale anisotropy

15 years of TA SD data

New excess at lower energy region in the direction of **Perseus-Pieces Supercluster**

Composition

10 years of TA hybrid data: 3560 events after event selection

 Agreement with mixtures of light composition using QGSJET II-04 as a hadronic interaction model in 10^{18.2}eV – 10^{19.1} eV

The TA experiment expansion

 \cdot TA \times 4: increase the data collection speed for energies greater than 57 EeV

* Additionally deployed part, about half of the final plan

Energy spectrum & composition

$TA \times 4$ experiment

Energy spectrum

- \cdot 3 years of TA $\times\,4$ SD data
 - In this period,
 6 sub-arrays operated independently
- Consistent with TA SD energy spectrum including cutoff structure

Prospects

- Inter-tower trigger was implemented in Oct. 2022
 - \rightarrow Increasing the aperture
- Data analysis is ongoing

K. Fujisue (ICRC2023)

Summary

- The TA experiment observes UHECRs in the Northern Hemisphere
- Energy spectrum
 - Some features: Knee, 2nd-Knee, Ankle, Instep, Cutoff
- \cdot Mass composition
 - \cdot Agreement with light composition in $10^{18.2}$ eV $-10^{19.1}$ eV
 - \cdot <Xmax> breaks around 2nd-knee (~10^{17.1} eV) observed with TALE

\cdot Anisotropy

- TA hotspot for E > 57 EeV = $10^{19.76}$ eV: $\textbf{2.8}\,\sigma$ with 15 years of TA SD data
- \cdot New excess in direction of PPSC with E $> 10^{19.4}~\text{eV}$
- TALE + TALE infill ($10^{15} \text{ eV} < \text{E} < 10^{18.5} \text{ eV}$)
 - \cdot TALE infill will start observation in near future
- TA $\times\,4~(\text{E} > 10^{19.7}~\text{eV})$
 - $\boldsymbol{\cdot}$ Energy spectrum is consistent with TA SD energy spectrum
