The emergence of nucleon mass QCD IN THE STANDARD MODEL

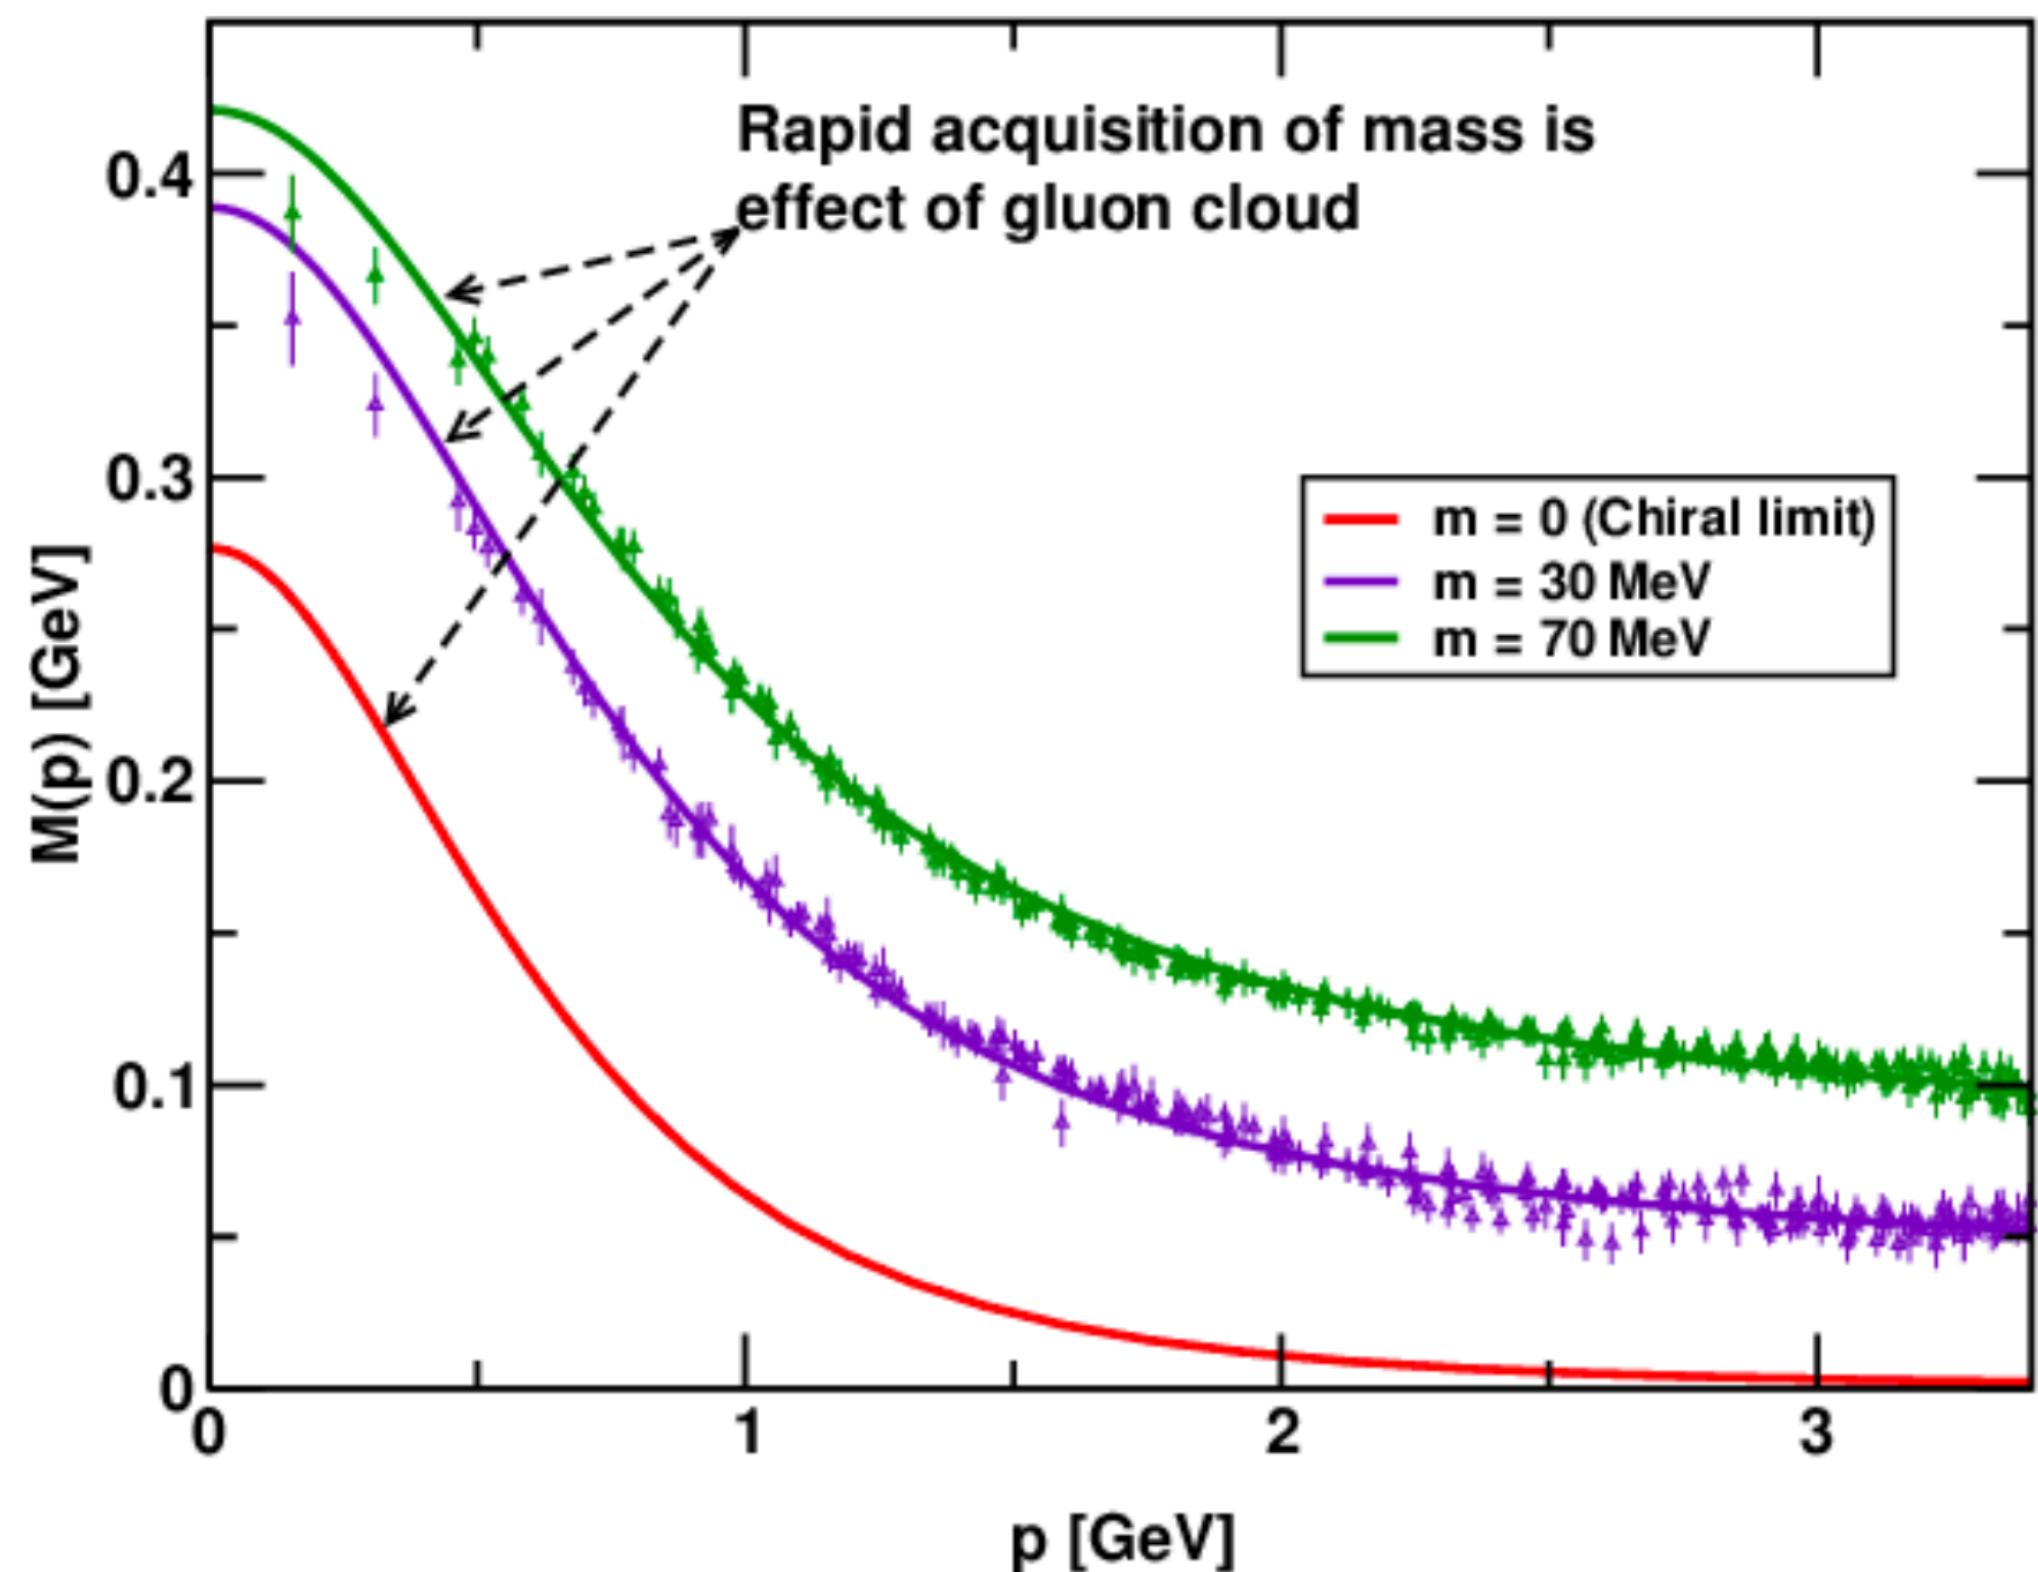

- Since the formation of protons and neutrons, most of the mass of the visible universe encapsulated in protons, neutrons, and nuclei.
- Surprising: nucleon mass much larger than sum of quark masses.
- How does QCD give rise to the 1GeV proton?*
- How is the proton mass distributed in its confinement size?*

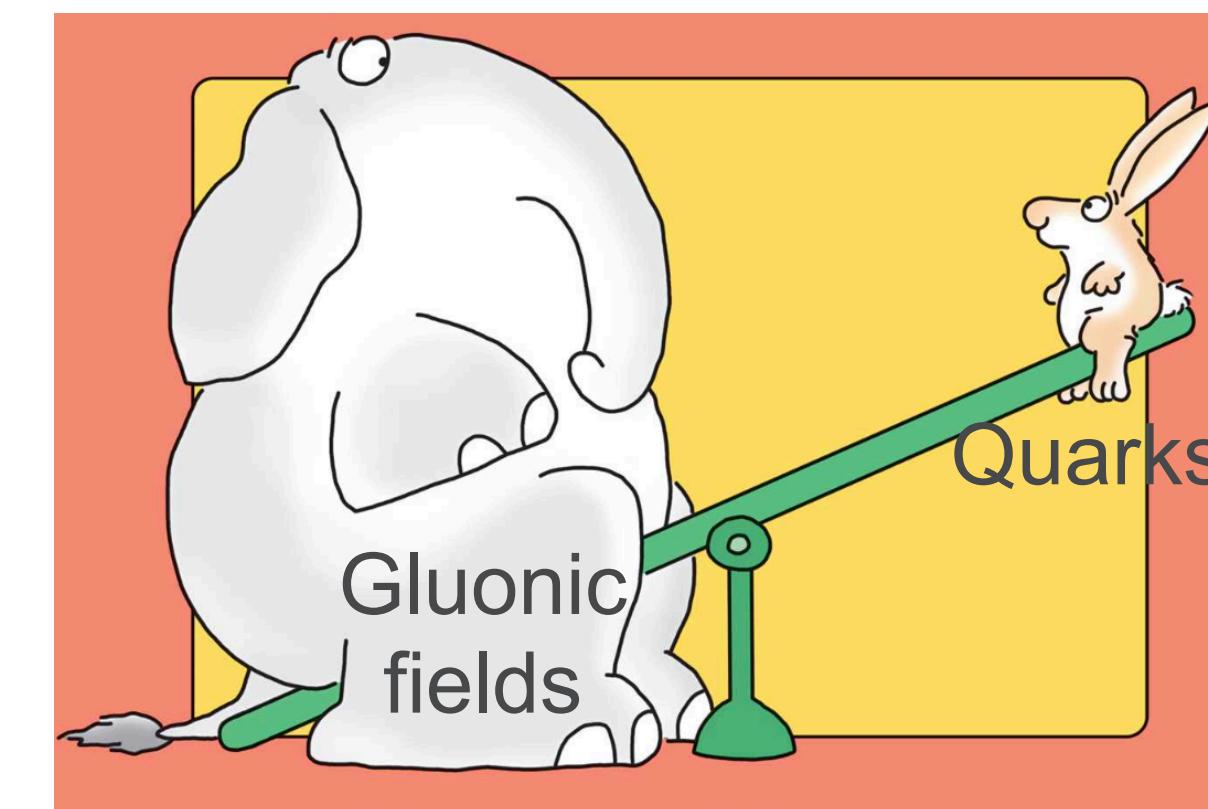

PROTON MASS IS AN EMERGENT PHENOMENON

QCD responsible for the proton mass

M. S. Bhagwat et al., Phys. Rev. C 68, 015203 (2003)
I. C. Cloet et al., Prog. Part. Nucl. Phys. 77, 1-69 (2014)

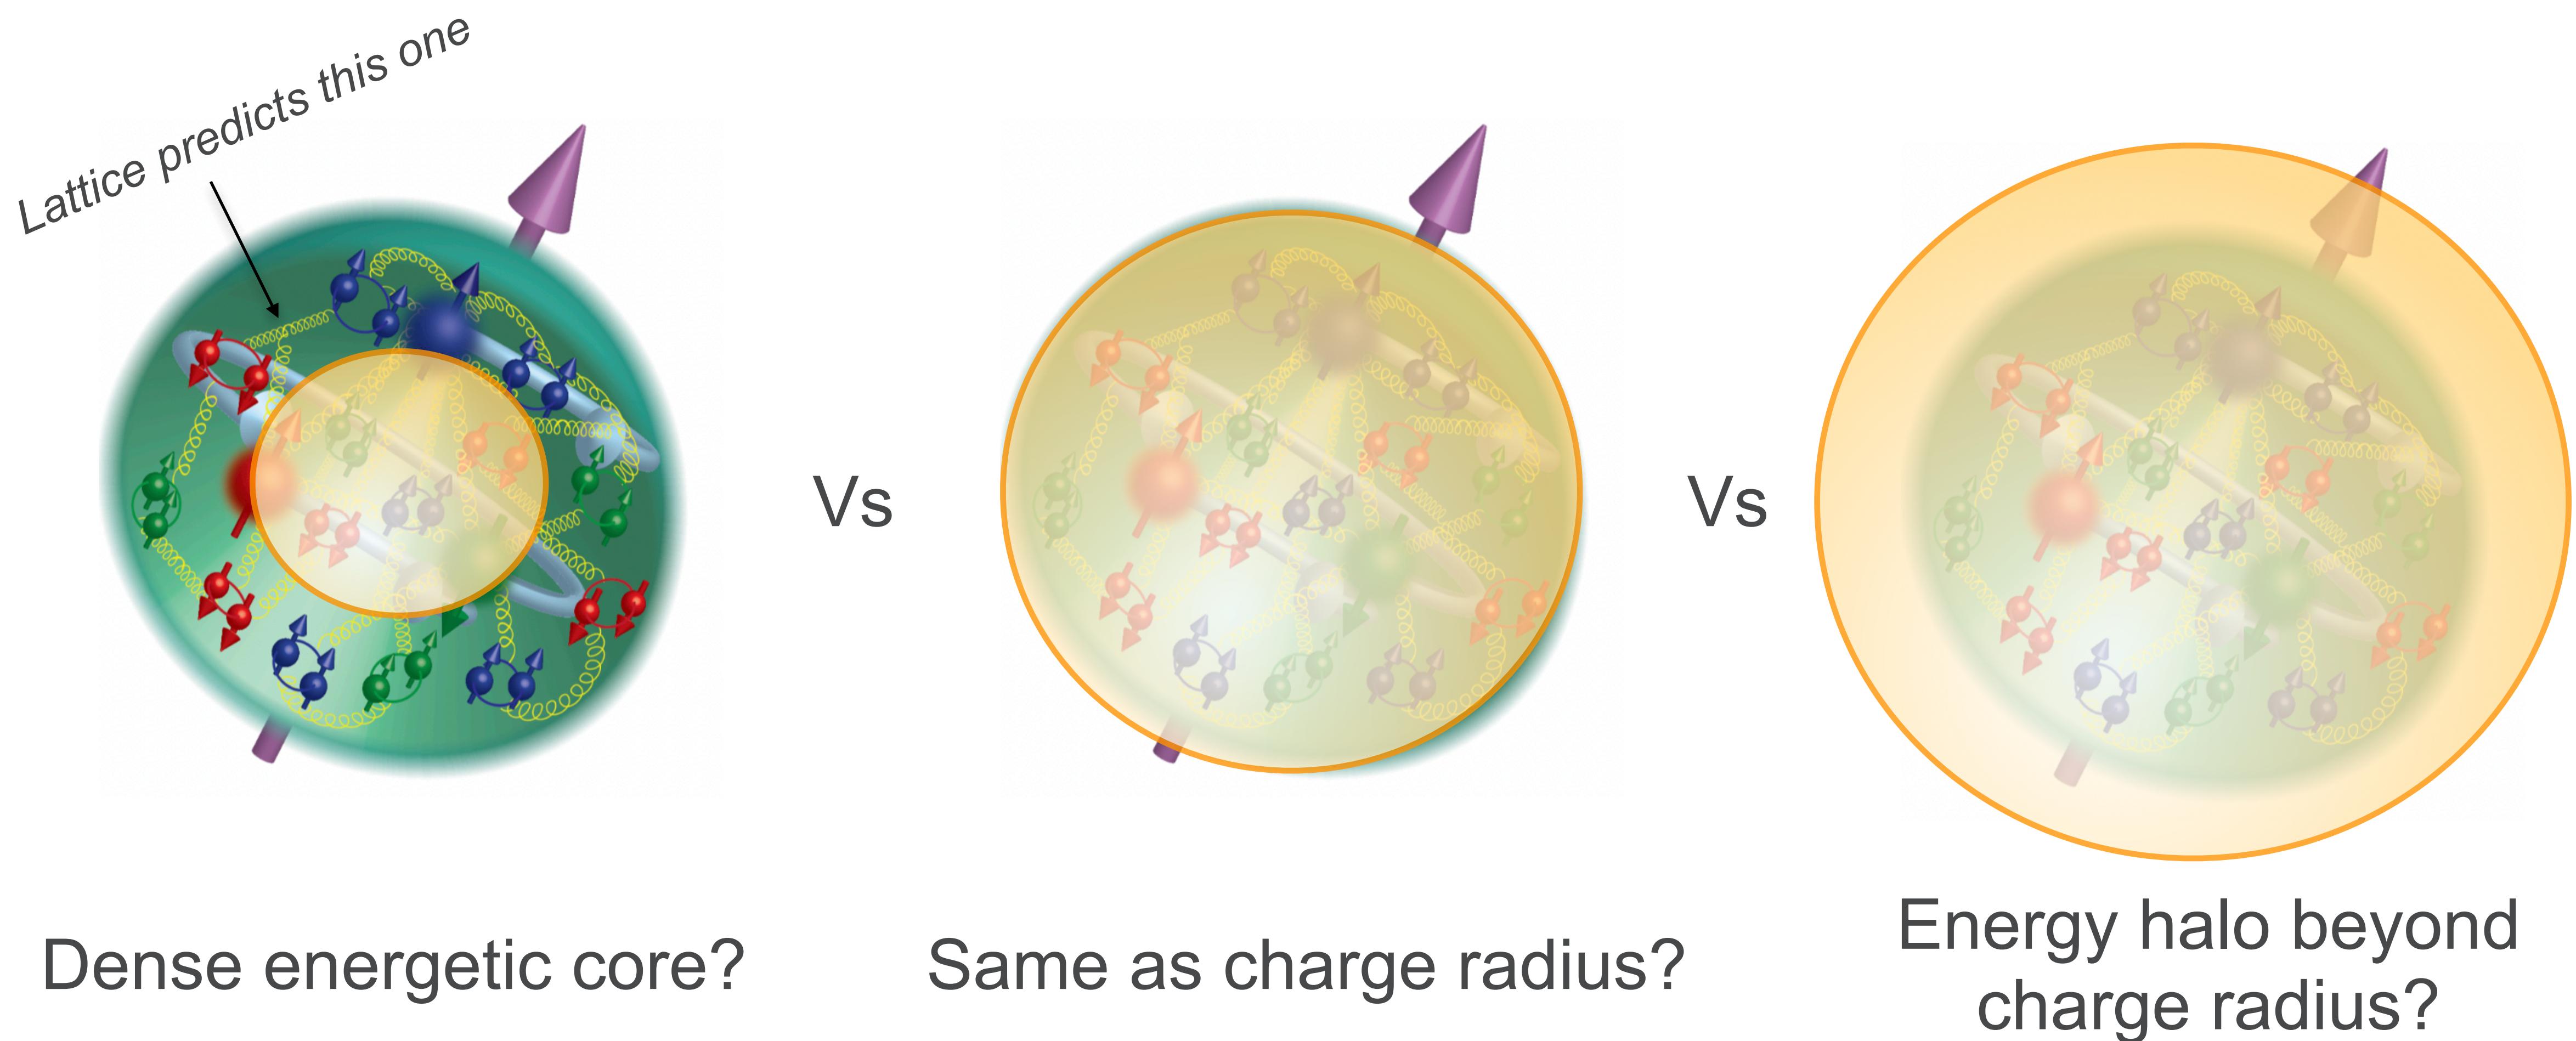

Most of the proton mass originates in the energy enclosed in the gluonic fields of the Strong Interaction itself

Bottom line: The Higgs mechanism is largely irrelevant for most of “normal” visible matter!

WHERE IS THE ENERGY INSIDE THE PROTON?

How does the mass radius compare to the charge radius?

Dense energetic core?

Same as charge radius?

Energy halo beyond
charge radius?

GRAVITATIONAL FORM FACTORS (GFFS)

Towards observables for the matter structure of the proton

GFFs are the form factors of the QCD energy-momentum tensor (EMT) for quarks and gluons

$$\langle N' | T_{q,g}^{\mu,\nu} | N \rangle = \bar{u}(N') \left(A_{g,q}(t) \gamma^{\{\mu} P^{\nu\}} + B_{g,q}(t) \frac{i P^{\{\mu} \sigma^{\nu\}} \rho \Delta_\rho}{2M} + C_{g,q}(t) \frac{\Delta^\mu \Delta^\nu - g^{\mu\nu} \Delta^2}{M} + \bar{C}_{g,q}(t) M g^{\mu\nu} \right) u(N)$$

GFFs encode mechanical properties of the proton:

- $A_{g,q}(t)$: Related to quark and gluon momenta, $A_{g,q}(0) = \langle x_{q,g} \rangle$
- $J_{g,q}(t) = 1/2 (A_{g,q}(t) + B_{g,q}(t))$: Related to angular momentum, $J_{\text{tot}}(0) = 1/2$
- $D_{g,q}(t) = 4C_{g,q}(t)$: Related to pressure and shear forces

Tensor (2++ graviton-like, mass) radius

$$\langle r_m^2 \rangle_g = \frac{6}{A_g(0)} \frac{dA_g(t)}{dt} \Big|_{t=0} - \frac{6}{A_g(0)} \frac{C_g(0)}{M_N^2}$$

Scalar (0++ glueball-like) radius

$$\langle r_s^2 \rangle_g = \frac{6}{A_g(0)} \frac{dA_g(t)}{dt} \Big|_{t=0} - \frac{18}{A_g(0)} \frac{C_g(0)}{M_N^2}$$

Both radii depend on the functional form of the gluonic A and C form factors at the origin.

HOW TO MEASURE THE GLUONIC GFFS

Gluons are elusive!

- Cannot use Electromagnetic probe: primarily couples to quarks
- Cannot use Weak probe: also primarily couples to quarks
- Cannot use hadronic probe made of light quarks: primarily sensitive to quark structure
- Cannot use direct gravitational probe: interaction too weak

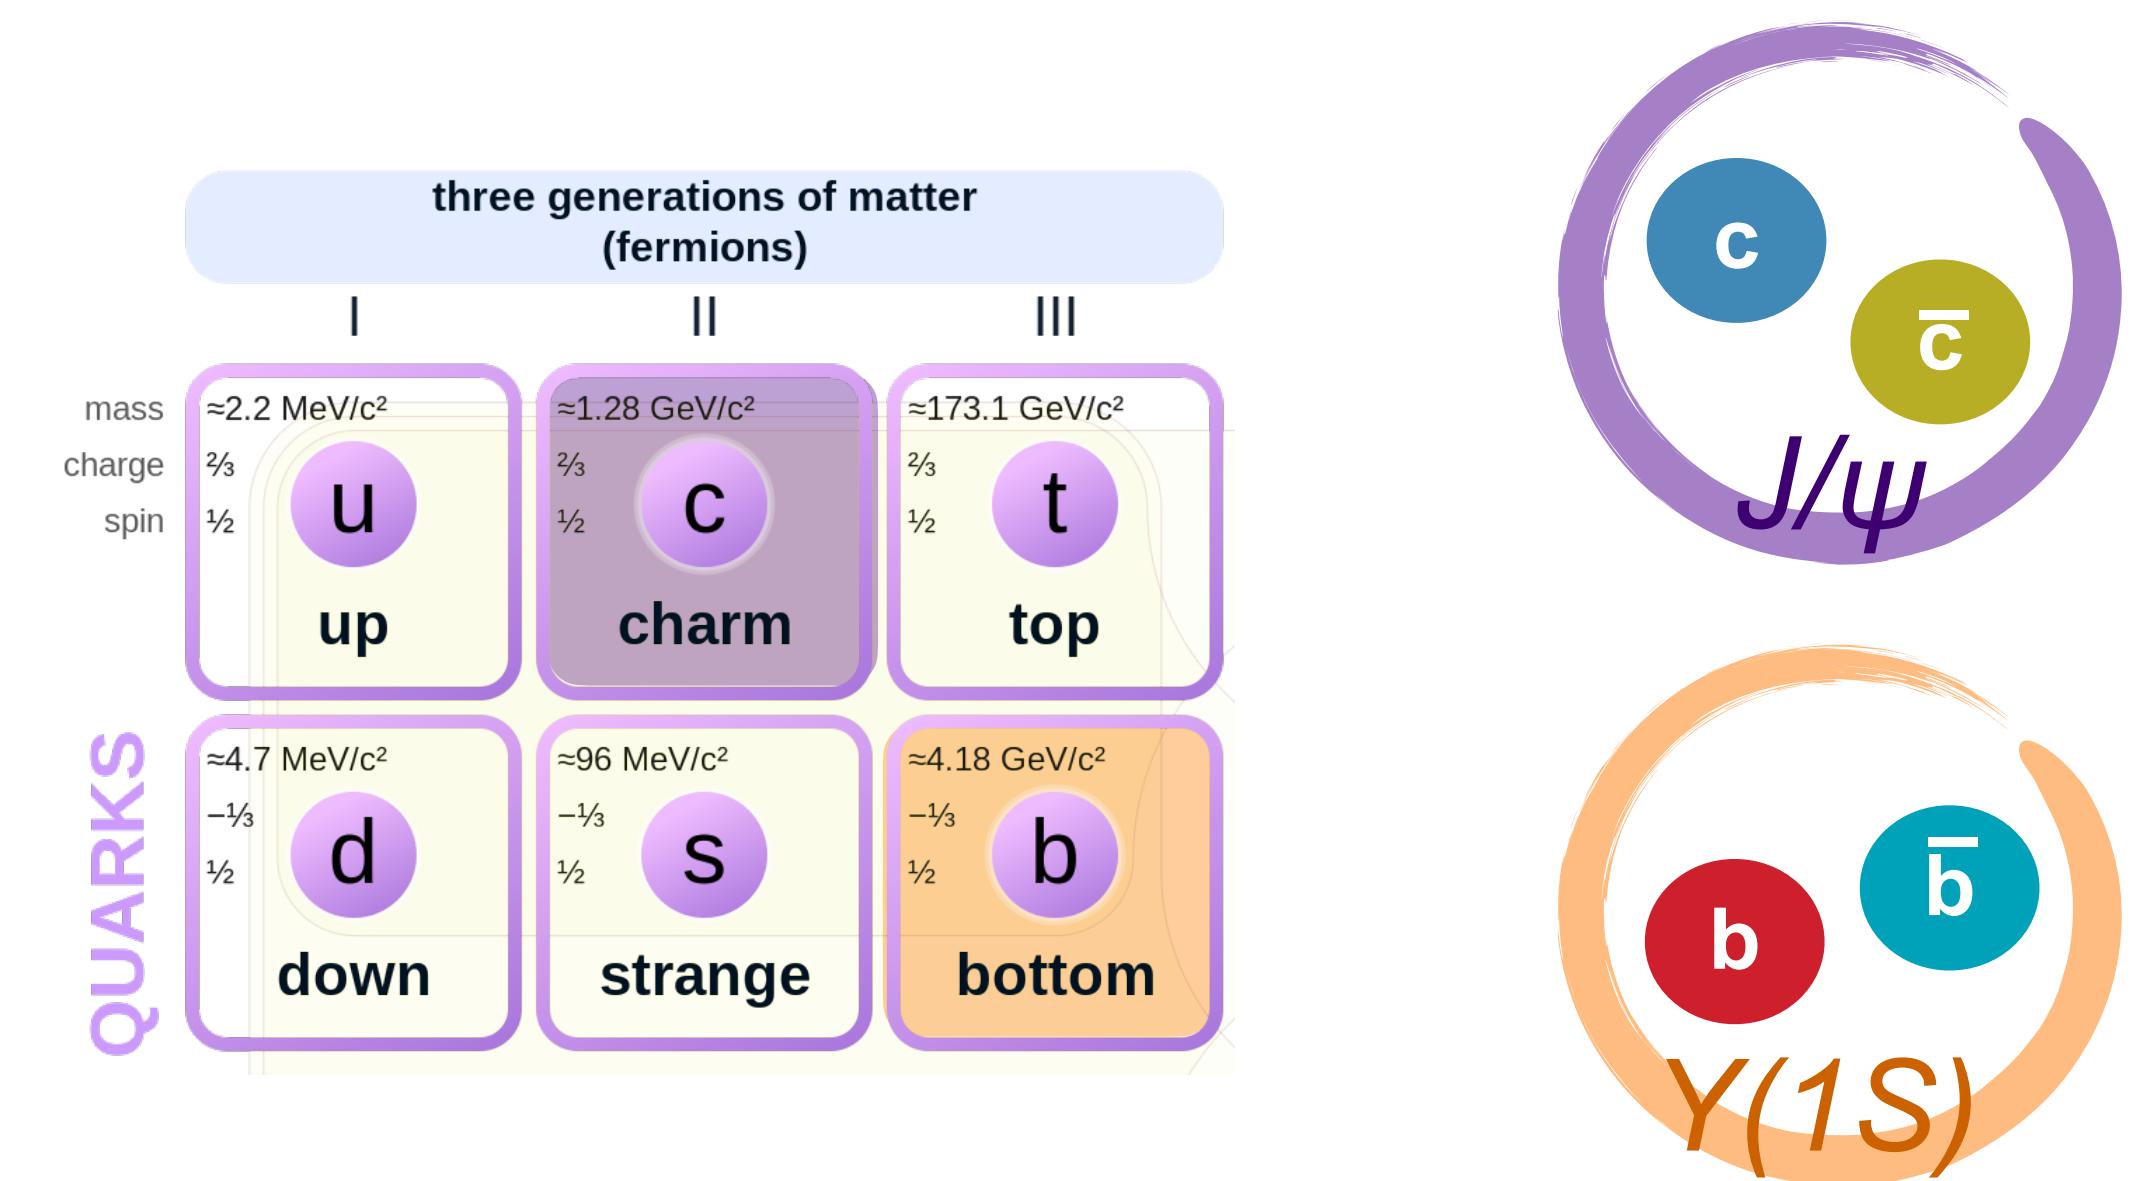

HOW TO MEASURE THE GLUONIC GFFS

Gluons are elusive!

- Cannot use Electromagnetic probe: primarily couples to quarks
- Cannot use Weak probe: also primarily couples to quarks
- Cannot use hadronic probe made of light quarks: primarily sensitive to quark structure
- Cannot use direct gravitational probe: interaction too weak

- Small “color” dipole made of heavy quarks well-suited to study gluons

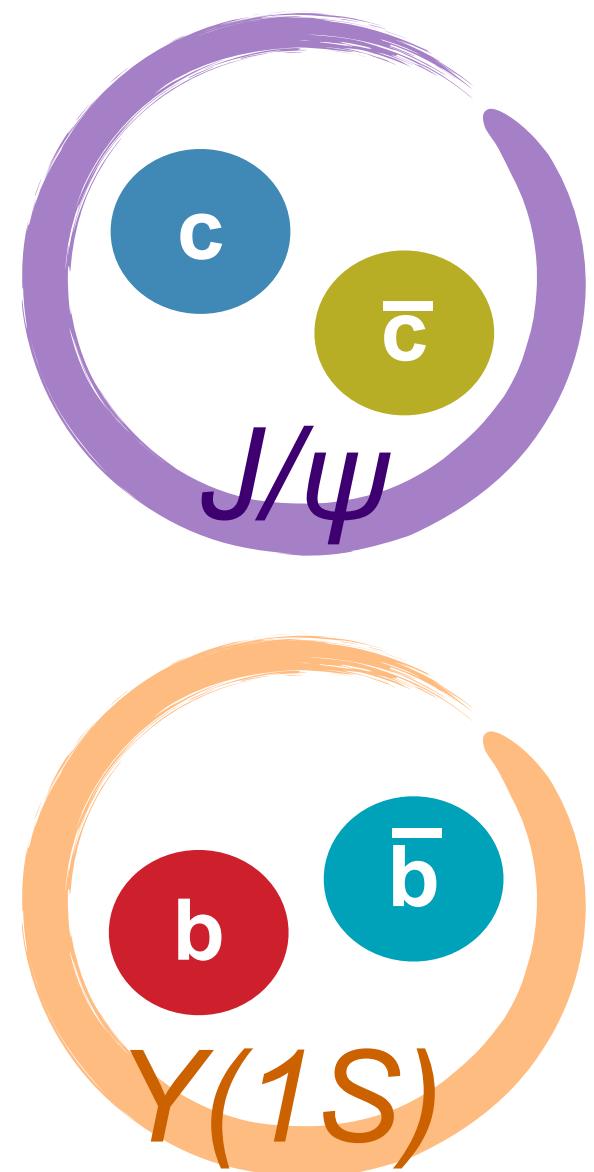

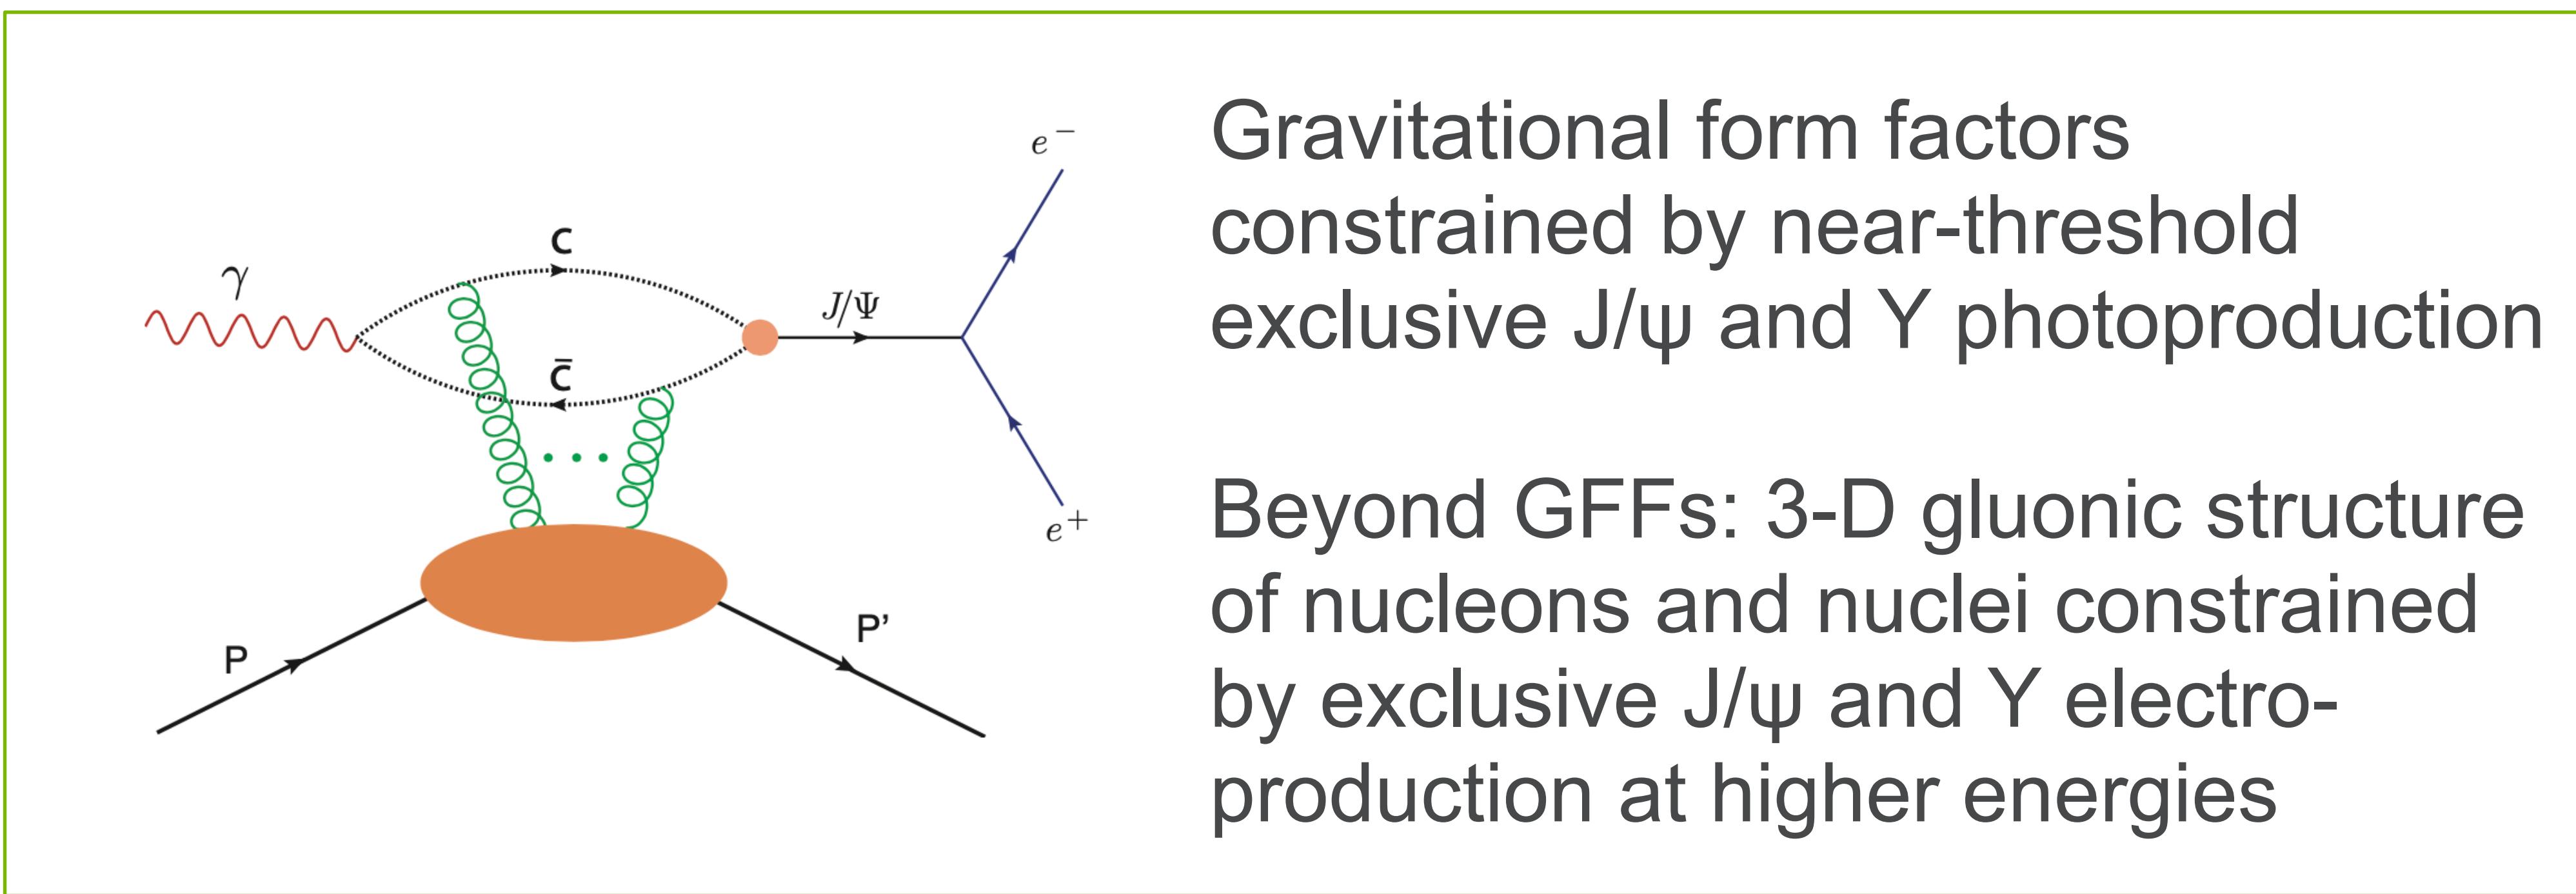

three generations of matter (fermions)			
mass	I	II	III
charge	$\frac{2}{3}$	$\frac{2}{3}$	$\frac{2}{3}$

HOW TO MEASURE THE GLUONIC GFFS

Gluons are elusive!

