

Particle identification with the ePIC detector at the EIC

Roberto Preghenella

INFN Bologna

on behalf of the ePIC Collaboration

EINN 2023

15th European Research Conference on
Electromagnetic Interactions with Nucleons and Nuclei
31 October - 4 November 2023, Paphos

The Electron-Ion Collider

a machine that will unlock the secrets of the strongest force in Nature
is a future electron-proton and electron-ion collider at BNL (USA)
foreseen to start operation in early 2030's

J Yeck
C Montag
B Surrow

- **the major US project in the field of nuclear physics**
 - one of the most important scientific facilities for the future of nuclear and subnuclear physics
- **the world's first collider for**
 - polarised electron-proton (and light ions)
 - electron-nucleus collisions
- **will allow to explore the secrets of QCD**
 - understand origin of mass & spin of the nucleons
 - extraordinary 3D images of the nuclear structure

Particle identification at EIC

one of the major challenges for the detector

- physics requirements**

- pion, kaon and proton ID
- over a wide range $|\eta| \leq 3.5$
- with better than 3σ separation
- significant pion/electron suppression

- momentum-rapidity coverage**

- forward: up to 50 GeV/c
- central: up to 6 GeV/c
- backward: up to 10 GeV/c

- demands different technologies**

Particle identification ~ particle velocity

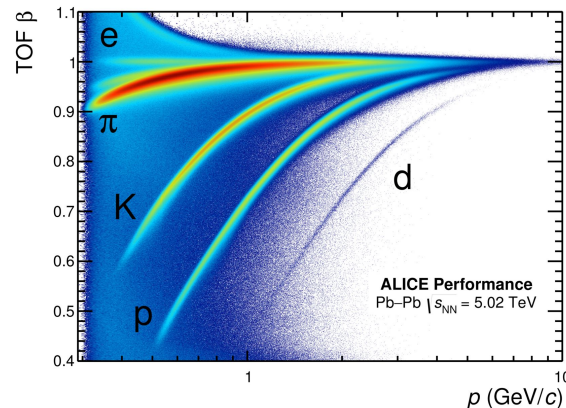

particle velocity + momentum (from tracking) or energy (from calo) = PID

- **velocity measurement yields mass**

- $p = m \beta \gamma$
- $E = m \gamma$

- **direct velocity measurement**

- time-of-flight
 - record time signal at multiple locations: $\Delta t = t_{\text{stop}} - t_{\text{start}}$
 - measure trajectory length and calculate: $\beta c = L / \Delta t$

- **velocity-dependent interactions**

- specific energy loss
- Cherenkov radiation
 - θ_c measured wrt. track direction
 - performance also depends on tracking

$$-\left\langle \frac{dE}{dx} \right\rangle = \frac{4\pi}{m_e c^2} \cdot \frac{nz^2}{\beta^2} \cdot \left(\frac{e^2}{4\pi\epsilon_0} \right)^2 \cdot \left[\ln \left(\frac{2m_e c^2 \beta^2}{I \cdot (1 - \beta^2)} \right) - \beta^2 \right]$$

$$\cos \theta = \frac{1}{n\beta}$$

- **other techniques for e-ID**

- Bremsstrahlung
- transition radiation
- calorimetry: E / p

$$I = \frac{z^2 e^2 \gamma \omega_p}{3c}$$

Particle identification techniques

EIC detector need more than one technique to cover the entire momentum ranges

- **central (< 6 GeV/c)**
 - TOF, DIRC
- **backward (< 10 GeV/c)**
 - aerogel RICH
- **forward (< 50 GeV/c)**
 - gaseous RICH

The ePIC experiment

layout of the barrel detector

B Surov

- **tracking**

M Posik

- new 1.7 T magnet
- Si-MAPS + MPGDs

- **calorimetry**

D Hornidge

- e-side: PbWO_4 EMCal
- barrel: imaging EMCal
- h-side: finely segmented
- outer barrel HCal

