TeVPA 2023, Naples (IT)

The gamma ray Galactic Center Excess (GCE)

Statistically significant excess in Fermi-LAT data [talk by D.Hooper]
few % of inner Galaxy flux

Debated nature:
Millisecond pulsar-like (MSP) in Galactic Bulge vs. Dark Matter (DM)

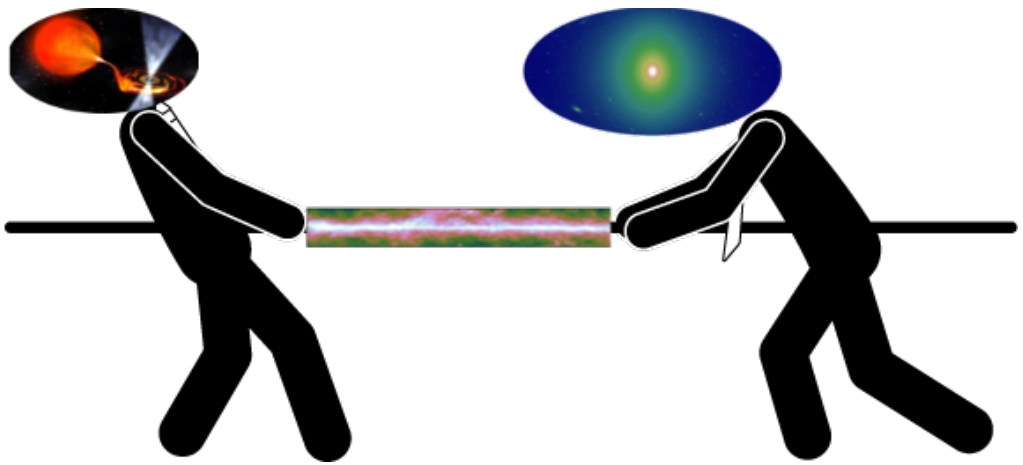

image credits: CLUMPY (J factor map), diffuse model [Storm+17], spectra [Gautam+21, Calore+14], morphology maps, [Storm+17], sim statistics [Lee+15]. *[Blame me for this collage]*

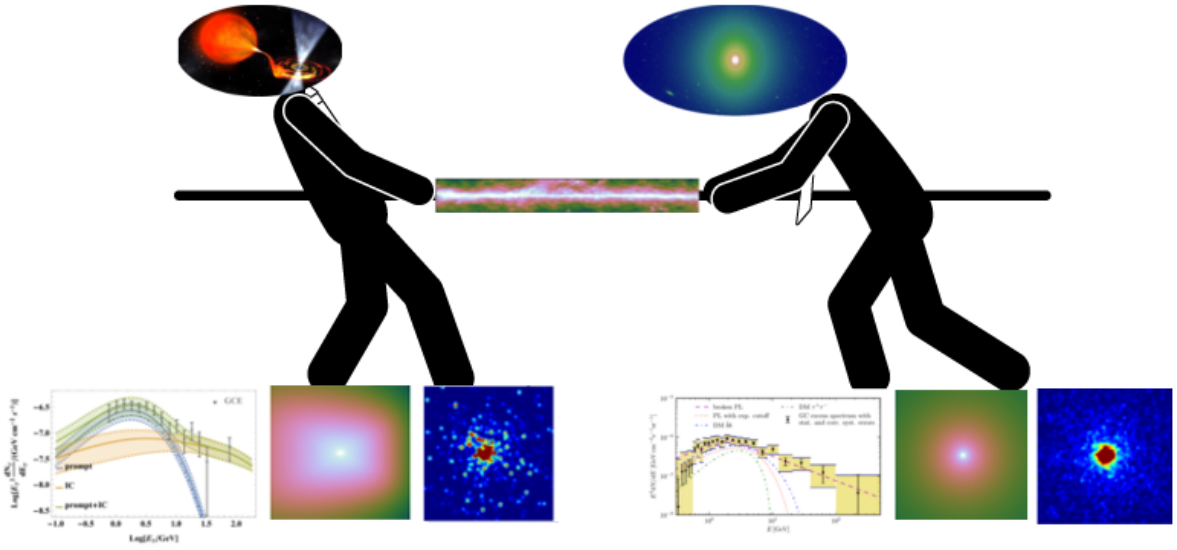
The gamma ray Galactic Center Excess (GCE)

Statistically significant excess in Fermi-LAT data [talk by D.Hooper]
few % of inner Galaxy flux

Debated nature:
Millisecond pulsar-like (MSP) in Galactic Bulge vs. Dark Matter (DM)



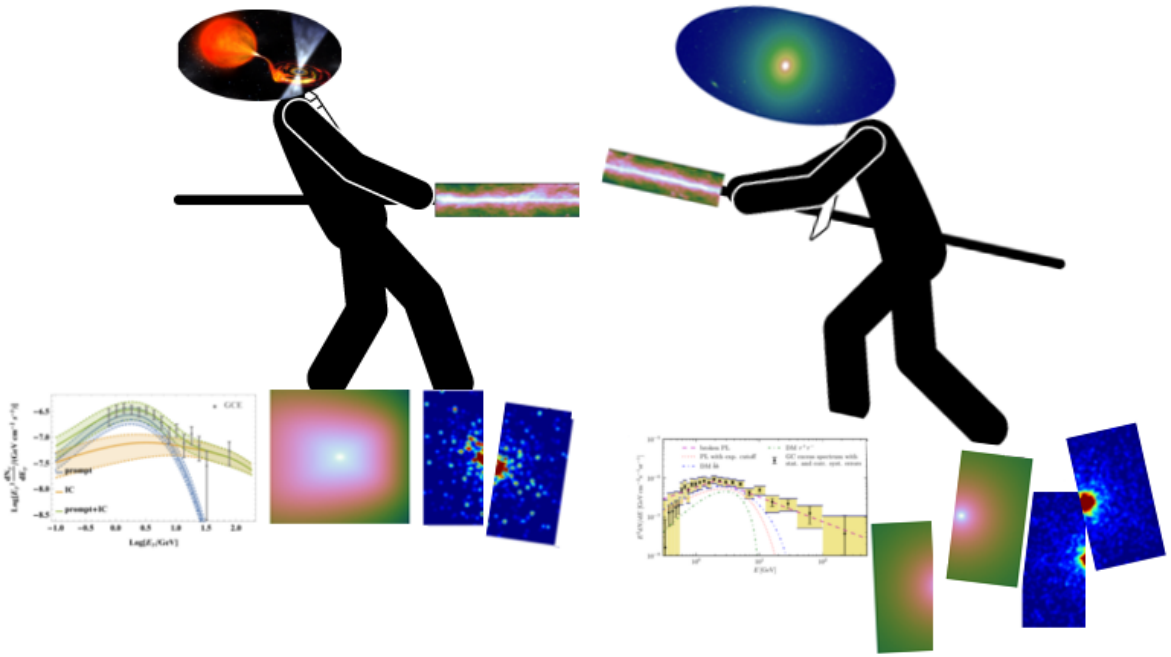
Characteristics: spectrum, morphology, photon statistics

image credits: CLUMPY (J factor map), diffuse model [Storm+17], spectra [Gautam+21, Calore+14], morphology maps, [Storm+17], sim statistics [Lee+15]. *[Blame me for this collage]*

The gamma ray Galactic Center Excess (GCE)

Statistically significant excess in Fermi-LAT data [talk by D.Hooper]
few % of inner Galaxy flux

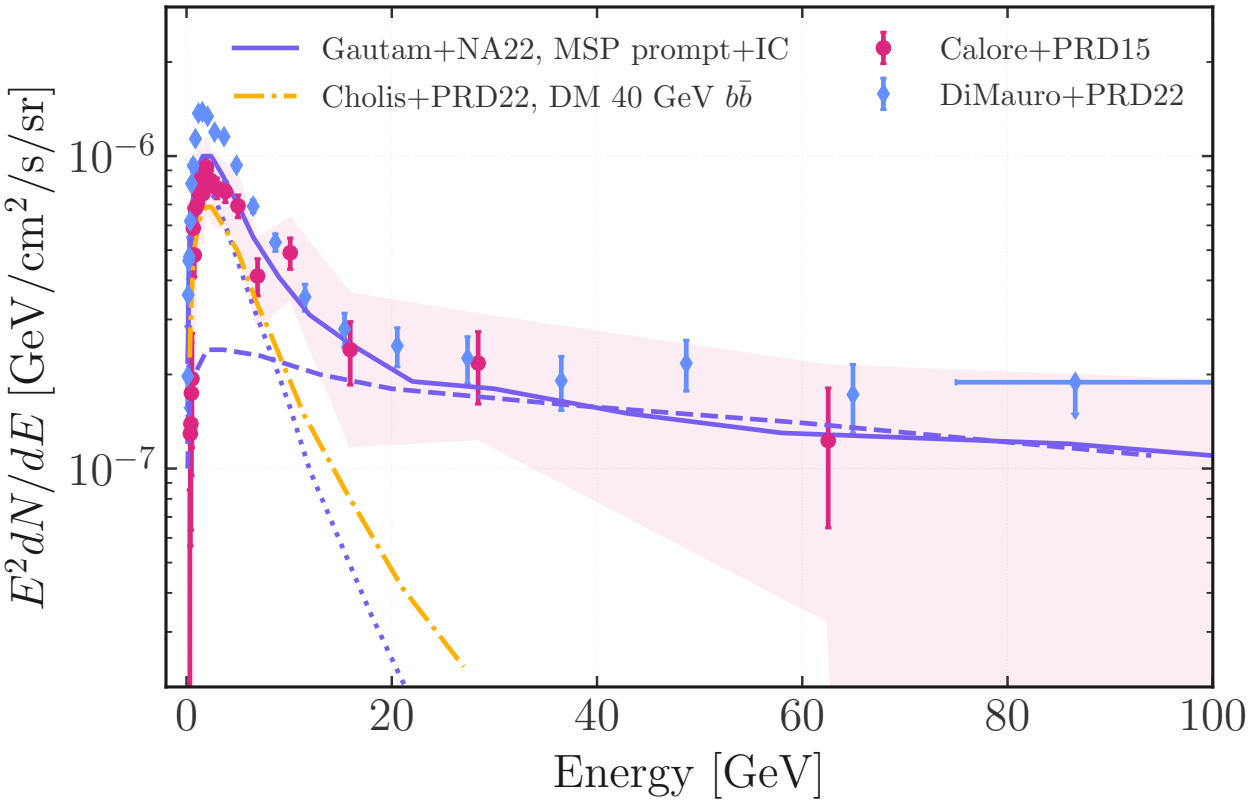
Debated nature:
Millisecond pulsar-like (MSP) in Galactic Bulge vs. Dark Matter (DM)



Interstellar diffuse emission mismodeling

image credits: CLUMPY (J factor map), diffuse model [Storm+17], spectra [Gautam+21, Calore+14], morphology maps, [Storm+17], sim statistics [Lee+15]. *[Blame me for this collage]*

Focus: the GCE high energy tail



Crucial discrimination power: naturally explained by inverse Compton of $e^{\pm}$ in MSP (see [GRA Monday session]), DM annihilation needs more tuning

Last dedicated work: [Linden+PRD'16] 7y of data using standard template fitting + photon count statistics (NPTF), likely same issues as [Lee+PRL'15] as pointed in [Leane+PRL'19] (see backup)

Goals & Outline

in collaboration with:

Francesca Calore (LAPTh, CNRS) Fiorenza Donato (University & INFN, Torino)

Assess GCE significance and measure characteristics of inner Galaxy gamma rays at > 10 GeV

1 Combining *state-of-the-art methods*, as pioneered in [Calore,SM+PRL'21]

* *Photon count statistics*: Measure faint point sources

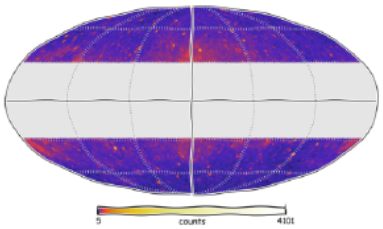
* *Adaptive template fitting* : Minimize/study diffuse emission model systematics, crucial for photon count statistics