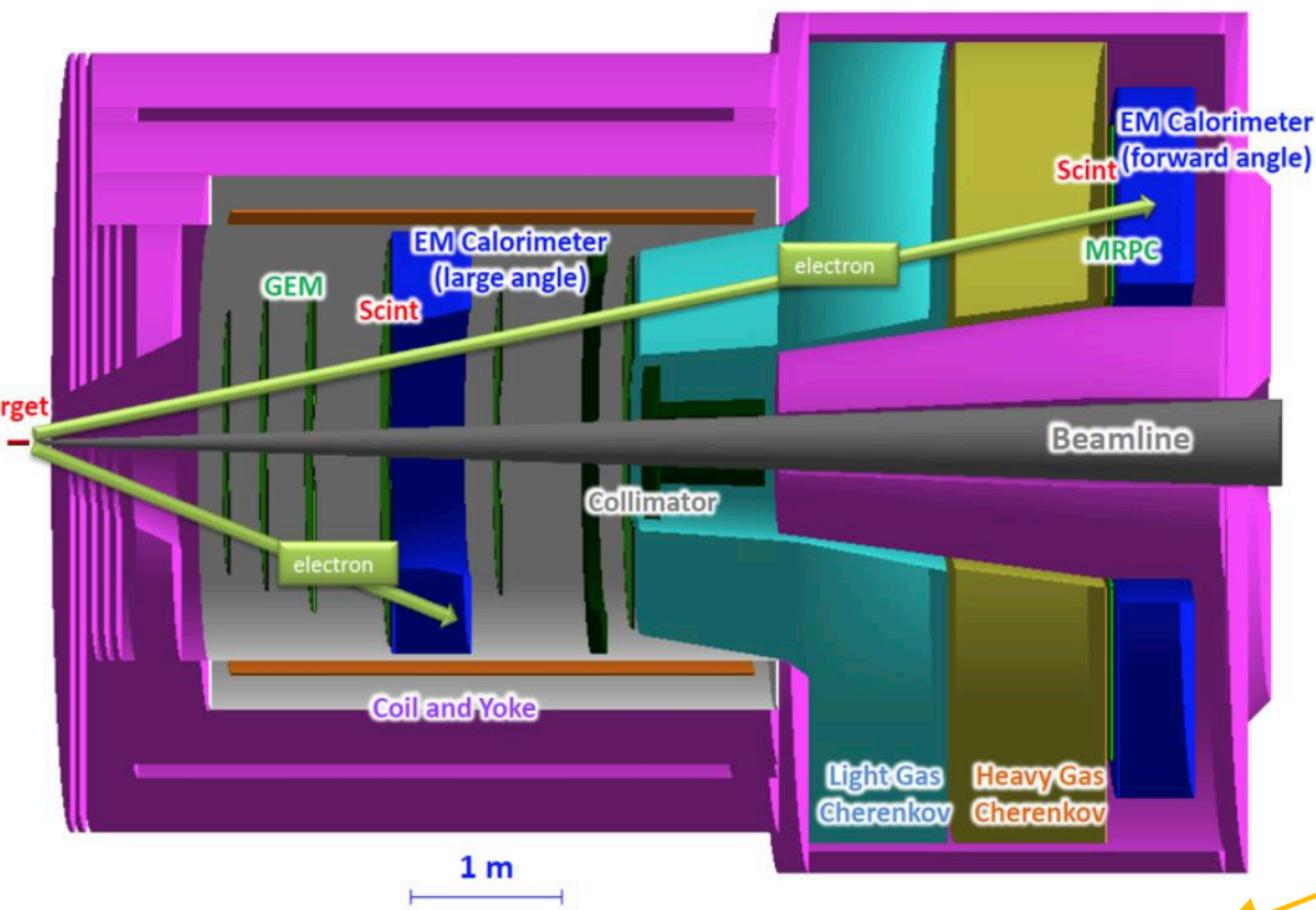

- Cannot use Electromagnetic probe: primarily couples to quarks
- Small “color” dipole made of heavy quarks well-suited to study gluons

12 GEV J/ψ EXPERIMENTS AT JEFFERSON LAB

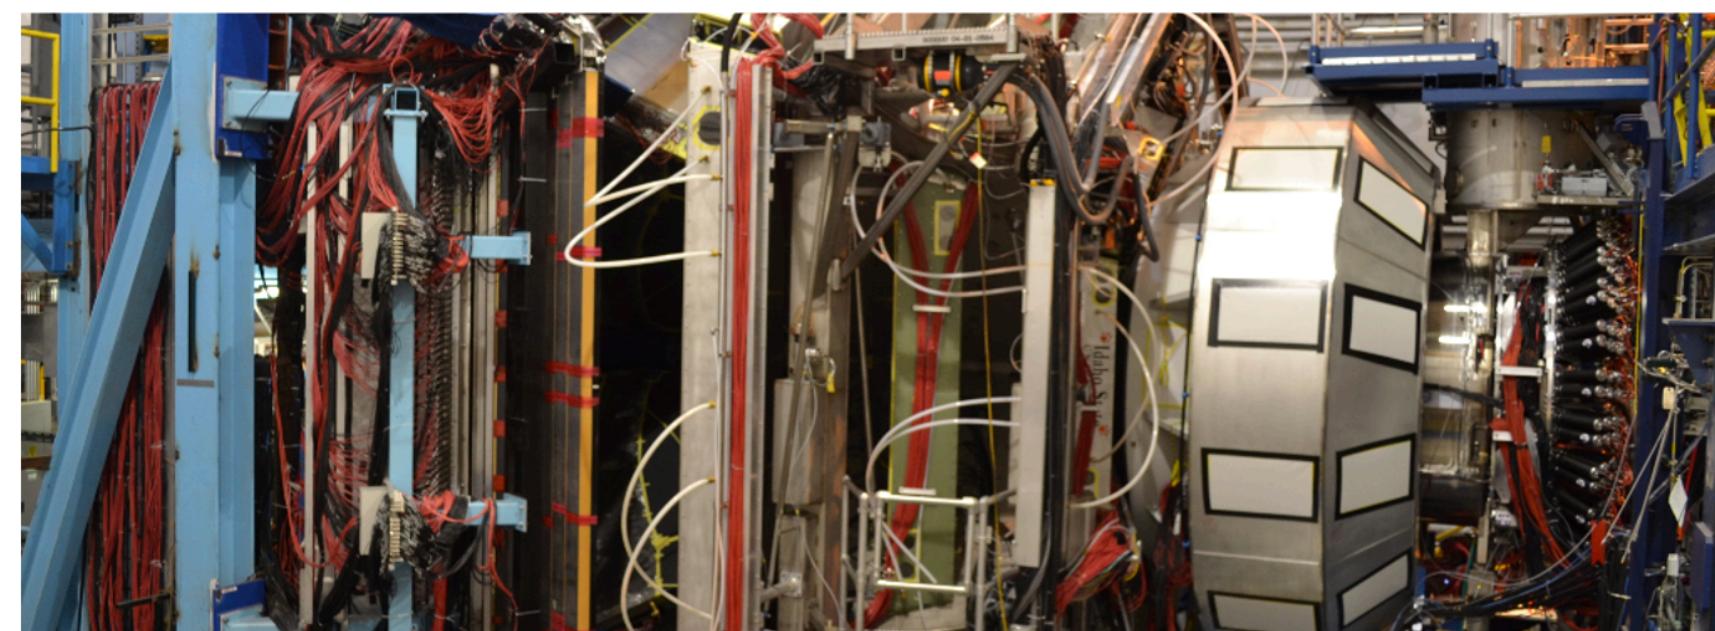

Hall D - GlueX observer the first J/ψ at JLab
A. Ali *et al.*, PRL 123, 072001 (2019)

Hall A has experiment E12-12-006 at **SoLID** to measure J/ψ in electro- and photoproduction, and an LOI to measure double polarization using **SBS**

Hall C has the J/ψ-007 experiment (E12-16-007)
LHCb hidden-charm pentaquark search

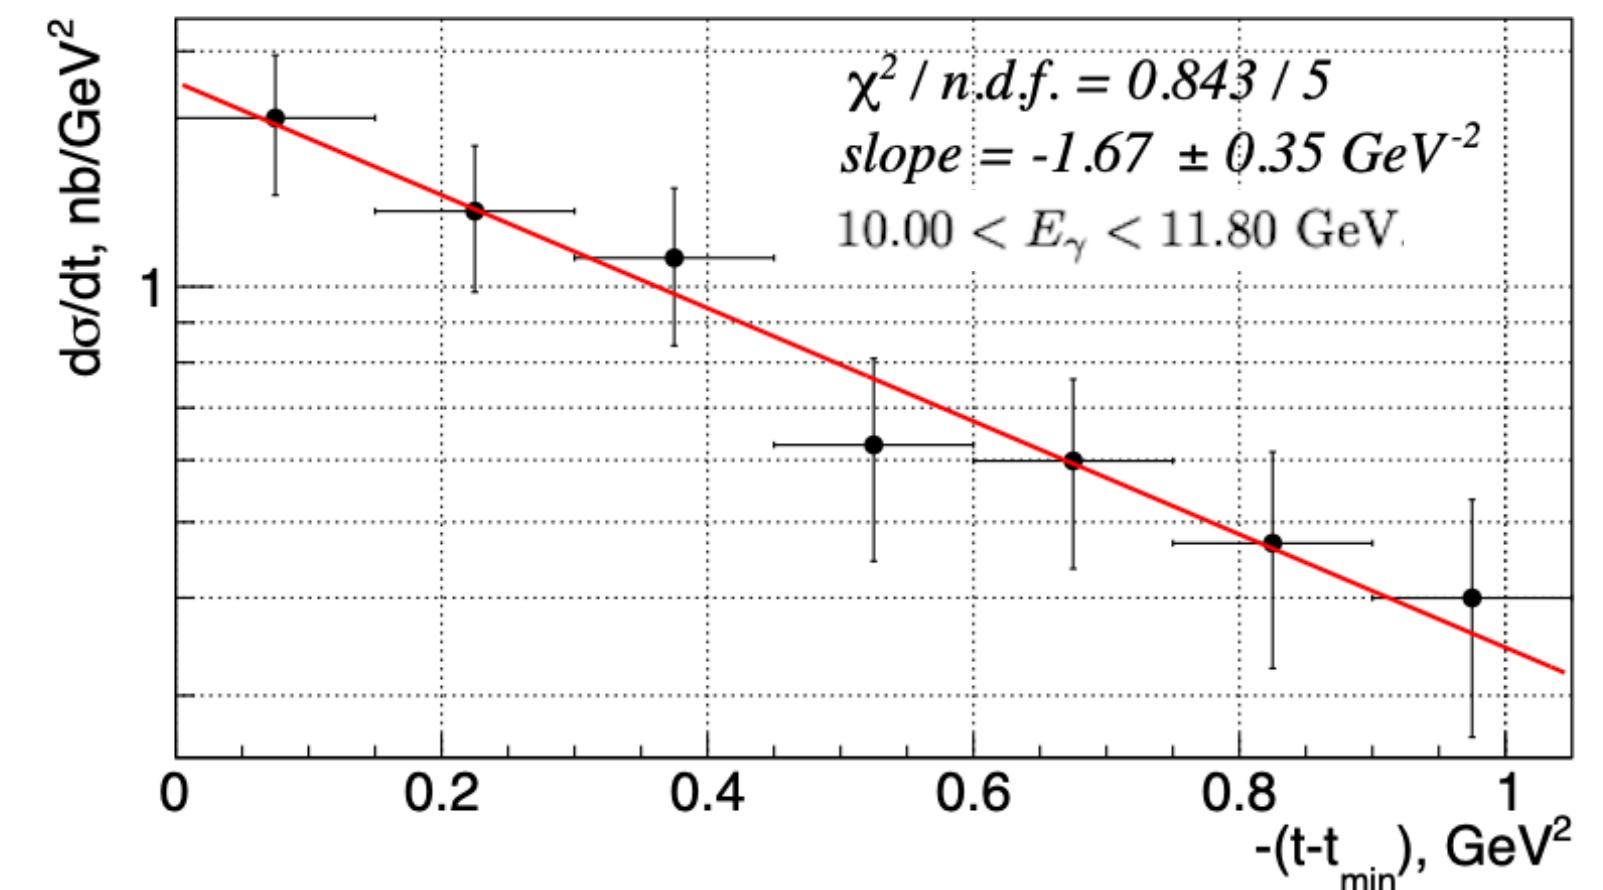

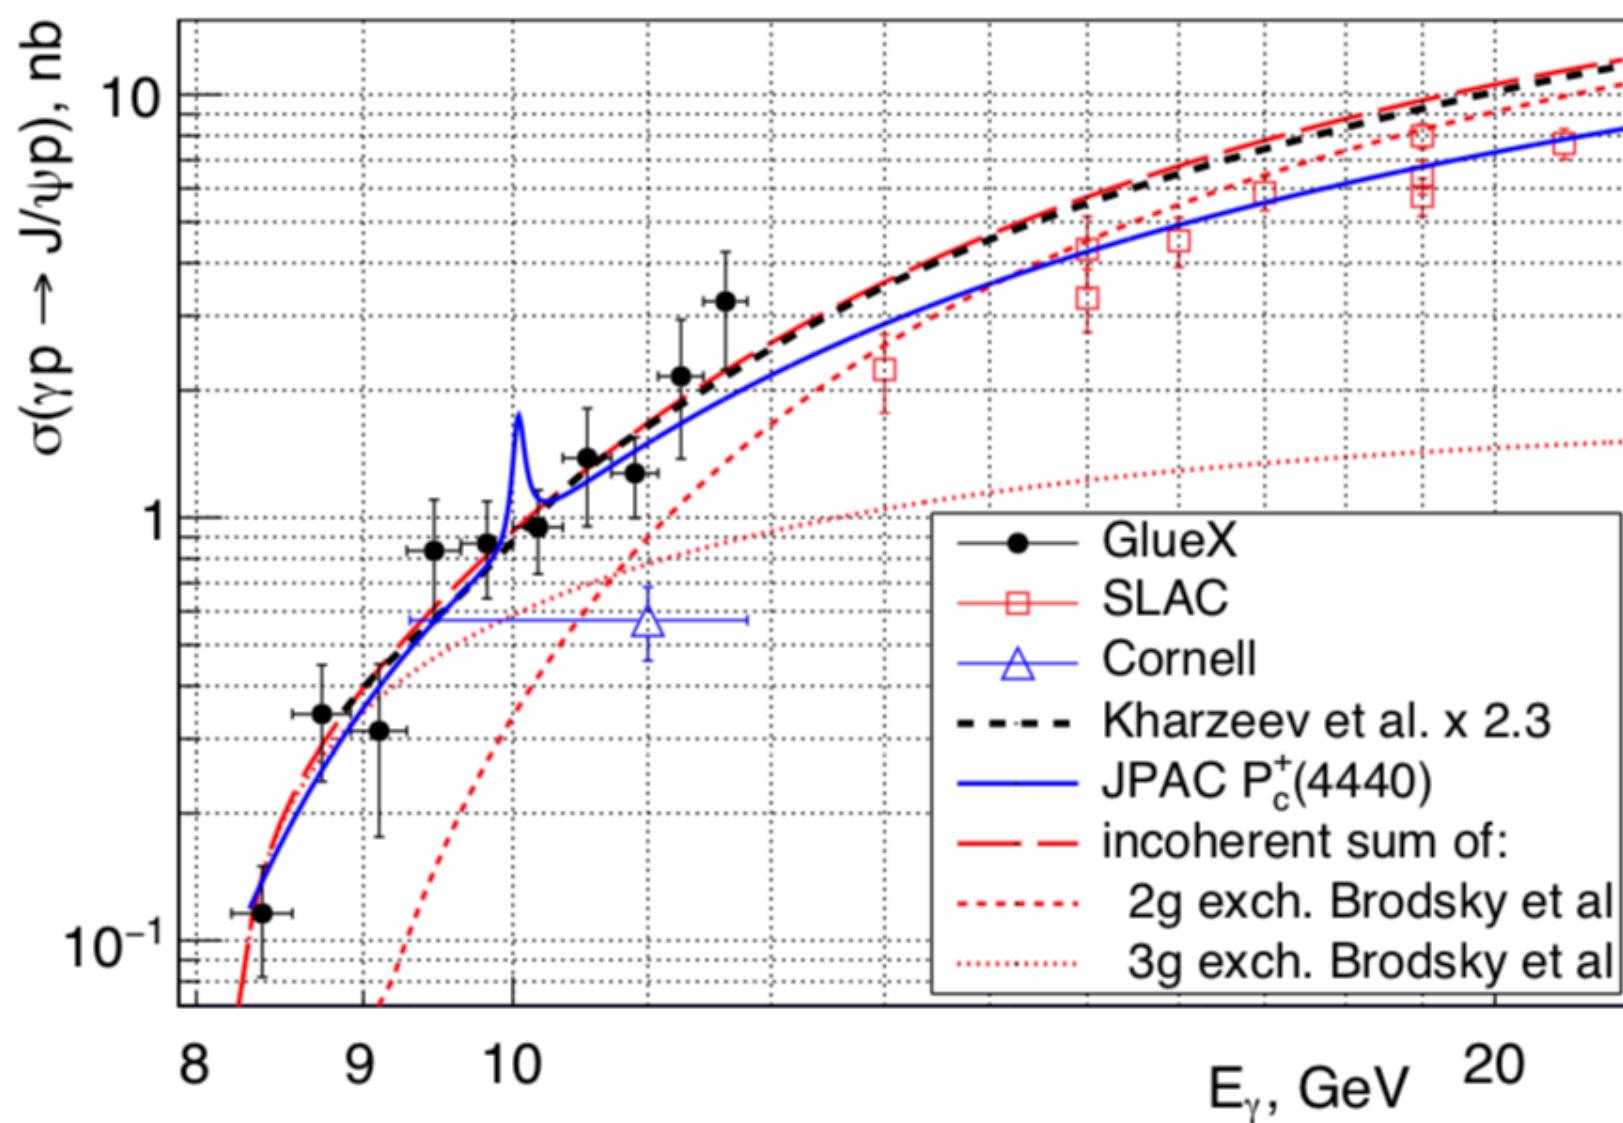

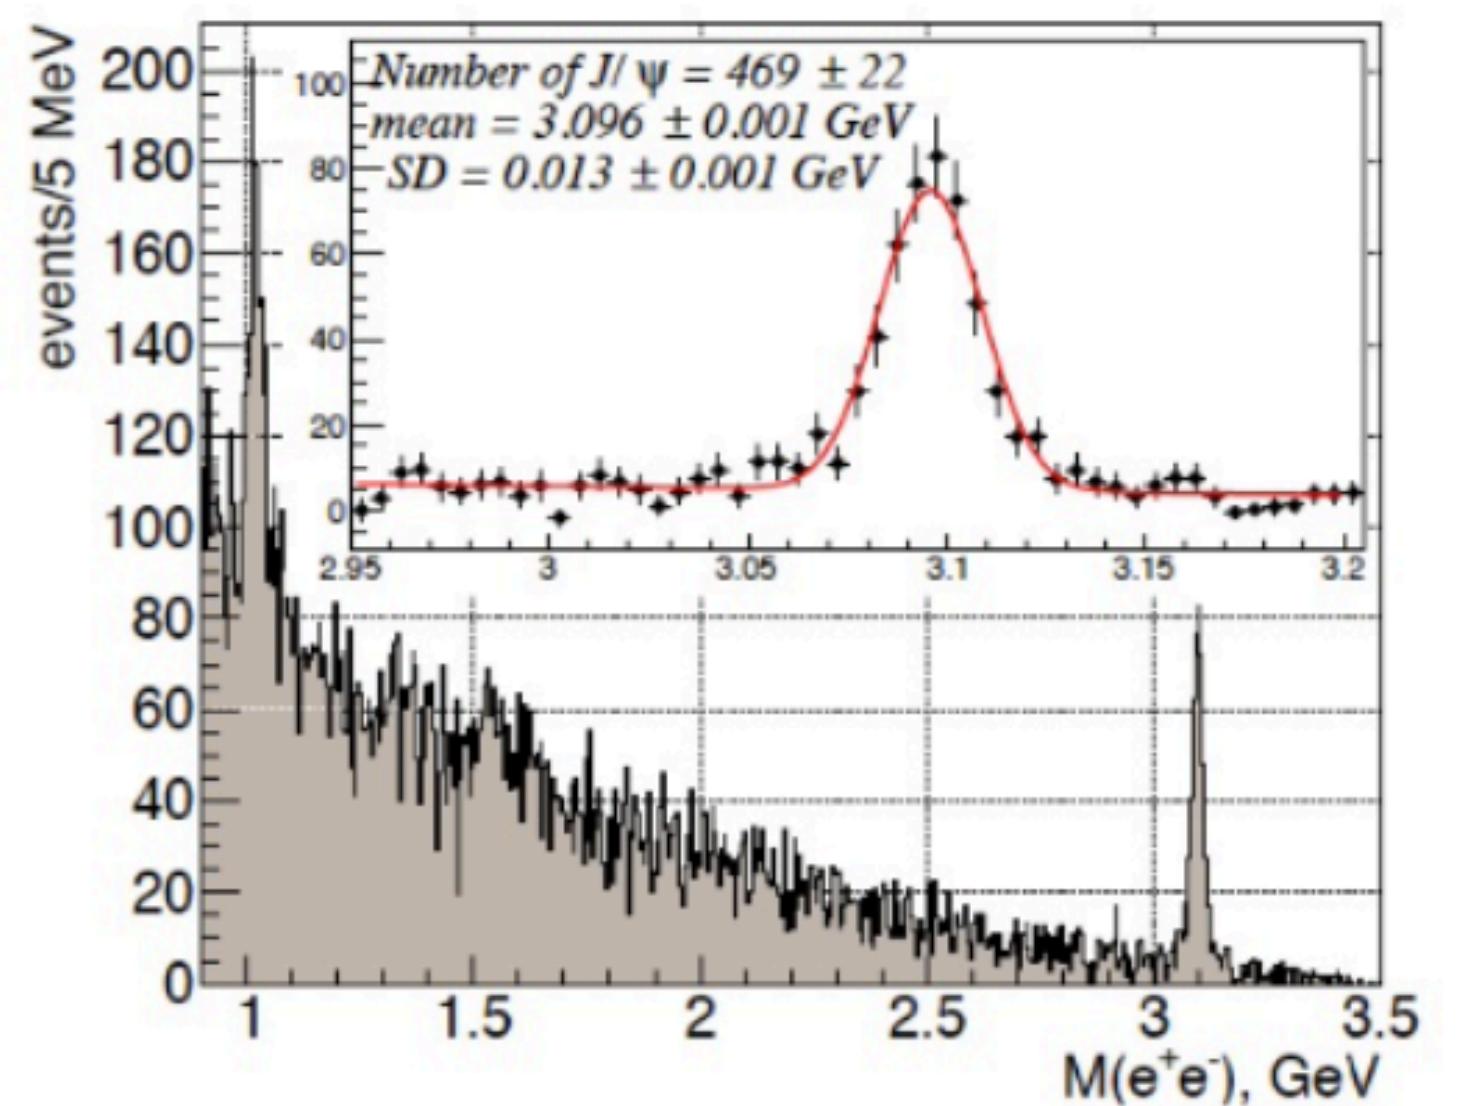

Hall B - CLAS12 has experiments to measure TCS + J/ψ in photoproduction as part of Run Groups A (hydrogen) and B (deuterium): E12-12-001, E12-12-001A, E12-11-003B

J/ψ NEAR THRESHOLD IN HALL D

First J/ψ results from JLab, published in PRL 123, 072001 (2019)

