Motivation

$1_{\text{mom}} + 2_{\text{coord}}$ tomographic images of quark distribution in nucleon at fixed longitudinal momentum

3-D image from FT of the longitudinal mom. transfer

[H. Abramowicz et al., whitepaper for NSAC LRP, 2007]

★ Also introduction from A. Metz and E. Voutier

★ GPDs are not well-constrained experimentally:

- **x-dependence extraction is not direct. DVCS amplitude:** $\mathcal{H} = \int_{-1}^{+1} \frac{H(x, \xi, t)}{x - \xi + i\epsilon} dx$

(SDHEP [J. Qiu et al, arXiv:2205.07846] gives access to x)

- independent measurements to disentangle GPDs
- GPDs phenomenology more complicated than PDFs (multi-dimensionality)
- and more challenges ...

Essential to complement the knowledge on GPD from lattice QCD

★ **Twist-2:** probabilistic densities - a wealth of information exists (mostly on PDFs)

★ **Twist-3:** poorly known, but very important:

- as sizable as twist-2
- contain information about quark-gluon correlations inside hadrons
- appear in QCD factorization theorems for various observables (e.g. g_2)
- certain twist-3 PDFs are related to the TMDs
- physical interpretation (e.g. average force on partons inside hadron)

While twist-3 $f_i^{(1)}$ share some similarities with twist-2 $f_i^{(0)}$ in their extraction, there are several challenges both experimentally and theoretically

Goals

- ★ Extraction of standard GPDs using A_i obtained from any frame
- ★ quasi-GPDs may be redefined (Lorentz covariant) inspired by light-cone

→ Proof-of-concept calculation ($\xi = 0$):

- symmetric frame: $\vec{p}_f^s = \vec{P} + \frac{\vec{Q}}{2}, \quad \vec{p}_i^s = \vec{P} - \frac{\vec{Q}}{2} \quad -t^s = \vec{Q}^2 = 0.69 \text{ GeV}^2$

- asymmetric frame: $\vec{p}_f^a = \vec{P}, \quad \vec{p}_i^a = \vec{P} - \vec{Q} \quad t^a = -\vec{Q}^2 + (E_f - E_i)^2 = 0.65 \text{ GeV}^2$

Comparison of A_i in two frames

Unpolarized GPDs

- ★ A_1, A_5 dominant contributions
- ★ Full agreement in two frames for both Re and Im parts of A_1, A_5
- ★ A_3, A_4, A_8 zero at $\xi = 0$
- ★ A_2, A_6, A_7 suppressed (at least for this kinematic setup and $\xi = 0$)

On-going work

Summary

- ★ New proposal for Lorentz invariant decomposition has great advantages:
 - significant reduction of computational cost
 - access to a broad range of t and ξ
- ★ LaMET formalism is applicable beyond leading twist. However, several improvements needed, e.g., mixing with quark-gluon-quark correlator
- ★ Future calculations have the potential to transform the field of GPDs
- ★ Synergy with phenomenology is an exciting prospect!
QGT Collaboration will be instrumental in such effort