2 Preliminary results

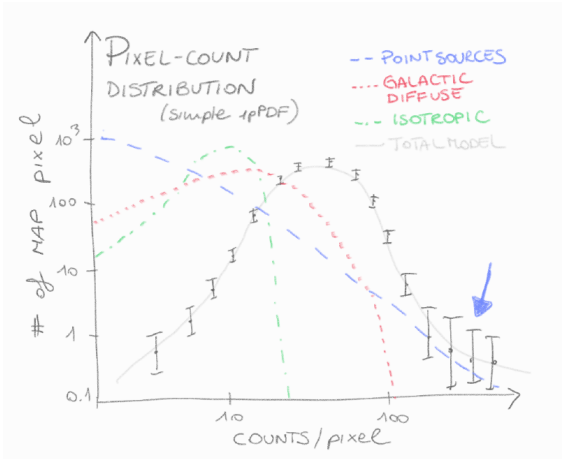
3 Summary & Outlook

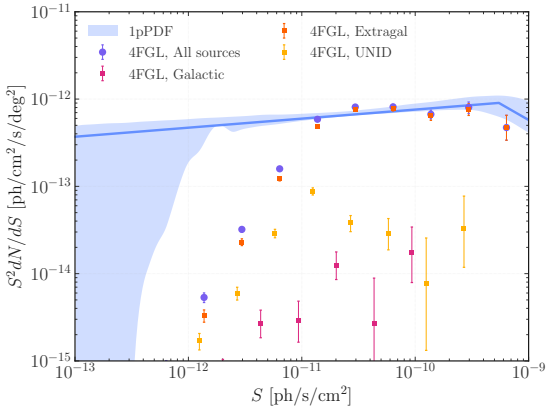
Photon count statistics of gamma rays

Statistical analysis of photon counts[1] to decompose the gamma-ray sky and measure source count distribution dN/dS below catalog flux threshold



1p-PDF





Main application: isotropic, extragalactic sources

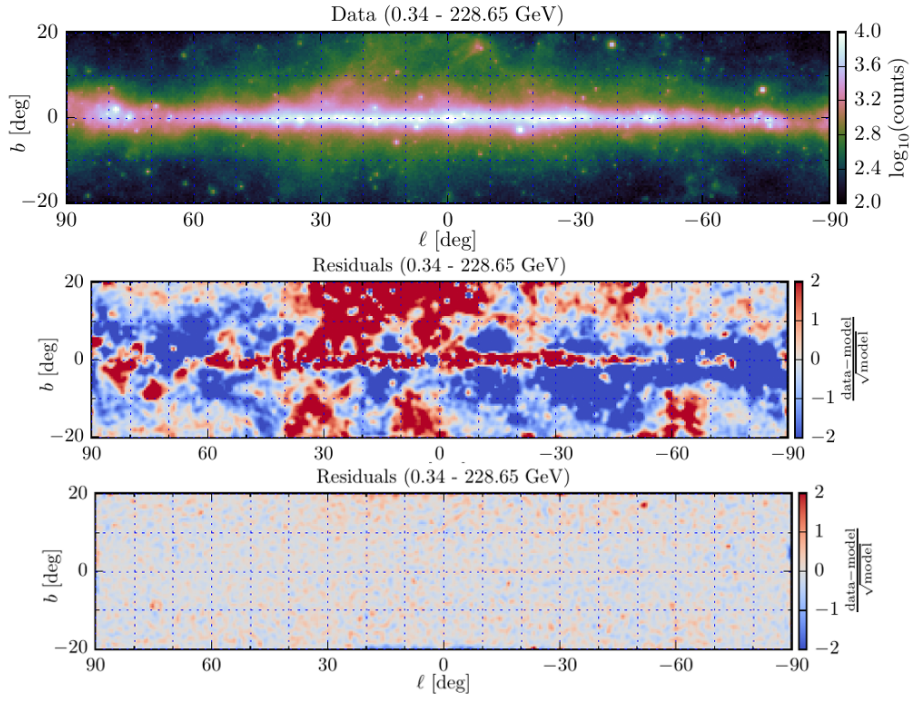
Bright diffuse backgrounds + mis-modeling could bias method at low latitudes

[Leane&Slatyer PRL'19,PRD'20,Buschmann+PRD'20,Calore,SM+PRL'21]

[1] Two main implementations: NPTF [Lee+PRL16,Mishra-Sharma+AJ'17]; 1pPDF [Zechlin+ApJS'16,+ApJL'16] based on formalism introduced in [Malyshev+ApJ2011]. Main applications include: extragalactic sources [Lisanti+Apj2016,DiMauro,SM+ApJ'18], blazar models [SM+PRD'20], DM halo, subhalo constraints [Zechlin,SM+PRD'18,Somalwar+ApJ'21], ...

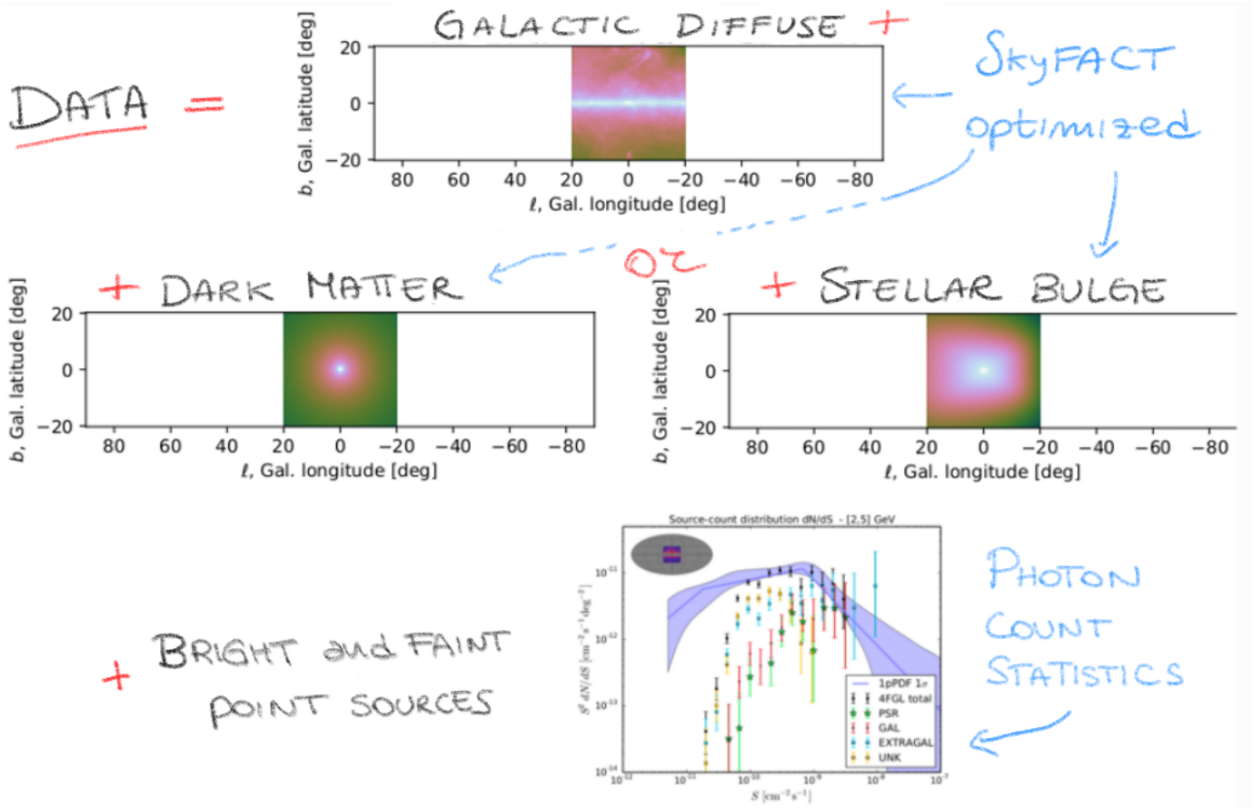
SkyFACT: overcoming diffuse emission mismodeling

Model to fit Fermi-LAT data: Σ_{pixels} energy spectrum x spatial morphology



- Standard fitting techniques: up to 30% residuals [Cholis+PRD'22,Pohl+PRD'22]
- Mismodeling at low angular scales: *spurious evidence* for new components such as point sources [Leane&Slatyer PRD'20, Karwin+22]
- **SkyFACT** [Storm+JCAP'17]: account for intrinsic uncertainties in spectral/spatial predictions by introducing very large number of parameters w/ regularisation conditions for the likelihood [→ C.Eckner's talk]

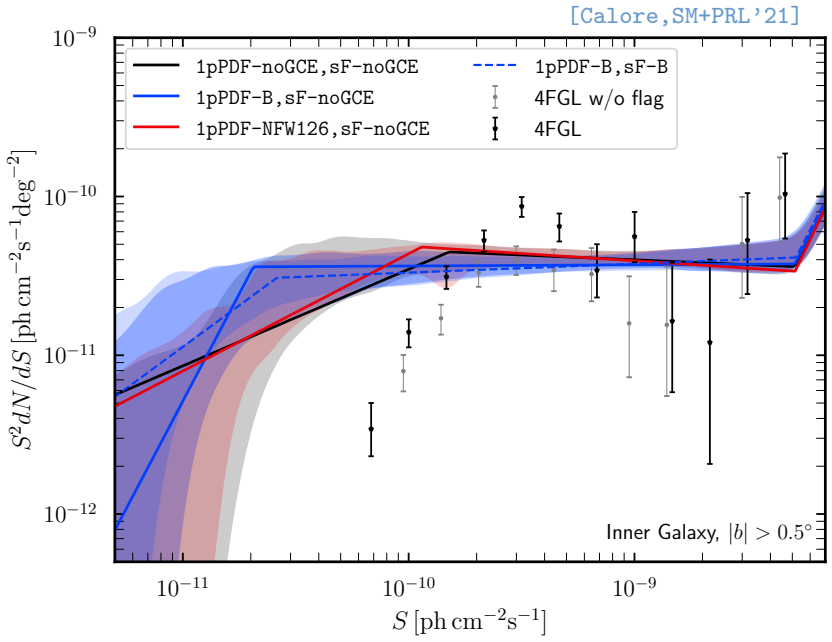
Combining 1pPDF and SkyFACT

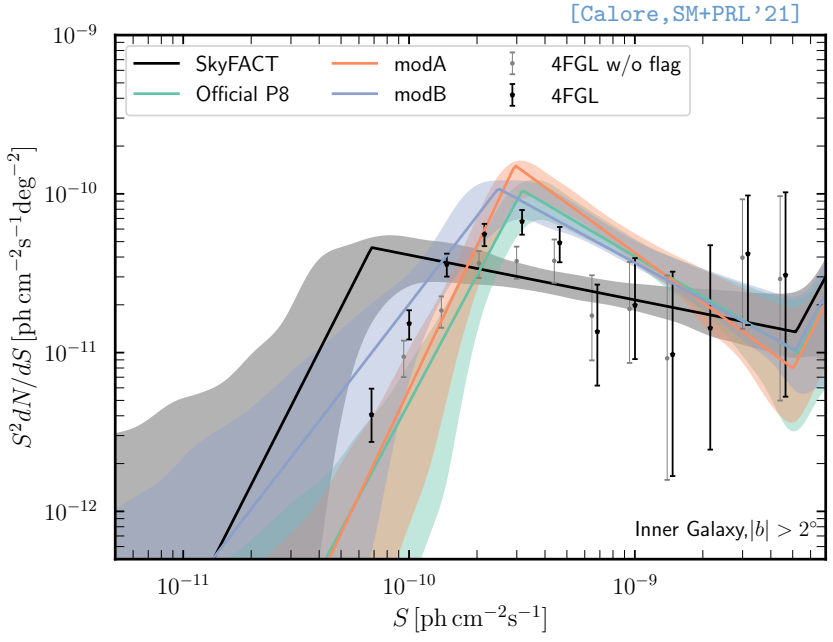


- SkyFACT: *reduce diffuse mis-modeling*
- Photon-count statistic: model faint sources *after reducing residuals*