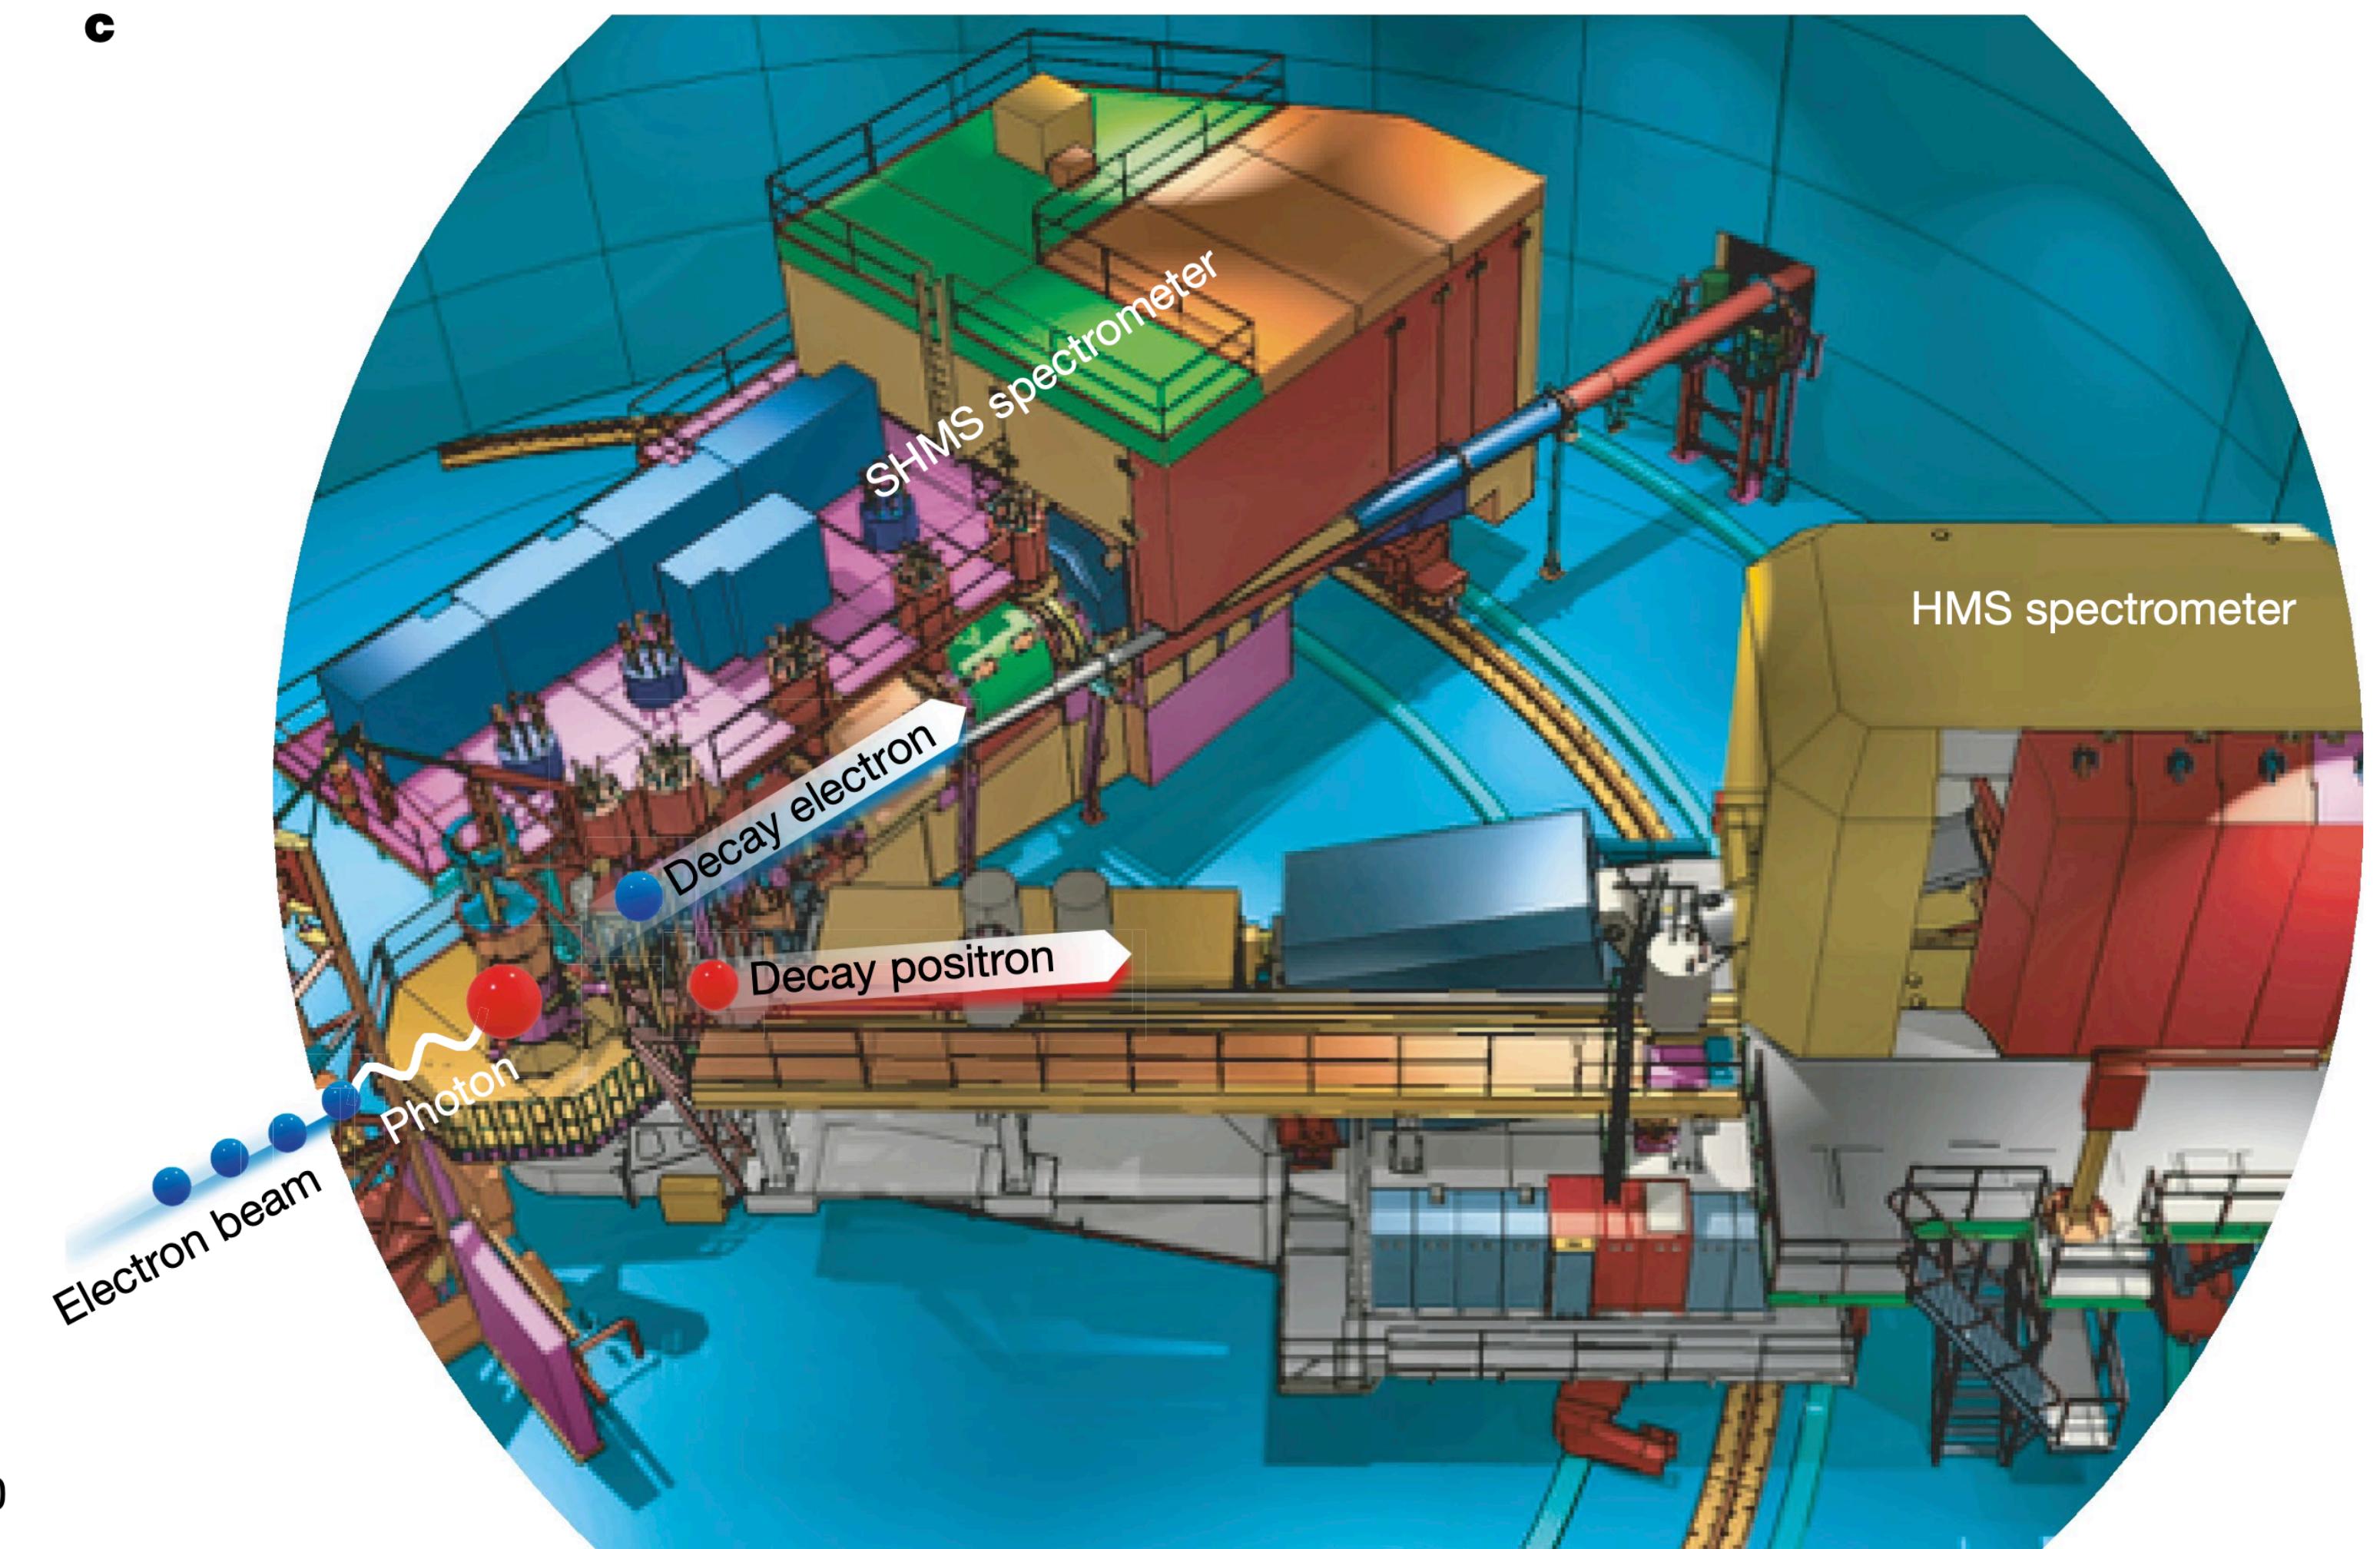

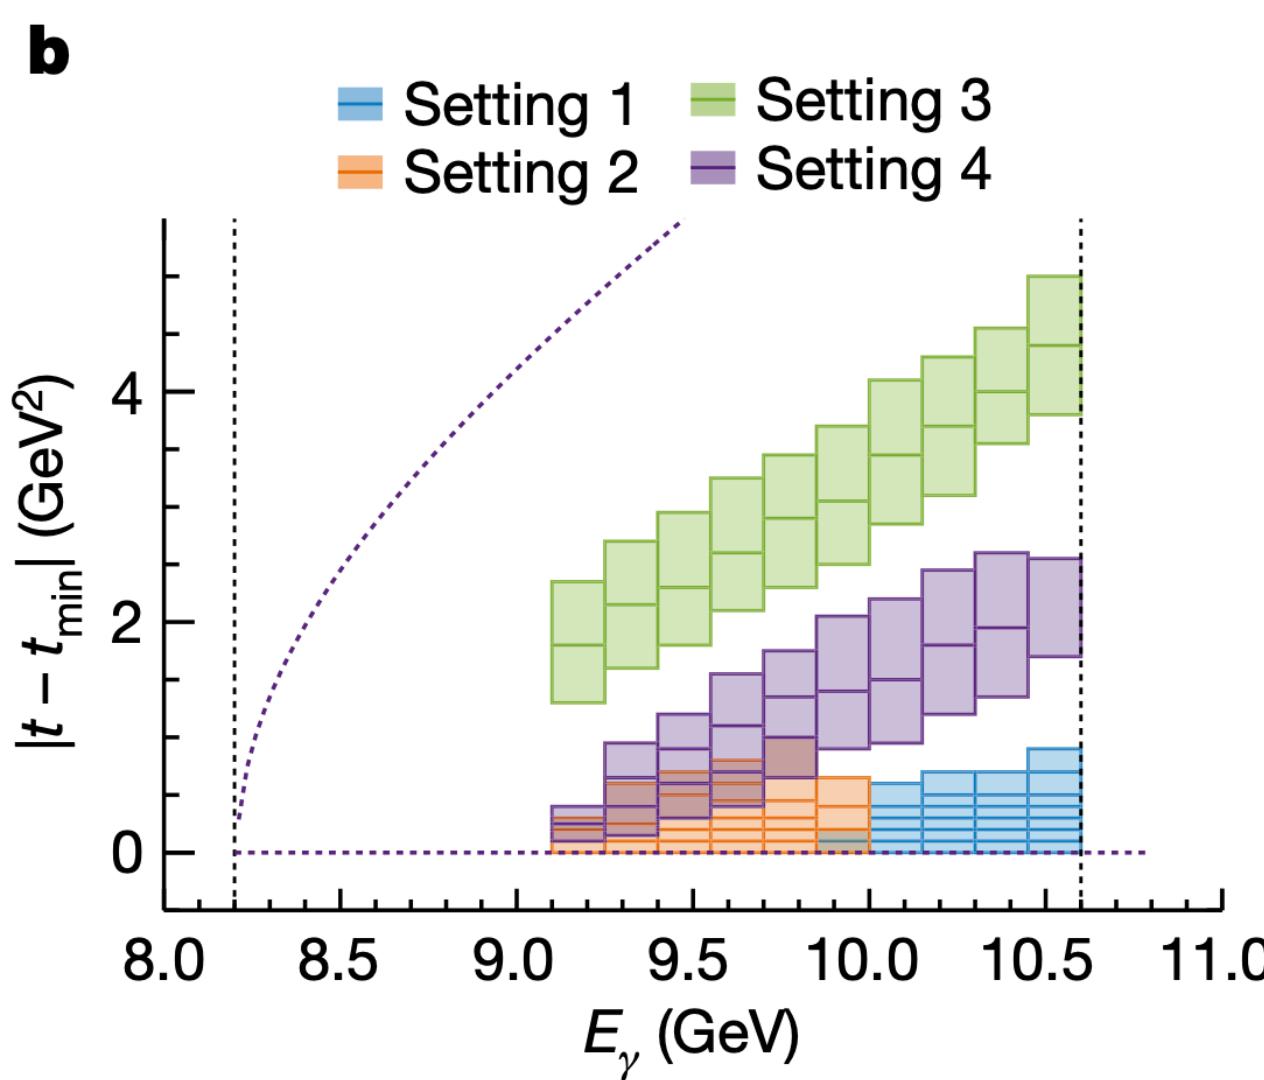

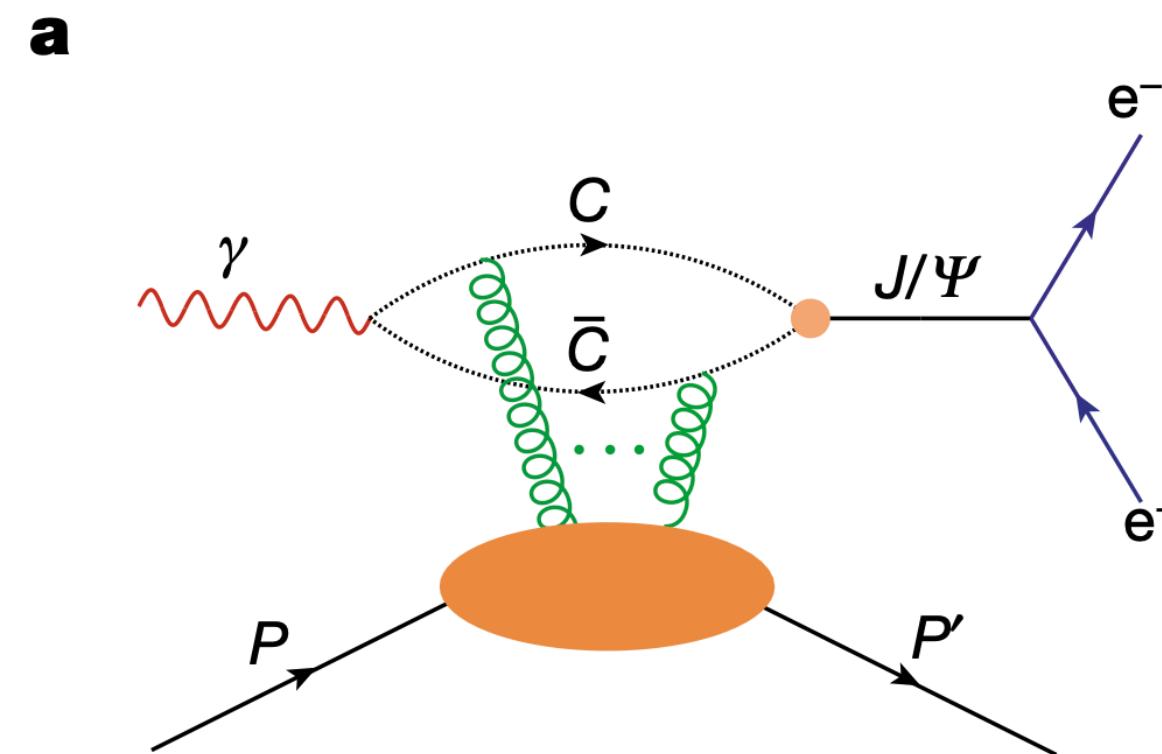

- 1D cross section (~469 counts)
- Trends significantly higher than old measurements
- Single 1D t-profile spurred on many new theoretical calculations
- Did not see evidence for hidden-charm pentaquarks

$\gamma p \rightarrow p J/\psi \rightarrow pe^+e^-$

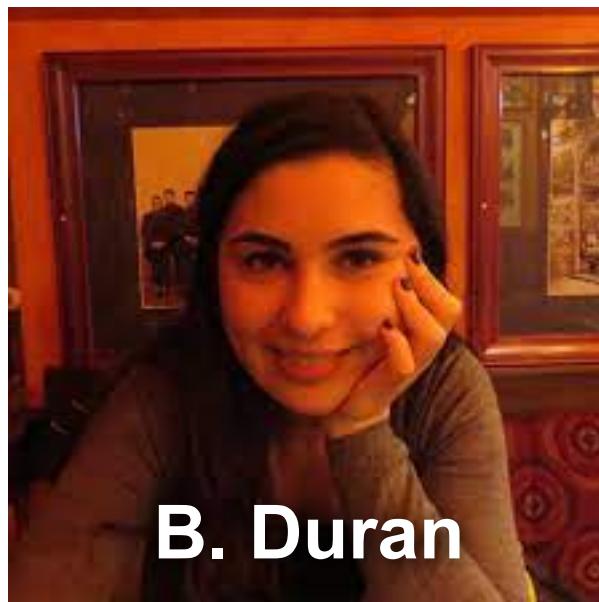

Near-threshold J/ψ photoproduction

HALL C EXPERIMENT E12-16-007

First results published in Nature!

2-D J/Ψ CROSS SECTIONS NEAR THRESHOLD

Ref. 9: D. Kharzeev, Phys. Rev. D 104, 054015 (2021).
 Ref. 27: Mamo & Zahed, 2204.08857 (2022)
 Ref. 10: Guo, Ji & Liu, Phys. Rev. D 103, 096010 (2021)
 Ref. 21: Sun, Tong & Yuan, Phys. Lett. B 822, 136655 (2021)
 Ref. 18: Hatta, Rajan & Yang, Phys. Rev. D 100, 014032 (2019)

Unfolded 2D cross section results compared to various model predictions informed by the 2019 1D GlueX results
 All models work reasonably well at higher energies but deviate at lower energies

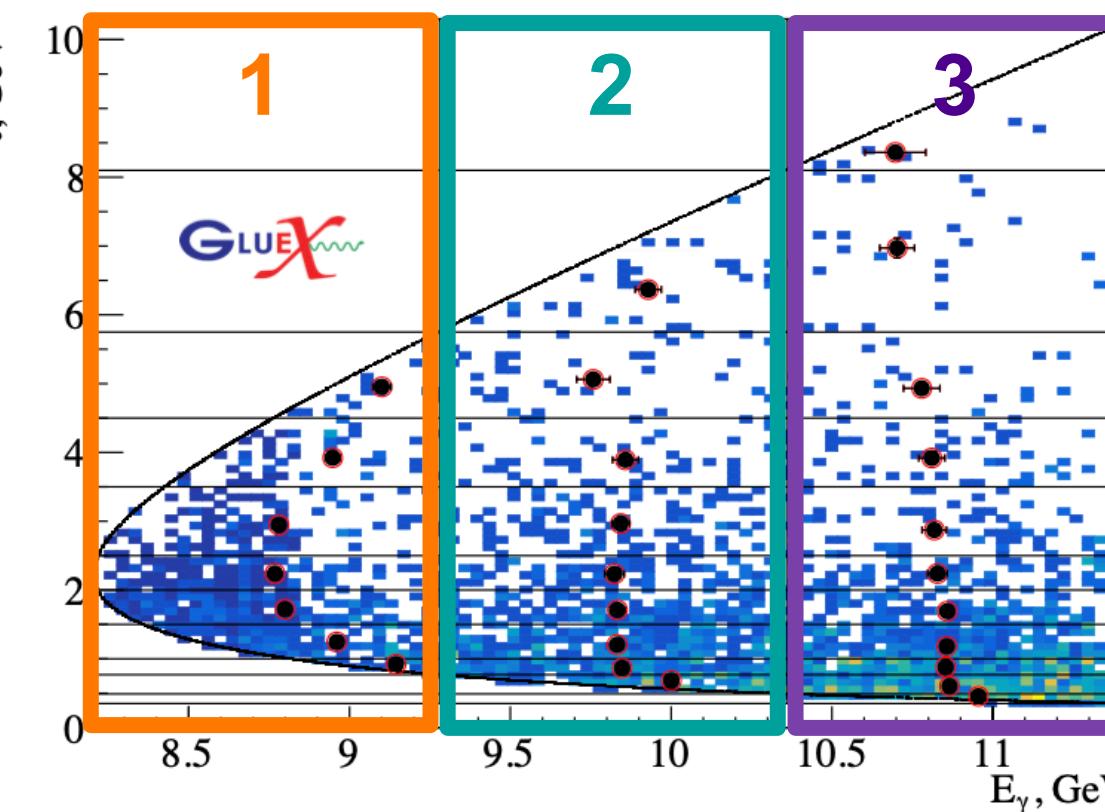

NEW GLUEX RESULTS

2.2k J/ ψ (~ same as J/ ψ -007 e+e- results)

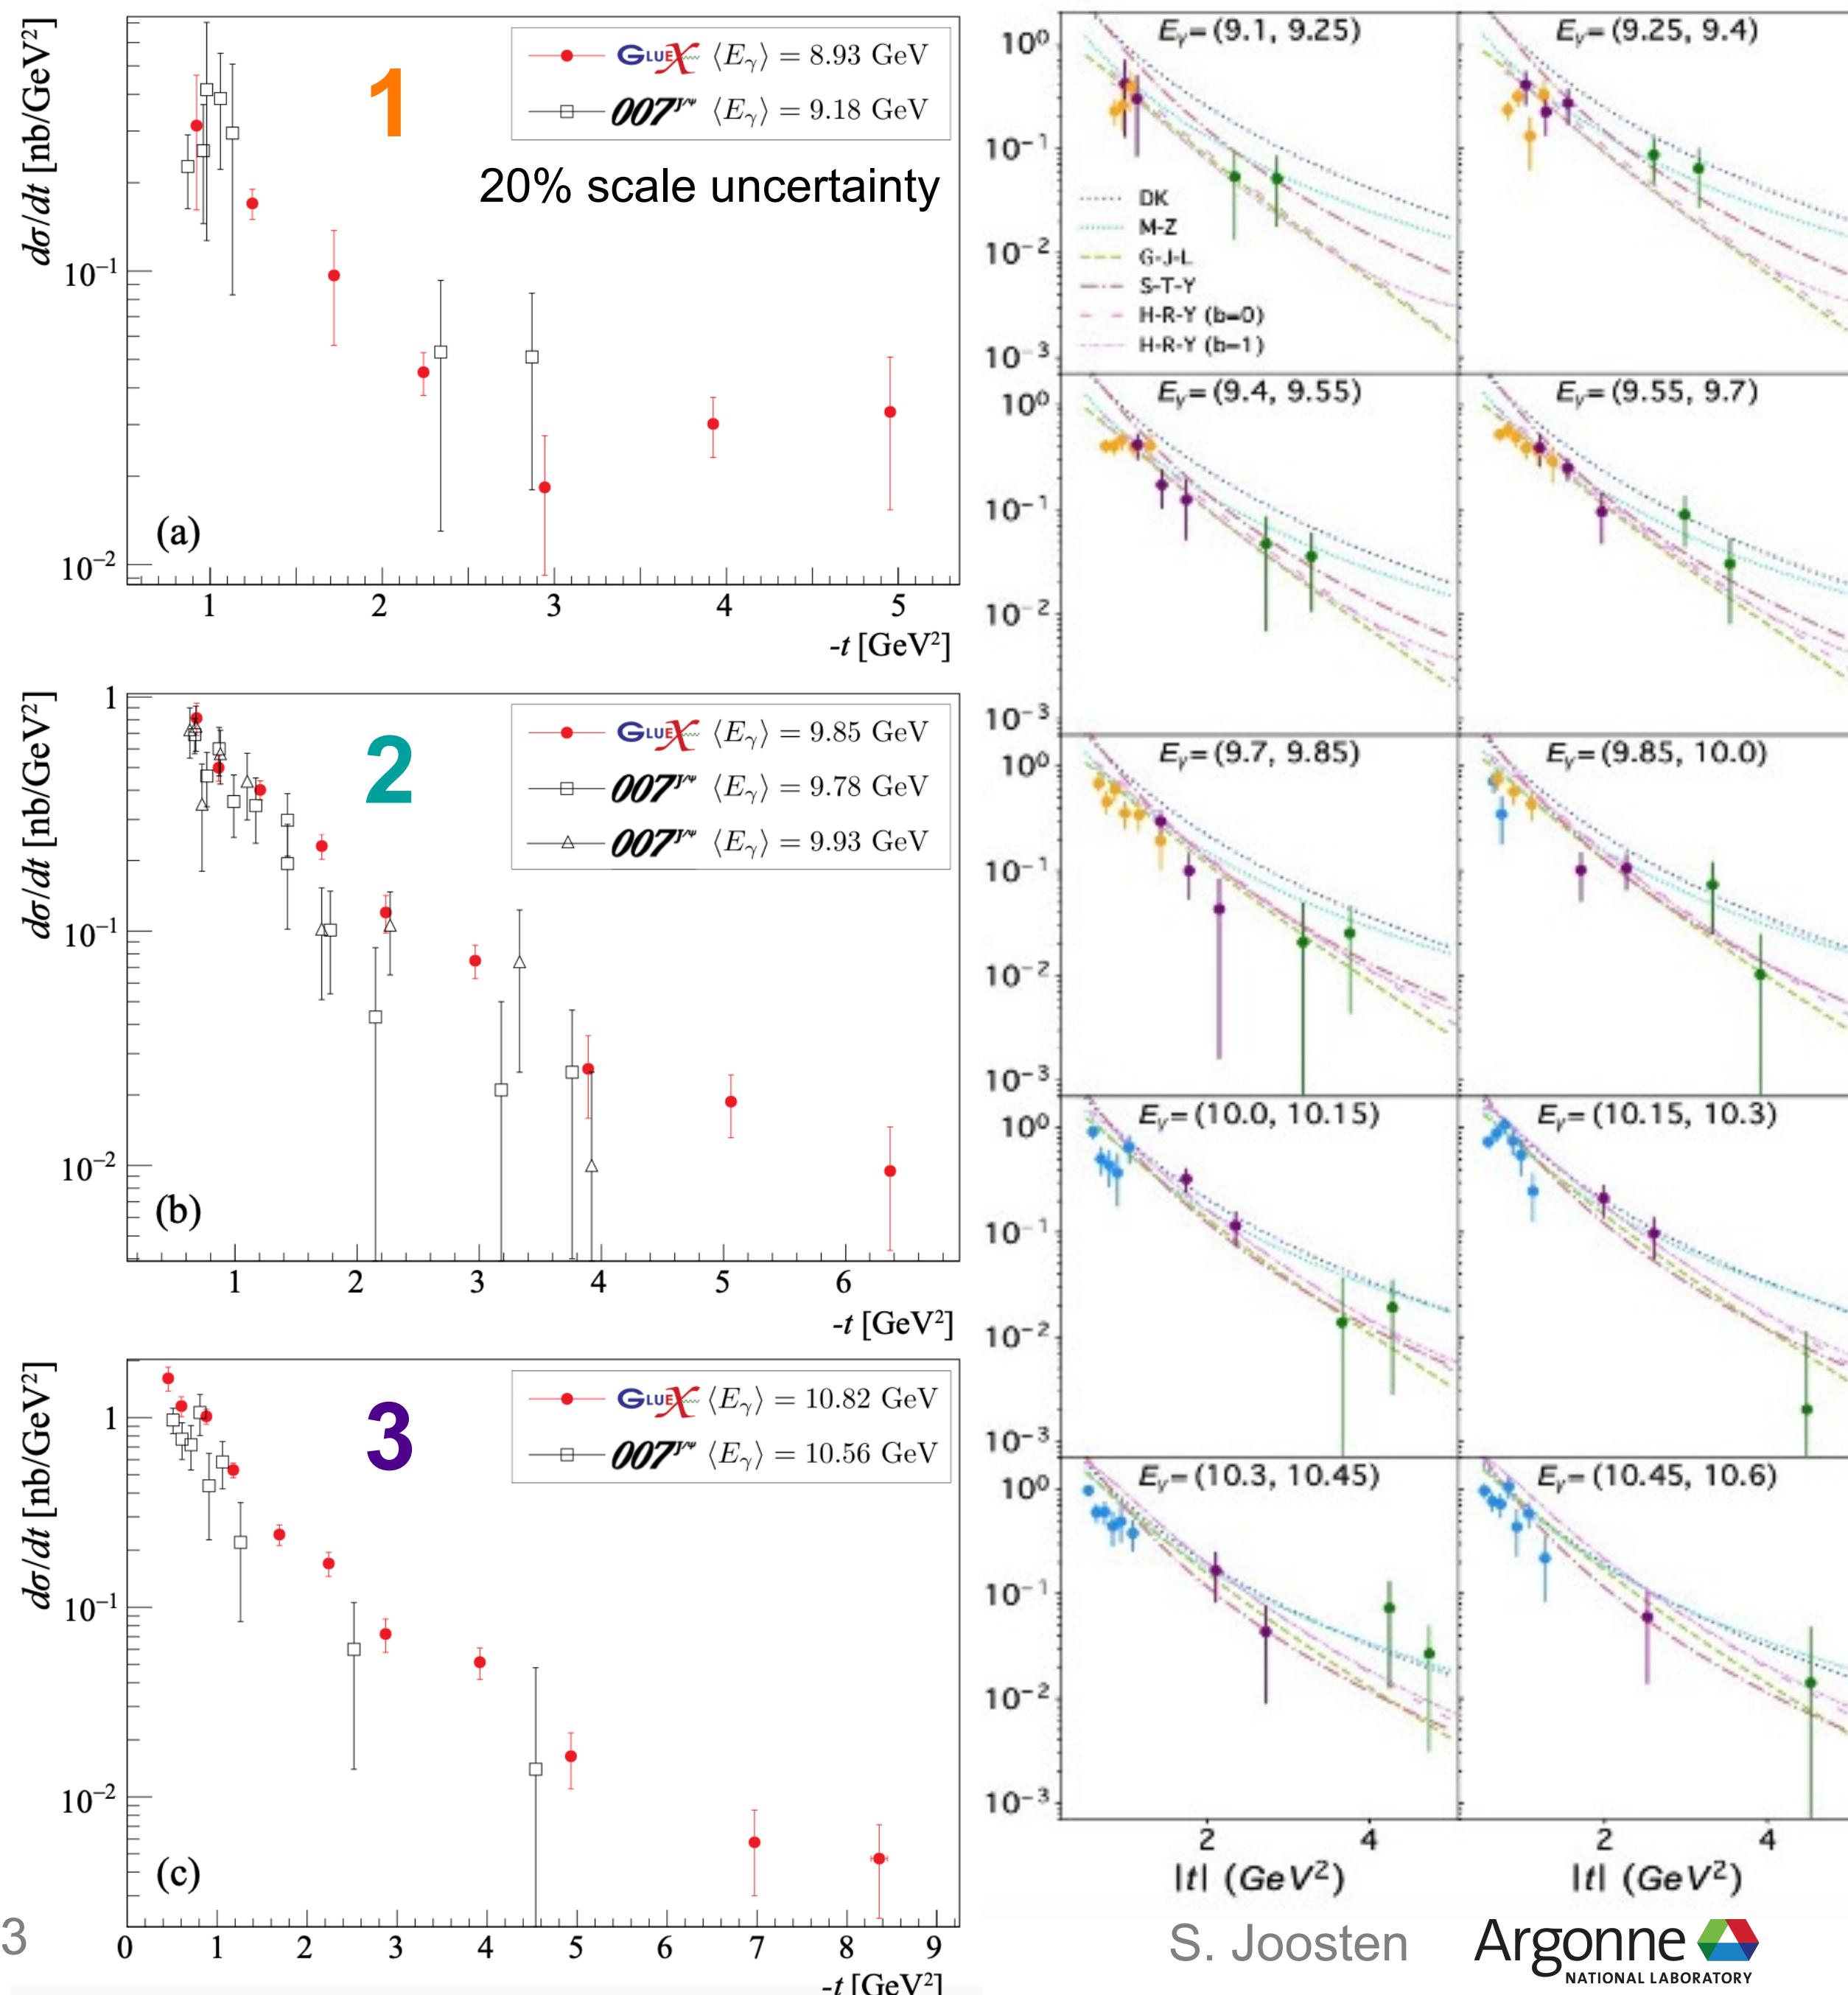

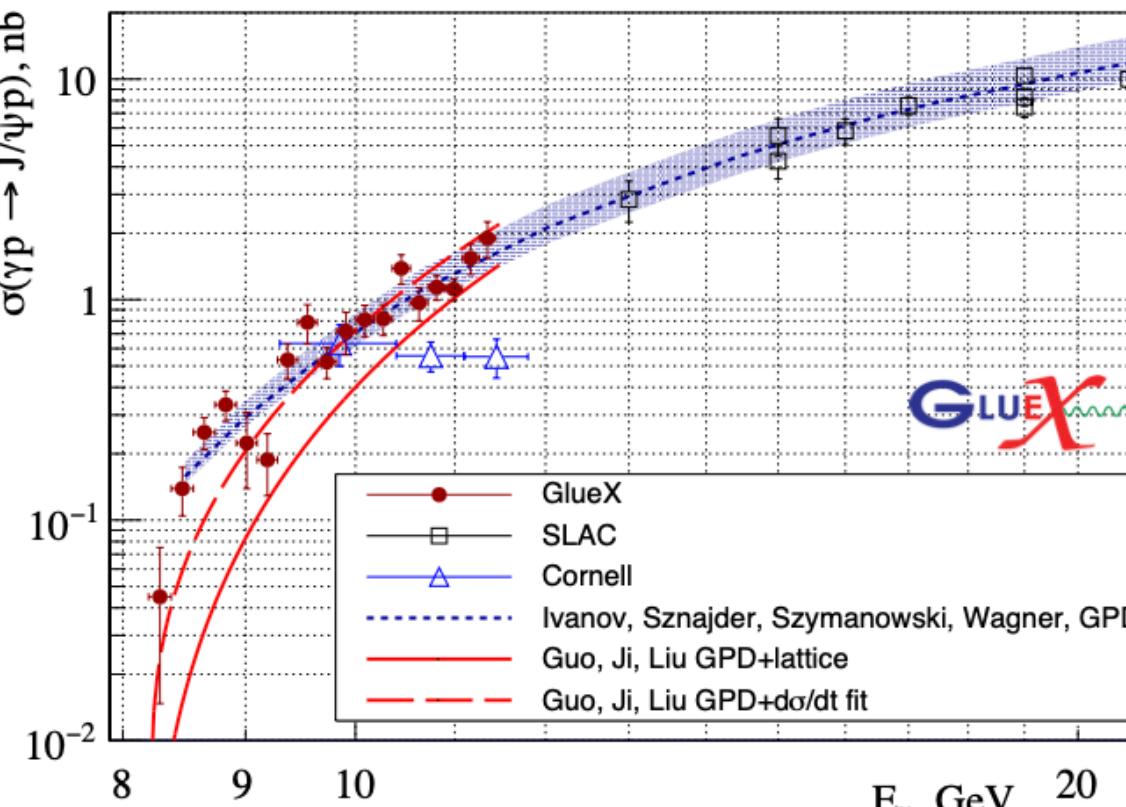

2-D differential cross section
in 3 E_γ slices
 $E_\gamma \sim 8.2 - 11.44$ GeV
(compared to 10 E_γ slices
 $E_\gamma \sim 9.1 - 10.6$ GeV
for J/ ψ -007)

New GlueX results have
20% scale uncertainty.
Good agreement within
errors with between GlueX
and J/ ψ -007

Differential cross section in 3 E_γ slices

Integrated 1-D cross section

MODEL ASSUMPTIONS AND CAVEATS

First model-dependent attempt to determine the GFFs from experiment

Assumptions

Neglect $B(t)$ - in concordance with both models and lattice QCD

Neglect \bar{C}_g when evaluating the cross section and radii (*)

Assume tripole shape for $A(t)$ and $C(t)$ (**)

Fix $A(0)$ to the average gluon PDF from CT18

Both models fit the data well ($\chi^2 \sim 1$)

(*) This is appropriate for the holographic model but not the GPD model. See Hatta et al. JHEP 12 (2018) 008 & Tanaka, K. JHEP 03 (2023) 013 for a calculation of $\bar{C}_g = -\bar{C}_q$

(**) Doing the same extraction with a dipole shape, or does not impact our results

Holographic Model

K. Mamo & I. Zahed, PRD 103, 094010 (2021) and 2204.08857 (2022)

$$\frac{d\sigma}{dt} = \mathcal{N} \times \frac{e^2}{64\pi(s - m_N^2)^2} \times \frac{A(-t, \kappa_T) + \eta^2 D(-t, \kappa_T, \kappa_S)]^2}{A^2(0)} \times F(\tilde{s}) \times 8$$

\mathcal{N} normalized to the previous world data (not given by the model)