- **particle ID**

- AC-LGAD TOF
- pfRICH
- hpDIRC
- dRICH

Particle identification in ePIC

synergy of Cherenkov imaging and time-of-flight techniques

particle ID

- AC-LGAD TOF
- pFRICH
- hpDIRC
- dRICH

ePIC
backward RICH

pfRICH – proximity focusing RICH

a classical proximity focusing RICH with timing capability for MIPs

- **Cherenkov radiator**

- 2.5 cm thick aerogel ($n = 1.04-1.05$)
- with 300 nm acrylic filter
- $\langle N_{pe} \rangle \sim 11-12$

- **proximity gap**

- 45 cm long
- nitrogen filled

- **HRPPD photosensors**

- 120 x 120 mm tiles
- pixelation: 32 x 32 pads
- DC-coupled

- **timing capability**

- MIP produces UV light (dozens of pe) in the HRPPD window
- provide time with $\sigma < 20$ ps

pfRICH acceptance optimisation

use side wall mirrors to increase pseudorapidity acceptance

without wall mirrors

achieve $-3.5 < \eta < -1.5$ acceptance
 conical mirrors to avoid inefficiency of the sensor plane

with wall mirrors

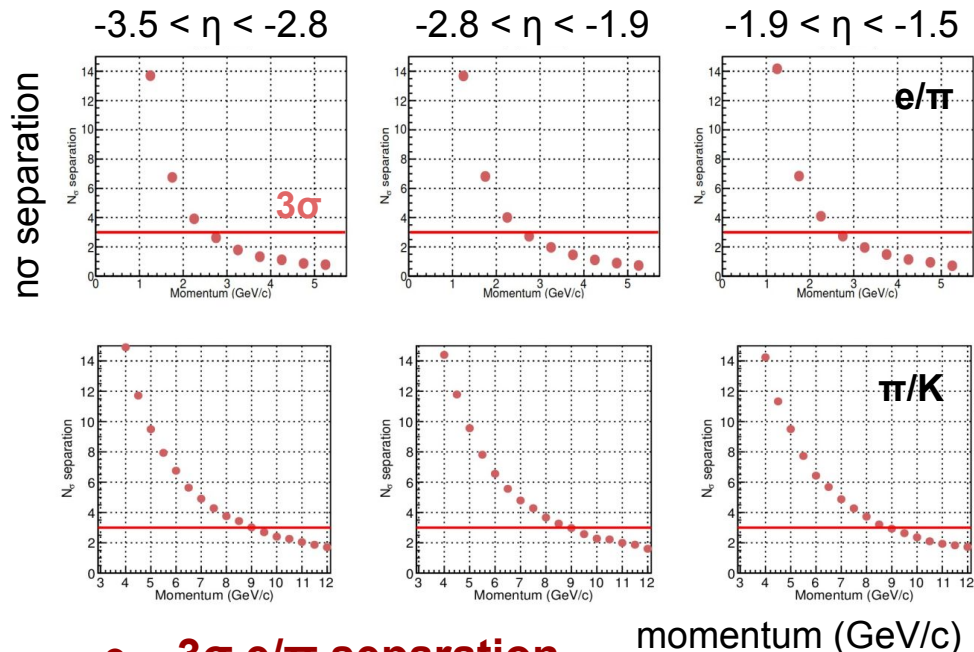

pfRICH performance simulation

complete Geant4 simulation, event-level digitisation and reconstruction

Momentum Vs Cherenkov angle (track)

- **direct and reflected photon hits**
 - reconstruction algorithm capable of handling complex categories
 - angles in agreement with expectations

- **3σ e/ π separation**
 - up to ~ 2.5 GeV/c
- **3σ π /K separation**
 - up to ~ 9.0 GeV/c

momentum (GeV/c)

dRICH – dual-radiator RICH

compact and cost-effective solution for broad momentum coverage at forward rapidity