First application to inner Galaxy [Calore,SM+PRL21, arXiv:2102.12497] at energies 2-5 GeV

Inner Galaxy, energies 2–5 GeV: results

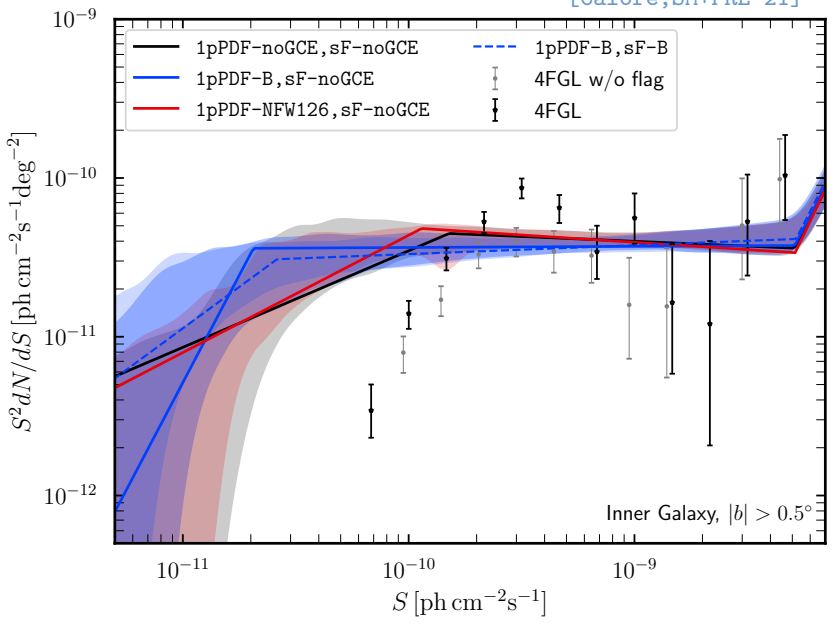




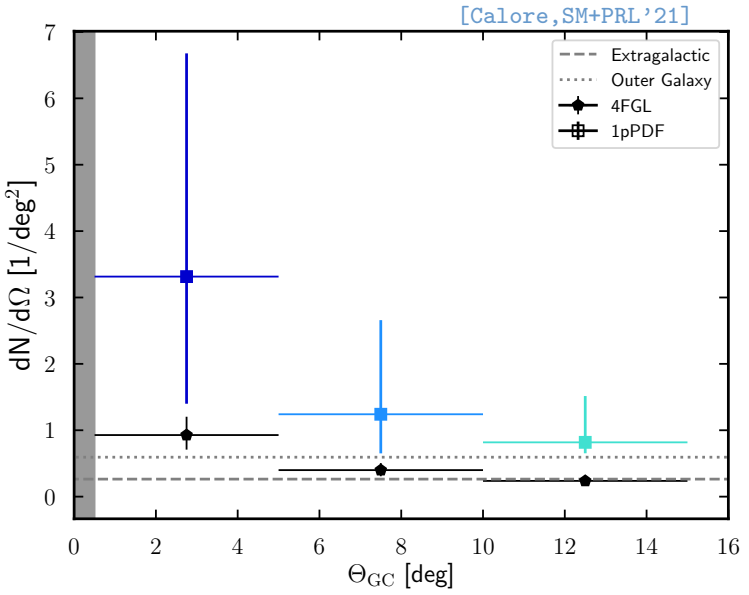
- Stellar-bulge morphology *preferred over dark matter*: SkyFACT only (10σ) and modeling faint sources (lnB$>$ 20), confirms [Bartels+NA'18,Macias+NA'18,JCAP'19]
- *Unresolved* point sources resolved down to $\sim 5 \cdot 10^{-11}$ ph cm^{-2} s^{-1}
- Diffuse mismodeling *strongly affects faint source reconstruction*

Inner Galaxy, energies 2–5 GeV: results

[Calore,SM+PRL'21]



[Calore,SM+PRL'21]

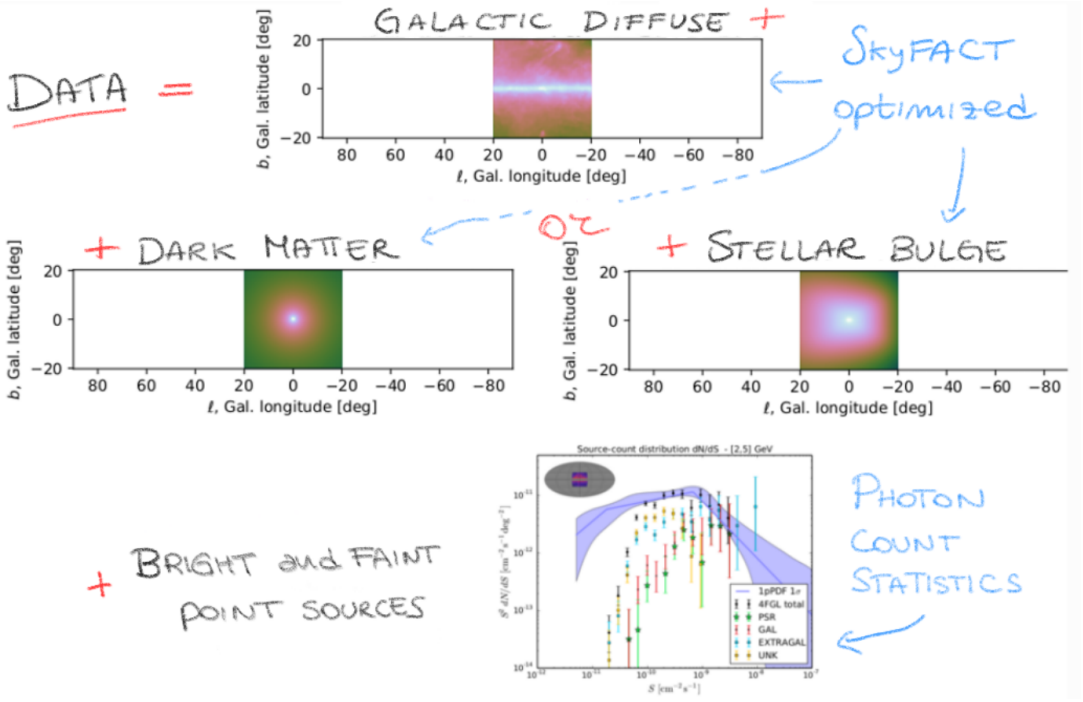


- Stellar-bulge morphology *preferred over dark matter*: SkyFACT only (10σ) and modeling faint sources (lnB$>$ 20), confirms [Bartels+NA'18,Macias+NA'18,JCAP'19]
- *Unresolved* point sources resolved down to $\sim 5 \cdot 10^{-11}$ ph cm^{-2} s^{-1}
- Diffuse mismodeling *strongly affects faint source reconstruction*
- Faint sources *not purely isotropic*, few % of total 2-5 GeV flux

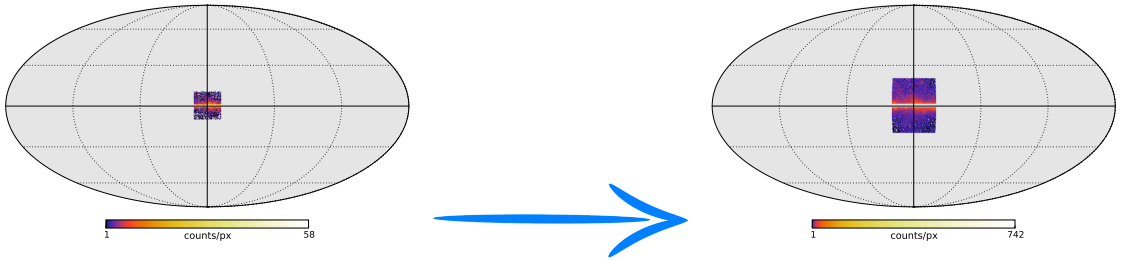
Corroborating a possible, (at least) partial stellar origin of the Galactic center excess

Extending to energies > 10 GeV

Fermi-LAT data selection: ULTRACLEANVETO, all PSF (2-5 GeV was PSF3)

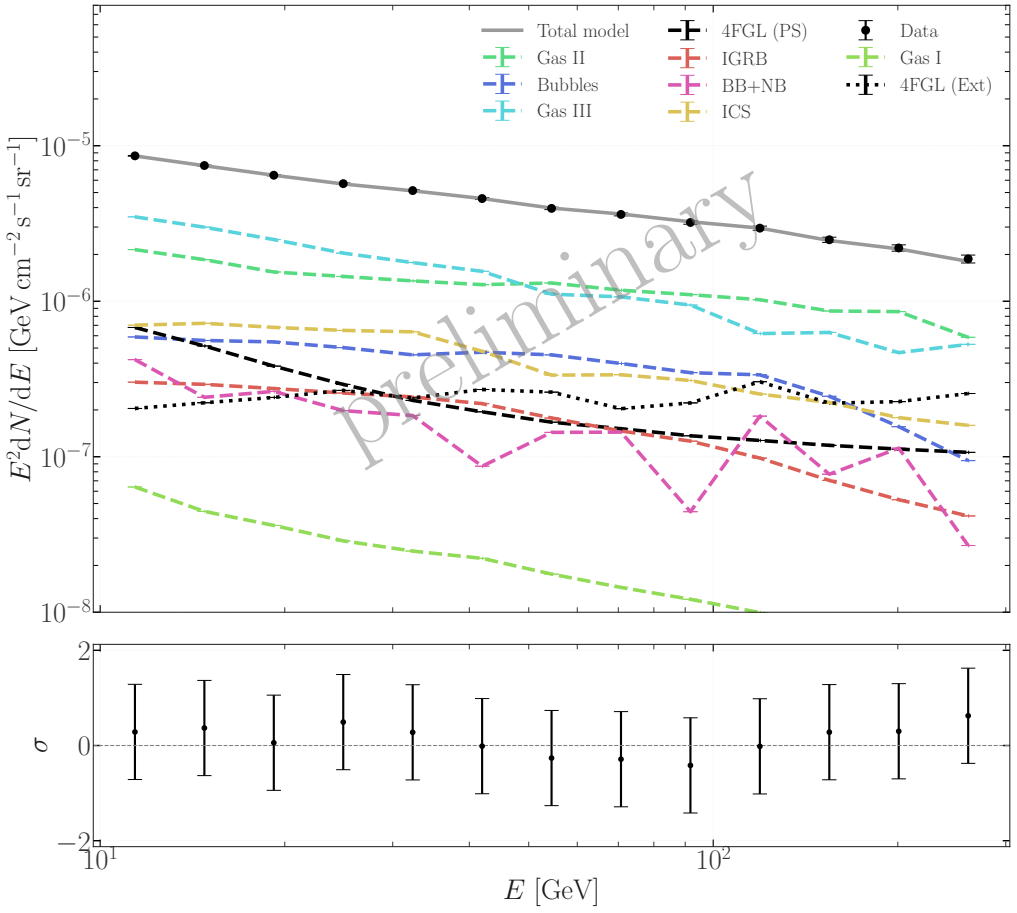


Extending inner Galaxy region of interest to 20x20 deg, cut plane at $b < |1|$ deg



SkyFACT results: inner Galaxy spectrum

GCE input spectrum: power law



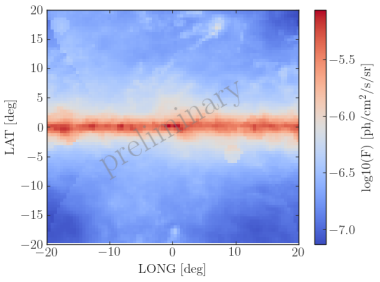
Model components compatible between
full energy (0.2-500 GeV) and high energy (> 10 GeV) fit

work in progress: MSP-like GCE input spectrum

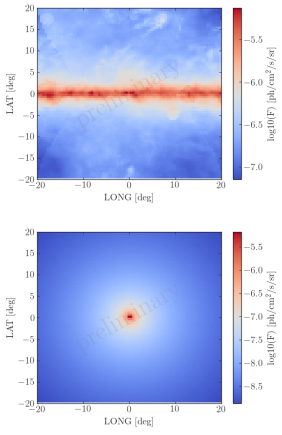
Stellar bulge of dark matter?