GPD Model

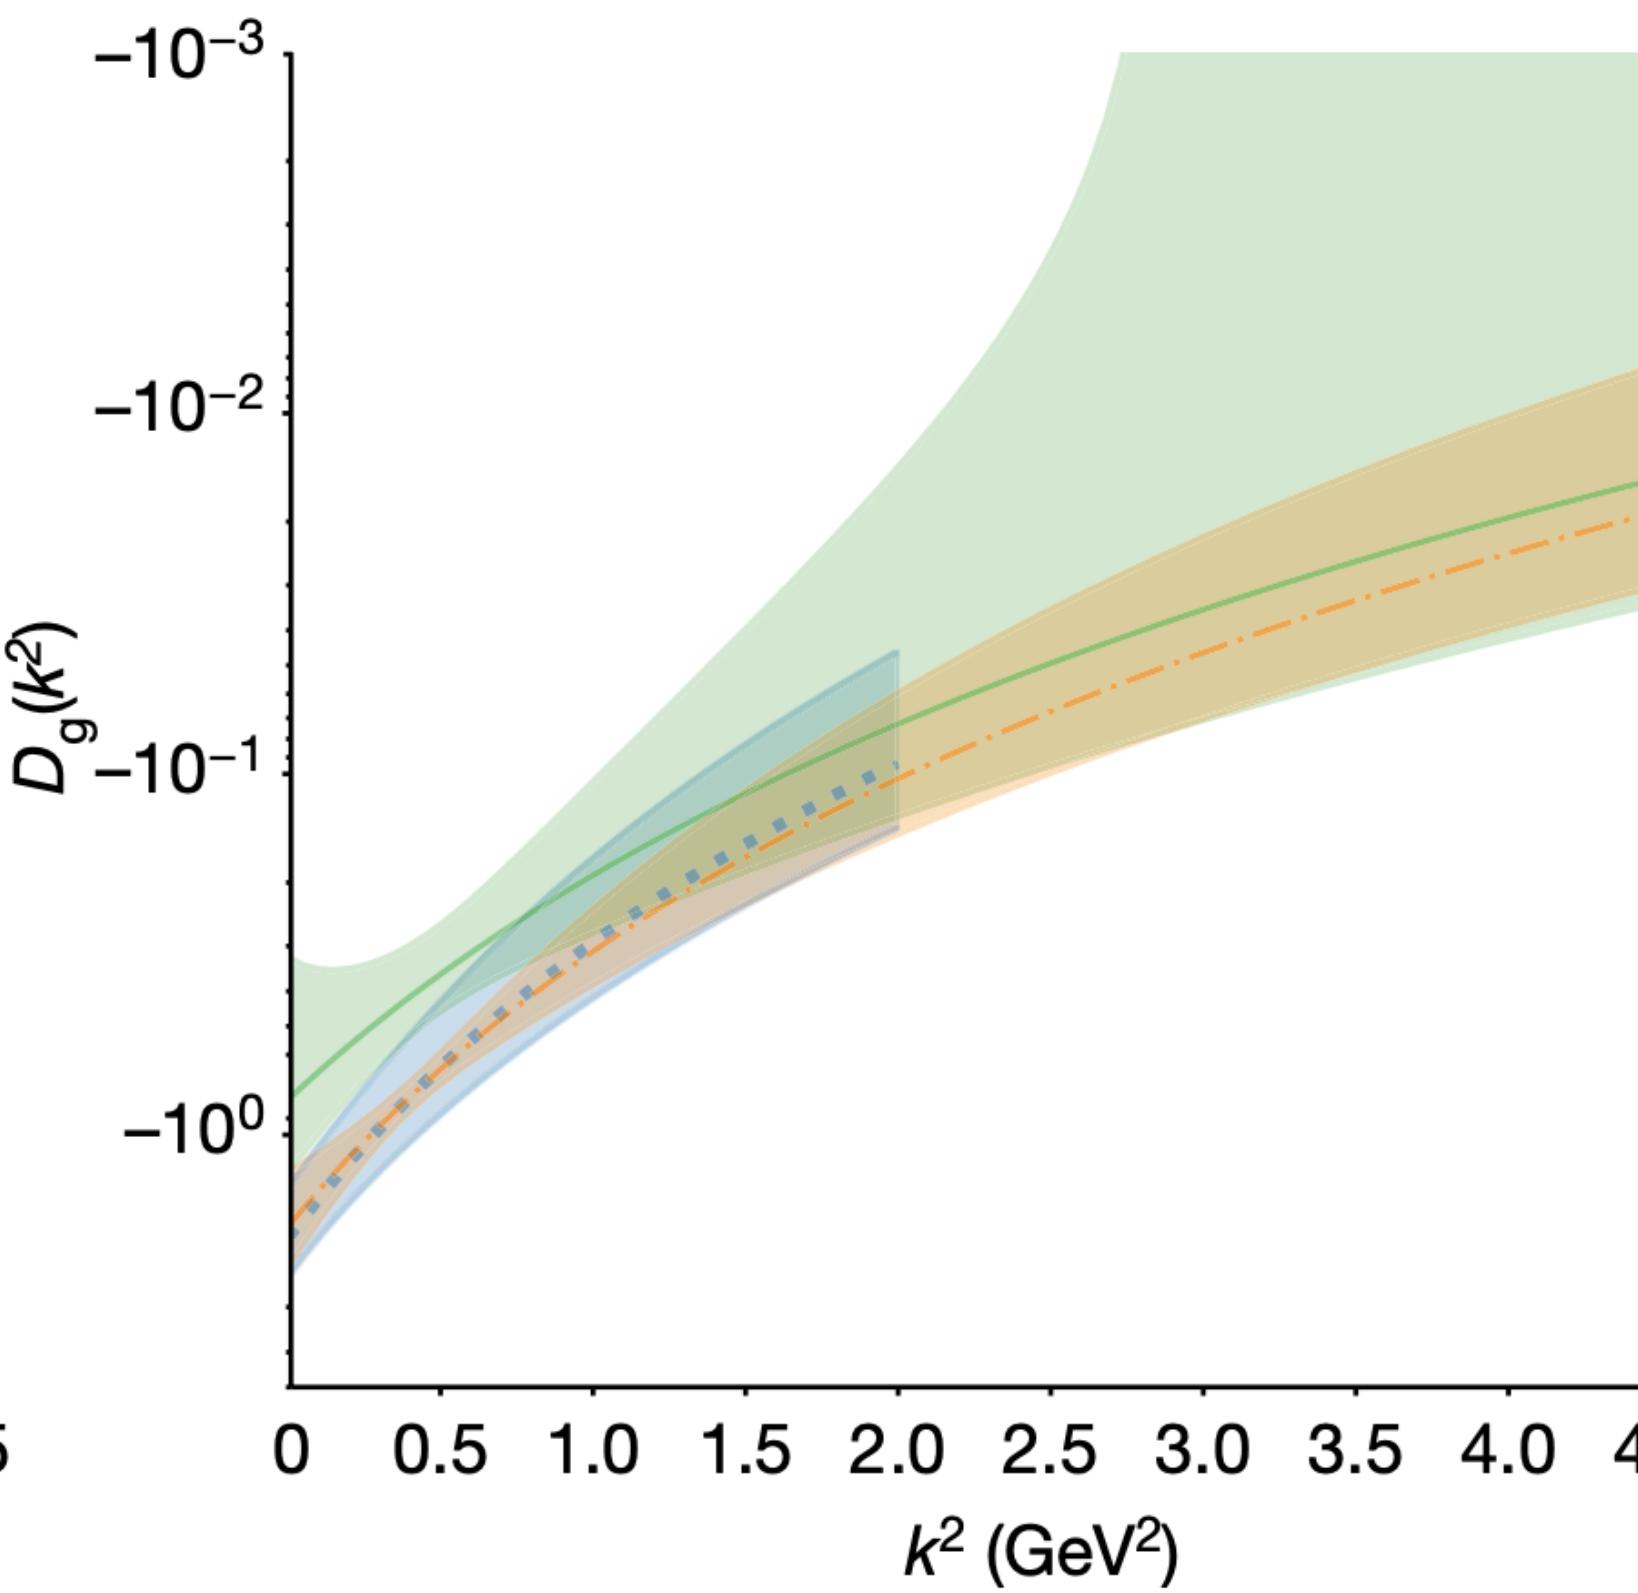

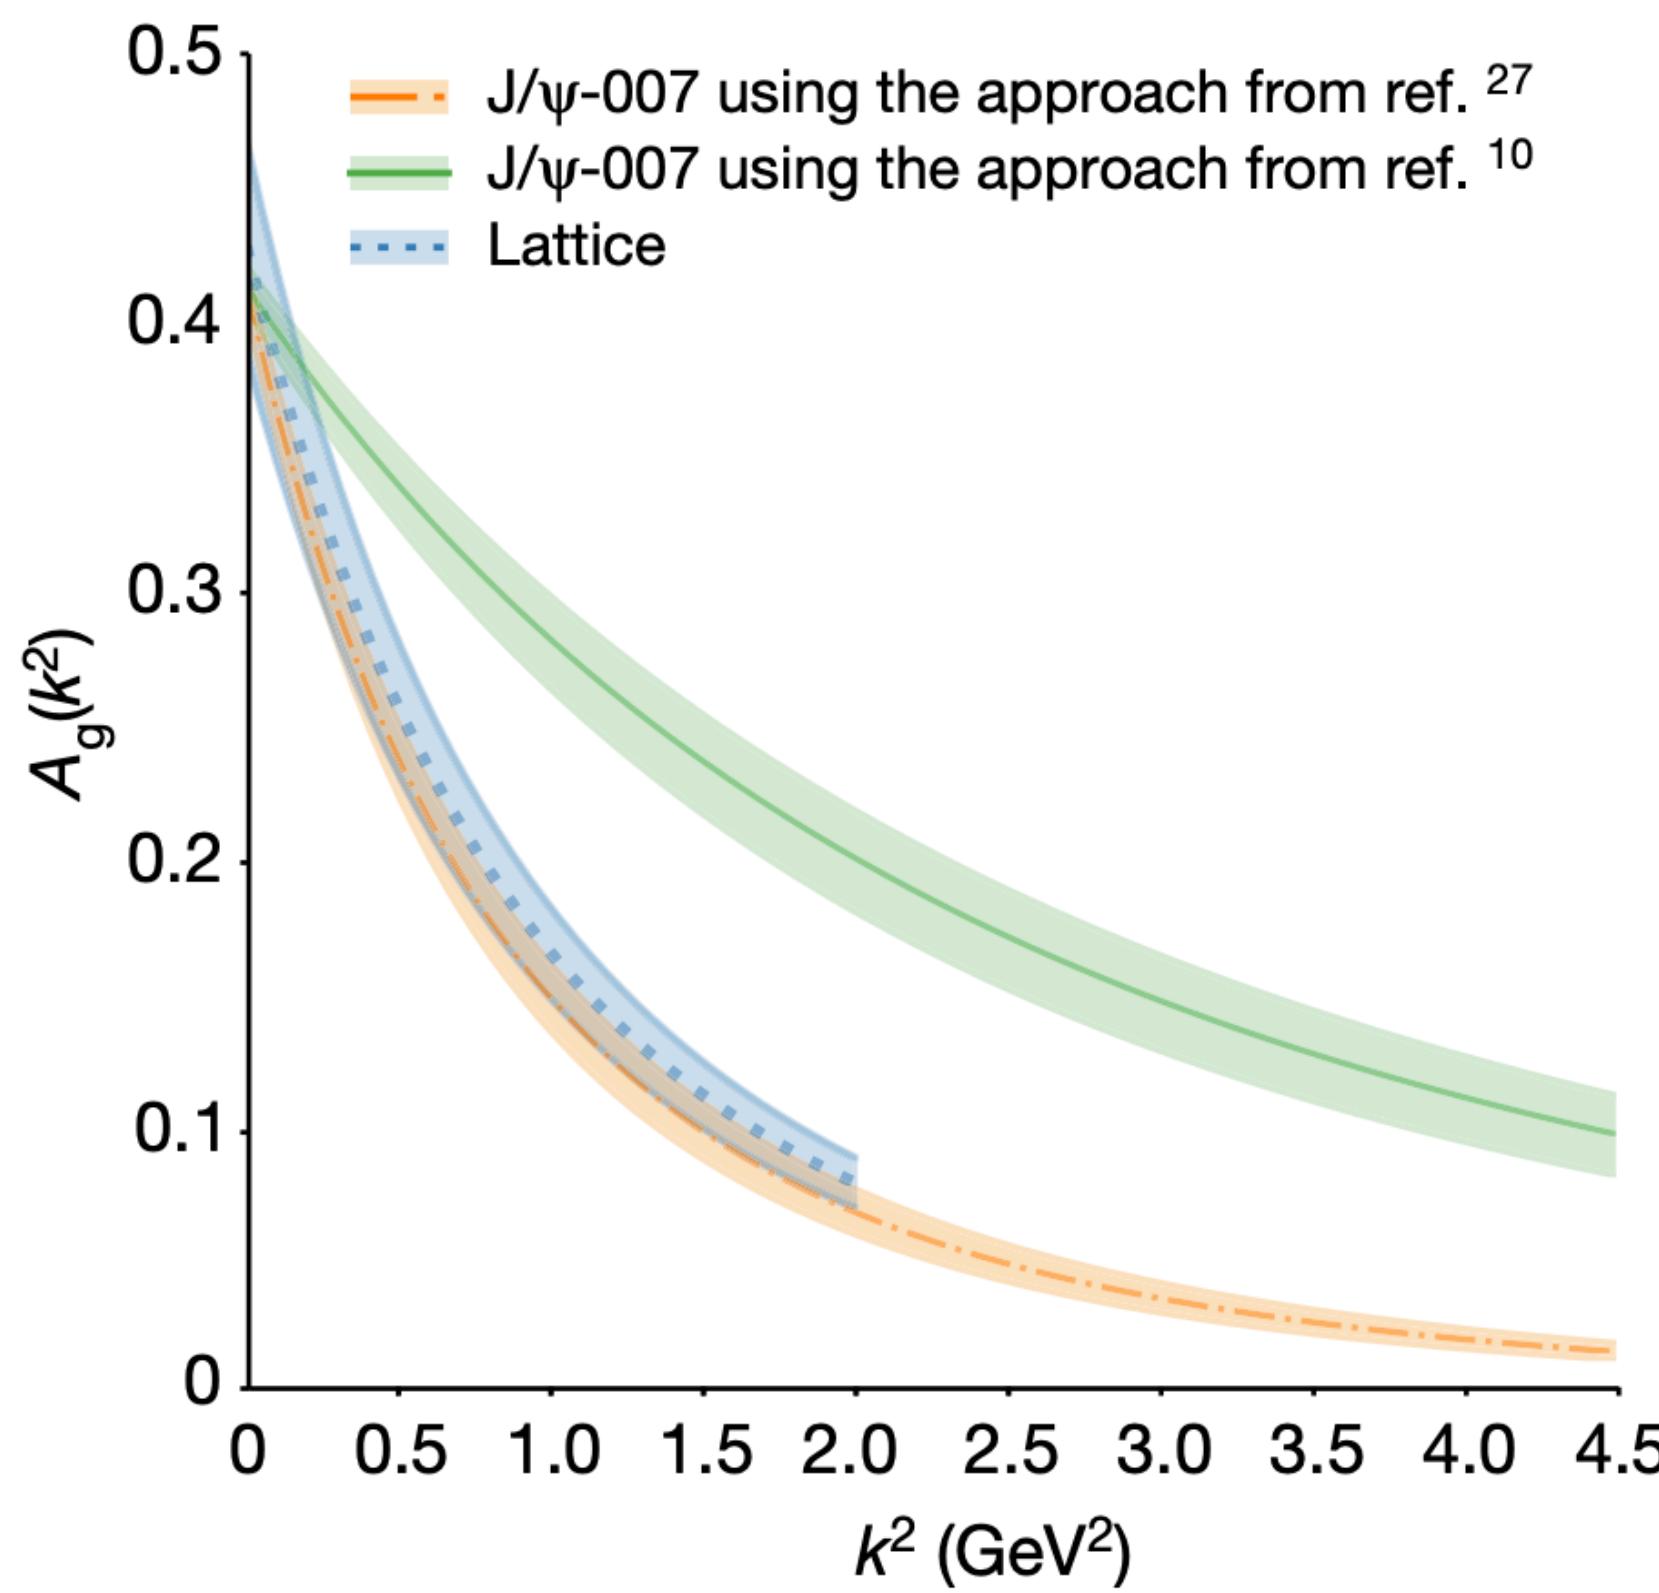

Y. Guo, X. Ji, Y. Liu, PRD 103, 096010 (2021)

$$\frac{d\sigma}{dt} = \frac{\alpha_e m e_Q^2}{4(W^2 - m_N^2)^2} \frac{(16\pi\alpha_s)^2}{3M_V^2} |\psi_{NR}|^2 |G(t, \xi)|^2$$

Assume $\xi \sim 1$ (it is less than 0.5 for most of the experimental data)

GLUONIC GFFS FROM EXPERIMENTAL DATA

Remarkable agreement between GFFs determined from data using the Holographic QCD approach and the direct Lattice QCD calculation!

Determined from experiment
Holographic QCD approach
GPD approach

Determined from theory
Lattice QCD calculation

Ref 27 (Holographic QCD): K. Mamo & I. Zahed, PRD 103, 094010 (2021) and 2204.08857 (2022)
Ref 10 (GPD Formalism): Y. Guo, X. Ji, Y. Liu, PRD 103, 096010 (2021)
Lattice: D. Pefkou, D. Hackett, P. Shanahan, Phys. Rev. D 105, 054509 (2022).

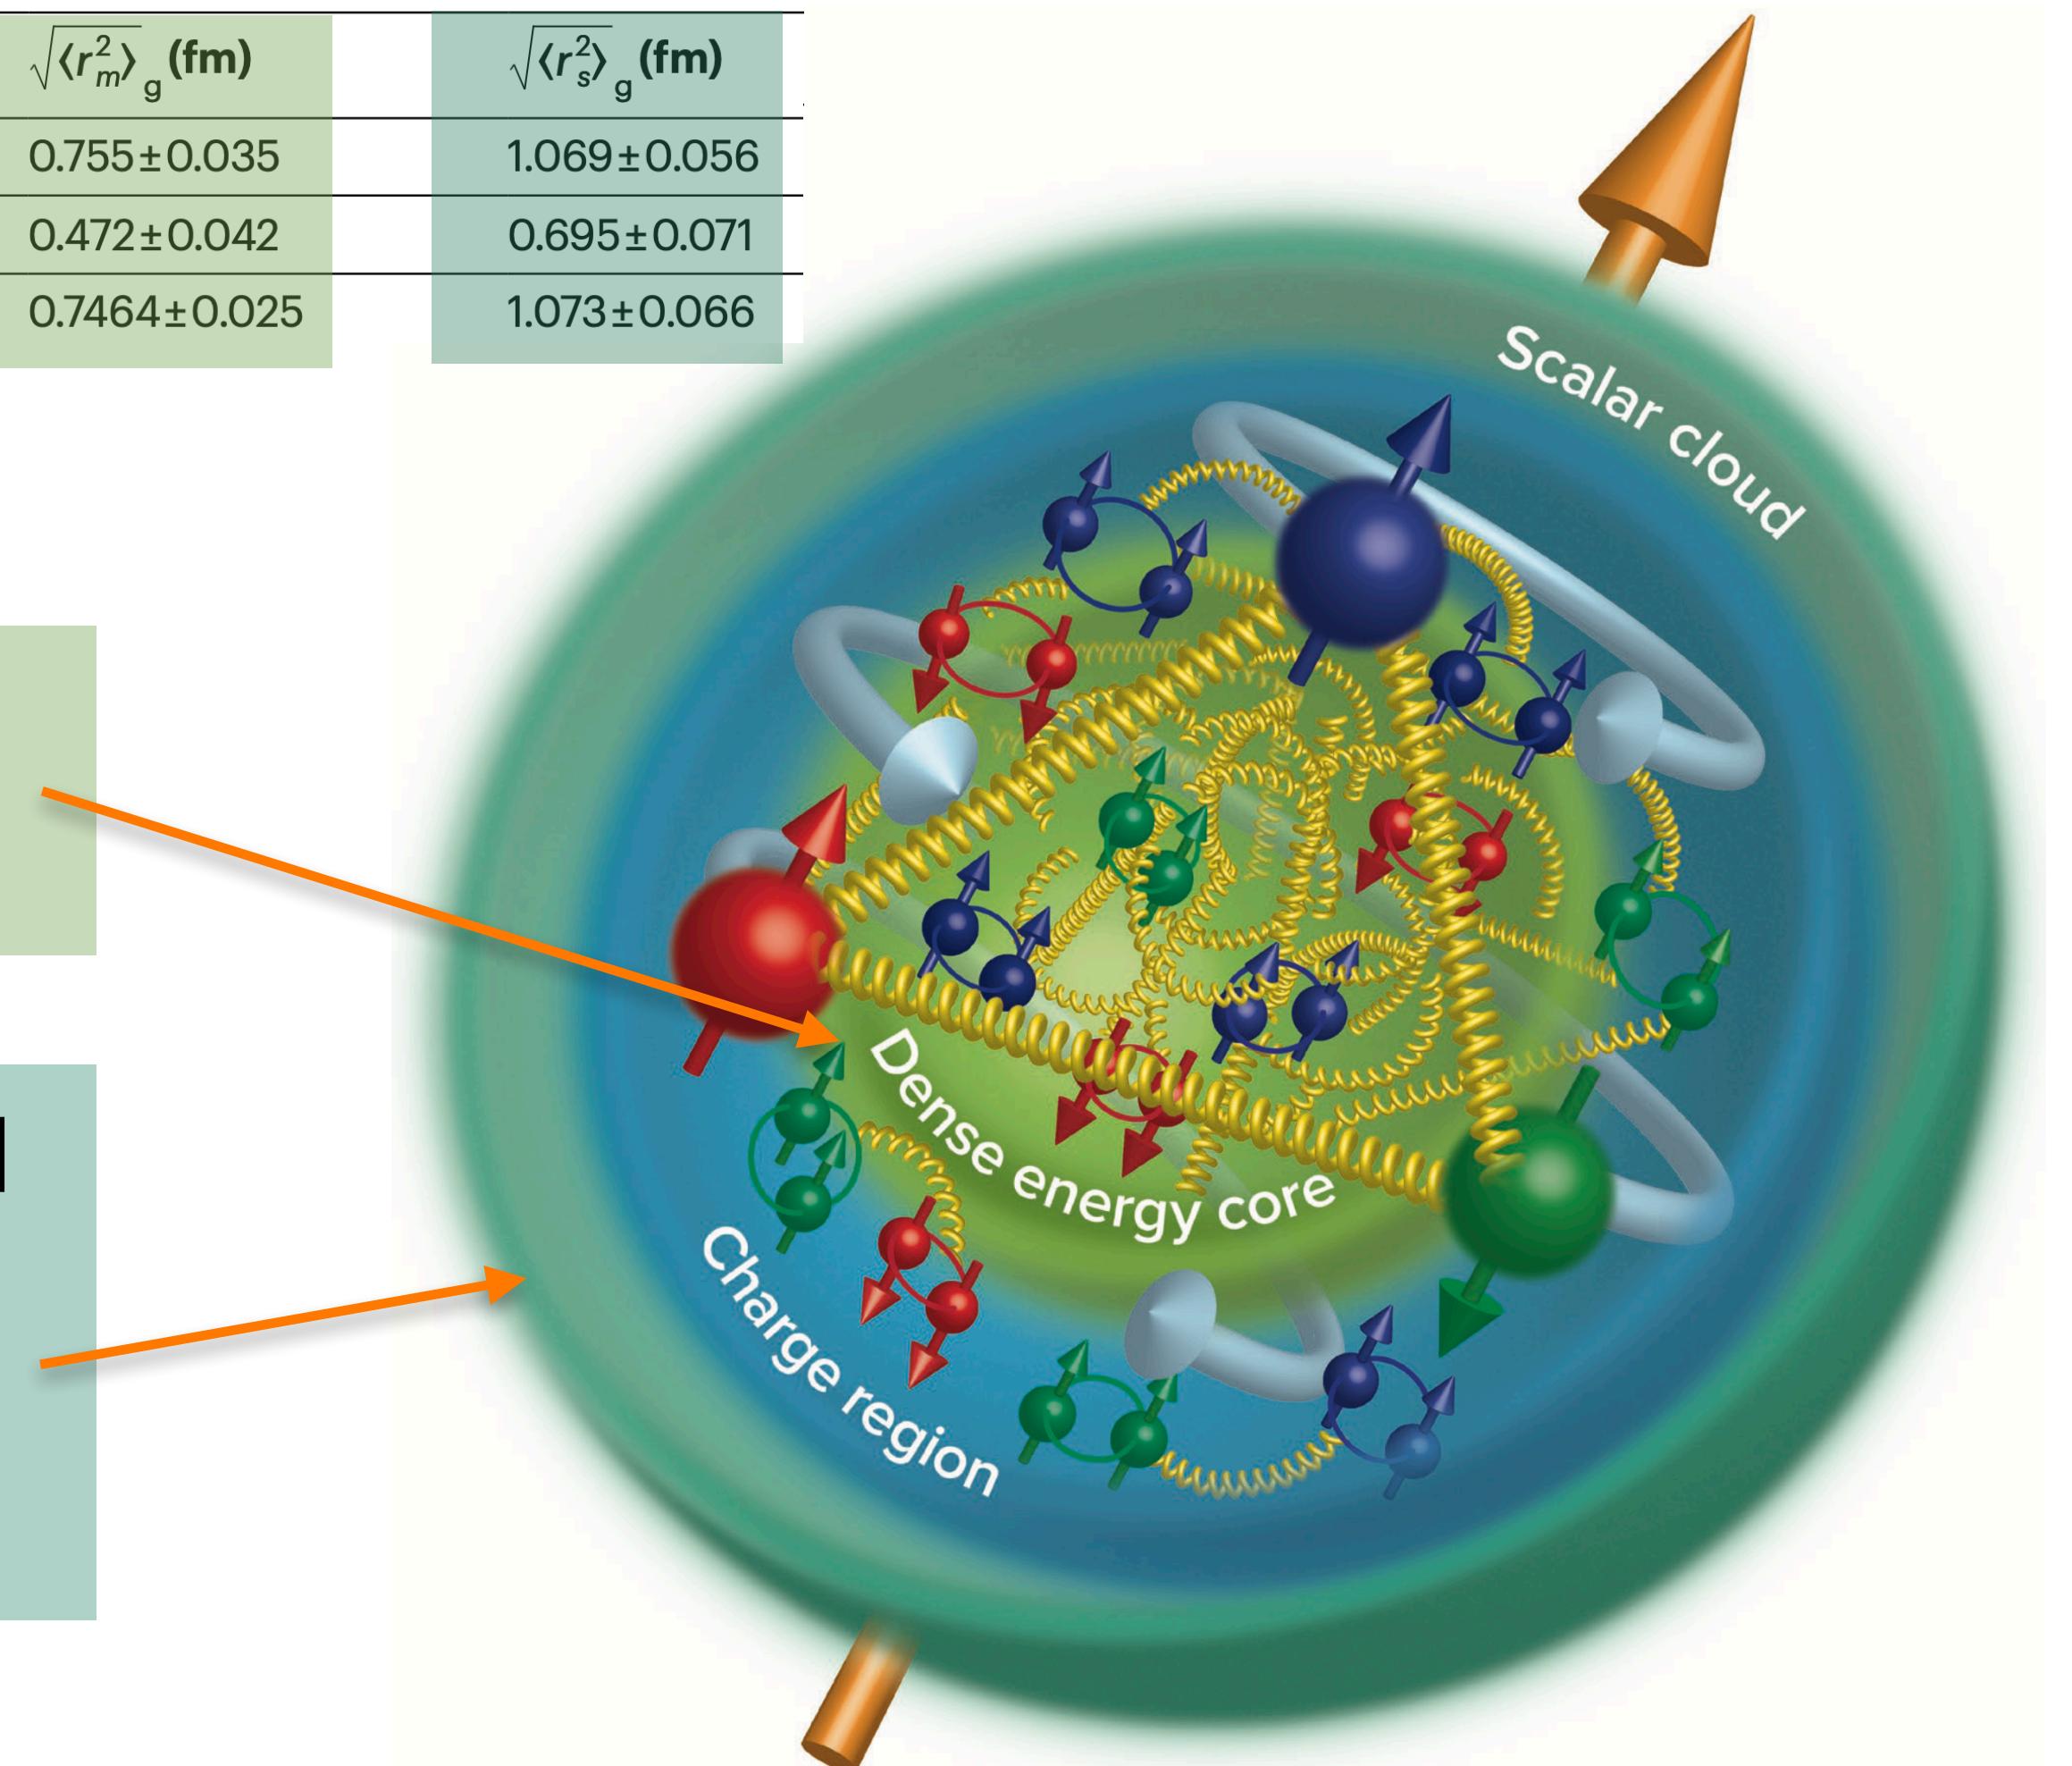

THE PROTON IN THREE REGIONS

Table 1 | The gluonic GFF fit parameters, proton mass radius and scalar radius

Theoretical approach	$\chi^2/\text{n.d.f.}$	$m_A (\text{GeV})$	$m_c (\text{GeV})$	$C_g(0)$	$\sqrt{\langle r_m^2 \rangle_g} (\text{fm})$	$\sqrt{\langle r_s^2 \rangle_g} (\text{fm})$
Holographic QCD	0.925	1.575 ± 0.059	1.12 ± 0.21	-0.45 ± 0.132	0.755 ± 0.035	1.069 ± 0.056
GPD	0.924	2.71 ± 0.19	1.28 ± 0.5	-0.20 ± 0.11	0.472 ± 0.042	0.695 ± 0.071
Lattice		1.641 ± 0.043	1.07 ± 0.12	-0.483 ± 0.133	0.7464 ± 0.025	1.073 ± 0.066

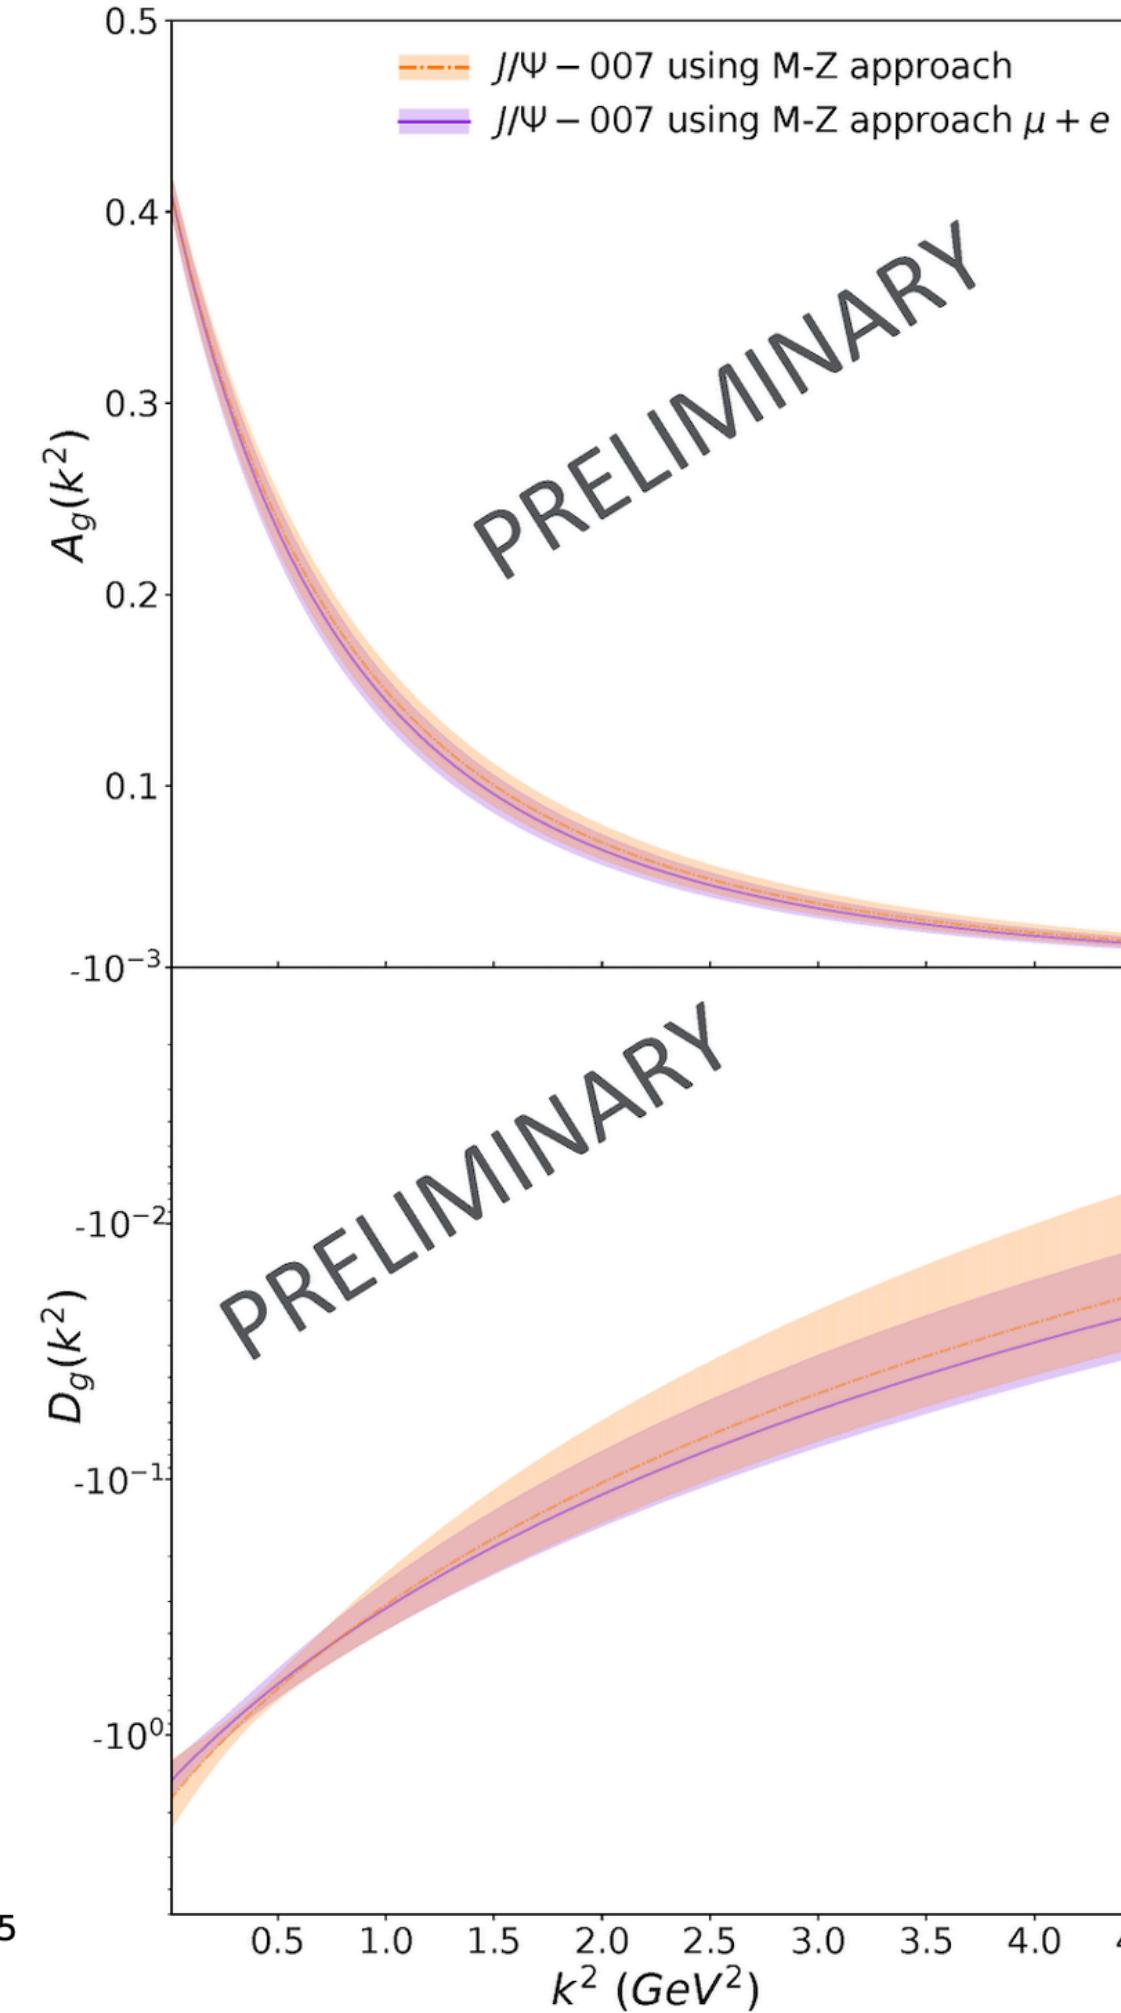

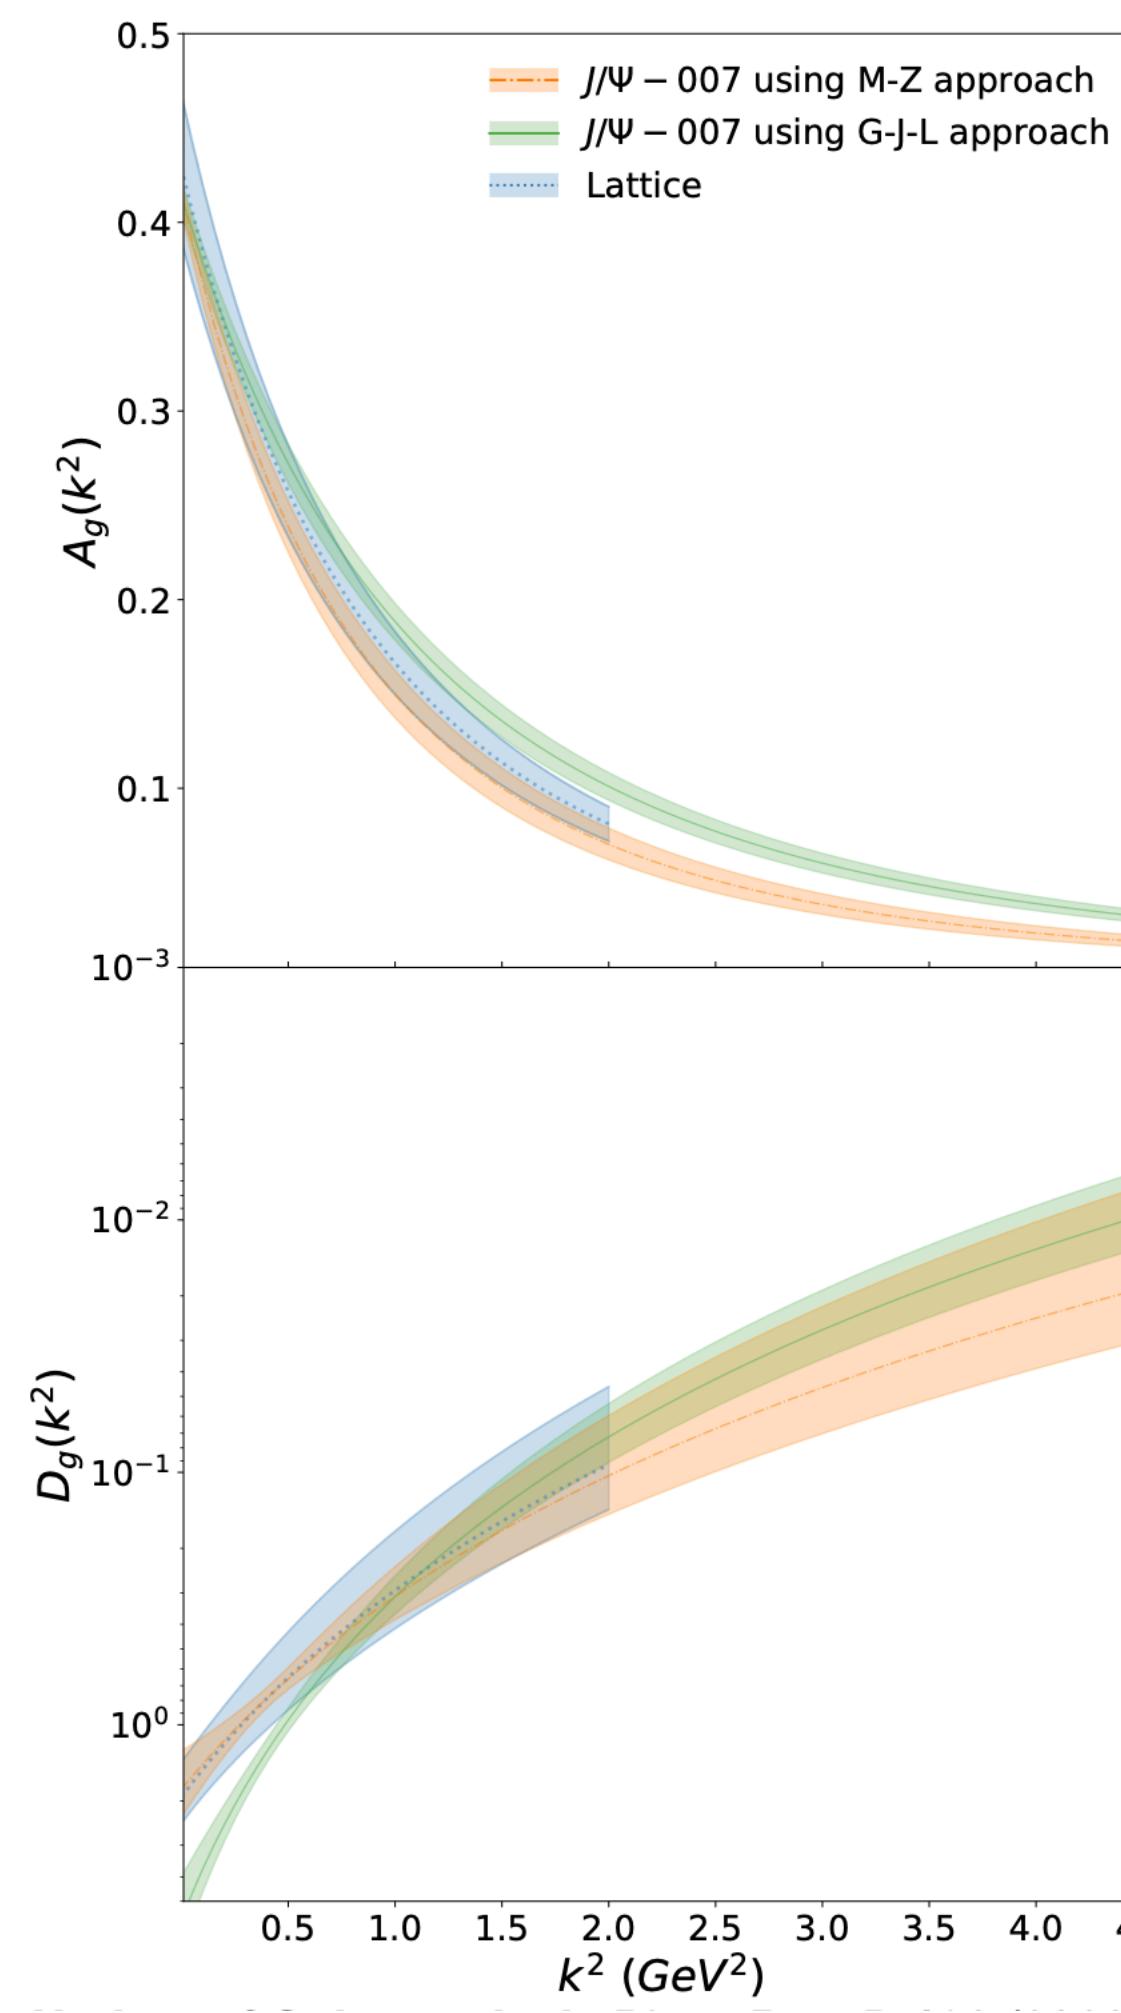

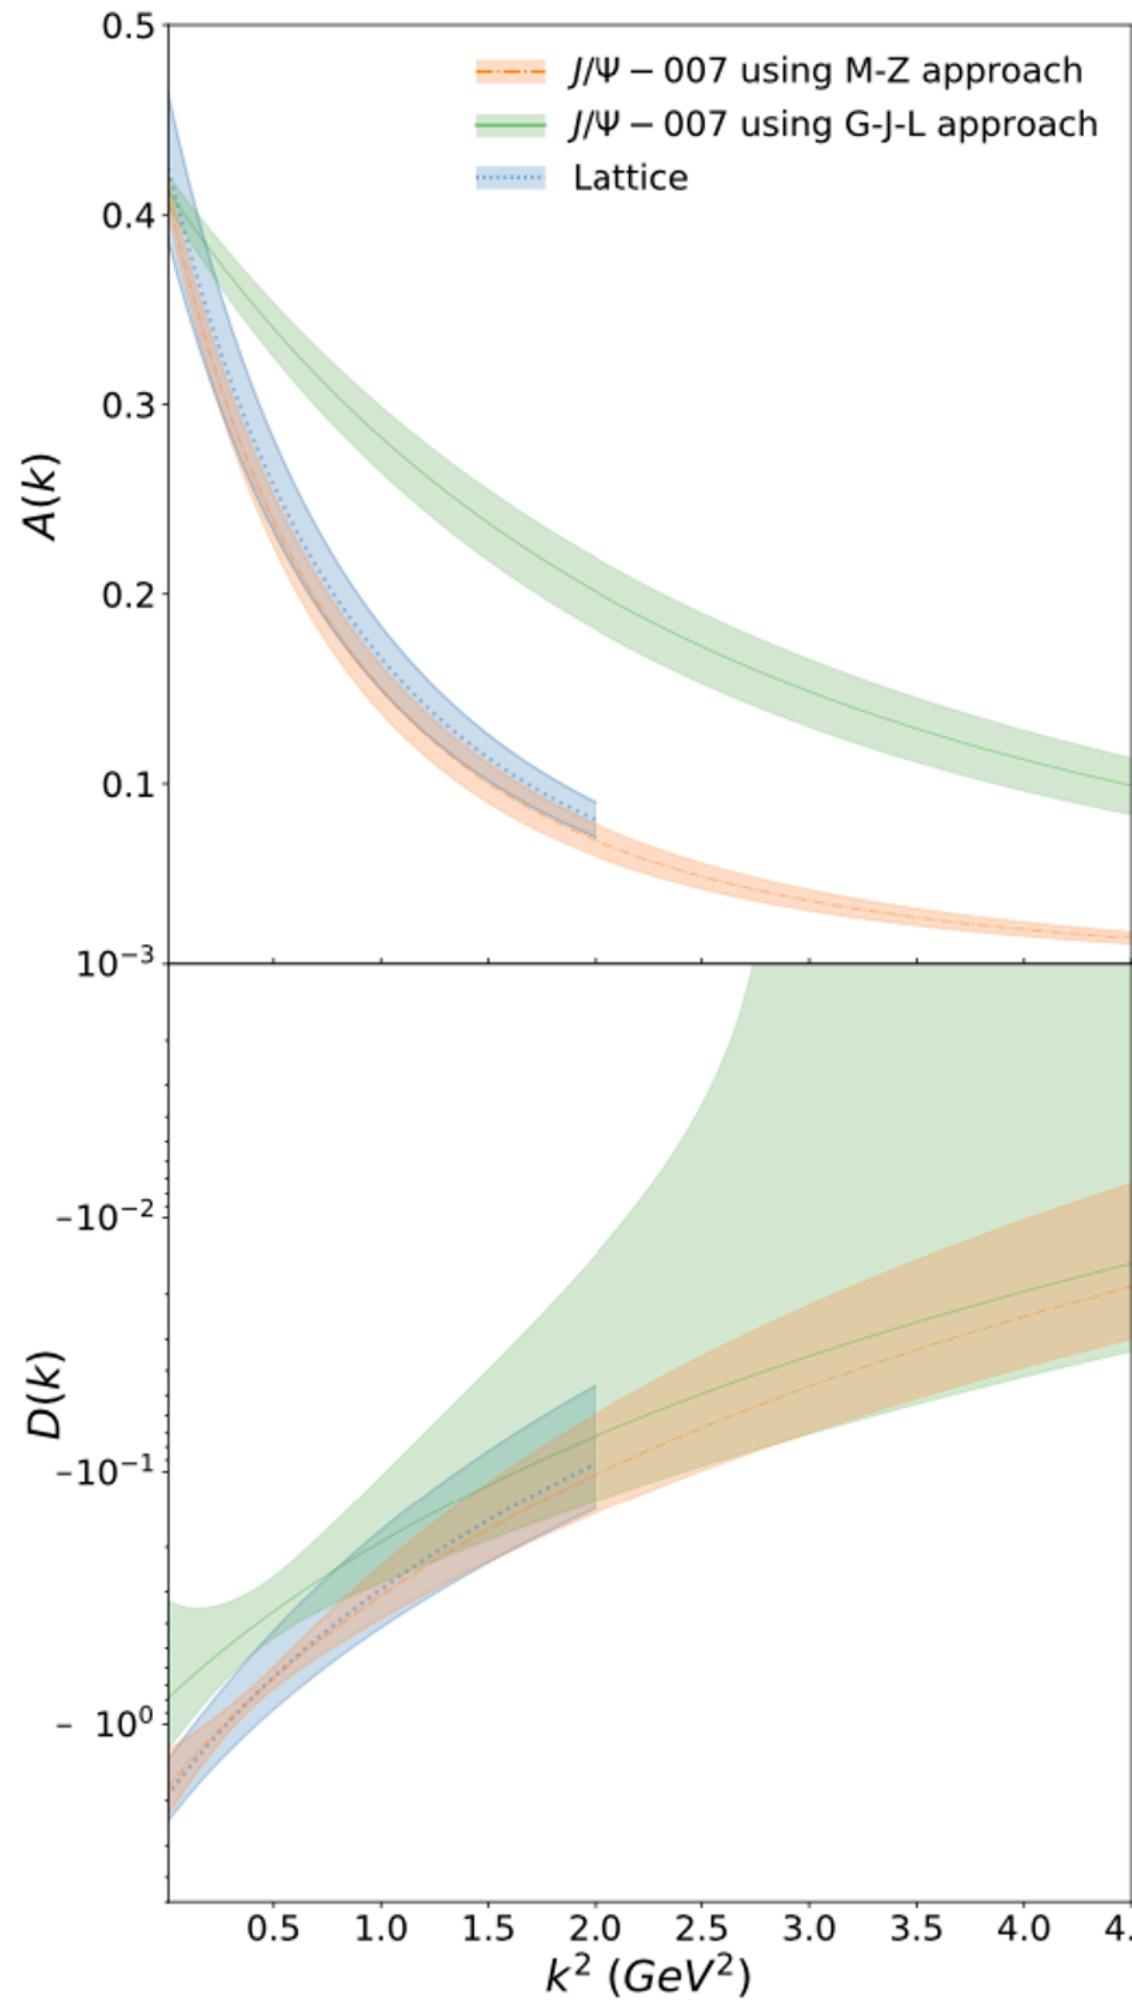

The proton's mass radius seems substantially smaller than its charge

The holographic QCD fit to our data and the latest Lattice calculations find a scalar gluonic cloud surrounding the charge region at about 1 fermi