- **radiators:** aerogel ($n \sim 1.02$) and C_2F_6 ($n \sim 1.0008$)
- **mirrors:** large outward-reflecting, 6 open sectors
- **sensors:** $3 \times 3 \text{ mm}^2$ pixel, 0.5 m^2 / sector
 - single-photon detection inside high B field ($\sim 1 \text{ T}$)
 - outside of acceptance, reduced constraints
 - SiPM optical readout

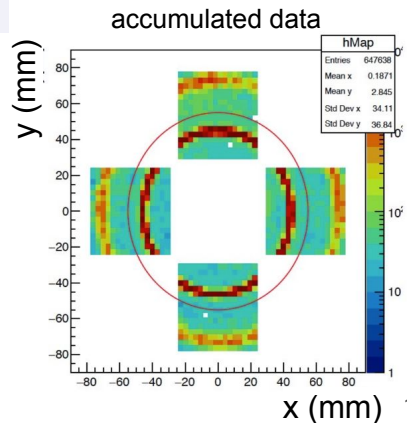

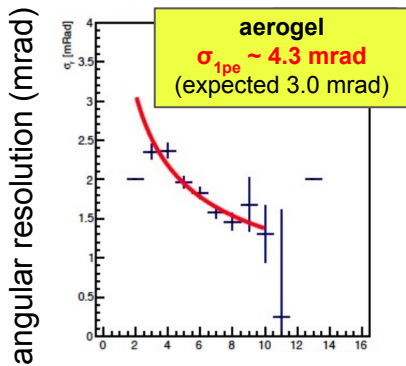

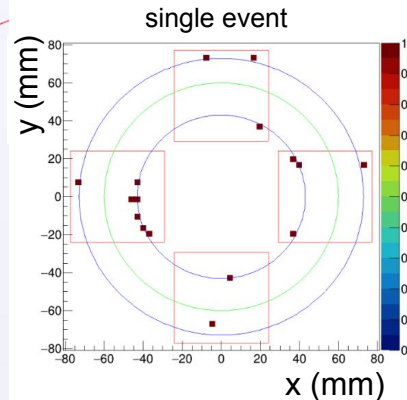

example event (accumulated hits)

dRICH beam tests

detector prototype to study dual radiator performance and interplay

dRICH beam tests

successful beam test with prototype SiPM photodetector units (CERN-PS, ended on 18th October)

PDU

4x SiPM matrix arrays
(256 channels)

front-end electronics
(ALCOR ASIC inside)

dRICH performance simulation

within ePIC simulation framework

continuously improving detector description and optimisation

- preliminary optimisation of dRICH optics
 - single mirror configuration
 - optimise focus in the most demanding region, $2.5 < \eta < 3.5$
 - target resolution of ~ 0.3 mrad
- realistic tiling and shaping of SiPM readout surface
 - grouping of SiPM according to 256-channel PDU
 - with 3 mm gap between PDU

> 3σ continuous separation

in the desired momentum range up to ~ 50 GeV/c

hpDIRC – high-performance DIRC

fast focusing DIRC with high-resolution 3D (x,y,t) reconstruction

- **crucial components**

- innovative 3-layer spherical lenses
- compact fused silica expansion volumes
- fast photodetection, small pixel MCP-PMT

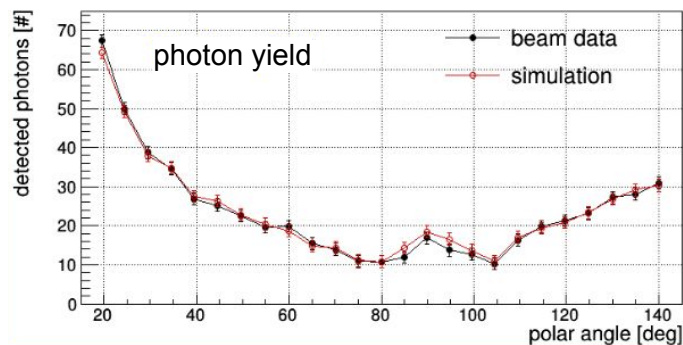

- **hpDIRC creates focused images**

- significantly improved resolution

hpDIRC performance validation

synergic beam test with PANDA prototype at CERN PS in 2018

observed pattern (20 deg polar angle)