SkyFACT fit, nested model comparison

no GCE

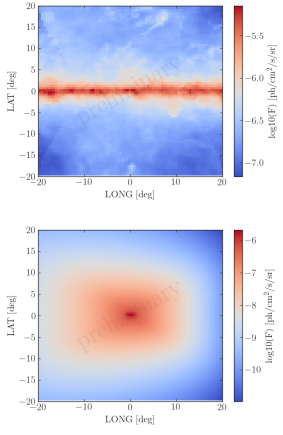


GCE: NFW ($\gamma = 1.26$)



Comparing to no GCE: 5.5σ
Comparing to boxy + nuclear bulge: no evidence

GCE: stellar + nuclear bulge



Comparing to no GCE: 9.7σ
Comparing to NFW: 7.9σ

Photon count statistics, Bayesian model comparison $B_{\rm ij} = \exp(\ln \mathcal{Z}_i - \ln \mathcal{Z}_j)$

no GCE

Comparing to no GCE:
$\ln(B) = 17$

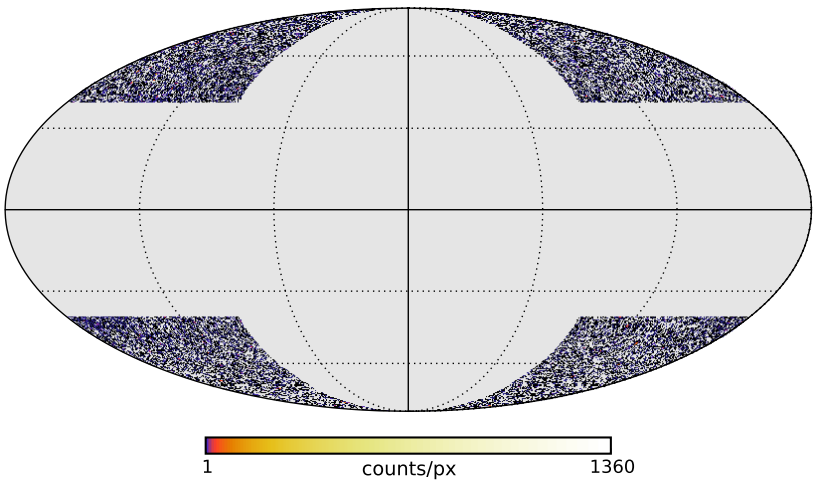
Comparing to no GCE:
lnB=37
Comparing to NFW: lnB=21

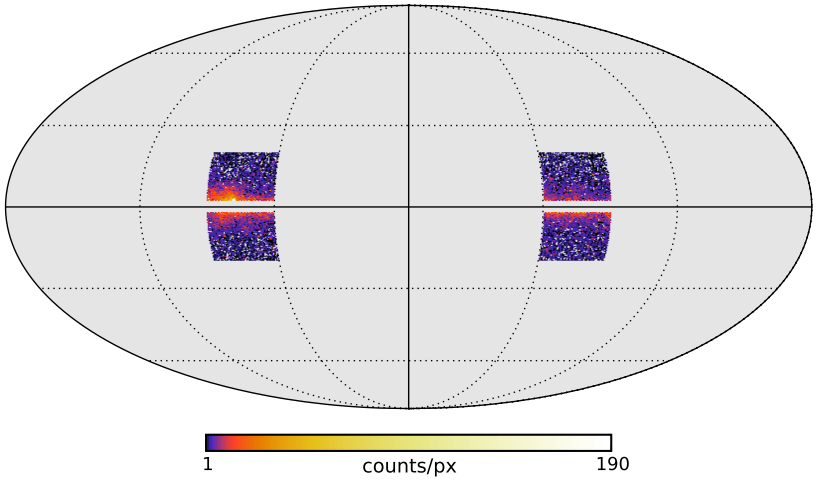
unresolved sources + norm of diffuse, GCE templates ~ 1

Evidence for a GCE at > 10 GeV
better described by a stellar bulge morphology

dN/dS results: control regions (10–300 GeV)

→ Compare source count distribution and density to inner Galaxy



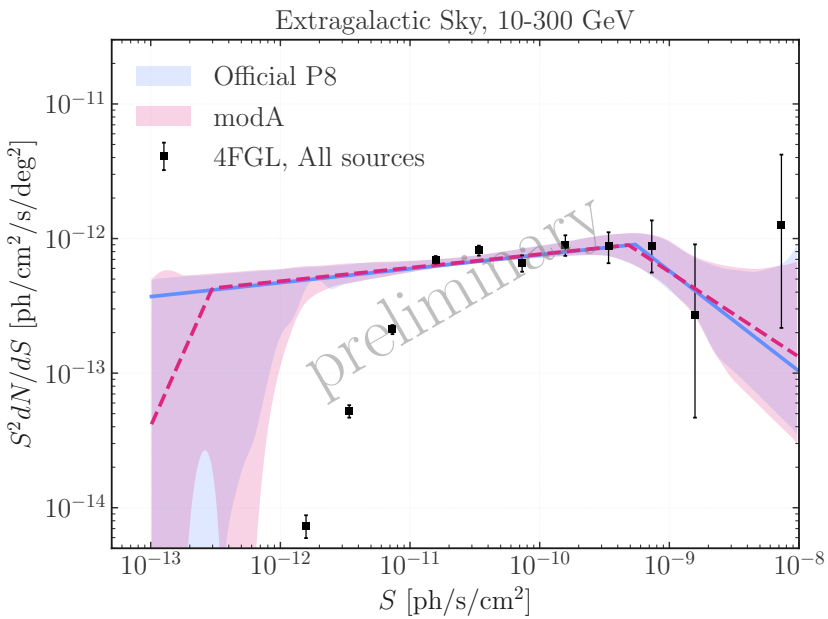


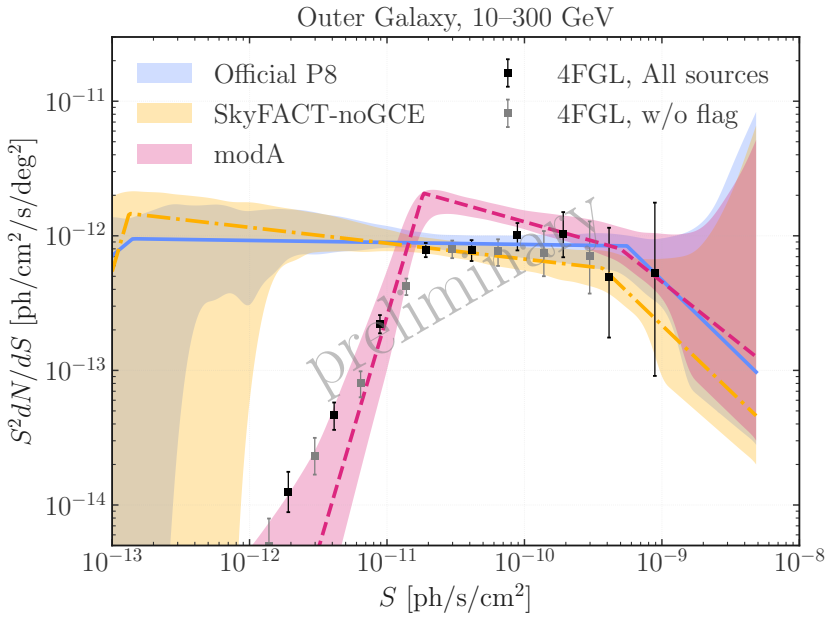
- High latitudes: stable and robust measurement, no matter diffuse model
- Low latitudes: large residuals with modA[2] drive spurious source reconstruction around catalog threshold
- Sources resolved at fluxes 1 order of magnitude lower with respect to catalog threshold, see e.g. 3FHL [DiMauro,SM+ApJ'18]

[2] GALPROP model from Fermi-LAT IGRB analysis [Ackermann+ApJ'15]

dN/dS results: control regions (10–300 GeV)

→ Compare source count distribution and density to inner Galaxy





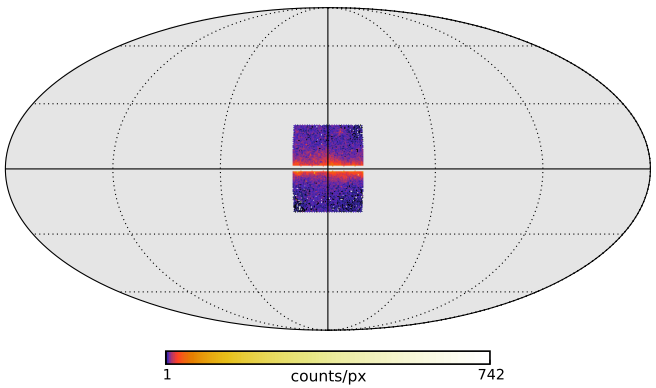
- High latitudes: stable and robust measurement, no matter diffuse model
- Low latitudes: large residuals with modA[2] drive spurious source reconstruction around catalog threshold
- Sources resolved at fluxes 1 order of magnitude lower with respect to catalog threshold, see e.g. 3FHL [DiMauro,SM+ApJ'18]

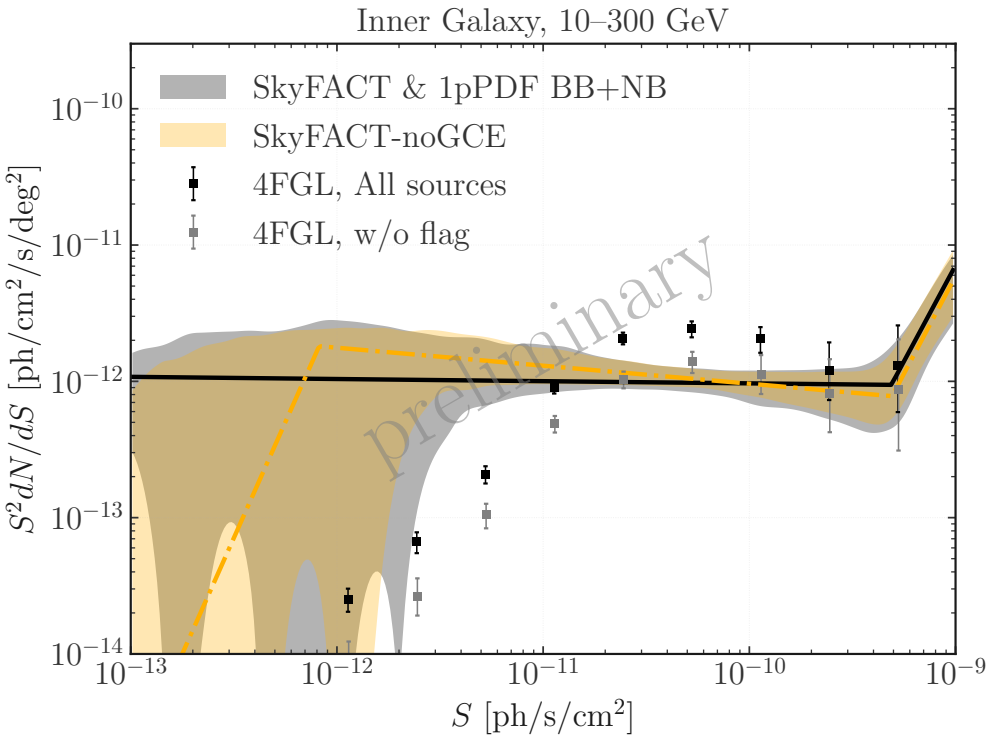
[2] GALPROP model from Fermi-LAT IGRB analysis [Ackermann+ApJ'15]

dN/dS results: inner Galaxy

Source-count distribution measured for 10–300 GeV:

20x20deg, cut plane at 1deg





- Gamma-ray point sources resolved down to $\sim 3 \cdot 10^{-12}$ ph cm^{-2} s^{-1}
- dNdS reconstruction robust against modification of diffuse emission model
- *work in progress*: spatial distribution

Summary & Outlook

Evidence for a stellar bulge-like Galactic Center Excess from $E > 10$ GeV Fermi-LAT data

- ✓ Addressing diffuse emissions mis-modeling with adaptive template fitting
- ✓ Measuring bright and faint point sources with photon count statistics

Work in progress:

- Spatial distribution of faint point sources in the inner Galaxy
- Consistency of results between energy bins
- Predictions for forthcoming surveys of high-energy gamma rays

Thank you for listening!