UPDATES SINCE THE J/ ψ -007 PAPER

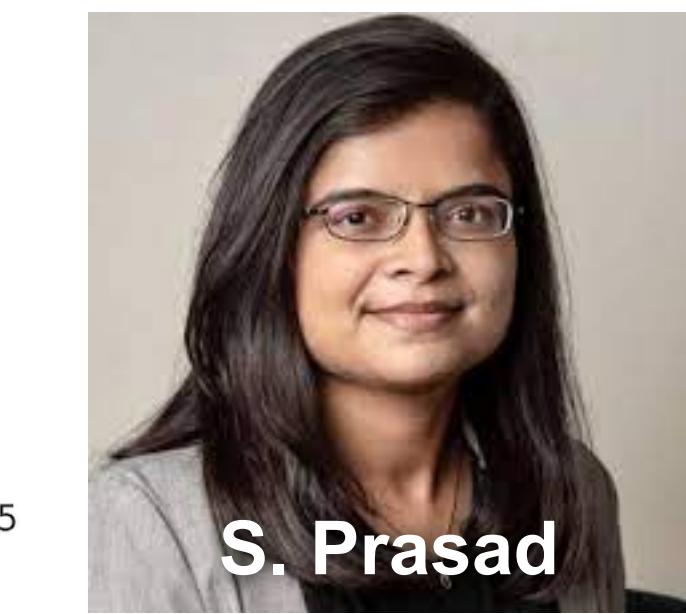

Update of G-J-L analysis PRD 108
 (2023) no.3, 034003 arXiv:2305.06992

- Analysis with the muons decay channel results , doubling the statistics

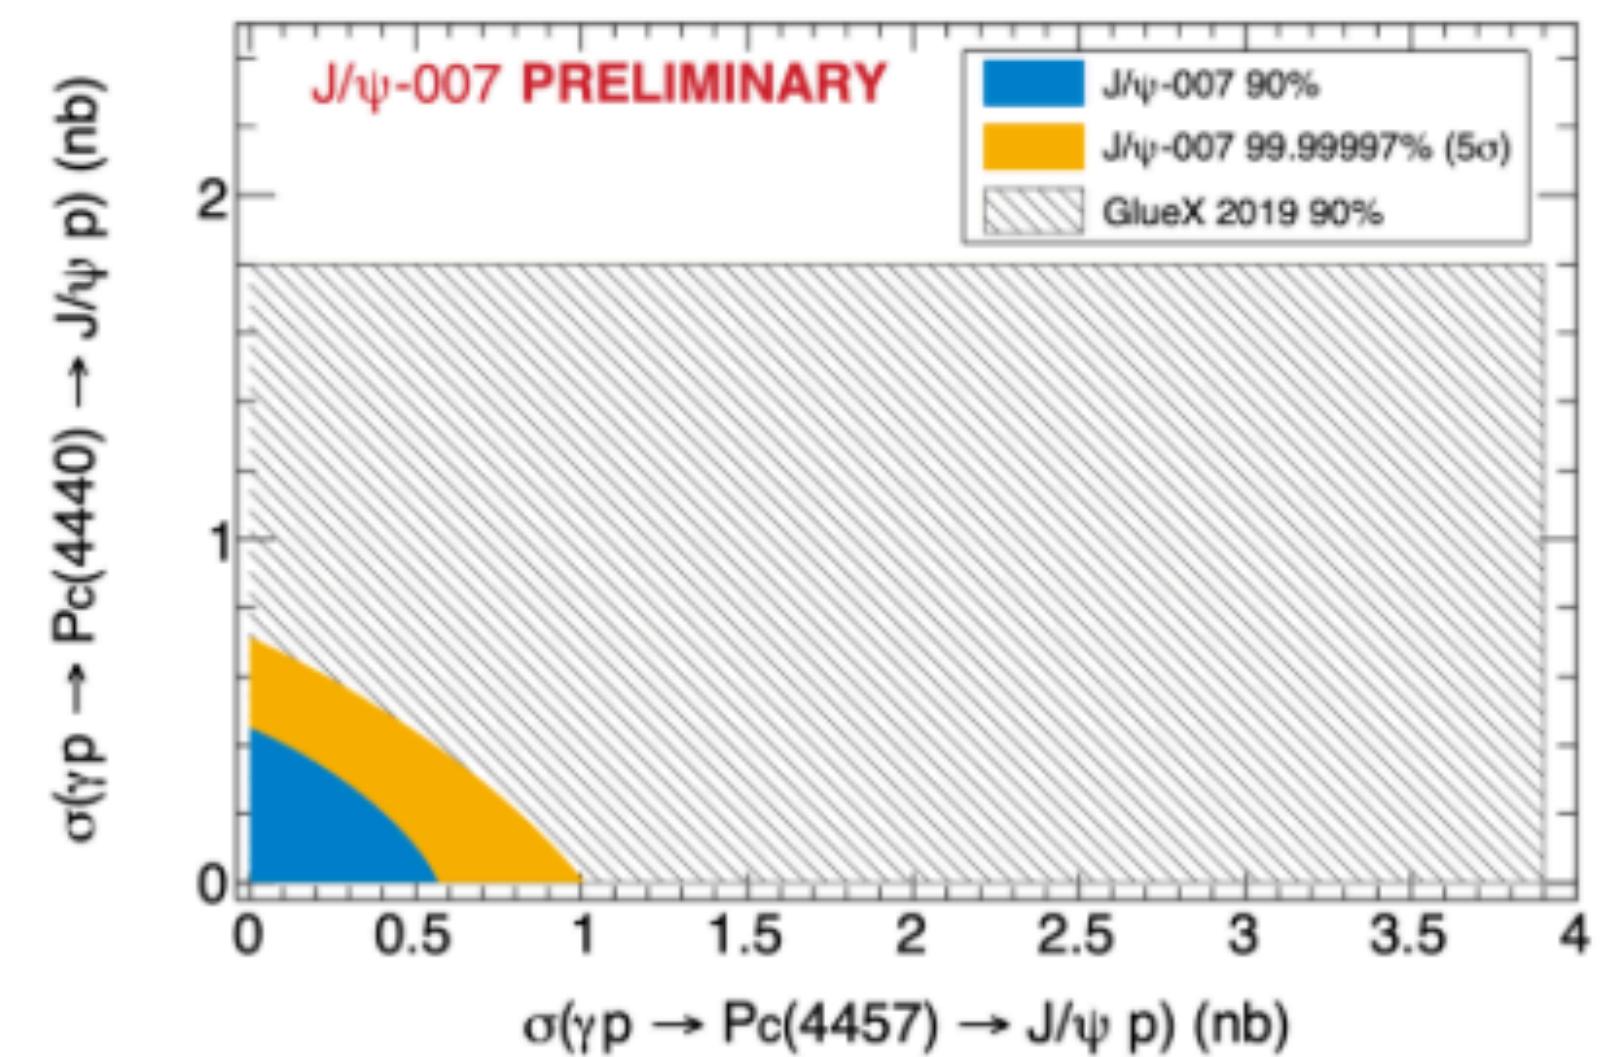

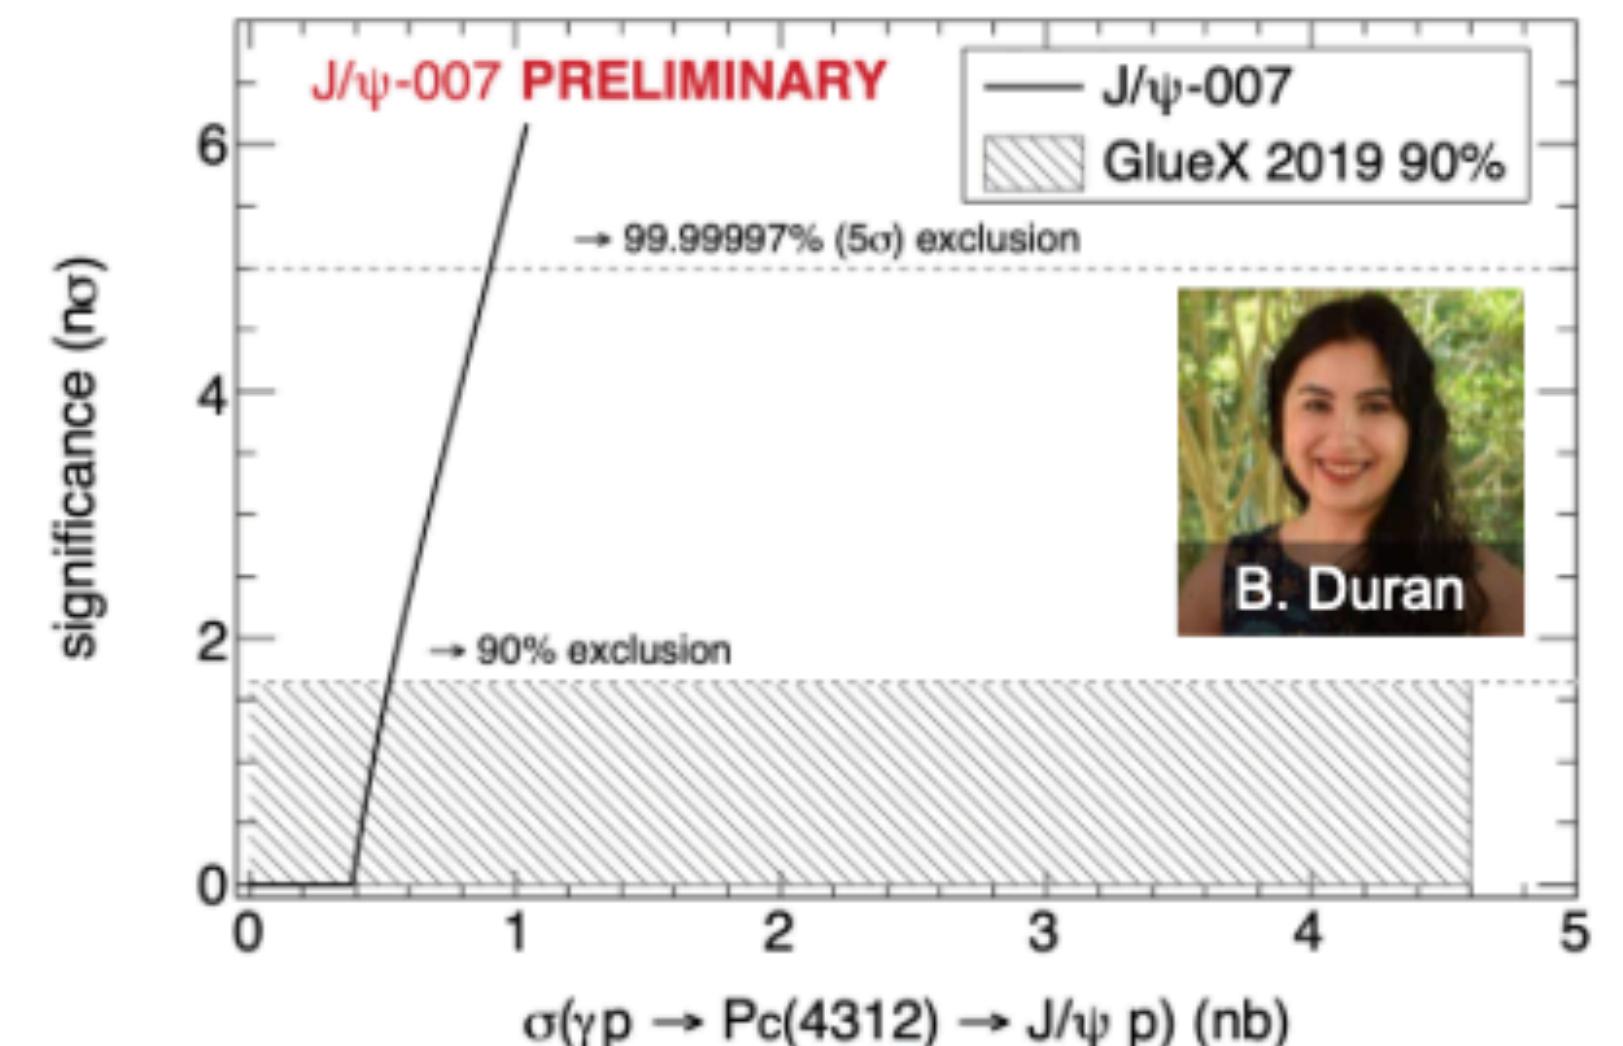

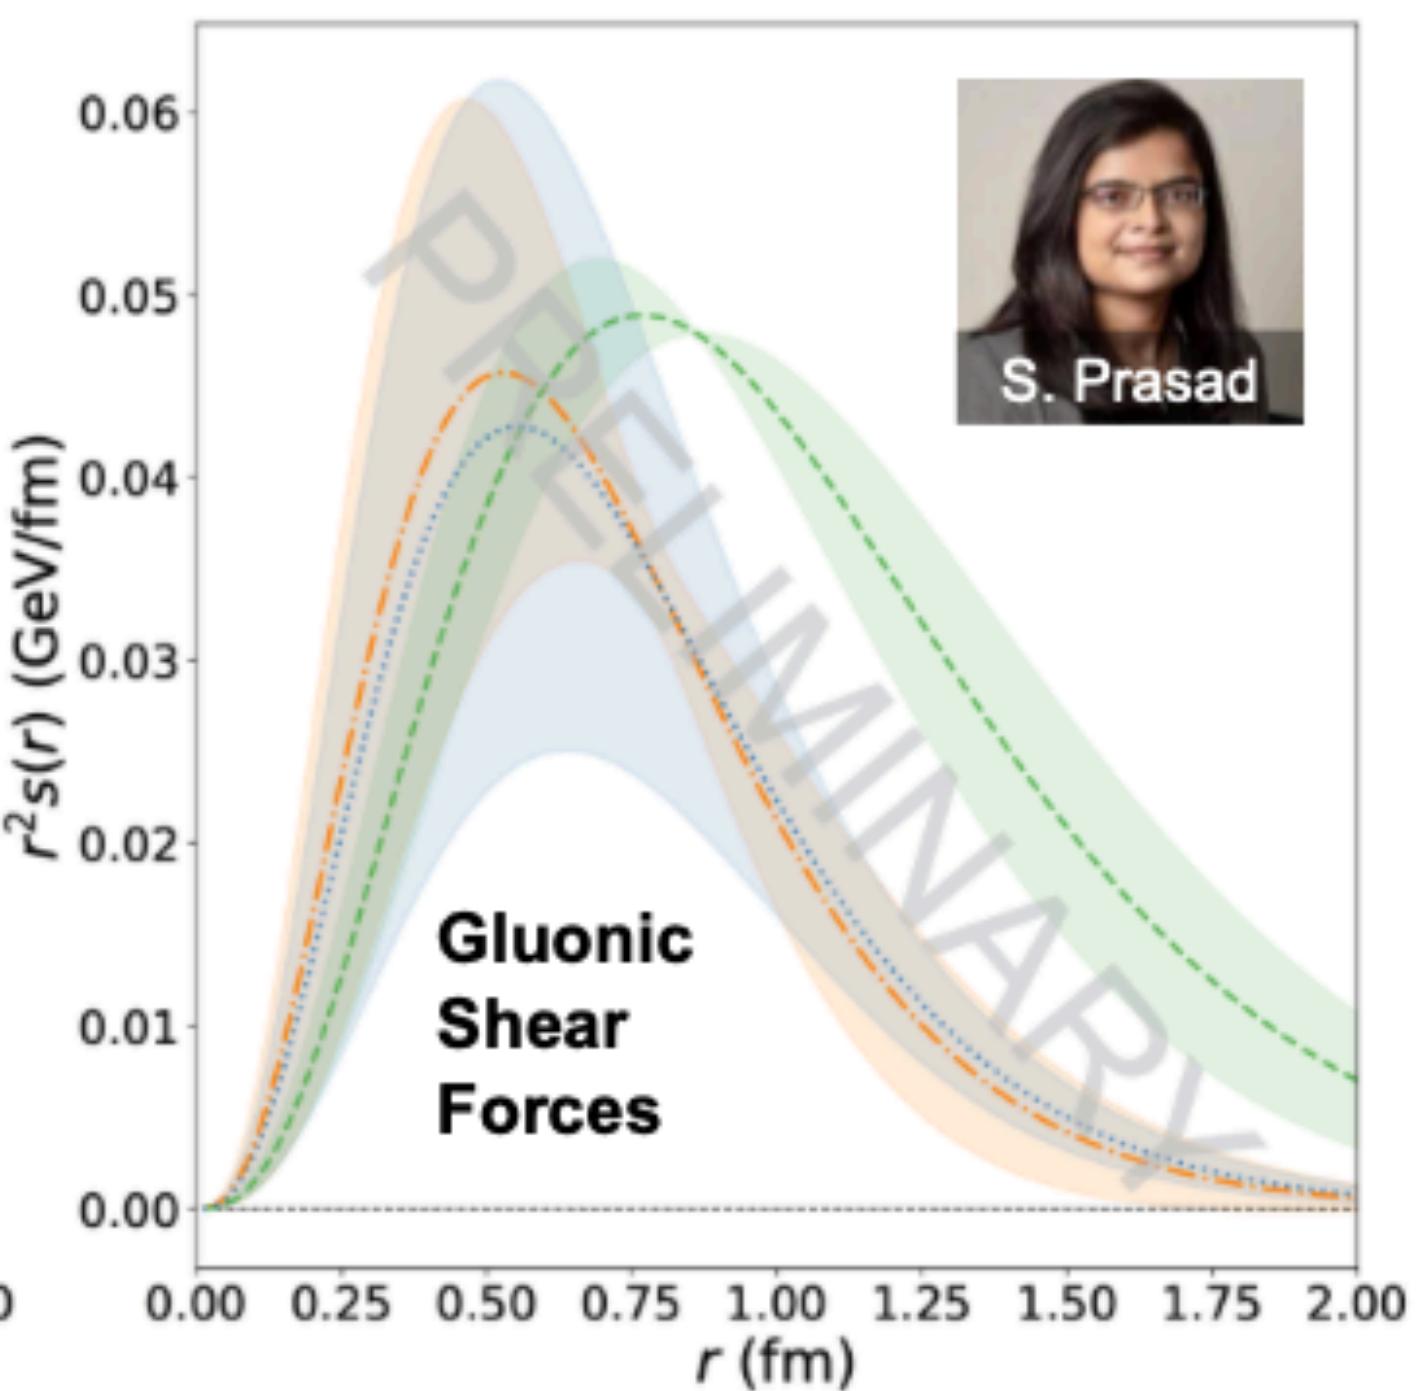

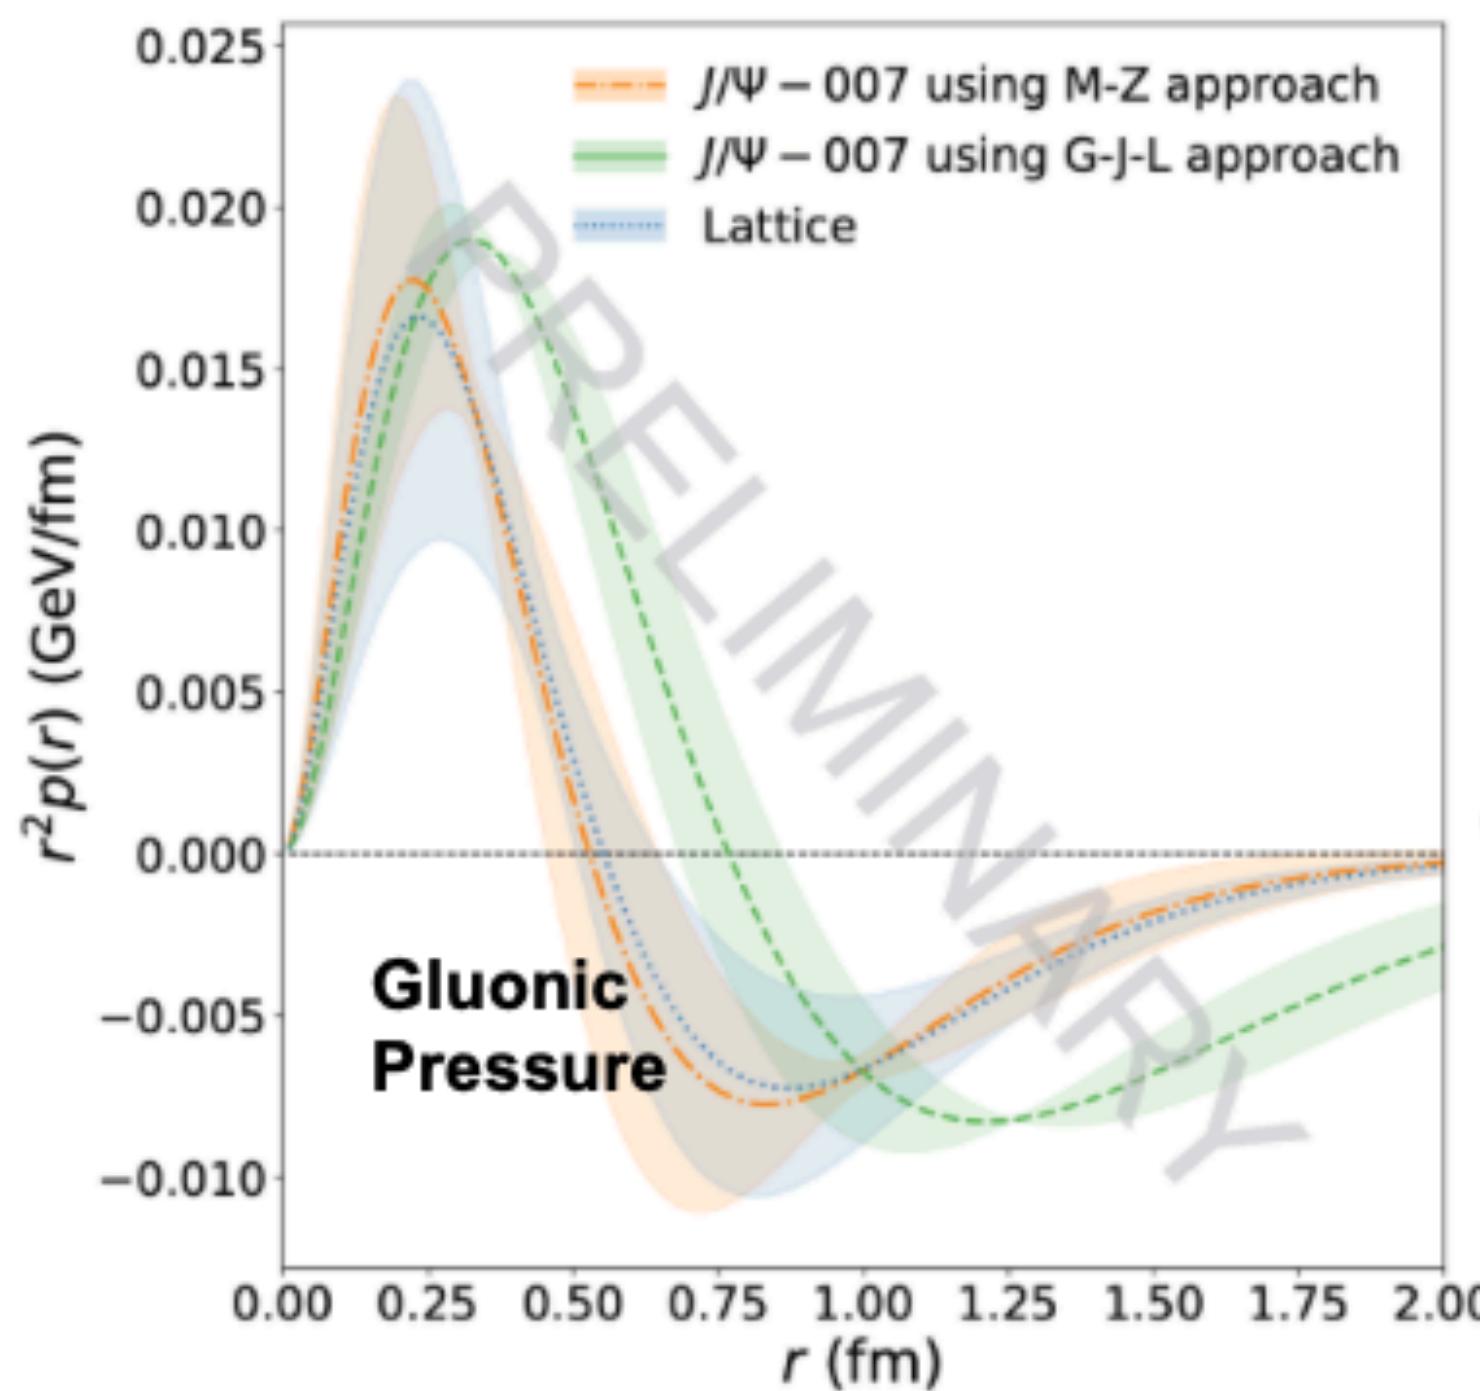

- Consistent with the electron results.

- Largest impact on the $C(t)$ form factor with improved precision

Upcoming J/ψ-007 Results

From near-threshold J/ψ in 2-D to gluonic gravitational form factors

- Expect more results in FY24: the gluonic pressure and shear forces in the proton, hidden-charm pentaquarks, and di-muon decay channel