π/p separation power at 7 GeV/c

- **measurements compared to simulation**

- single-photon Cherenkov-angle resolution
- number of photons
- π/p separation power

- **are in excellent agreement**

- same code used for ePIC hpDIRC GEANT studies
- good confidence in hpDIRC performance simulation

hpDIRC performance in B field

simulation studies of the impact of magnetic field on hit pattern

MARCO magnetic field map (1.7 T)

B = OFF

B = ON

detector plane located in modest magnetic field < 0.5 T

Photon yield per particle

Cherenkov angle resolution per photon (SPR)

no significant impact on the performance

TOF – Time of Flight

based on AC-LGAD technology, also used in ePIC far-forward instrumentation

two AC-LGAD layers

barrel TOF, $|\eta| < 1.4$

strips

500 μm x 1 cm
 $\sigma_t = 35$ ps

forward, $1.5 < \eta < 3.5$

pixels

500 μm x 500 μm
 $\sigma_t = 25$ ps

Detector	Area	Channel size	Channel number	Time resolution	Spatial resolution	Material budget
Barrel TOF	~ 10 m ²	0.5mm x 10mm	~ 2.2 M	35 ps	30 μm in r-φ	0.01 X0
Forward TOF	~ 1.4 m ²	0.5mm x 0.5mm	~ 5.6 M	25 ps	30 μm in x and y	0.05 X0

Barrel TOF detector layout

follows the design of STAR Intermediate Silicon Tracker

ePIC barrel TOF

STAR Intermediate Silicon Tracker

- **tilted stave modules**

- with overlaps in φ (full 2π azimuthal coverage)
- readout board on stave's ends (out of acceptance)
- room-temperature cooling for front-end electronics, ASIC

Forward TOF detector layout

based on the design of CMS Endcap Timing Layer

ePIC forward-TOF

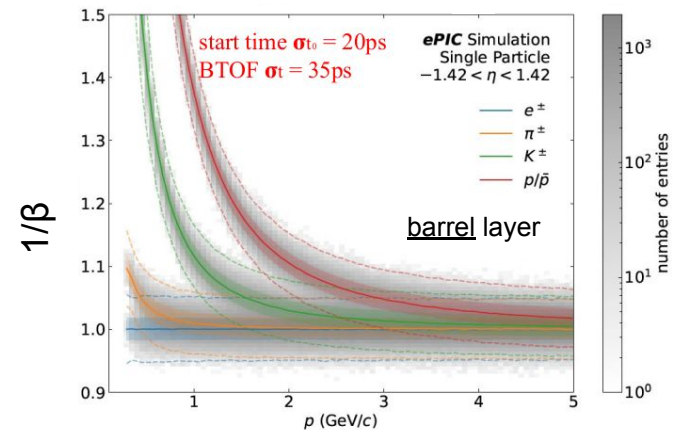

CMS Endcap Timing Layer

- **two half DEEs**
 - convenient for installation & maintenance
 - tiled by rectangular detector modules (three types, different lengths)
 - room-temperature cooling for front-end electronics, ASIC

TOF performance simulation

detector geometry implemented in Geant, digitisation and integration in tracking software

- **barrel TOF with 35 ps**
 - 3 σ K/ π separation up to ~ 1.3 GeV/c @ $\eta = 0$
- **forward TOF layer with 25 ps**
 - 3 σ K/ π separation up to ~ 2.4 GeV/c

Photosensors – HRPPD

smaller version of LAPPD MCP-PMT technology, being developed with Incom Inc.