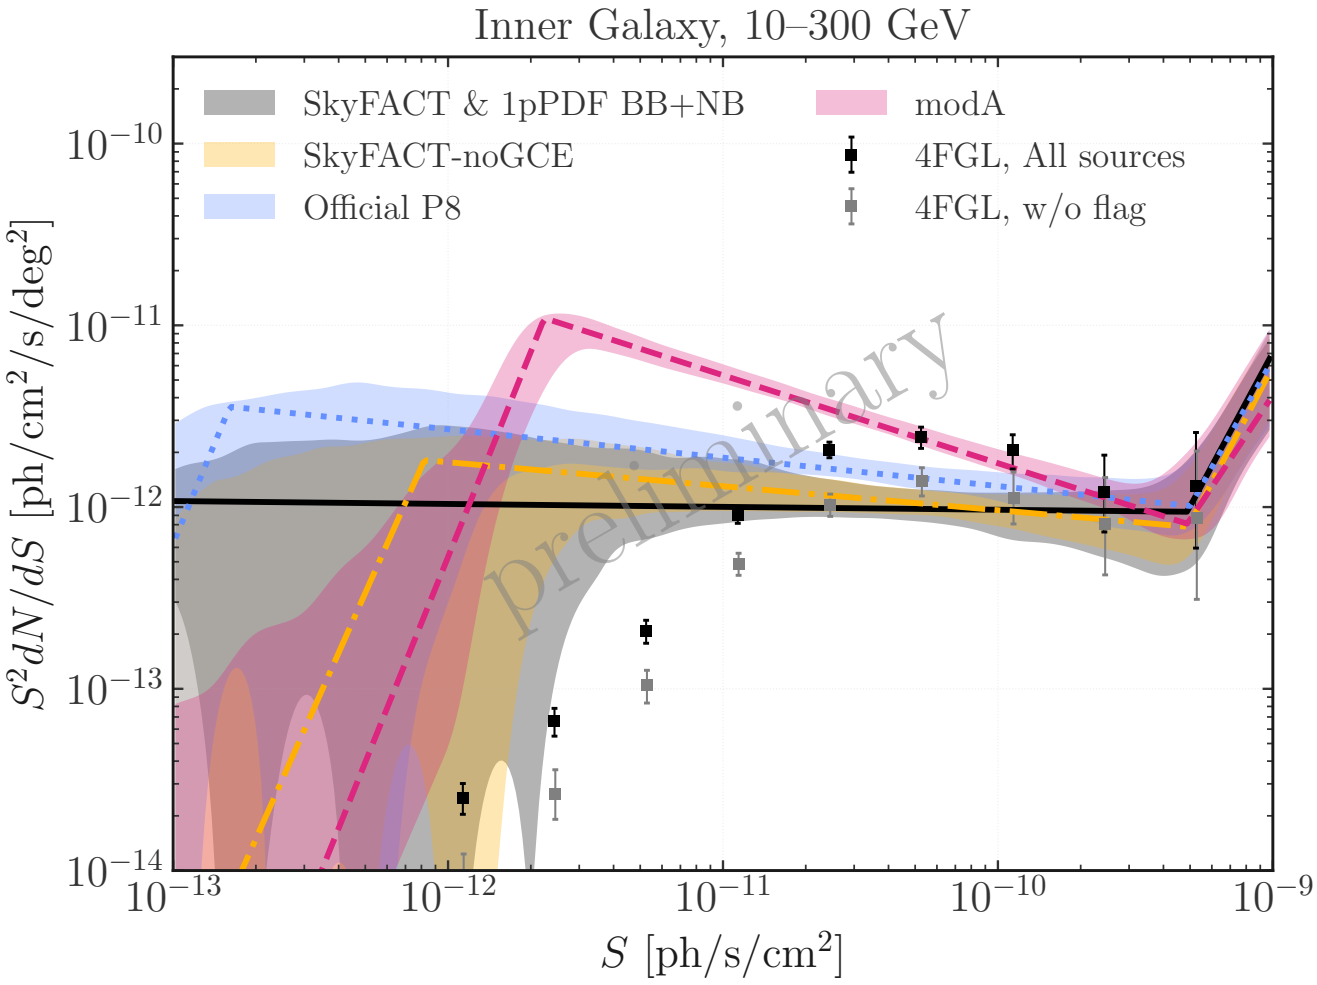
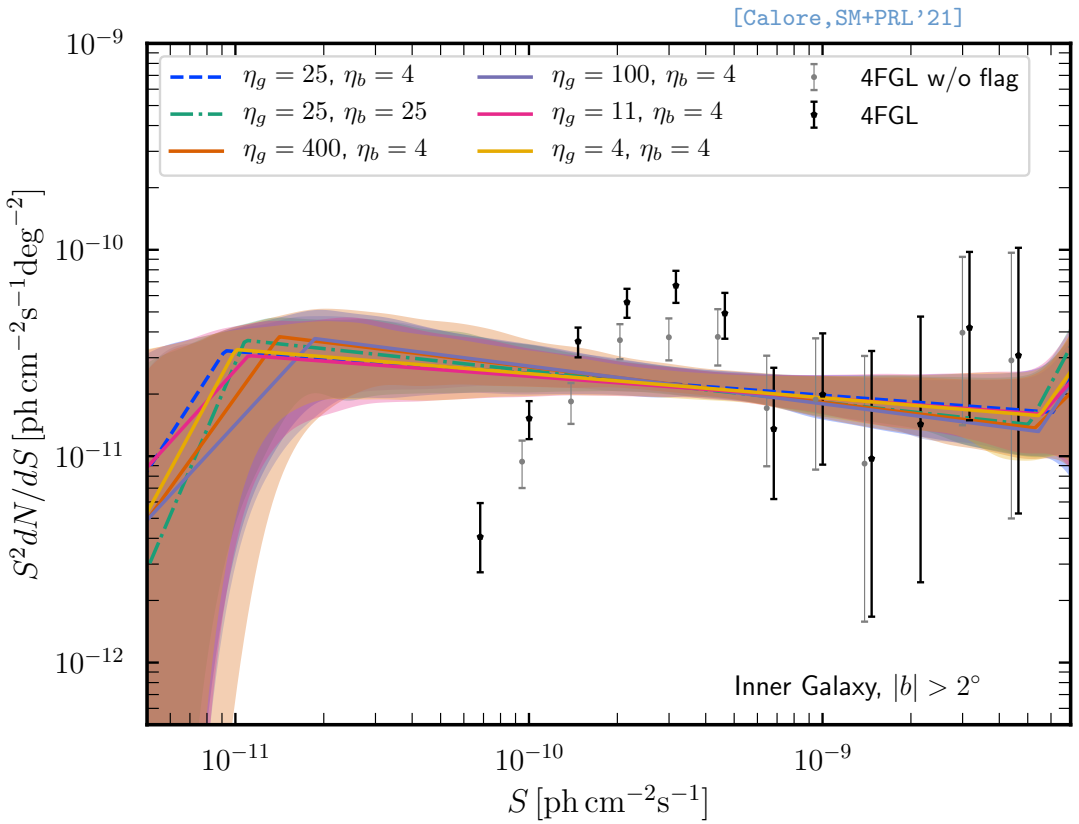
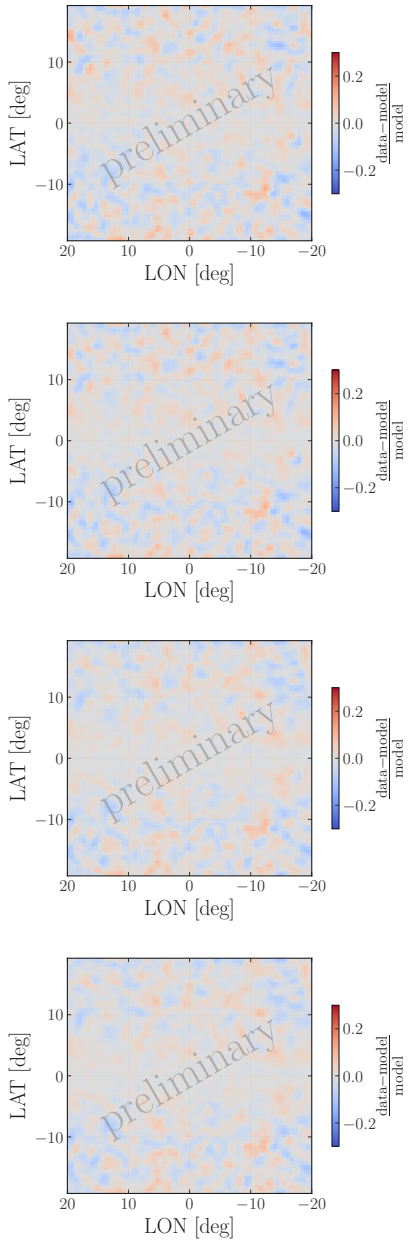
More on dN/dS & diffuse mismodeling



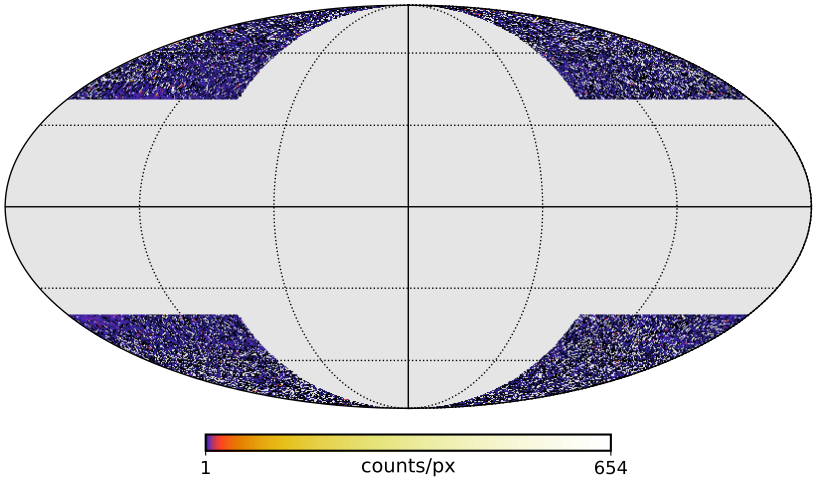
SkyFACT: gas smoothing scale

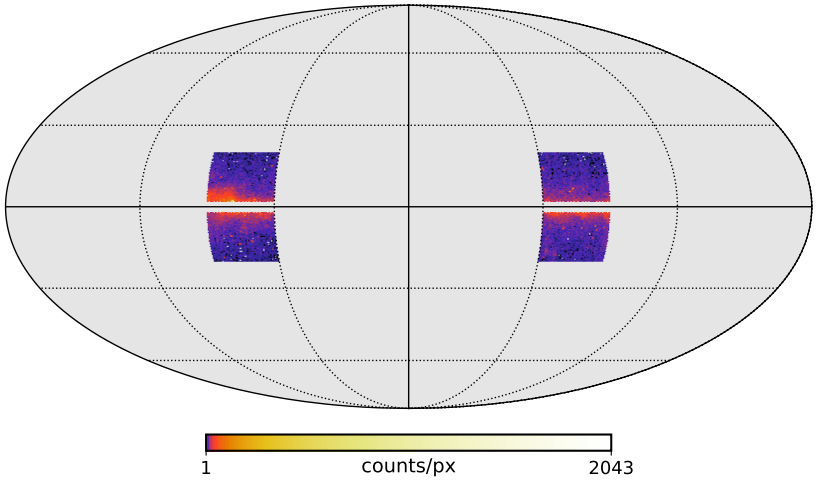


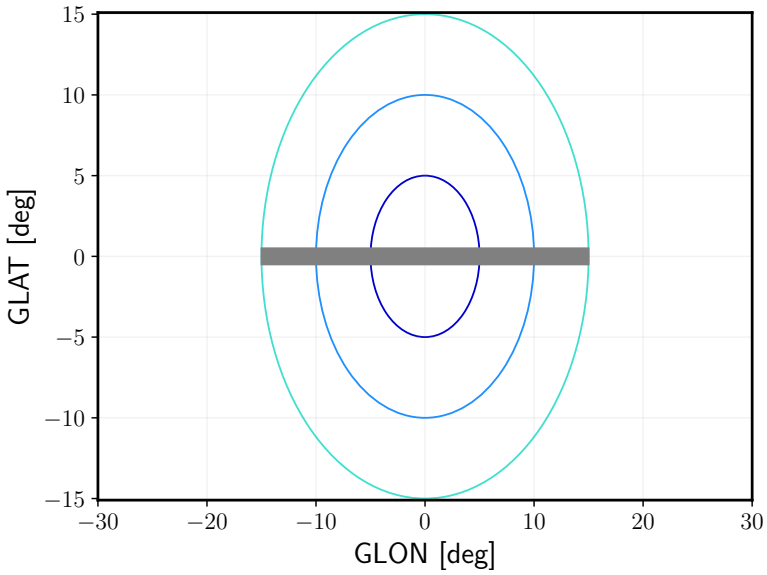


skyFACT: influence of smoothing scale of templates on dN/dS and residuals (2–5 GeV)

dNdS results: control regions (2–5 GeV)