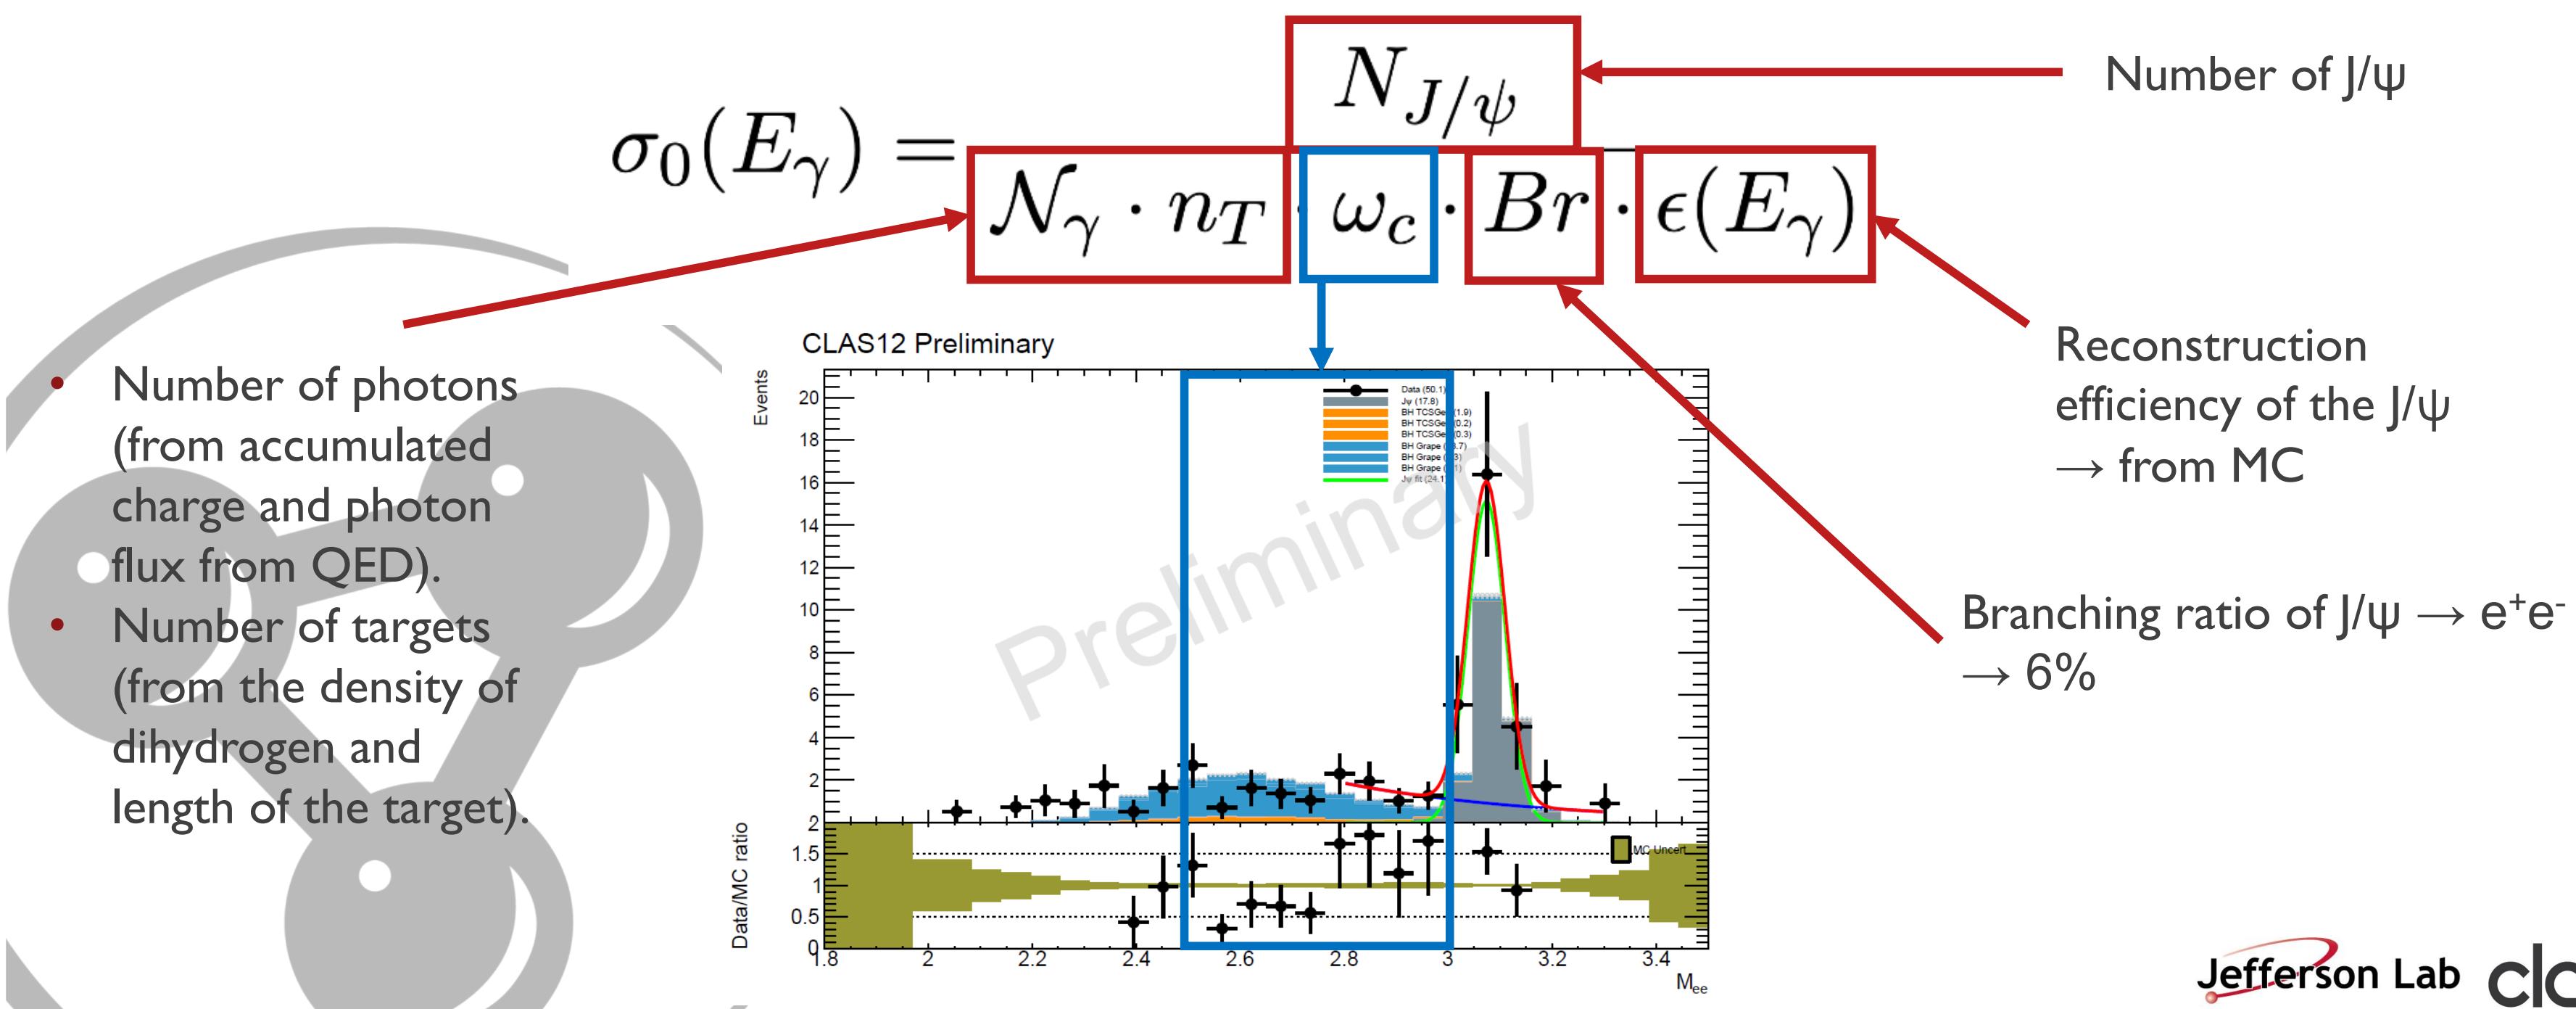

Slide from Pierre Chatagnon

NEW CLAS12 RESULTS AND OUTLOOK

From TCS to near-threshold J/ ψ photoproduction

14/16

J/ ψ (quasi-)photoproduction events selection & cross-section extraction

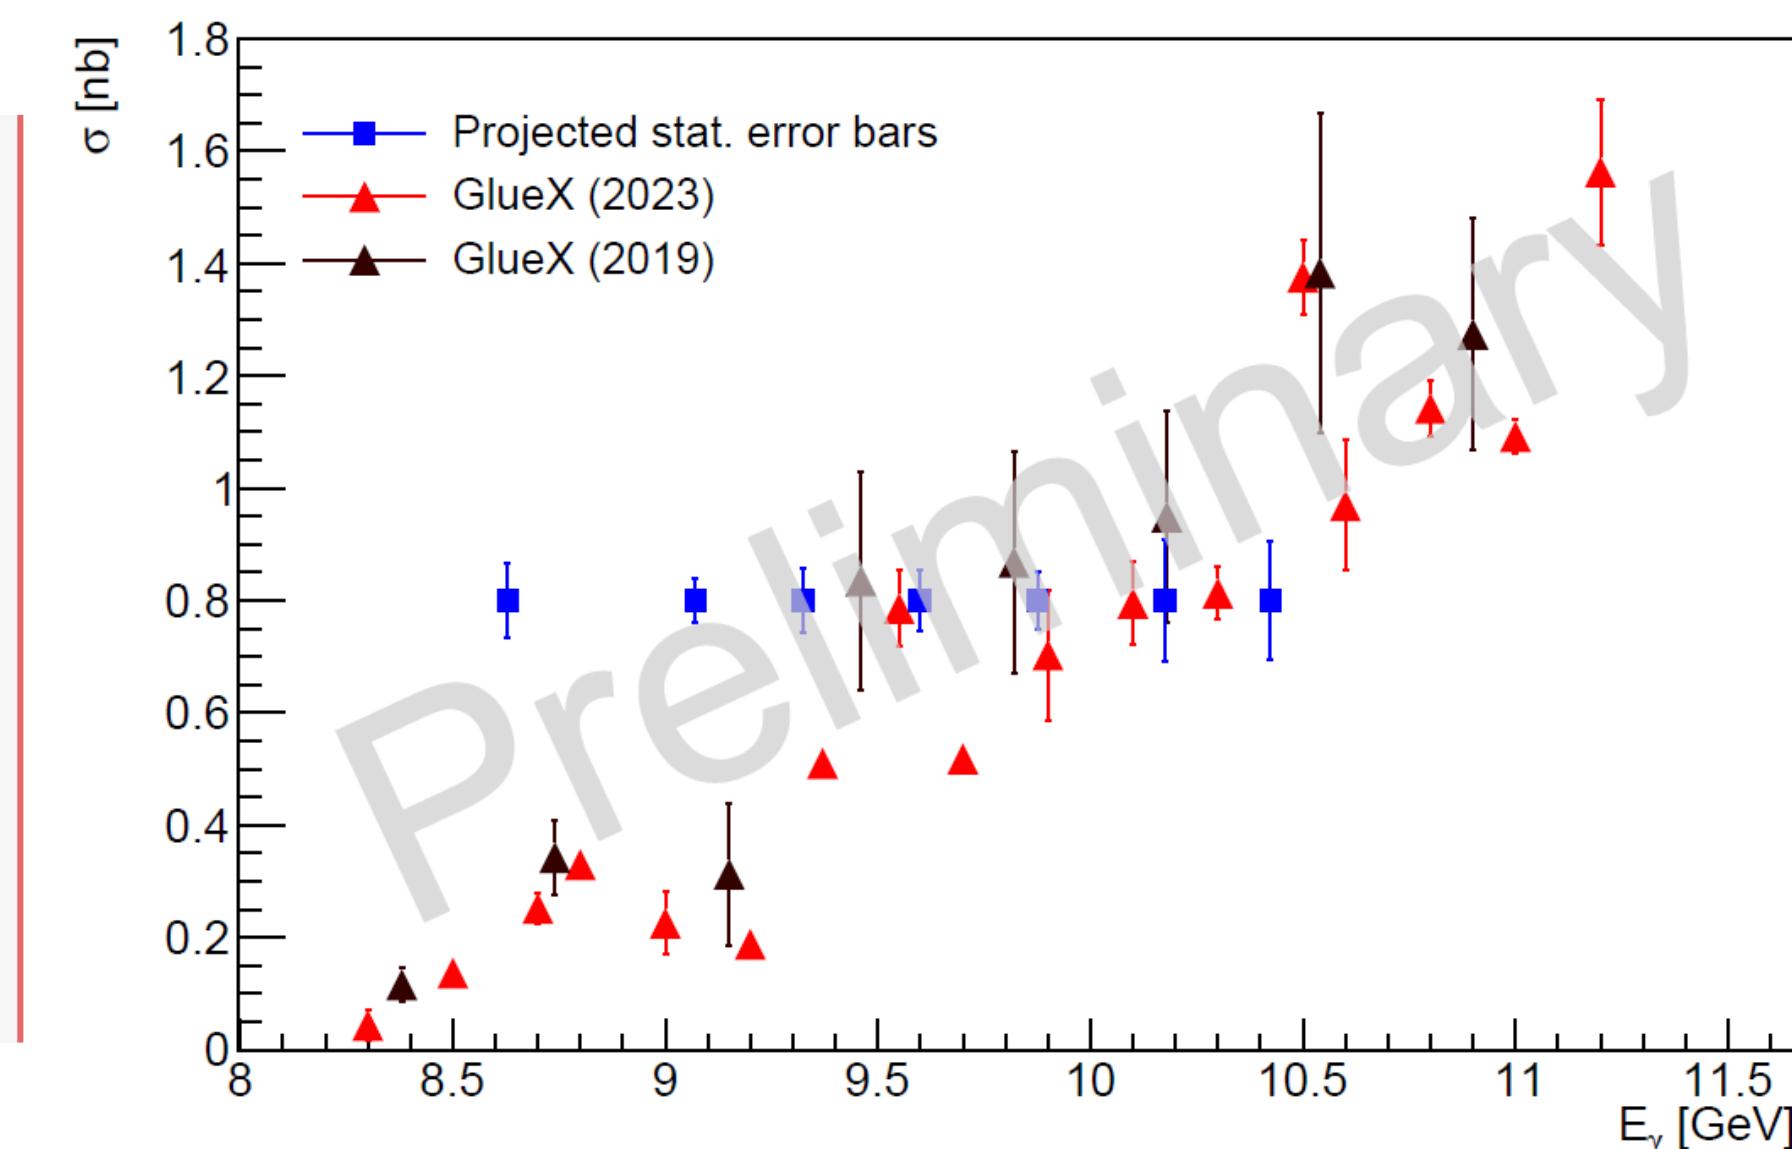

Argonne National Laboratory is a
U.S. Department of Energy laboratory
managed by UChicago Argonne, LLC.

NEW CLAS12 RESULTS AND OUTLOOK

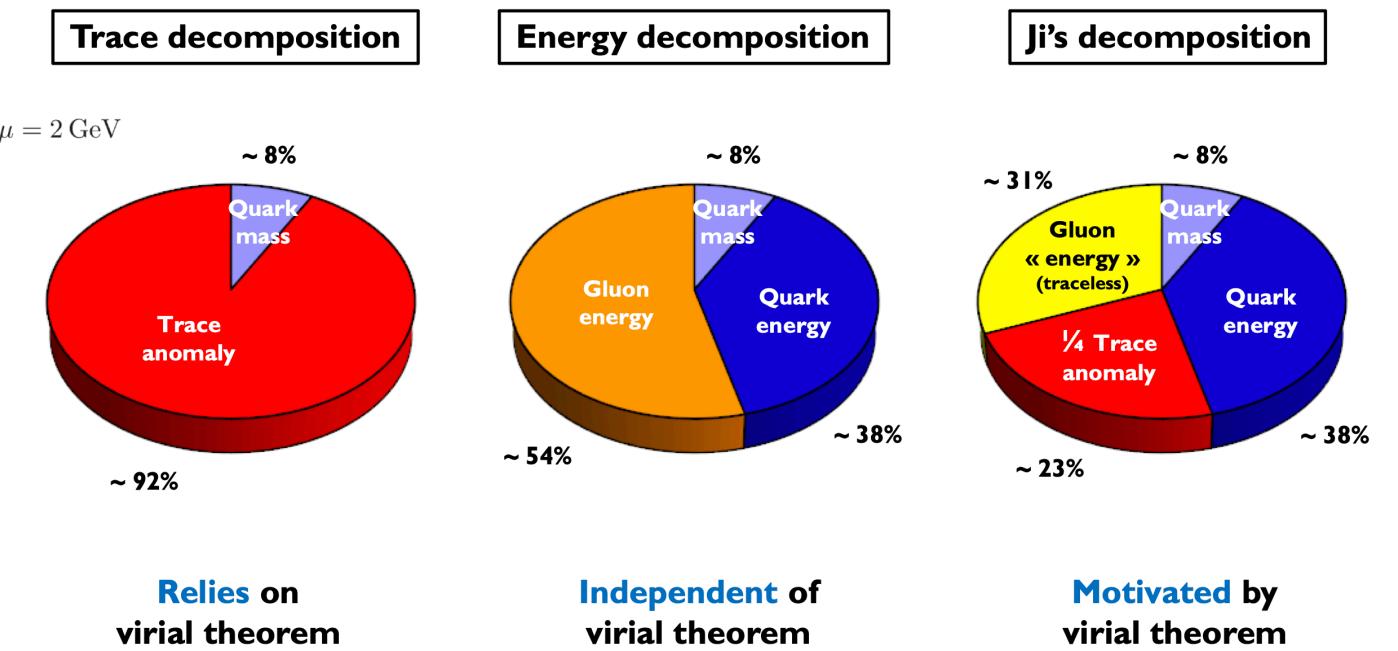

Projections for the full CLAS12 proton target dataset

- Projected statistics error bars based on full dataset available on proton target and expected 50% improvement for tracking.
- Maximum photon energy slightly smaller than GlueX.
- Projected error bars are competitive with GlueX.
- t-dependence will also be extracted.
- J/ ψ photoproduction on neutron is also measured (Analysis by R. Tyson, U. of Glasgow).

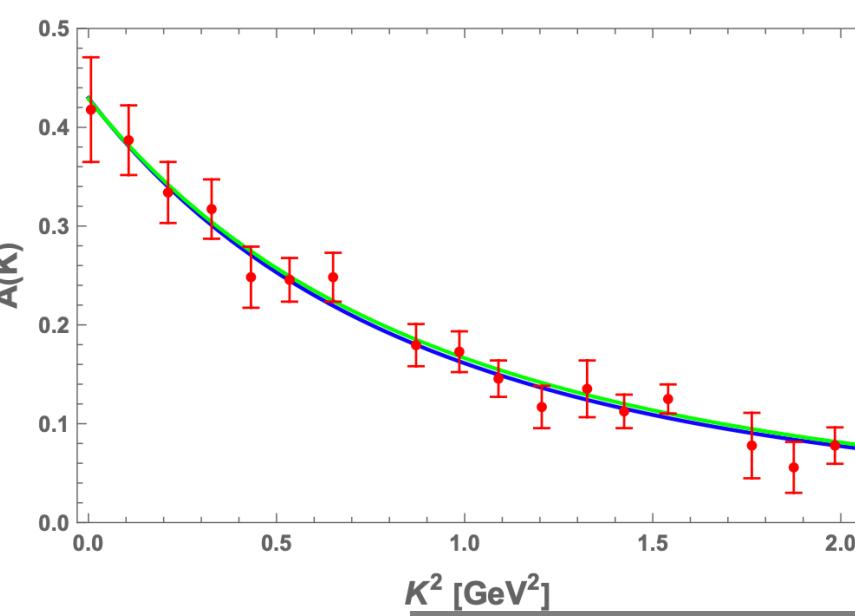

Including all data taken on unpolarized proton and improved tracking efficiency

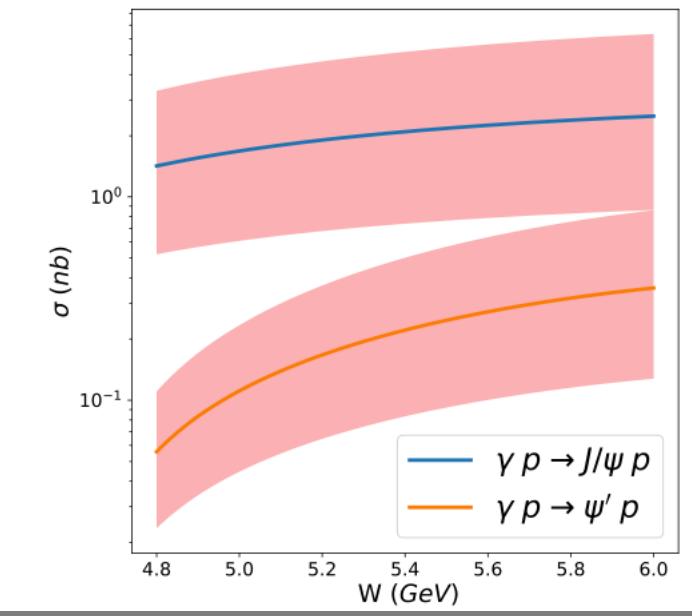

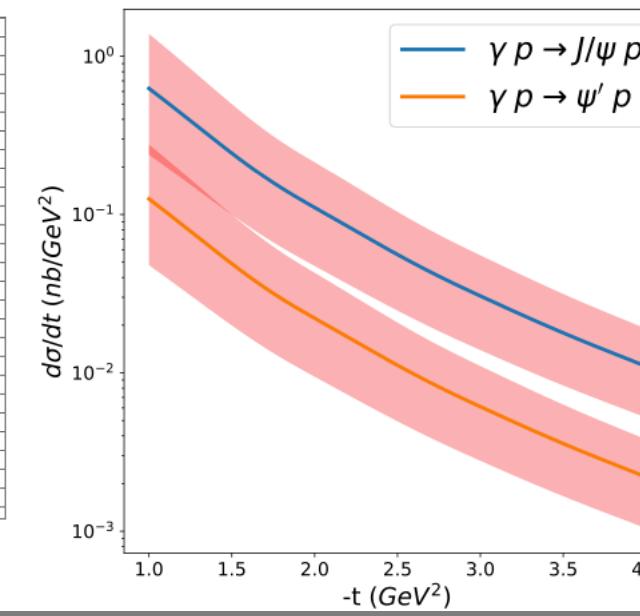

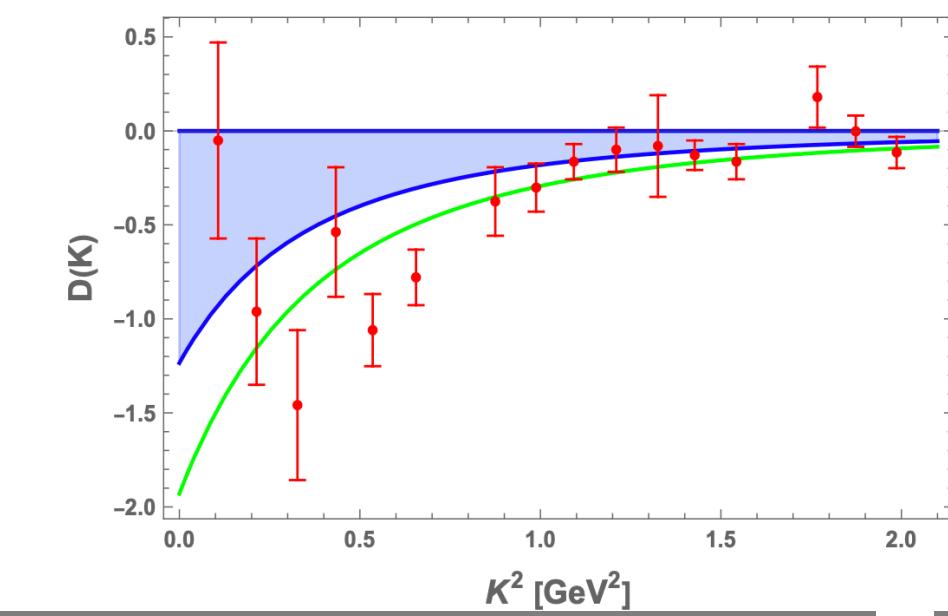

PROMINENT RECENT DEVELOPMENTS

Proton mass budget decompositions,
C. Lorce (from 2022 INT workshop)

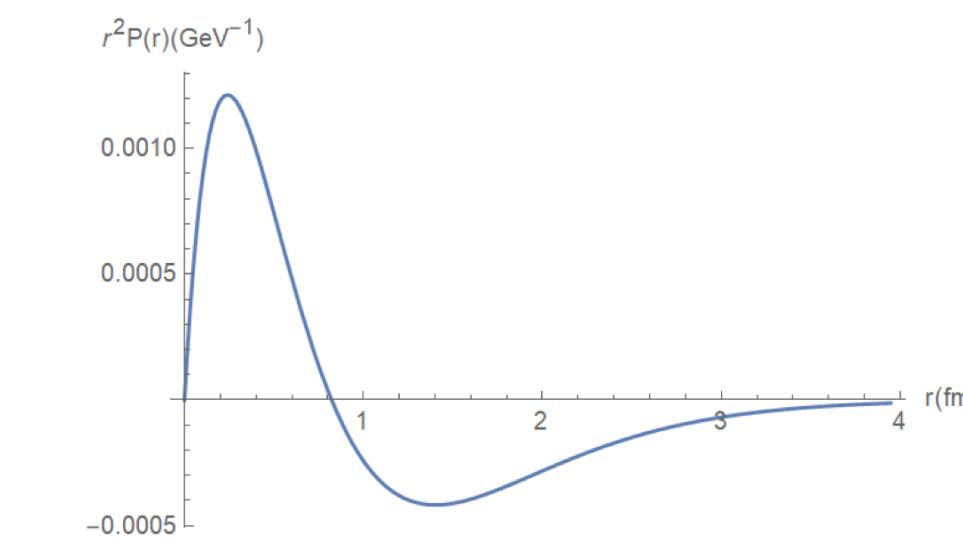

Proton gravitational form factors
holographic QCD compared with
Lattice, K. Mamo & I. Zahed (2022)

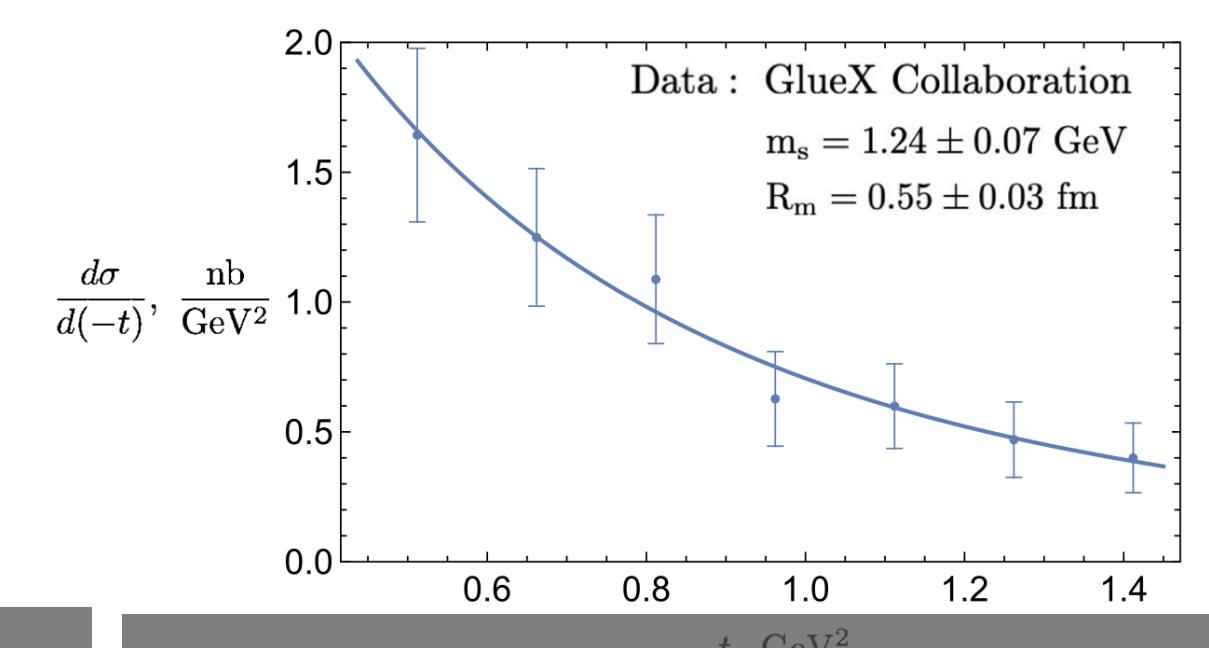

Near-threshold heavy quarkonium
production at large momentum transfer,
P. Sun, X-B. Tong, F. Yuan (PRD 2022)

- A hot topic: many theoretical developments, and pace of publications only speeding up!
- Many extractions depend on extrapolating to the forward limit ($t=0$), which introduces theoretical systematic uncertainties. Precise high- t as a function photon energy crucial.
- Other avenues for factorization include large- t region, large Q^2 region, or larger vector meson mass.

Gluon contribution to pressure
in GPD formalism, Y. Guo, X. Ji,
Y. Liu, (PRD 2021)

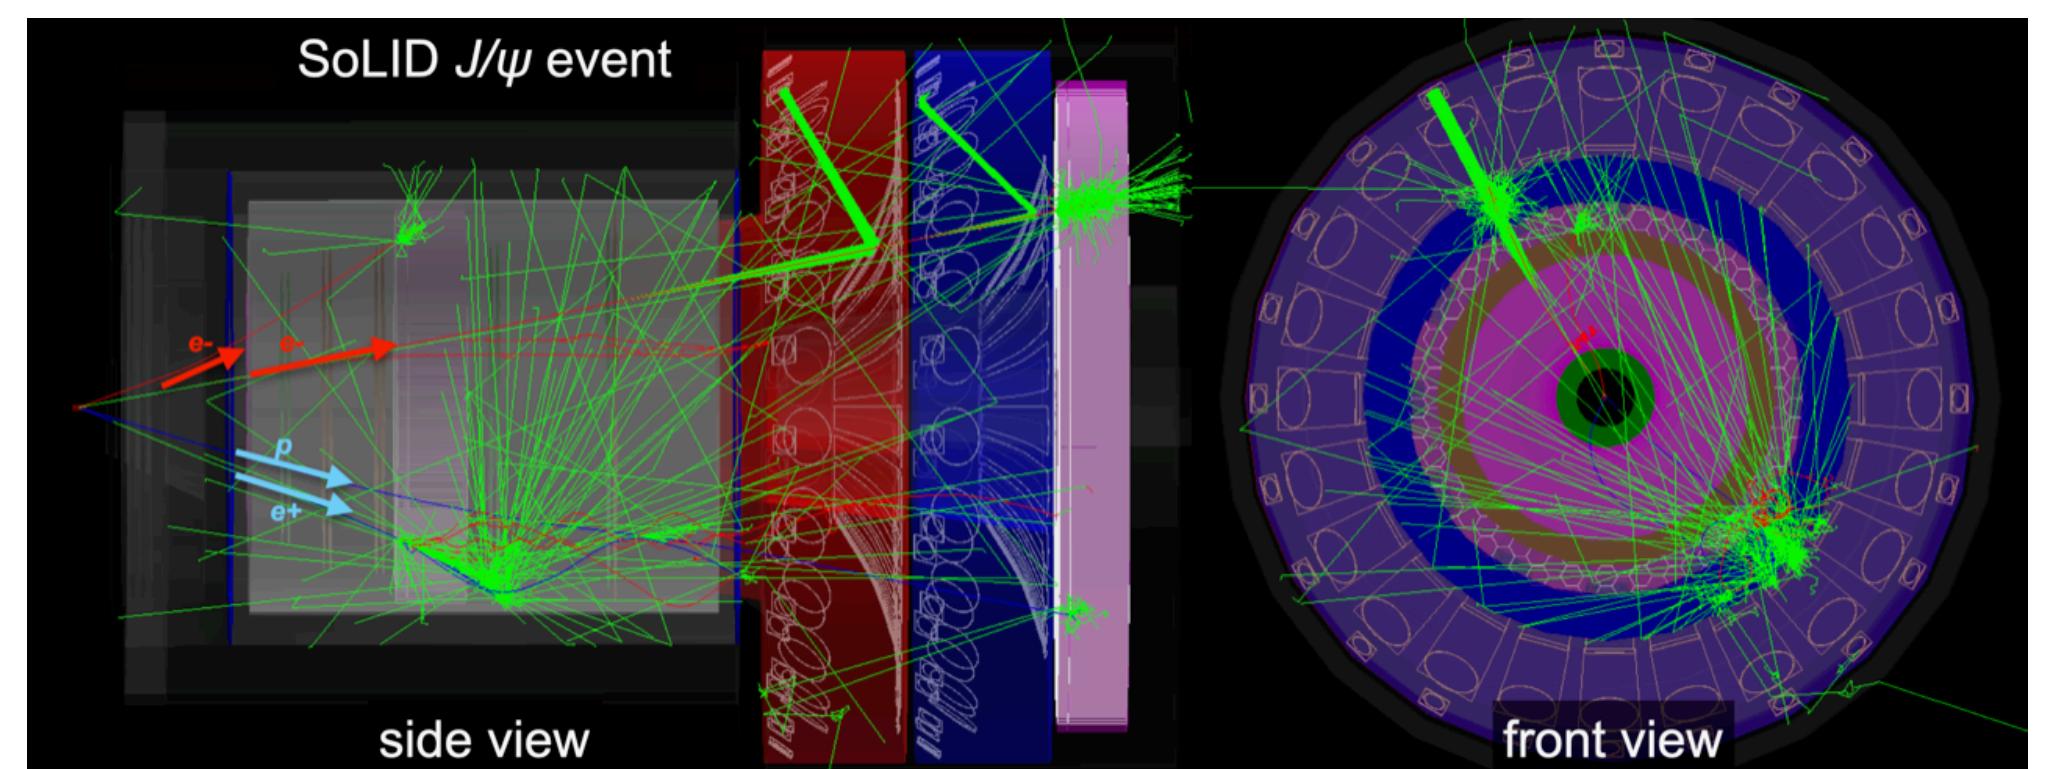

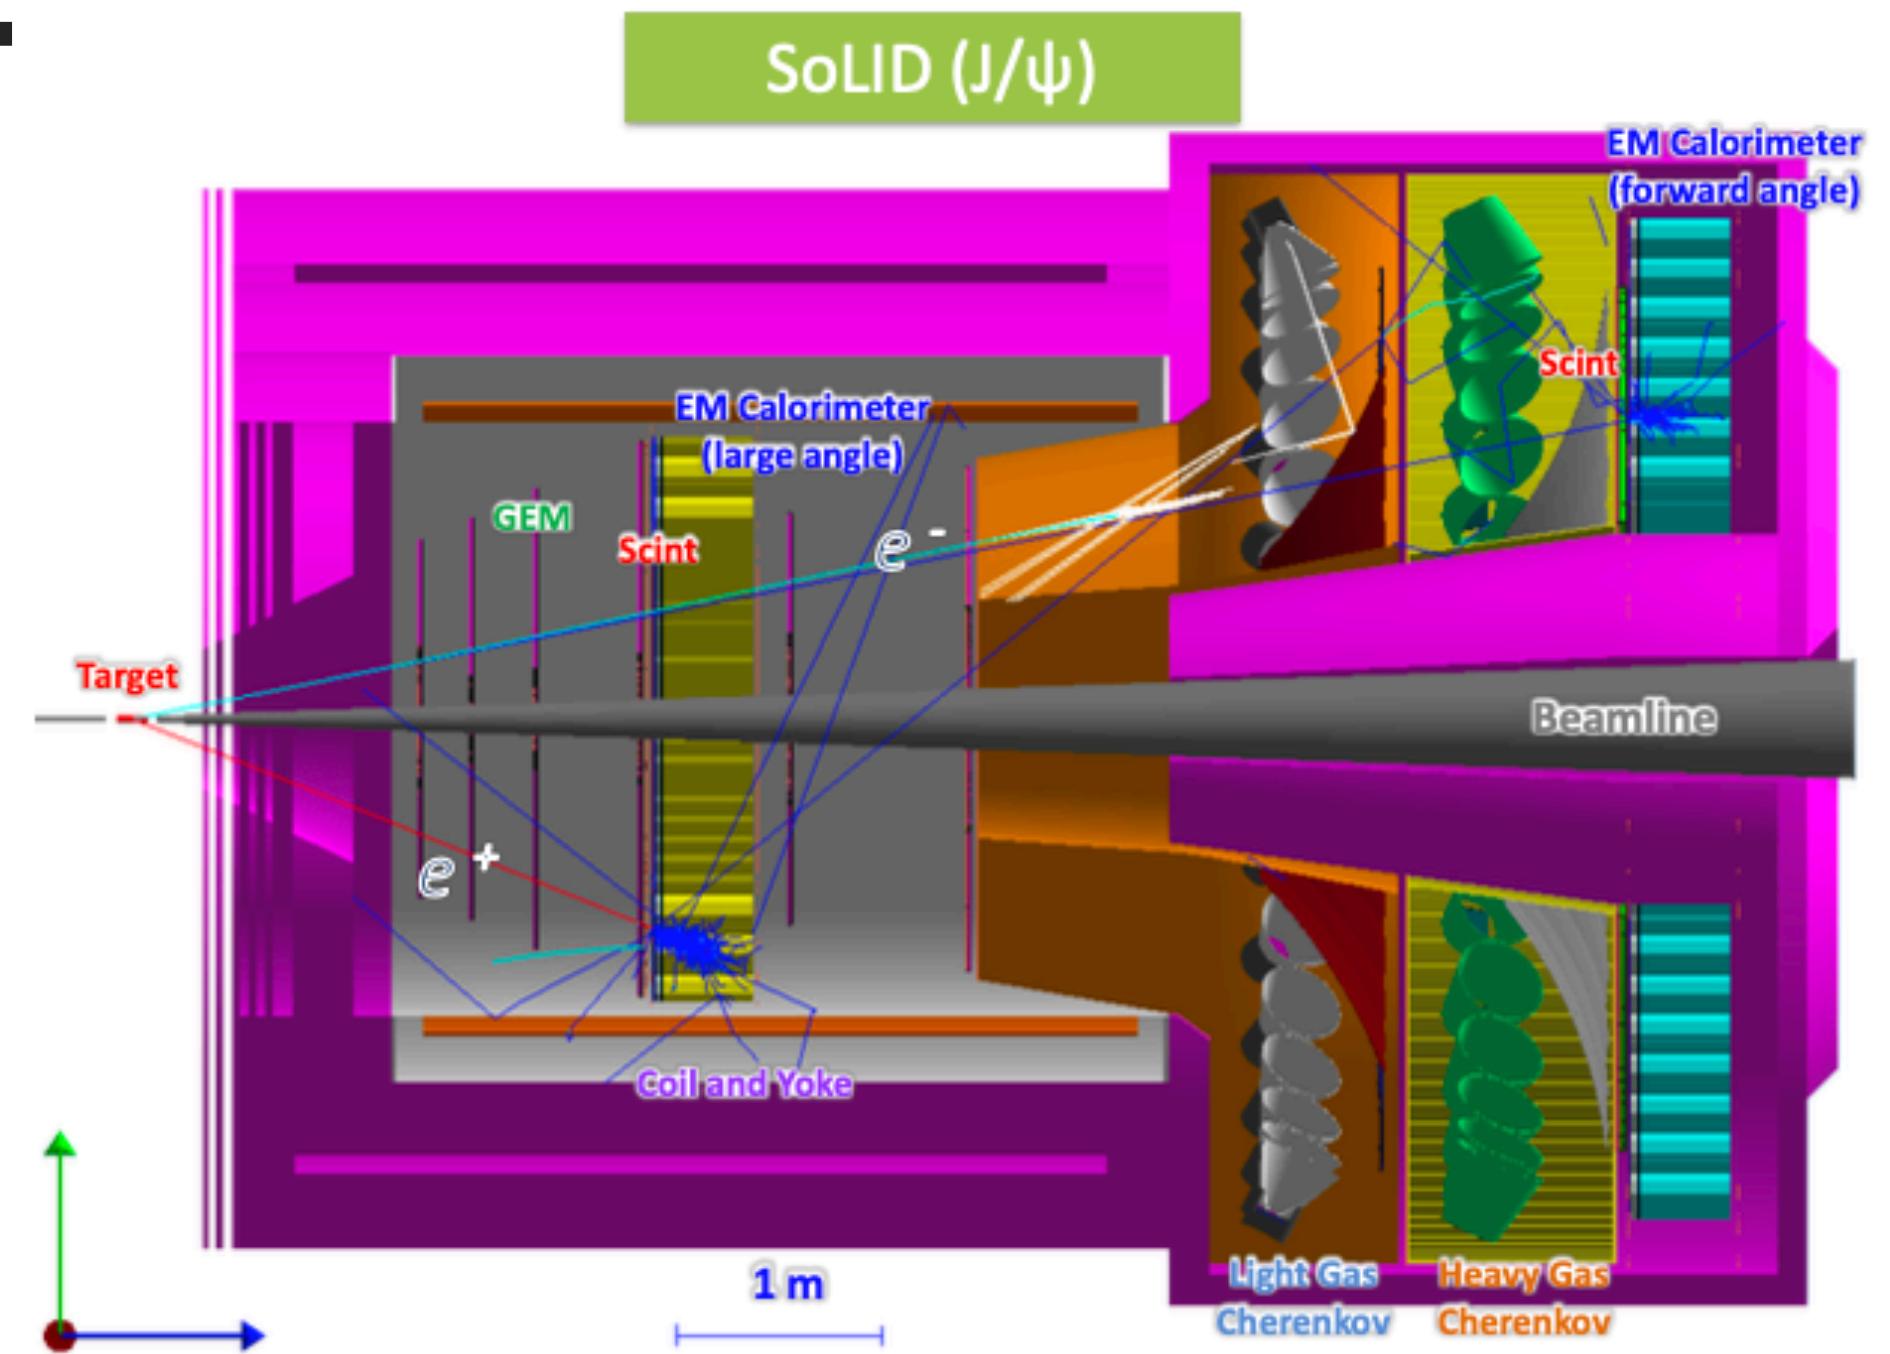

Gluonic radius of the proton
based on 1D GlueX results, D.
Kharzeev (PRD 2021)