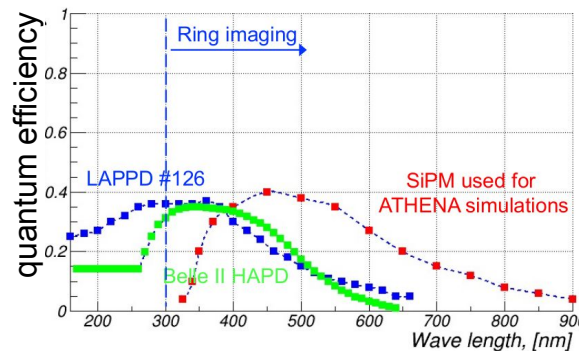

● DC-coupled HRPPD

- choice for backward RICH detector
 - for both mRICH and pRICH layout
- 108 x 108 mm² active area (120 x 120 mm² total)
- high intrinsic time resolution
- low DCR (compared to SiPM) ~ 1 kHz/cm²
- low COST (compared to other MCP-PMT)
 - possible application for DIRC

● ongoing R&D

- optimisation of QE and pixelation
- characterisation in B field
 - gain and time resolution
- mechanical / electrical interface
 - with direct pixel readout

Possible HRPPD applications for the EIC

pfRICH: total 68 HRPPD

- **backward RICH (pfRICH)**
 - low DCR noise (wrt. SiPM) and timing capability
 - HRPPD is baseline photosensors as of November 2022
- **barrel DIRC (hpDIRC)**
 - MCP-PMT are the leading sensor candidate technologies
 - established (PHOTONIS), more recent (PHOTEK)
 - HRPPD expected to be more cost-effective
- **forward RICH (dRICH)**
 - use is problematic
 - large magnetic field
 - with field lines ~ perpendicular to MCP channel

pfRICH DIRC dRICH

perspective for a sizeable production of ~ 150 HRPPDs if also hpDIRC adopts it

hpDIRC: total 72 HRPPD

Photosensors – SiPM

magnetic-field insensitive and cheap solution for the dRICH

- **pros**

- cheap
- high photon efficiency
- excellent time resolution
- insensitive to B field

- **cons**

- large DCR, $\sim 50 \text{ kHz/mm}^2$ @ $T = 24 \text{ }^\circ\text{C}$
- not radiation tolerant
 - moderate fluence $< 10^{11} \text{ n}_{\text{eq}}/\text{cm}^2$

- **R&D on mitigation strategies**

- reduce DCR at low temperature
 - operation at $T = -30 \text{ }^\circ\text{C}$ (or lower)
- recover radiation damage
 - in-situ high-temperature annealing
- exploit timing capabilities
 - with ALCOR (INFN) front-end chip

SiPM environment

moderate radiation, strong magnetic field

radiation damage estimates

1-MeV neutron equivalent fluence (1 fb⁻¹ ep running)

location of dRICH photosensors

assume fluence: $\sim 10^7 \text{ neq} / \text{cm}^2 / \text{fb}^{-1}$

conservatively assume max fluence and 10x safety factor

moderate radiation, 1000 fb⁻¹ integrated \mathcal{L} corresponds to $\sim 10^{10} \text{ n}_{\text{eq}}/\text{cm}^2$

MARCO magnetic field maps

1.7 T field

2.0 T field

non-uniform, strong magnetic field $\sim 0.7 \text{ T}$
field lines \sim parallel to photodetector surface

SiPM ageing

max acceptable DCR for Physics performance
 ~ 10 noise hits / sector within 500 ps

Hamamatsu S13360-3050 @ Vover = 4 V, T = -30 C

online annealing extends SiPM lifetime by ~ 10x

can reach 500 fb^{-1} without touching the detector
 ~ half of the EIC integrated Physics

more aggressive annealing can bring up to 1000 fb^{-1}

model input from R&D measurements

- DCR increase: $500 \text{ kHz}/10^9 n_{\text{eq}}$
- residual DCR (online annealing): $50 \text{ kHz}/10^9 n_{\text{eq}}$
- residual DCR (oven annealing): $15 \text{ kHz}/10^9 n_{\text{eq}}$