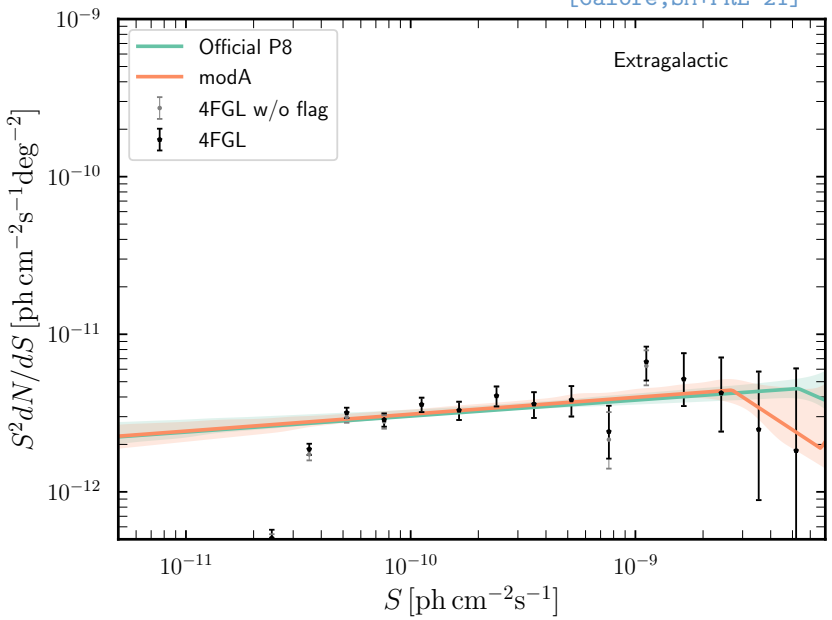




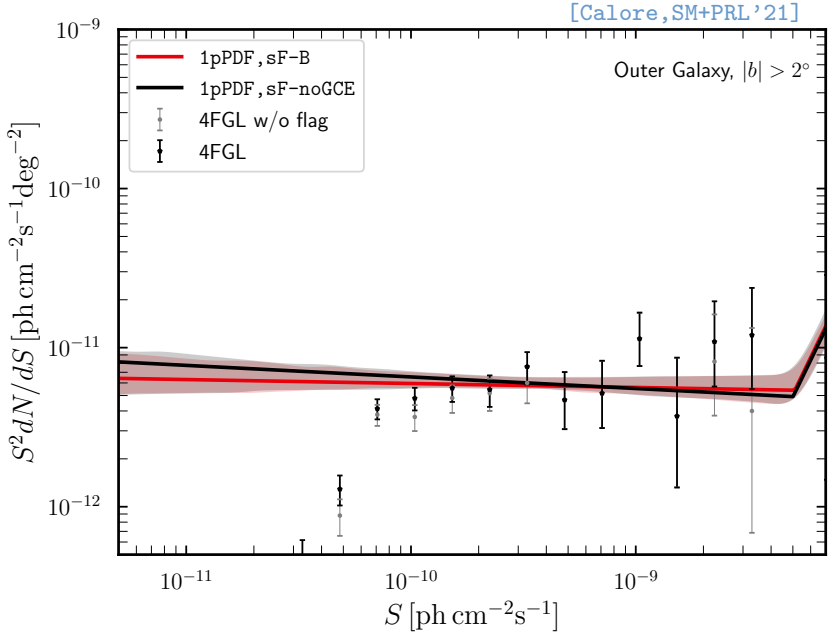


dNdS results: control regions (2–5 GeV)

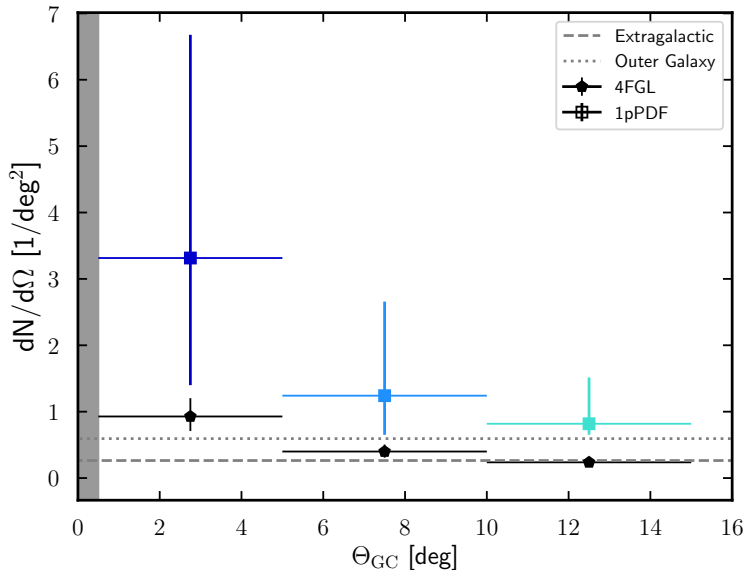
[Calore,SM+PRL'21]



[Calore,SM+PRL'21]



[Calore,SM+PRL'21]

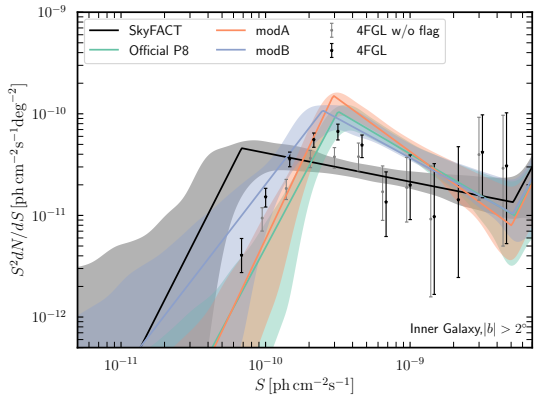


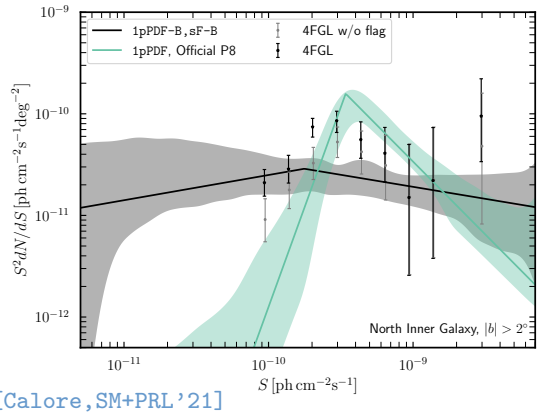
Source count distribution 2–5 GeV: systematics

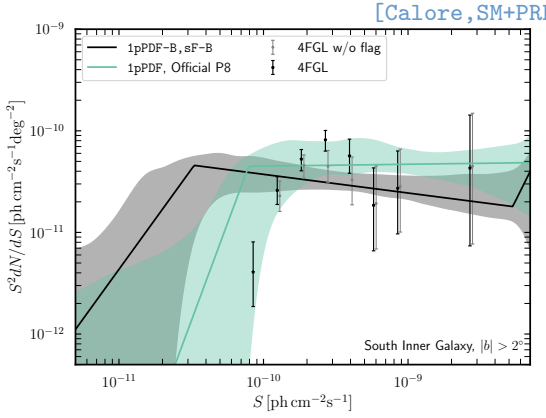
Stability of results tested against many systematics, see supplementary [Calore, SM+PRL'21]

Diffuse emission mismodeling

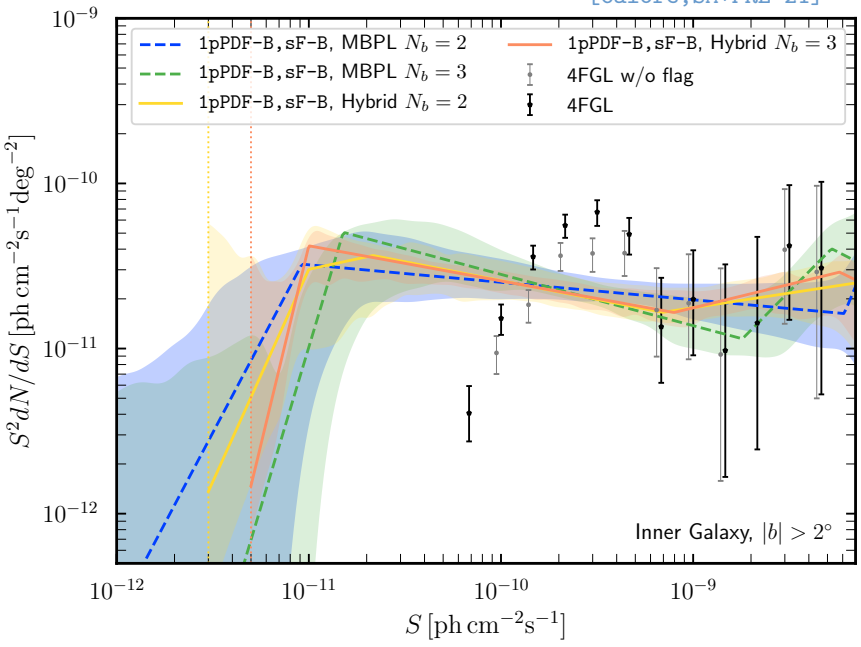
[Calore,SM+PRL'21]







[Calore,SM+PRL'21]

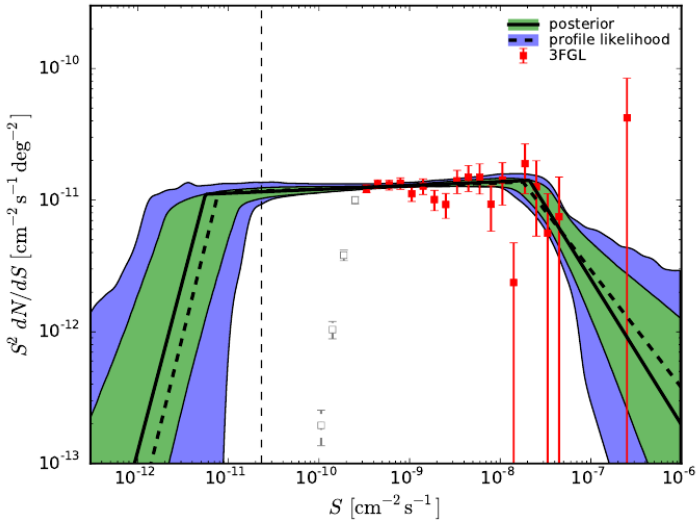


1pDPF modeling: flux cuts, dNdS breaks

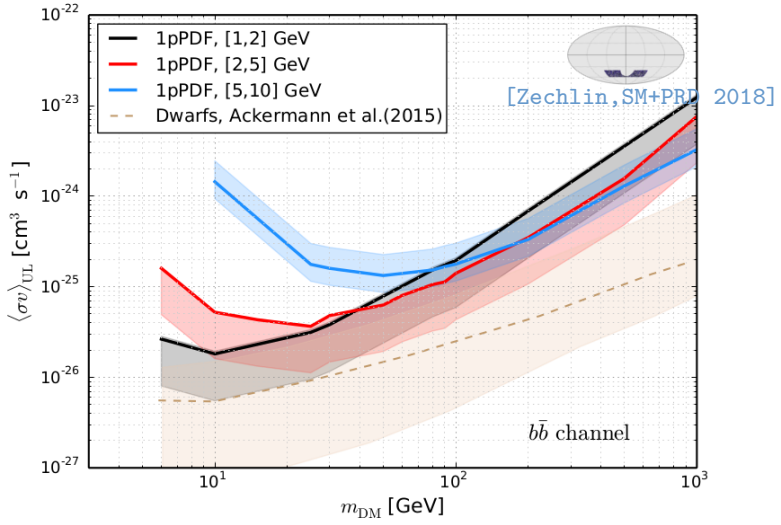
Test of 1pPDF method with Fermi-LAT data