THE SoLID-J/ ψ EXPERIMENT

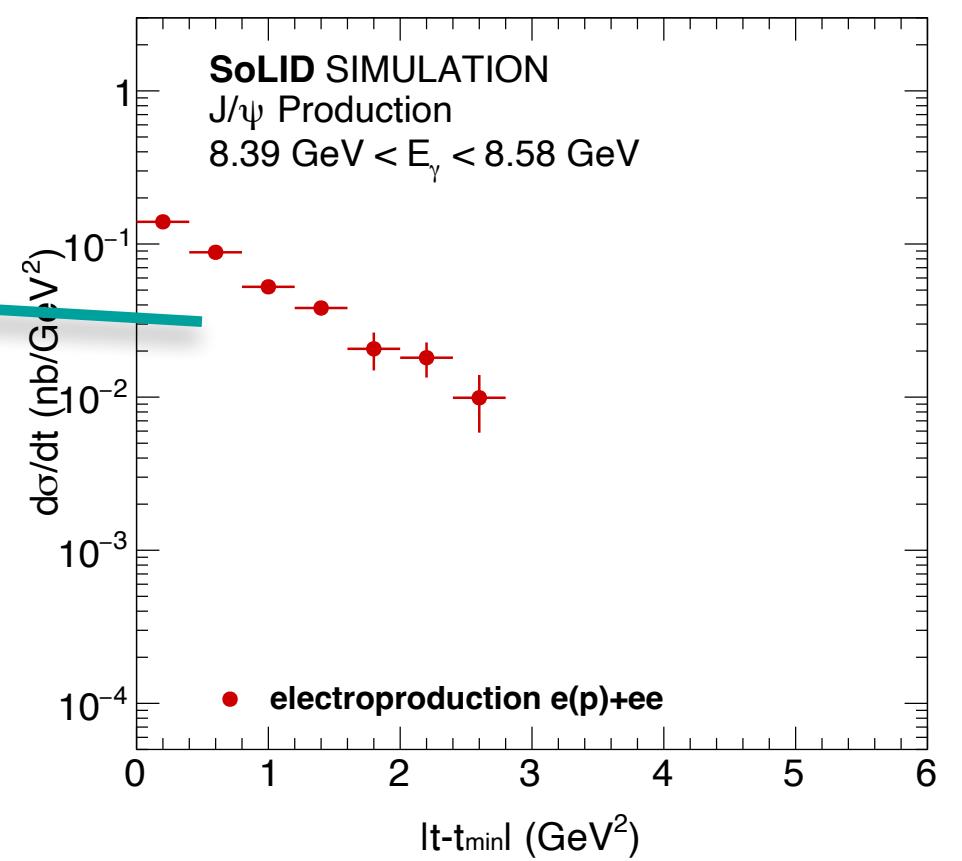

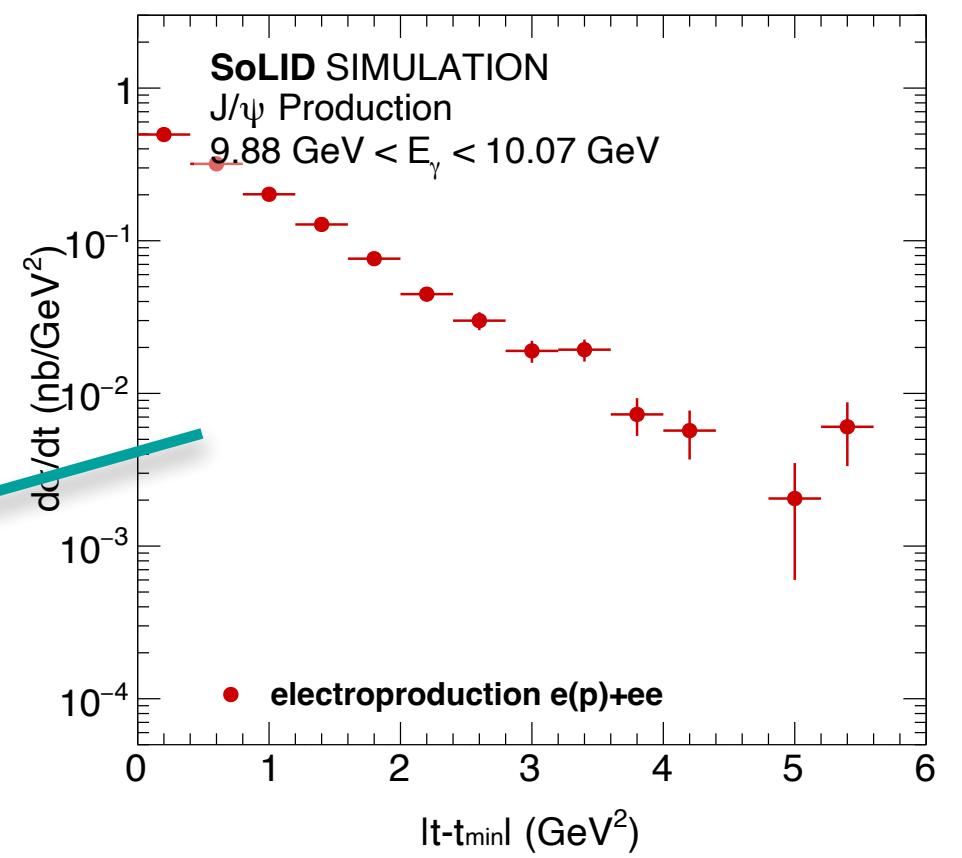

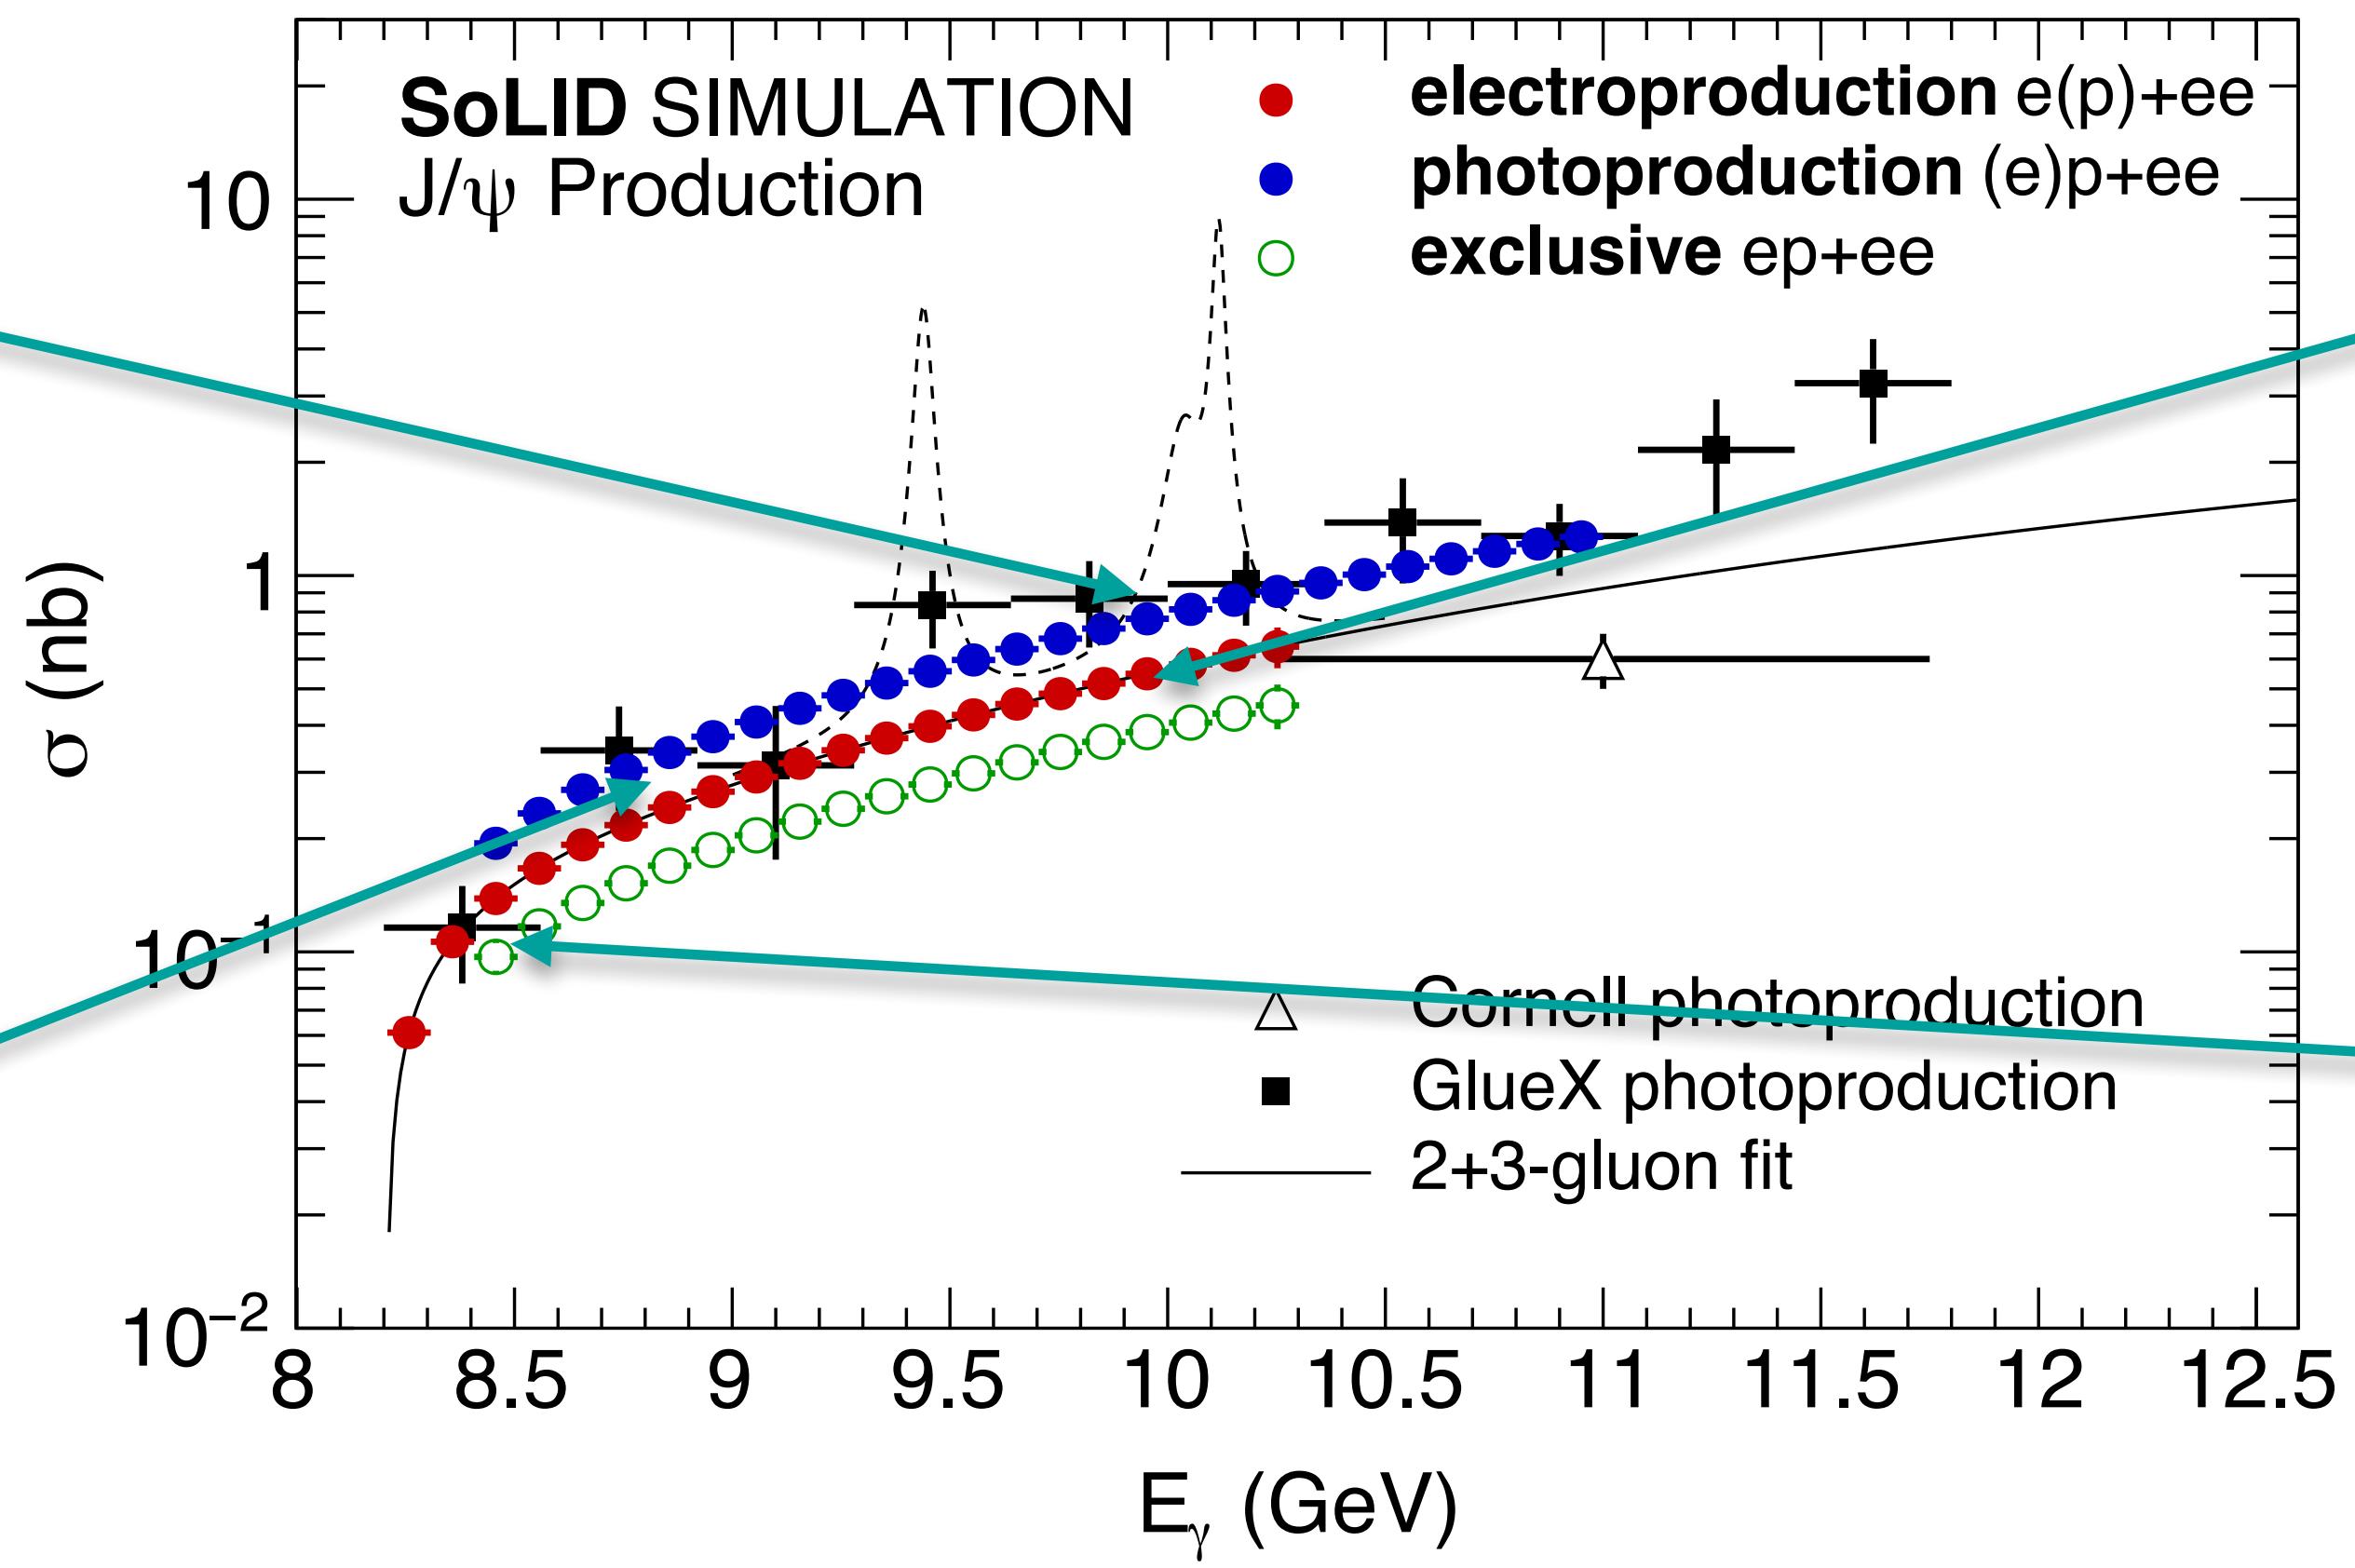

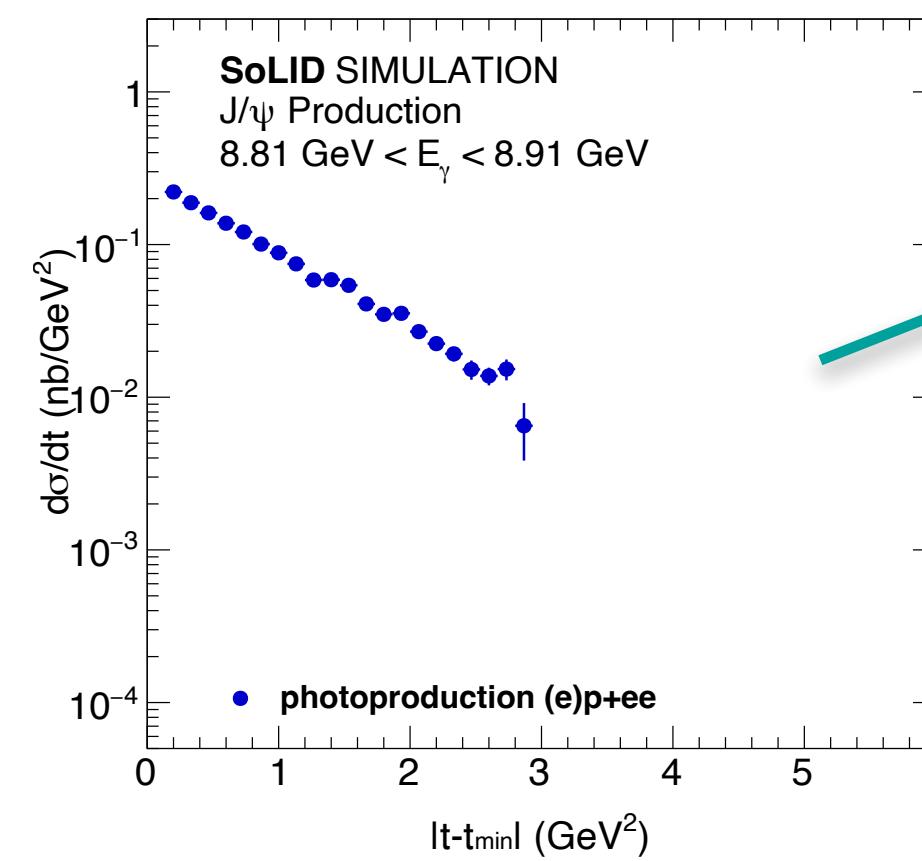

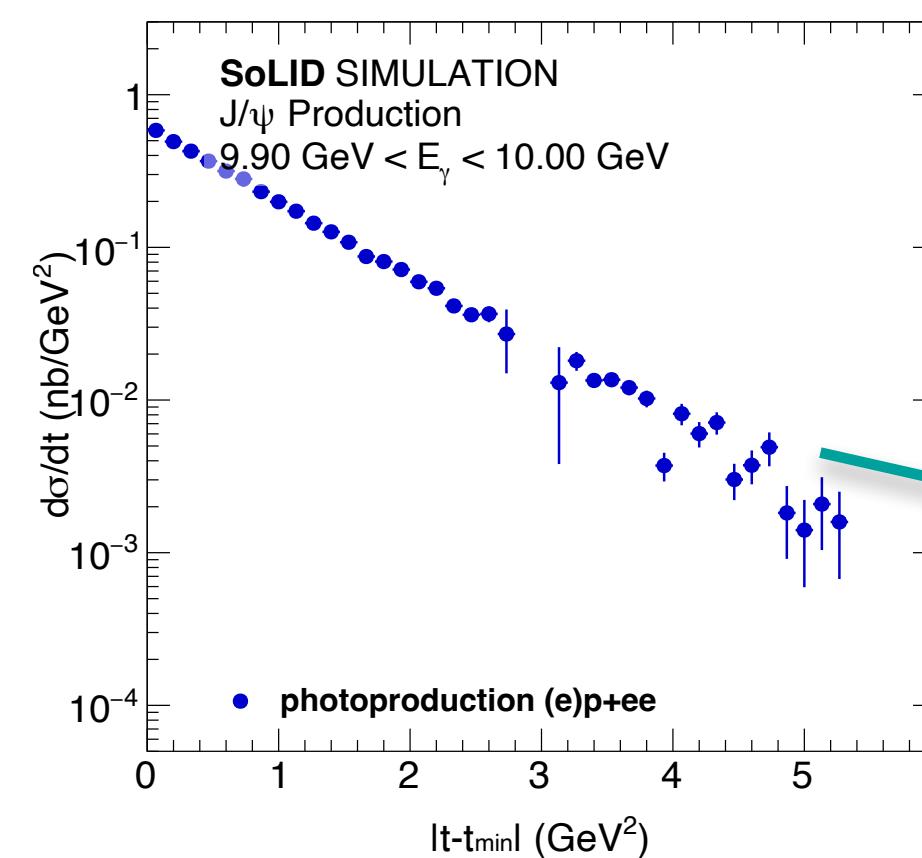

Ultimate factory for near-threshold J/ ψ

- General purpose large-acceptance spectrometer
- 50+10 days of $3\mu\text{A}$ beam on a 15cm long LH₂ target ($10^{37}/\text{cm}^2/\text{s}$)
- **Ultra-high luminosity:** 43.2ab^{-1}
- **Open 2-particle trigger**, covering J/ ψ production in four channels:
Electroproduction ($e^-e^-e^+$), photoproduction (p,e^-e^+),
inclusive (e^-e^+), exclusive (ep,e^-e^+)
- The electroproduction channel provides for a modest lever-arm in Q^2 near threshold

SOLID-J/ ψ PROJECTIONS

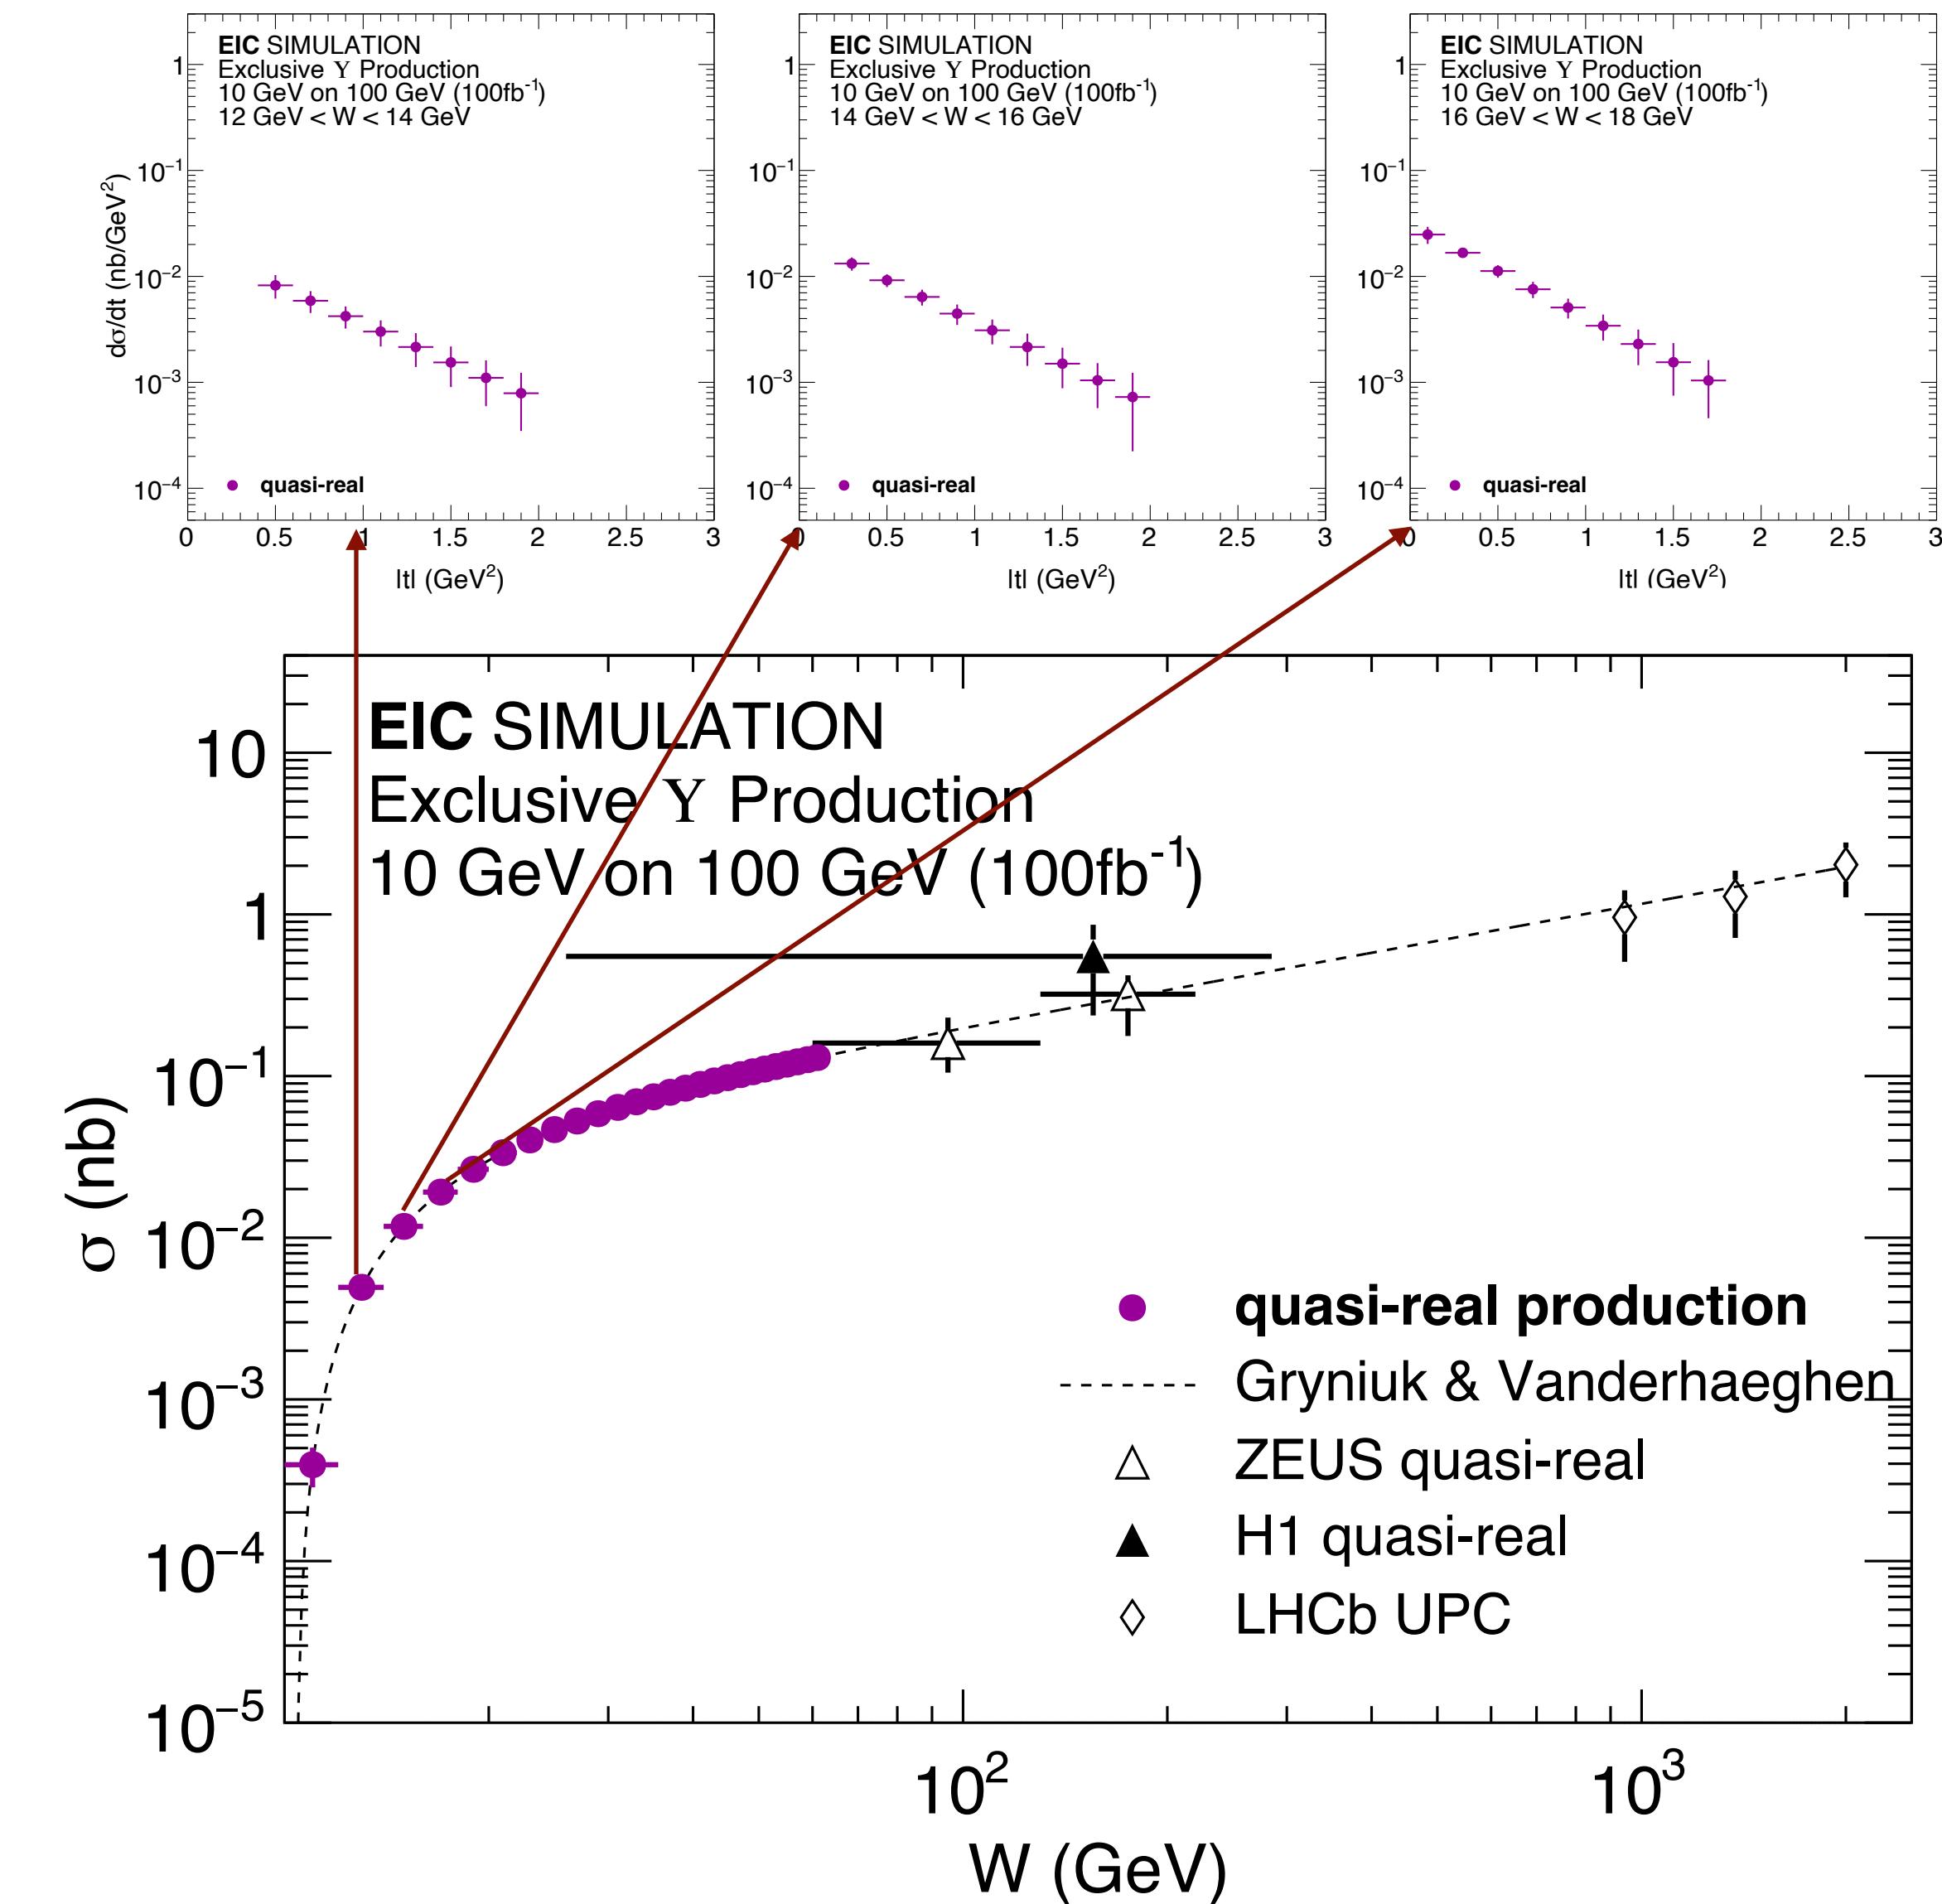

High-precision 2-D cross section crucial to really connect GFFs to data

$Y(1S)$ NEAR THRESHOLD

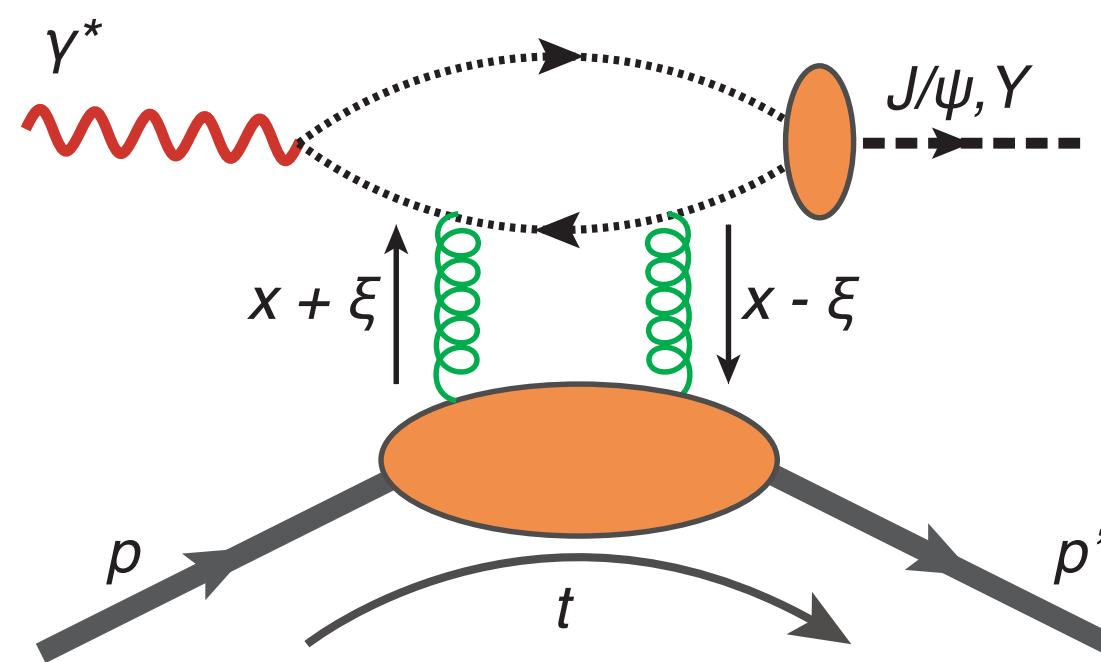

$Y(1S)$ with the ePIC detector

- $Y(1S)$ at EIC trades statistical precision of J/ψ at SoLID for lower theoretical uncertainties and extra channel to study universality.
- Large Q^2 reach at EIC an additional knob to study production

DEEPLY-VIRTUAL QUARKONIUM PRODUCTION

Accessing the 3-D gluon structure

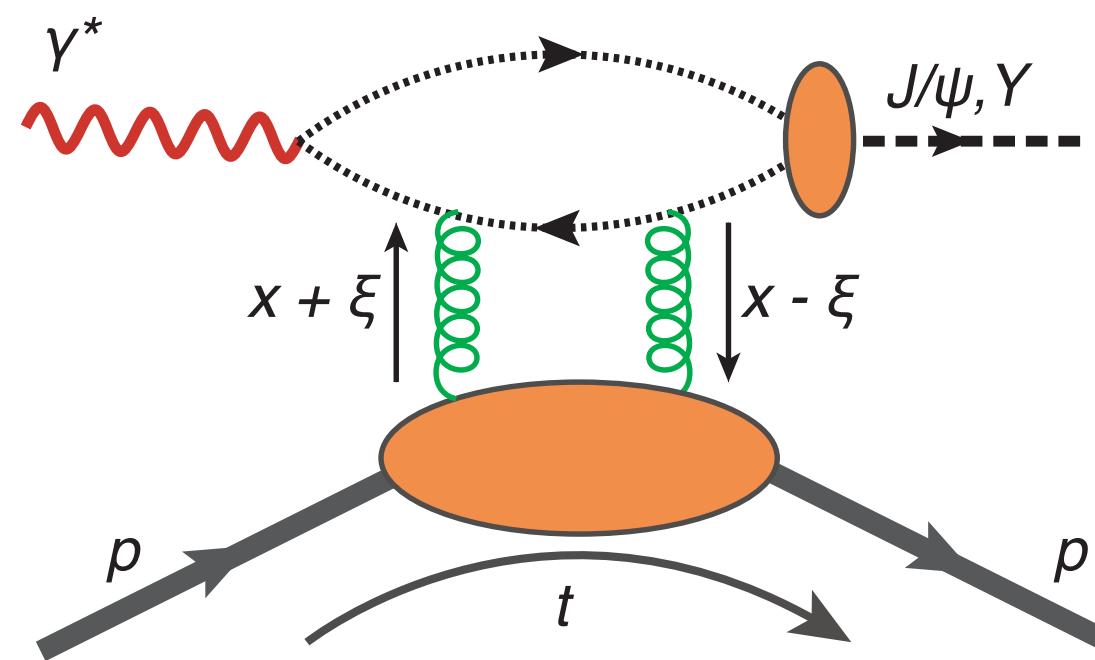

Hard scale: $Q^2 + M_V^2$

Modified Bjorken- x :
$$x_V = \frac{Q^2 + M_V^2}{2p \cdot q}$$

DEEPLY-VIRTUAL QUARKONIUM PRODUCTION

Accessing the 3-D gluon structure

**average unpolarized gluon GPD related to
 t -dependent cross section (LO)**

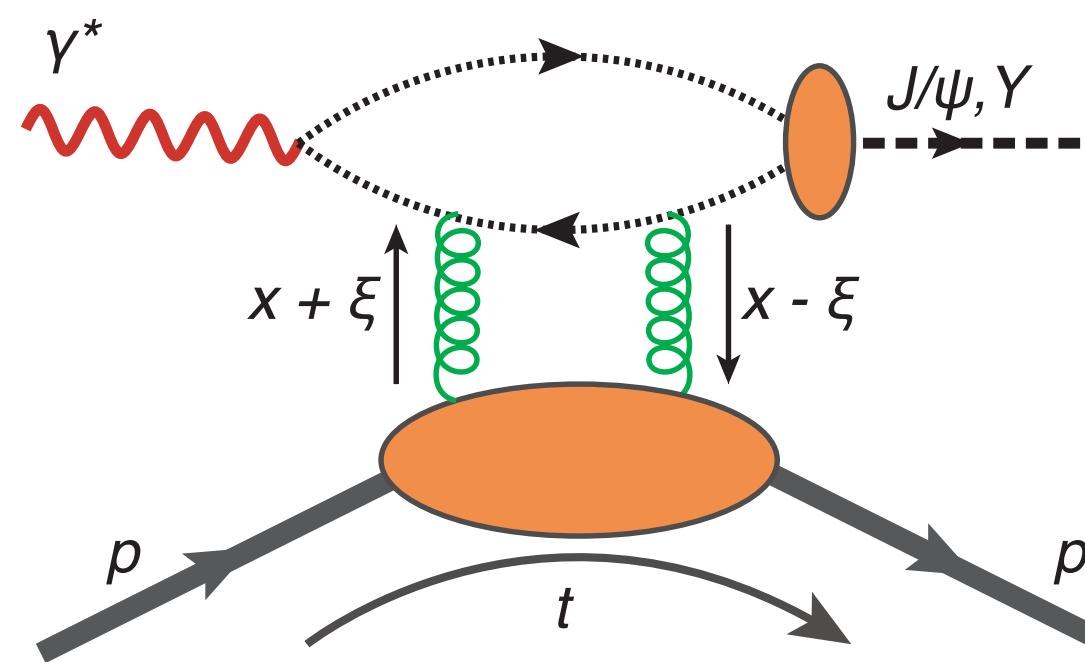

$$|\langle \mathcal{H}_g \rangle|(t) \propto \sqrt{\frac{d\sigma}{dt}(t)/\frac{d\sigma}{dt}(t=0)}$$