1-MeV neq fluence from background group (conservative)

- $9 \cdot 10^6 n_{\text{eq}} / \text{fb}^{-1}$
- includes 10x safety factor

these predictions are according to present knowledge / tested solutions
 there are more handles to further mitigate DCR
 lower Vover, 3V
 lower T operation -40 C or below

Summary

ePIC meets EIC PID needs with advanced detector technology

- **PID is one of the major challenges for the ePIC detector at the EIC**
 - physics requires high-purity π K p over large phase-space
 - multiple techniques needed
 - time-of-flight, ring imaging Cherenkov
 - calorimetry for e (μ) identification
- **selected detector technologies meet the requirements**
 - AC-LGAD TOF
 - high-performance DIRC
 - dual-radiator RICH
 - proximity-focusing RICH
- **ongoing R&D and engineering activities**
 - risk reduction
 - optimisation of technologies

dRICH beam tests

successful operation of SiPM with complete readout chain

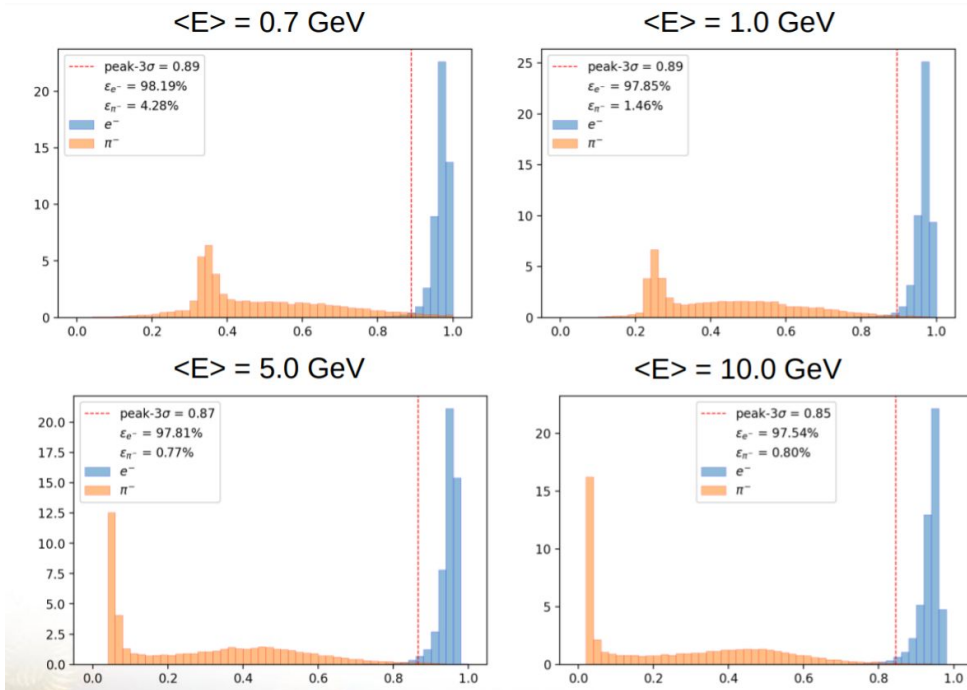

SiPM sensors were **irradiated** (up to 10^{10}) and **annealed** (150 hours at $T = 150$ C)

EMCal e/π separation power

excellent, up to 10^4 pion suppression

barrel SciGlass

Realistic ePIC simulation

Muon identification

muon ID using a combination of EM and Hadron calorimetry

Total hadron interaction length:

6-7 λ_0 for central and 7-8 λ_0 for forward

Pion punch through probability: 10^{-2} to 10^{-3} level

- Utilizing central track, barrel EMCal, EMCal active support and barrel HCal
- Pion rejection starting at 10^{-1} at low p and saturate above 100:1 above a few GeV/c

dRICH photodetector unit

conceptual design of final layout

SiPM sensor matrices mounted on carrier PCB board

- 4x 64-channel SiPM array device (256 channels) for each unit
 - need modularity to realise curved readout surface
- 1240 photodetector units for full dRICH readout