In 1-10 GeV

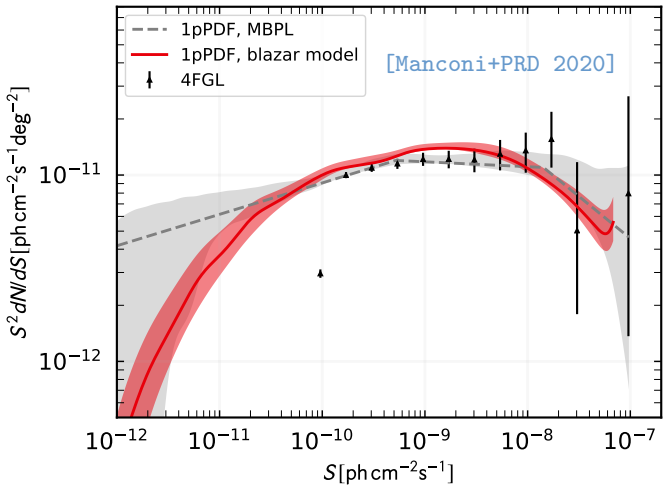
[Zechlin+ApjS 2016]



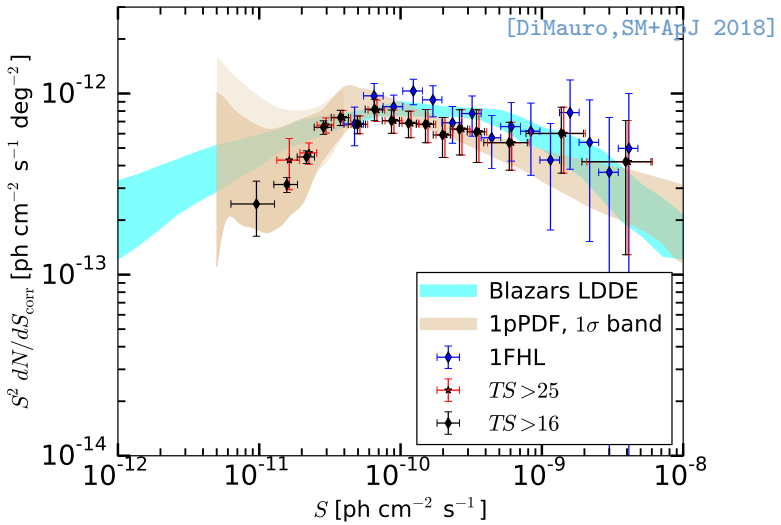
Adding a galactic dark matter template



To constrain blazar models



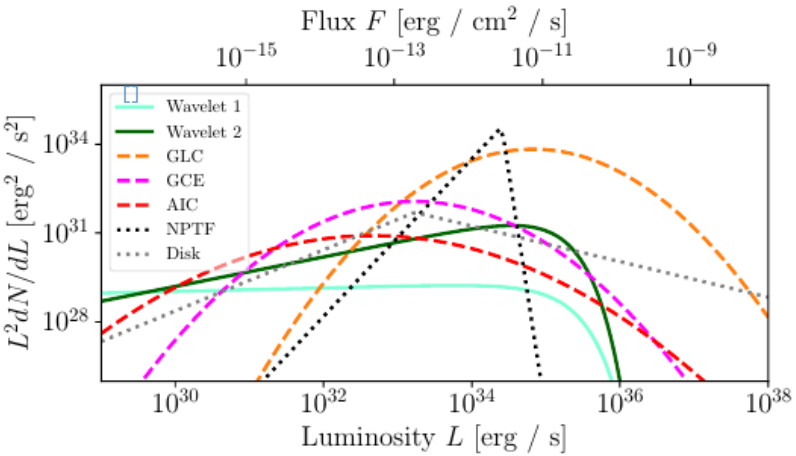
In $>$ 10 GeV, with efficiency corrections



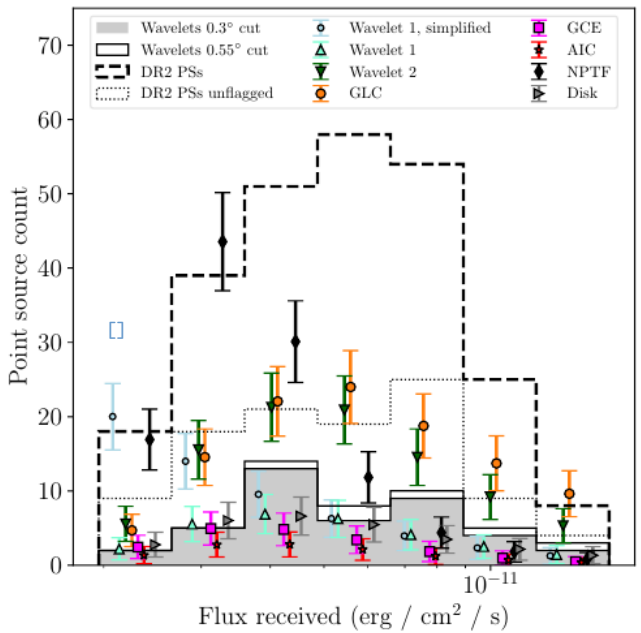
Luminosity functions of MSP explaining the excess

[Dinsmore&Slatyer'JCAP'22]: Comparing 7 models for MSP properties explaining the excess:

sources detectable? # overall to explain excess? viable luminosity functions?



Number of detectable MSP highly depends on luminosity function model, which is uncertain



Models can produce 100-10^6 MSP w/o overproducting 4FGL sources

Factor 5-20 sensitivity: 30% of the excess would give detectable MSP in Fermi-LAT

Photon count statistics: timeline [until 2020, using NPTF]

Is the excess diffuse or point-like (sources spatially distribuited as dark matter)?

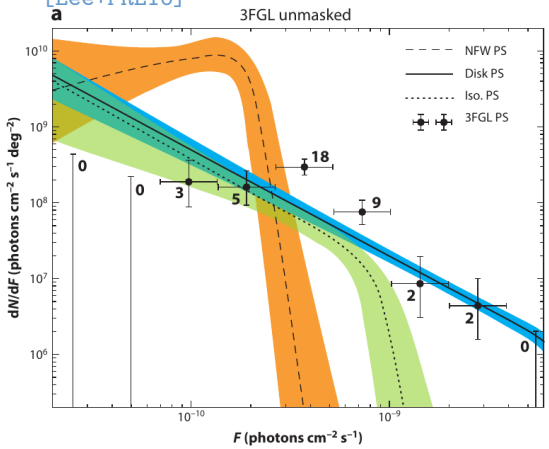
2016 : Excess entirely due to unresolved **point-sources** [Lee+PRL'16]

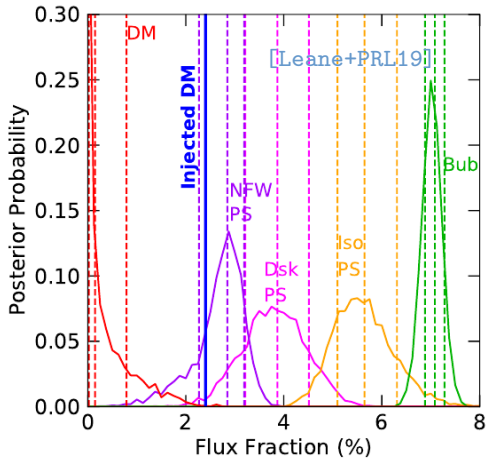
2019 : Earlier results not robust: smooth dark matter not reconstructed even if injected **dark matter** *strickes back?* [Leane+PRL'19]

2019/2020 : Explain why injection test failed: background mismodeling! excess still consistent with being **partially point sources** with updated diffuse models [Chang+PRD'20, Buschmann+PRD'20]

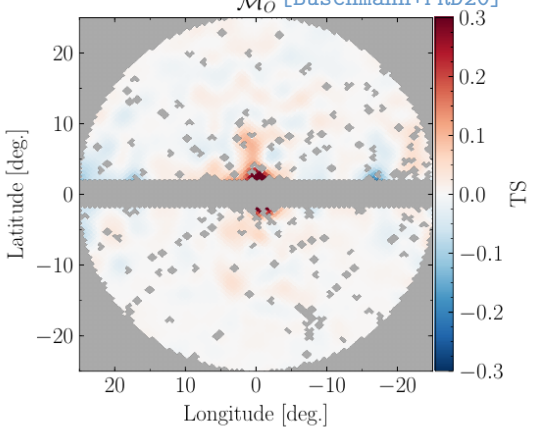
2020 : Preference for point sources influenced by spurios sources/ excess north-south asymmetry, robustness further casted into doubt [Leane+PRL,PRD'20]

[Lee+PRL16]





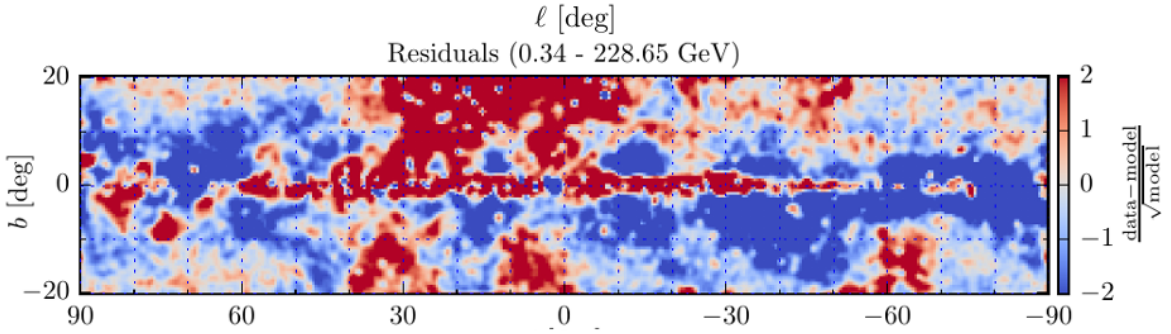
$\mathcal{M}_O$ [Buschmann+PRD20]



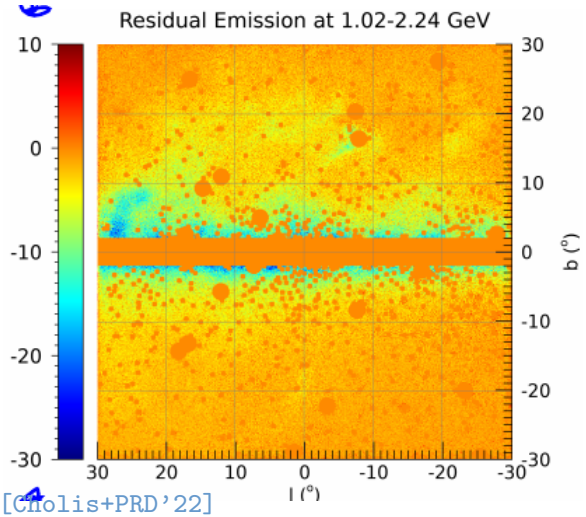
Robustness of results highly dependent on serious systematics from Galactic diffuse emission mismodeling