EIC detector requirements for PID

definition of requirements in the Yellow Report

- generic all-purpose detector and performance matrix**

- summarises the detector requirements for the diverse physics program at EIC
- focus on the PID-relevant subset of the detector matrix

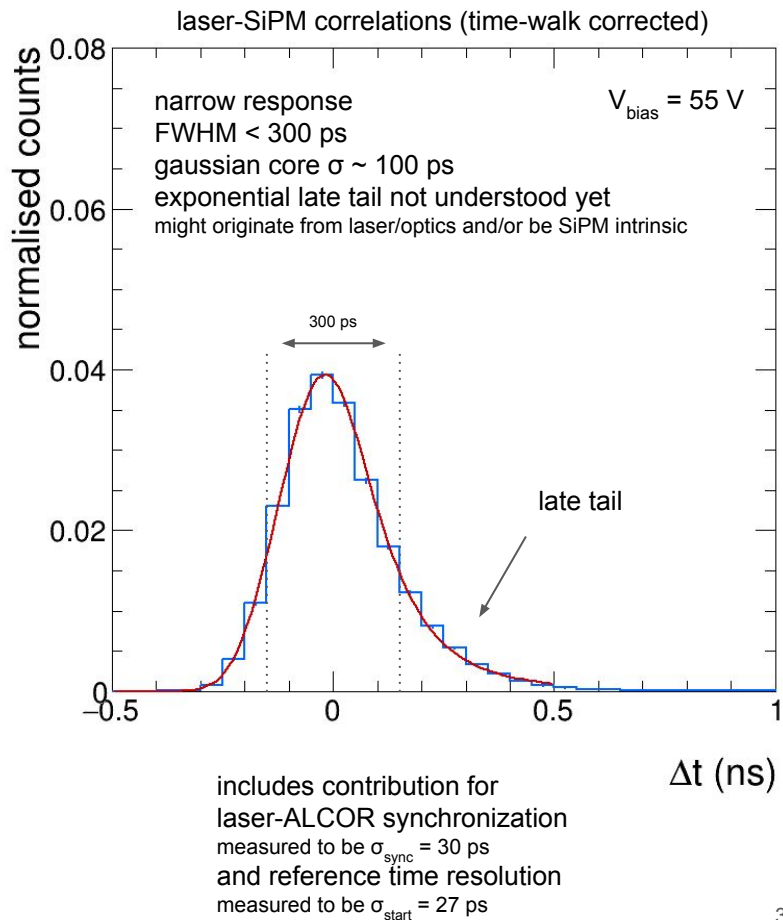

η	θ (mrad)	Nomenclature	Electrons and Photons			$\pi/K/p$				
			Resolution σ/E	PID	min E photon	p-Range (GeV/c)	Separation			
-4.0 to -3.5		Central Detector	not accessible					$\geq 3 \sigma$		
-3.5 to -3.0			Backward Detector	1%/E \oplus 2.5%/E \oplus 1% (for 40 cm space)	π suppression n up to 1.1E-4	20 MeV	≤ 10 GeV/c

Timing performance measurements with ALCOR

time resolution of SiPM ($\sigma < 85$ ps) must not be dominant contribution to overall time resolution ($\sigma < 150$ ps)

HRPPD tests in magnetic field

ePIC solenoid magnetic field (Tesla) in Z direction;

- **pfRICH HRPPD will be exposed to a ~ 1.4 T magnetic field**
 - field lines at an angle of up 12.6 degrees to wrt. HRPPD normal
- **tests of HRPPD prototype in high magnetic field**
 - carried out by Argonne and Incom using g-2 calibration solenoid
 - data analysis by eRD110 members of pfRICH team
- **preliminary conclusion**
 - gain in this high magnetic field can be fully restored by increasing HV from 925 to ~ 1075 V