Galactic diffuse mismodeling: residuals

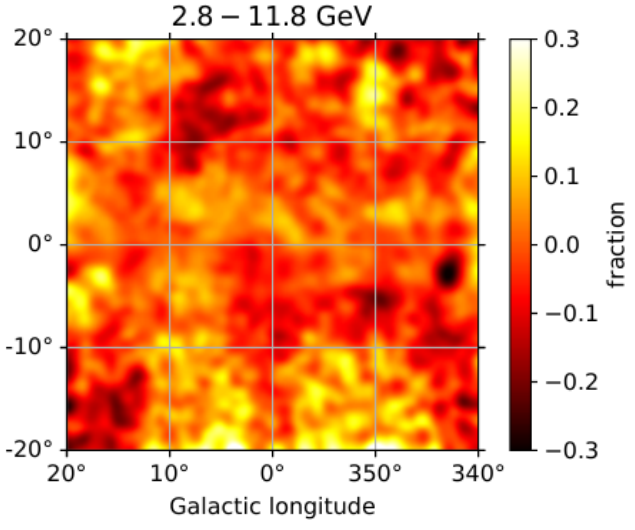
Model to fit Fermi-LAT data: Σ_{pixels} energy spectrum x spatial morphology



[Storm+JCAP'17]



[Cholis+PRD'22]



[Pohl+PRD'22]

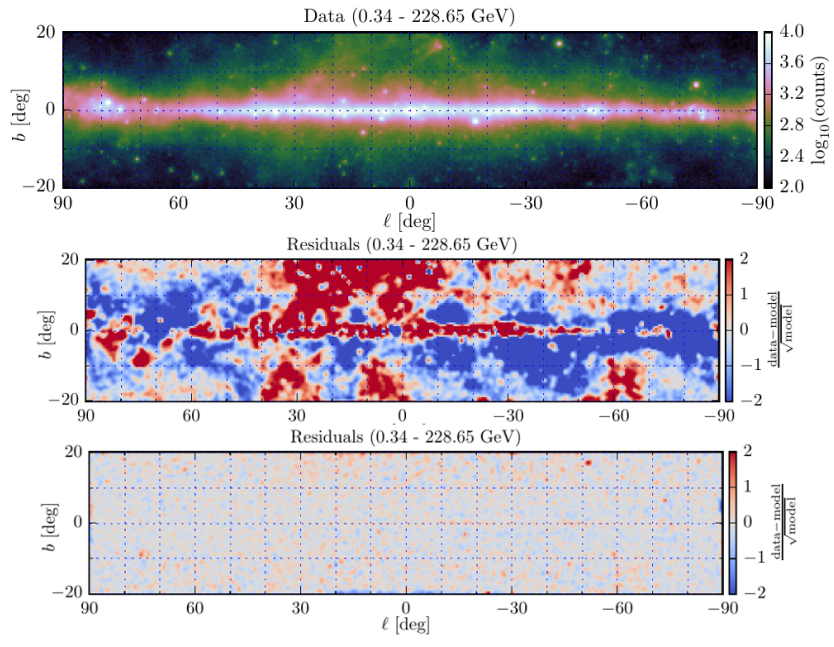
Template fitting: still up to 30% residuals

Mismodeling at low angular scales, north-south: *spurious evidence* for new components such as point sources [Leane&Slatyer PRD'20, Karwin+22]

How do we reduce residuals?

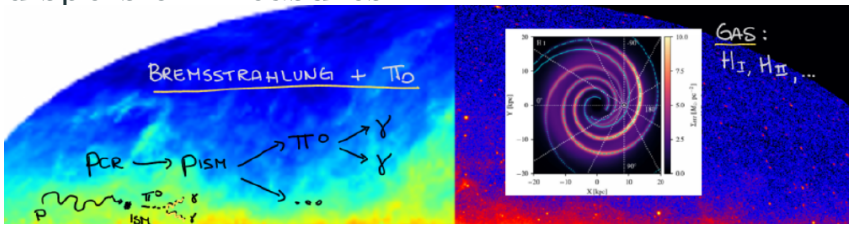
Data-driven:

- Spherical harmonic marginalization [Buschmann+PRD20]
- Gaussian Processes [Mishra-Sharma,Cranmer,'22]
- SkyFACT: sky factorisation with adaptive constraining templates [Storm+JCAP'17]



Improve models:

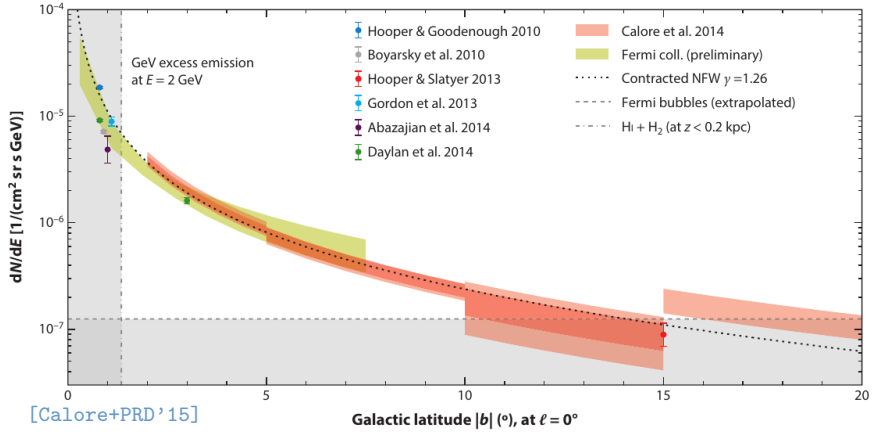
Better estimates of target H_I, H_2, H_{II} gas column density, inferred by line spectra, dispersion measures



- new atomic HI reconstr, with radiation model of emission +absorption [Shmakov+22]
- convolutional neural nets to fill gaps in molecular H_2 tracers like CO [Shmakov+22,Karwin+22]
- bayesian inference of 3D CO maps [Mertsch&Vittino'20]

Morphology

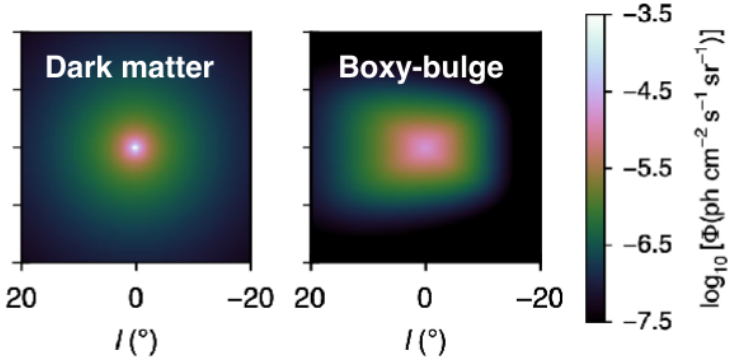
Extended up to $\sim$ 10deg ($\sim$ 1.5kpc)

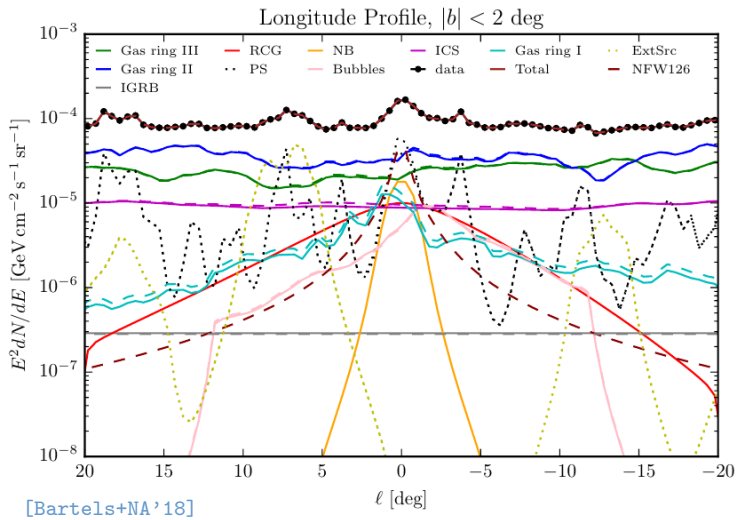


[Calore+PRD'15]

Early works: spherical simmetric around GC, contracted NFW profile $\gamma = 1.26$

Recent debate: [DiMauro PRD'20,21, Pohl+ApJ'22, McDermott+22], ...





[Bartels+NA'18]

- Evidence for stellar bulge-like
  [Bartels+NA'18,Macias+NA'18,JCAP'19,Calore,SM+PRL'21]
- Longitudinal asimmetry at $\sim$ 10 deg

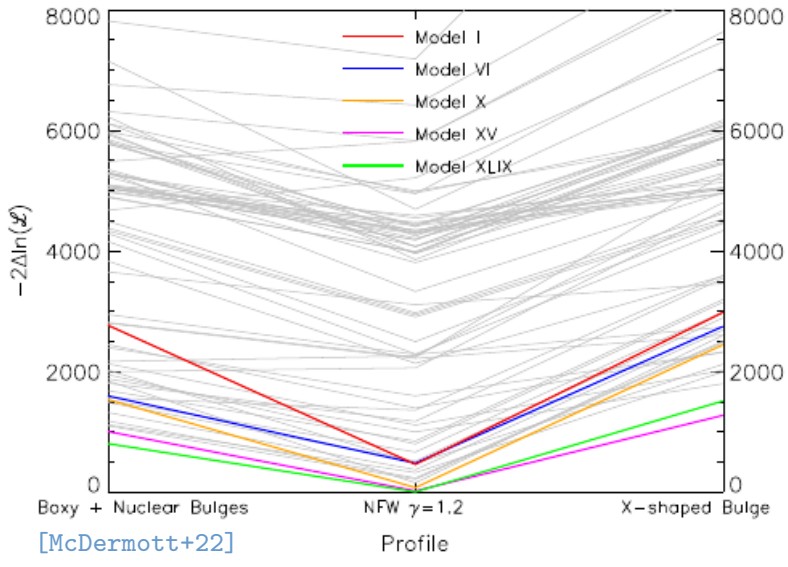
Discriminate interpretation? Yes!

Morphology: still debated

Independent groups find different results for the morphology of the excess

Spherical symmetric (dark matter-like)

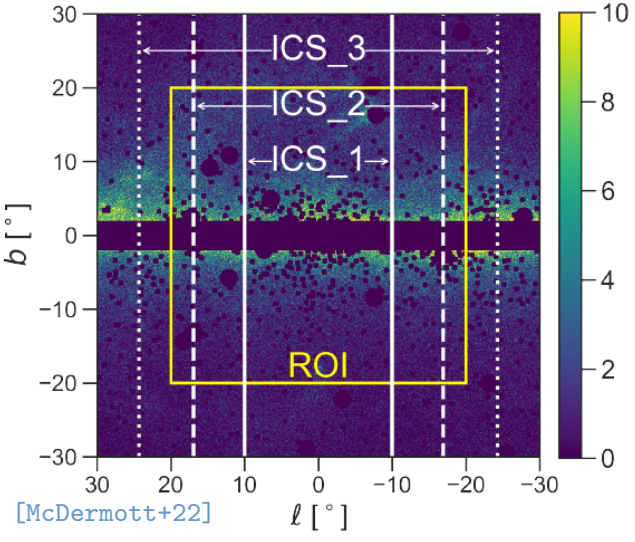
- Early works often *not testing* other morphologies
- Recent works: [DiMauro PRD'20,21, Cholis+PRD'22,McDermott+22], ... using astrophysical models and varying many parameters



[McDermott+22]

Stellar bulge (MSP-like)

- Two independent groups in 2018 [Bartels+NA'18,Macias+NA'18,JCAP'19]
- Subsequent works with even more significance: [Calore,SM PRL'21,Pohl+ApJ22] (ring based, skyfact based)



[McDermott+22]

Difficult to close this debate using only template fitting: current residuals too high