Hard scale: $Q^2 + M_V^2$

Modified Bjorken-x: $x_V = \frac{Q^2 + M_V^2}{2p \cdot q}$

DEEPLY-VIRTUAL QUARKONIUM PRODUCTION

Accessing the 3-D gluon structure

average unpolarized gluon GPD related to
 t -dependent cross section (LO)

$$|\langle \mathcal{H}_g \rangle|(t) \propto \sqrt{\frac{d\sigma}{dt}(t)/\frac{d\sigma}{dt}(t=0)}$$

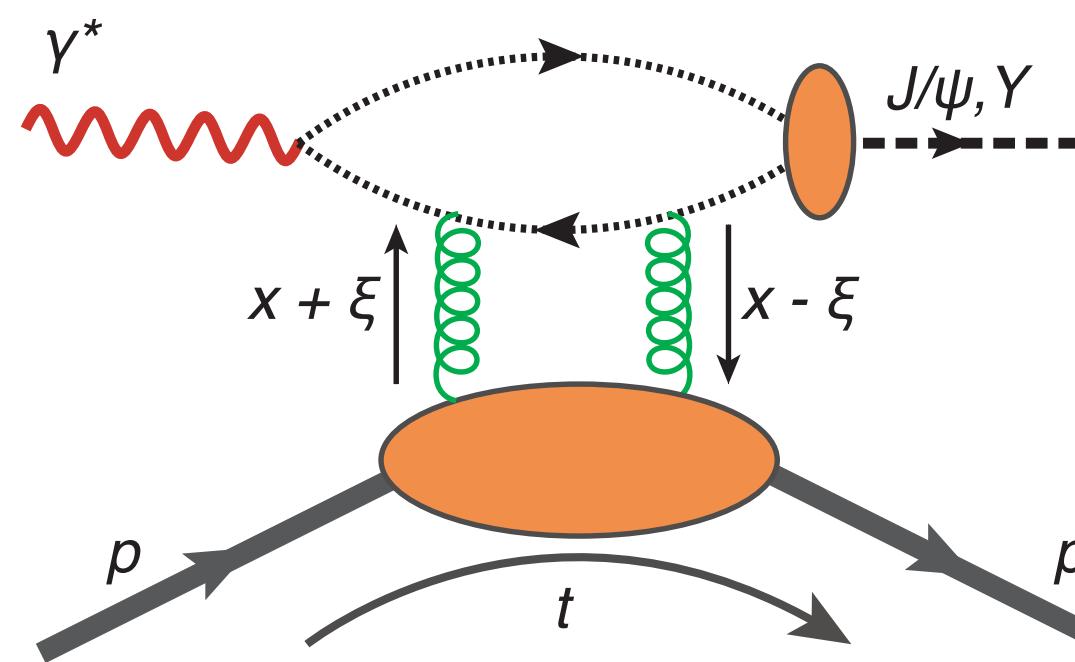

Fourier transform:
3-D transverse gluonic density

$$\rho(|\vec{b}_T|, x_V) = \int \frac{d^2 \vec{\Delta}_T}{(2\pi)^2} e^{i \vec{\Delta}_T \cdot \vec{b}_T} |\langle H_g \rangle|(t = -\vec{\Delta}_T^2)$$

DEEPLY-VIRTUAL QUARKONIUM PRODUCTION

Accessing the 3-D gluon structure

average unpolarized gluon GPD related to
 t -dependent cross section (LO)

$$|\langle \mathcal{H}_g \rangle|(t) \propto \sqrt{\frac{d\sigma}{dt}(t)/\frac{d\sigma}{dt}(t=0)}$$

Hard scale: $Q^2 + M_V^2$

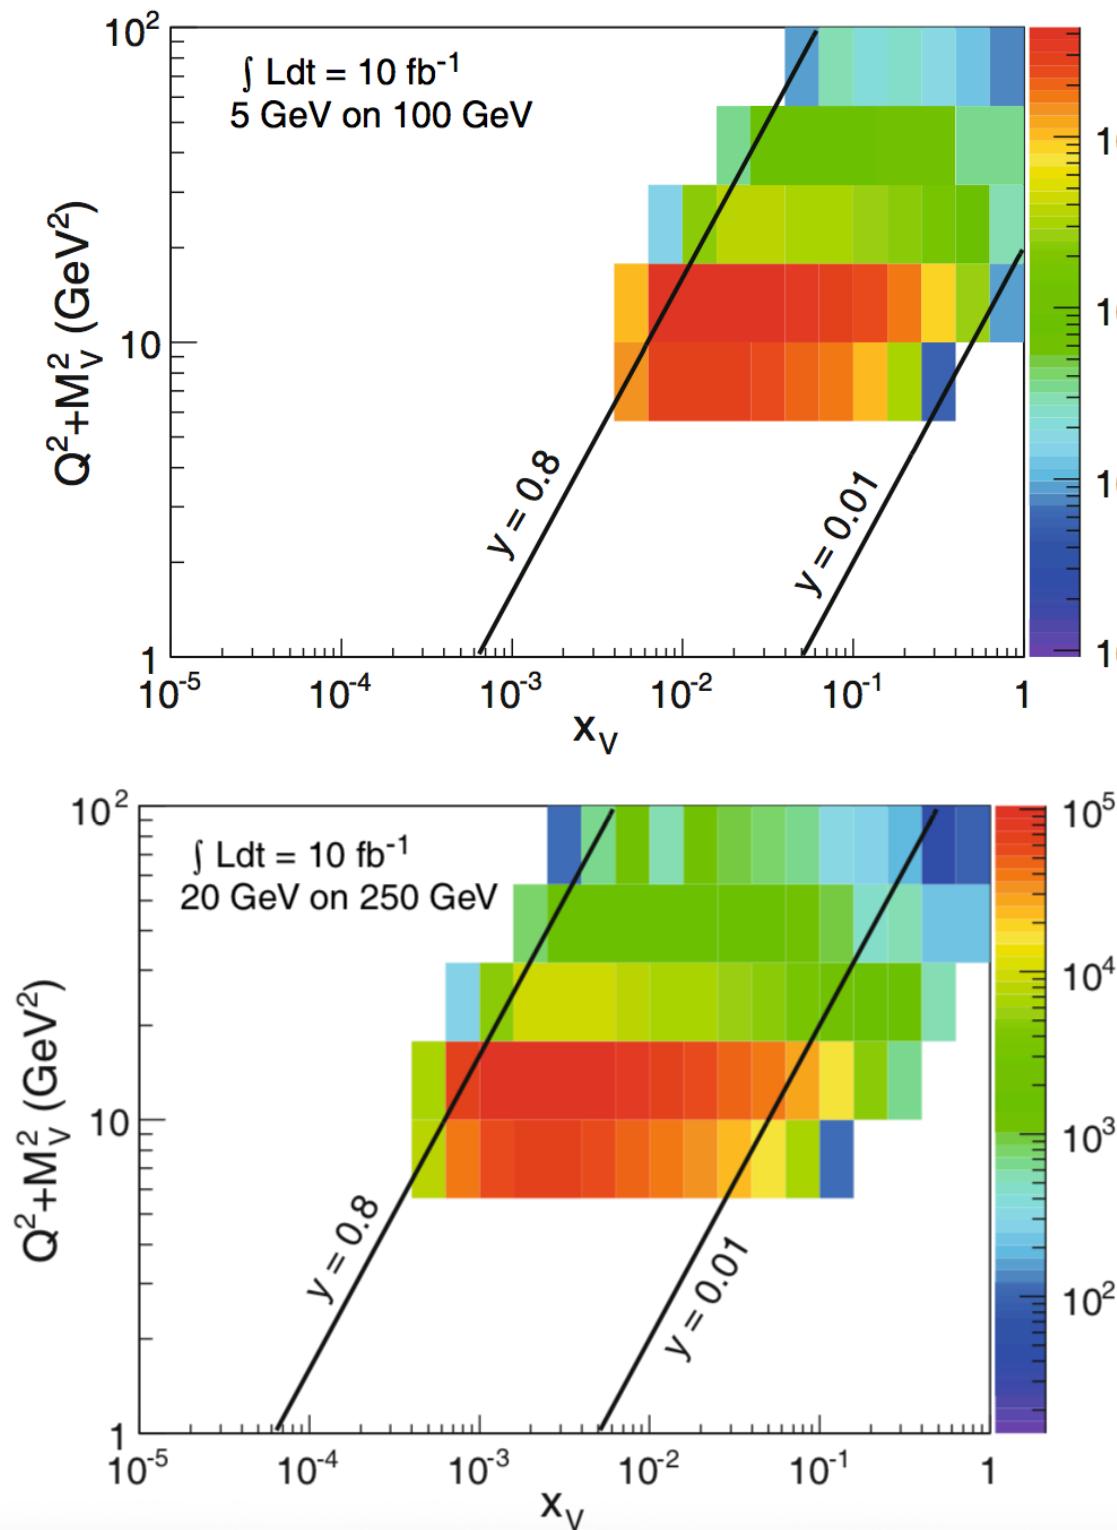

Modified Bjorken-x: $x_V = \frac{Q^2 + M_V^2}{2p \cdot q}$

Fourier transform:
3-D transverse gluonic density

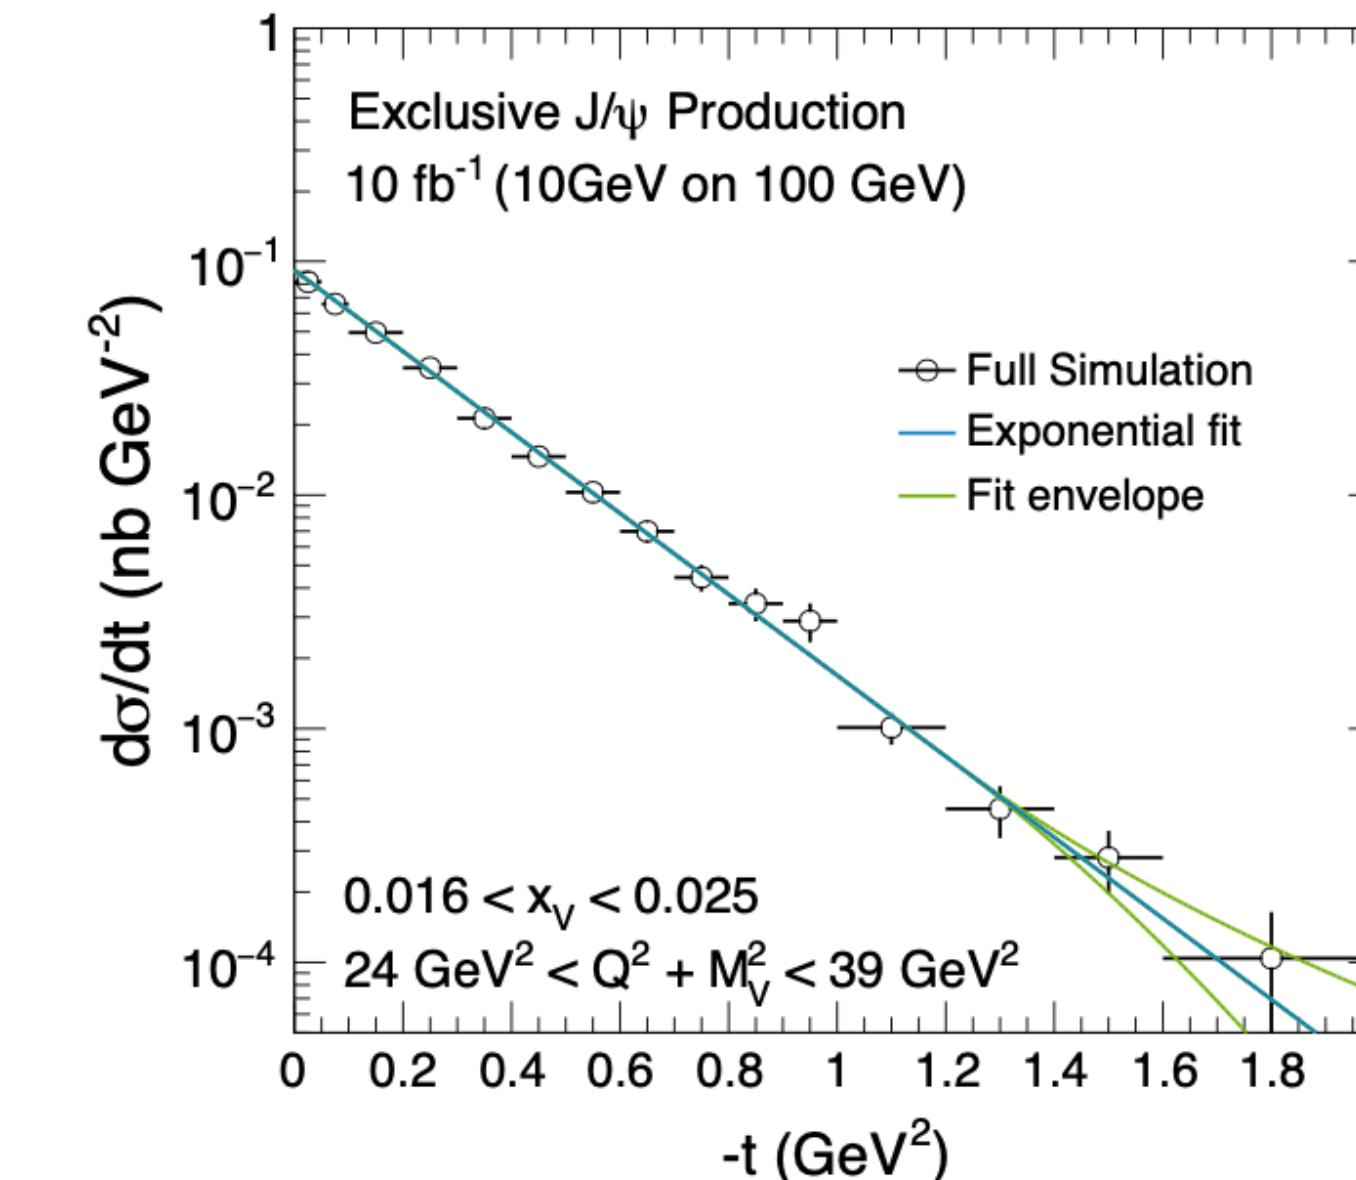

$$\rho(|\vec{b}_T|, x_V) = \int \frac{d^2 \vec{\Delta}_T}{(2\pi)^2} e^{i \vec{\Delta}_T \vec{b}_T} |\langle H_g \rangle|(t = -\vec{\Delta}_T^2)$$

3-D GPDs can be related to 2-D Gravitational Form Factors

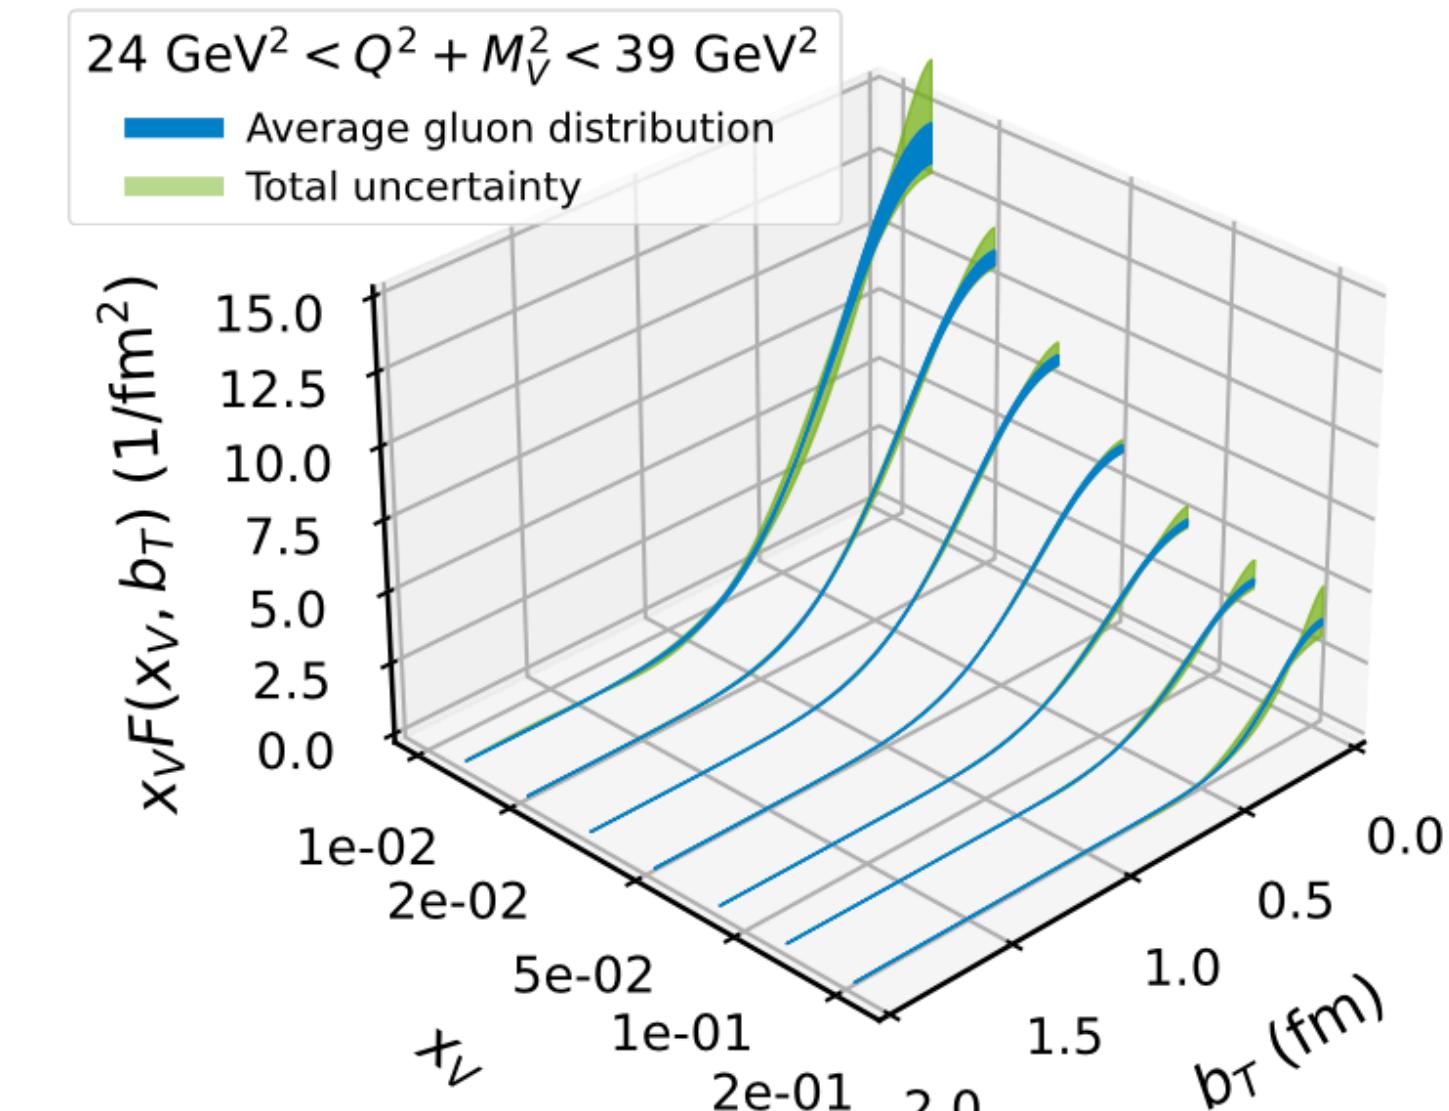

GLUON TOMOGRAPHY WITH J/Ψ

Only possible at an EIC:
 from the valence region
 deep into the sea!

***t*-spectra**

Normalized average gluon density

Same can be done with Y(1S) at EIC!

CONCLUSION

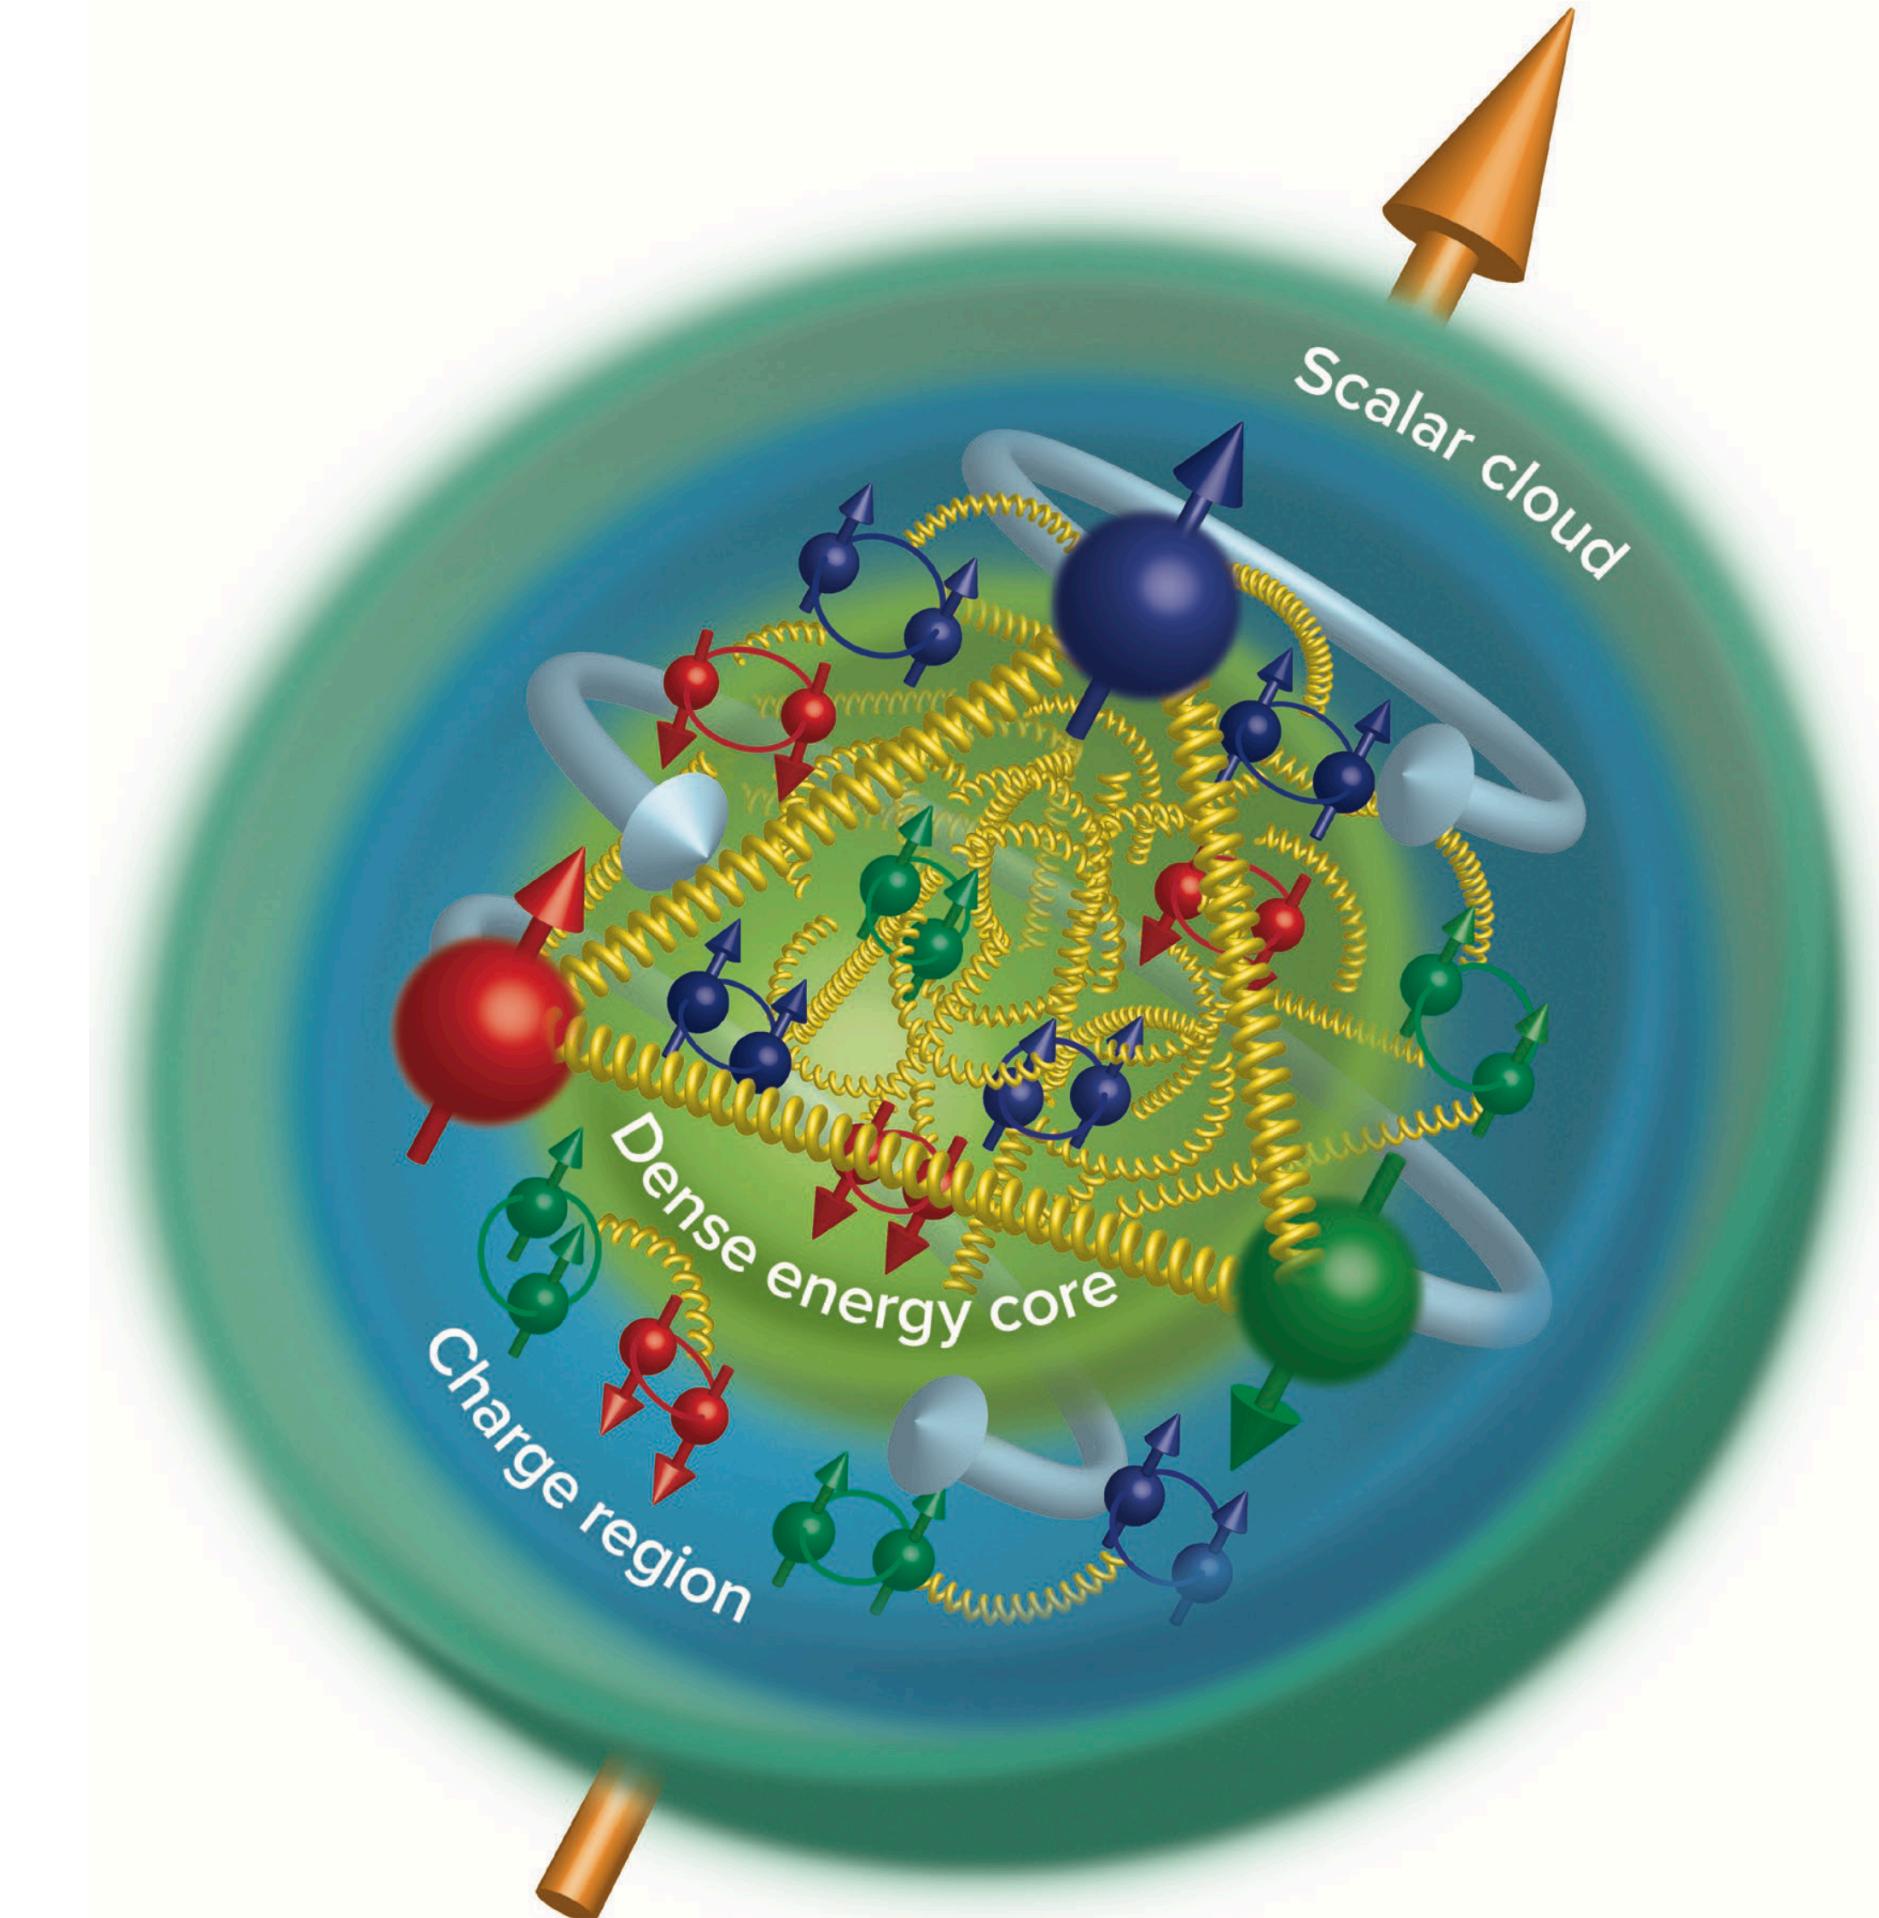

The JLab 12-GeV program has delivered important first results on near-threshold J/ψ production from GlueX and Hall C (J/ψ -007)

- A new window on the gluonic structure of the proton
- Does the proton appears to have a dense energy core
- What are the implications of a possible scalar gluonic cloud?

The planned near-threshold J/ψ production program at Jefferson Lab is crucial to further our understanding of the origin of mass.

- SoLID can reach J/ψ observables that cannot be achieved anywhere else, including precision measurements at high t and precision electroproduction near threshold.

The mass structure of the nucleons and nuclei is a rapidly evolving topic, reaching from Jefferson Lab to the EIC

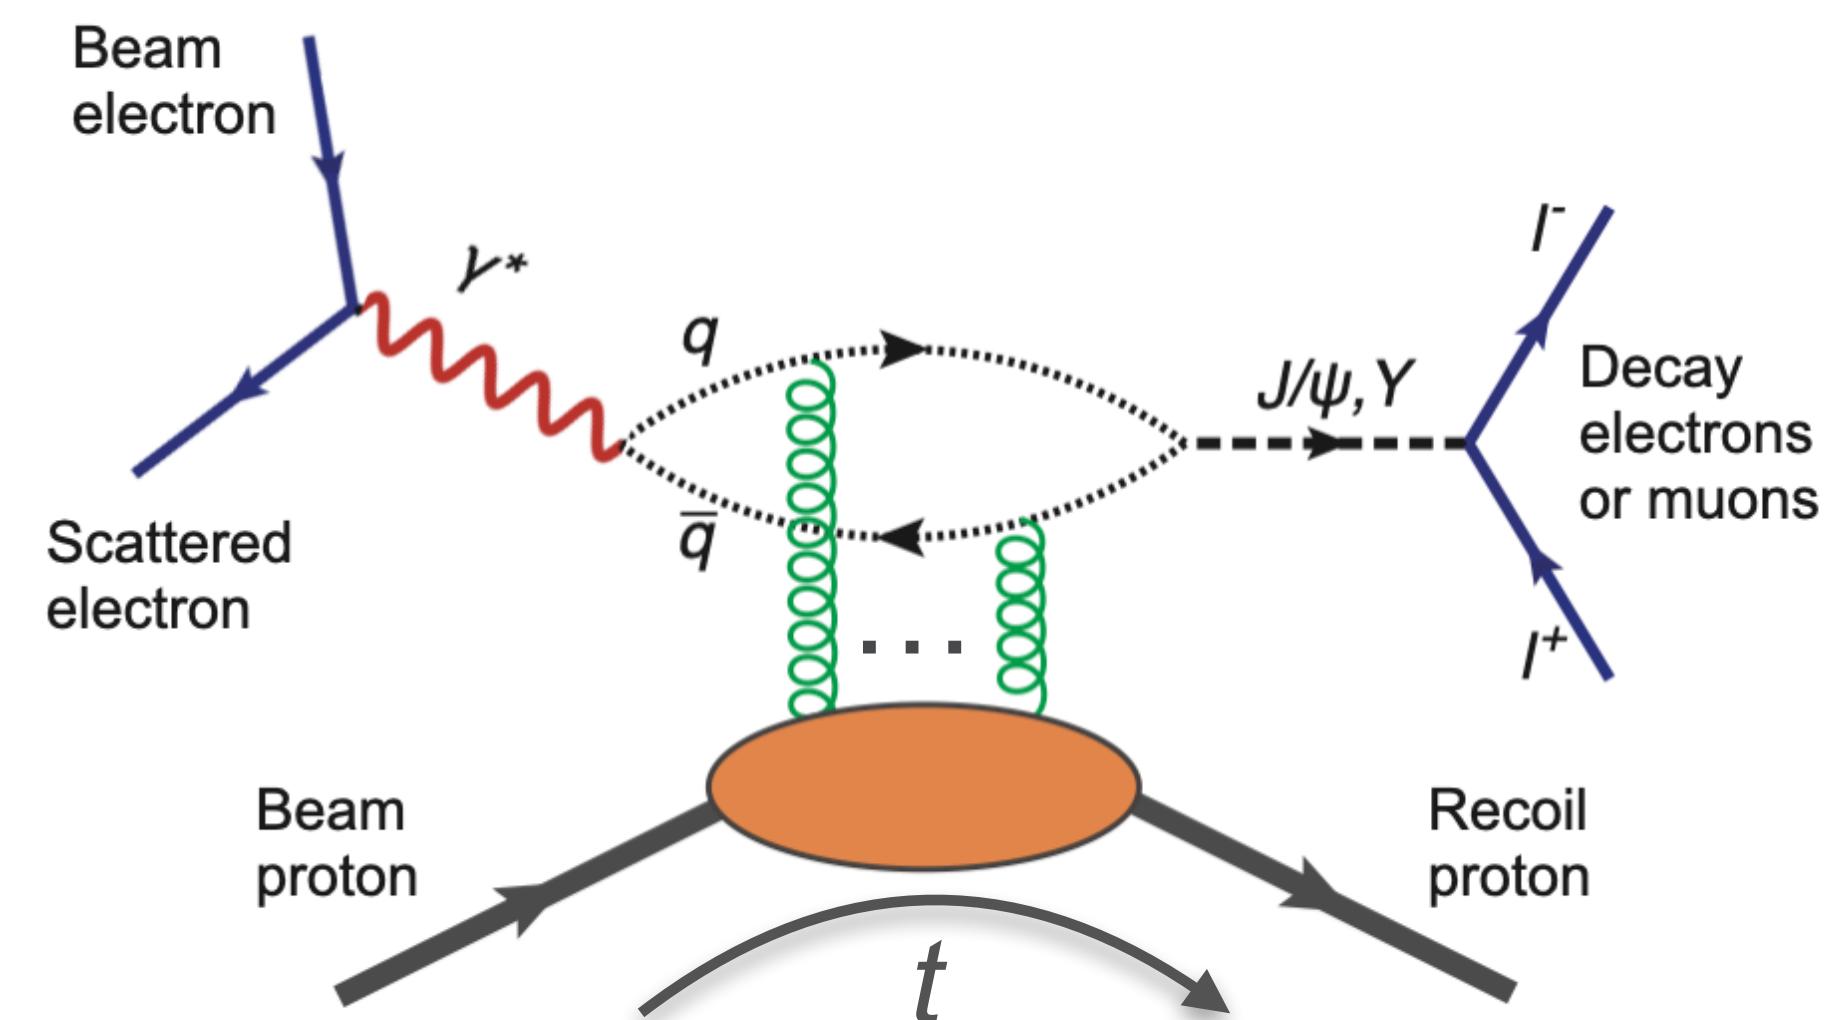

QUESTIONS?

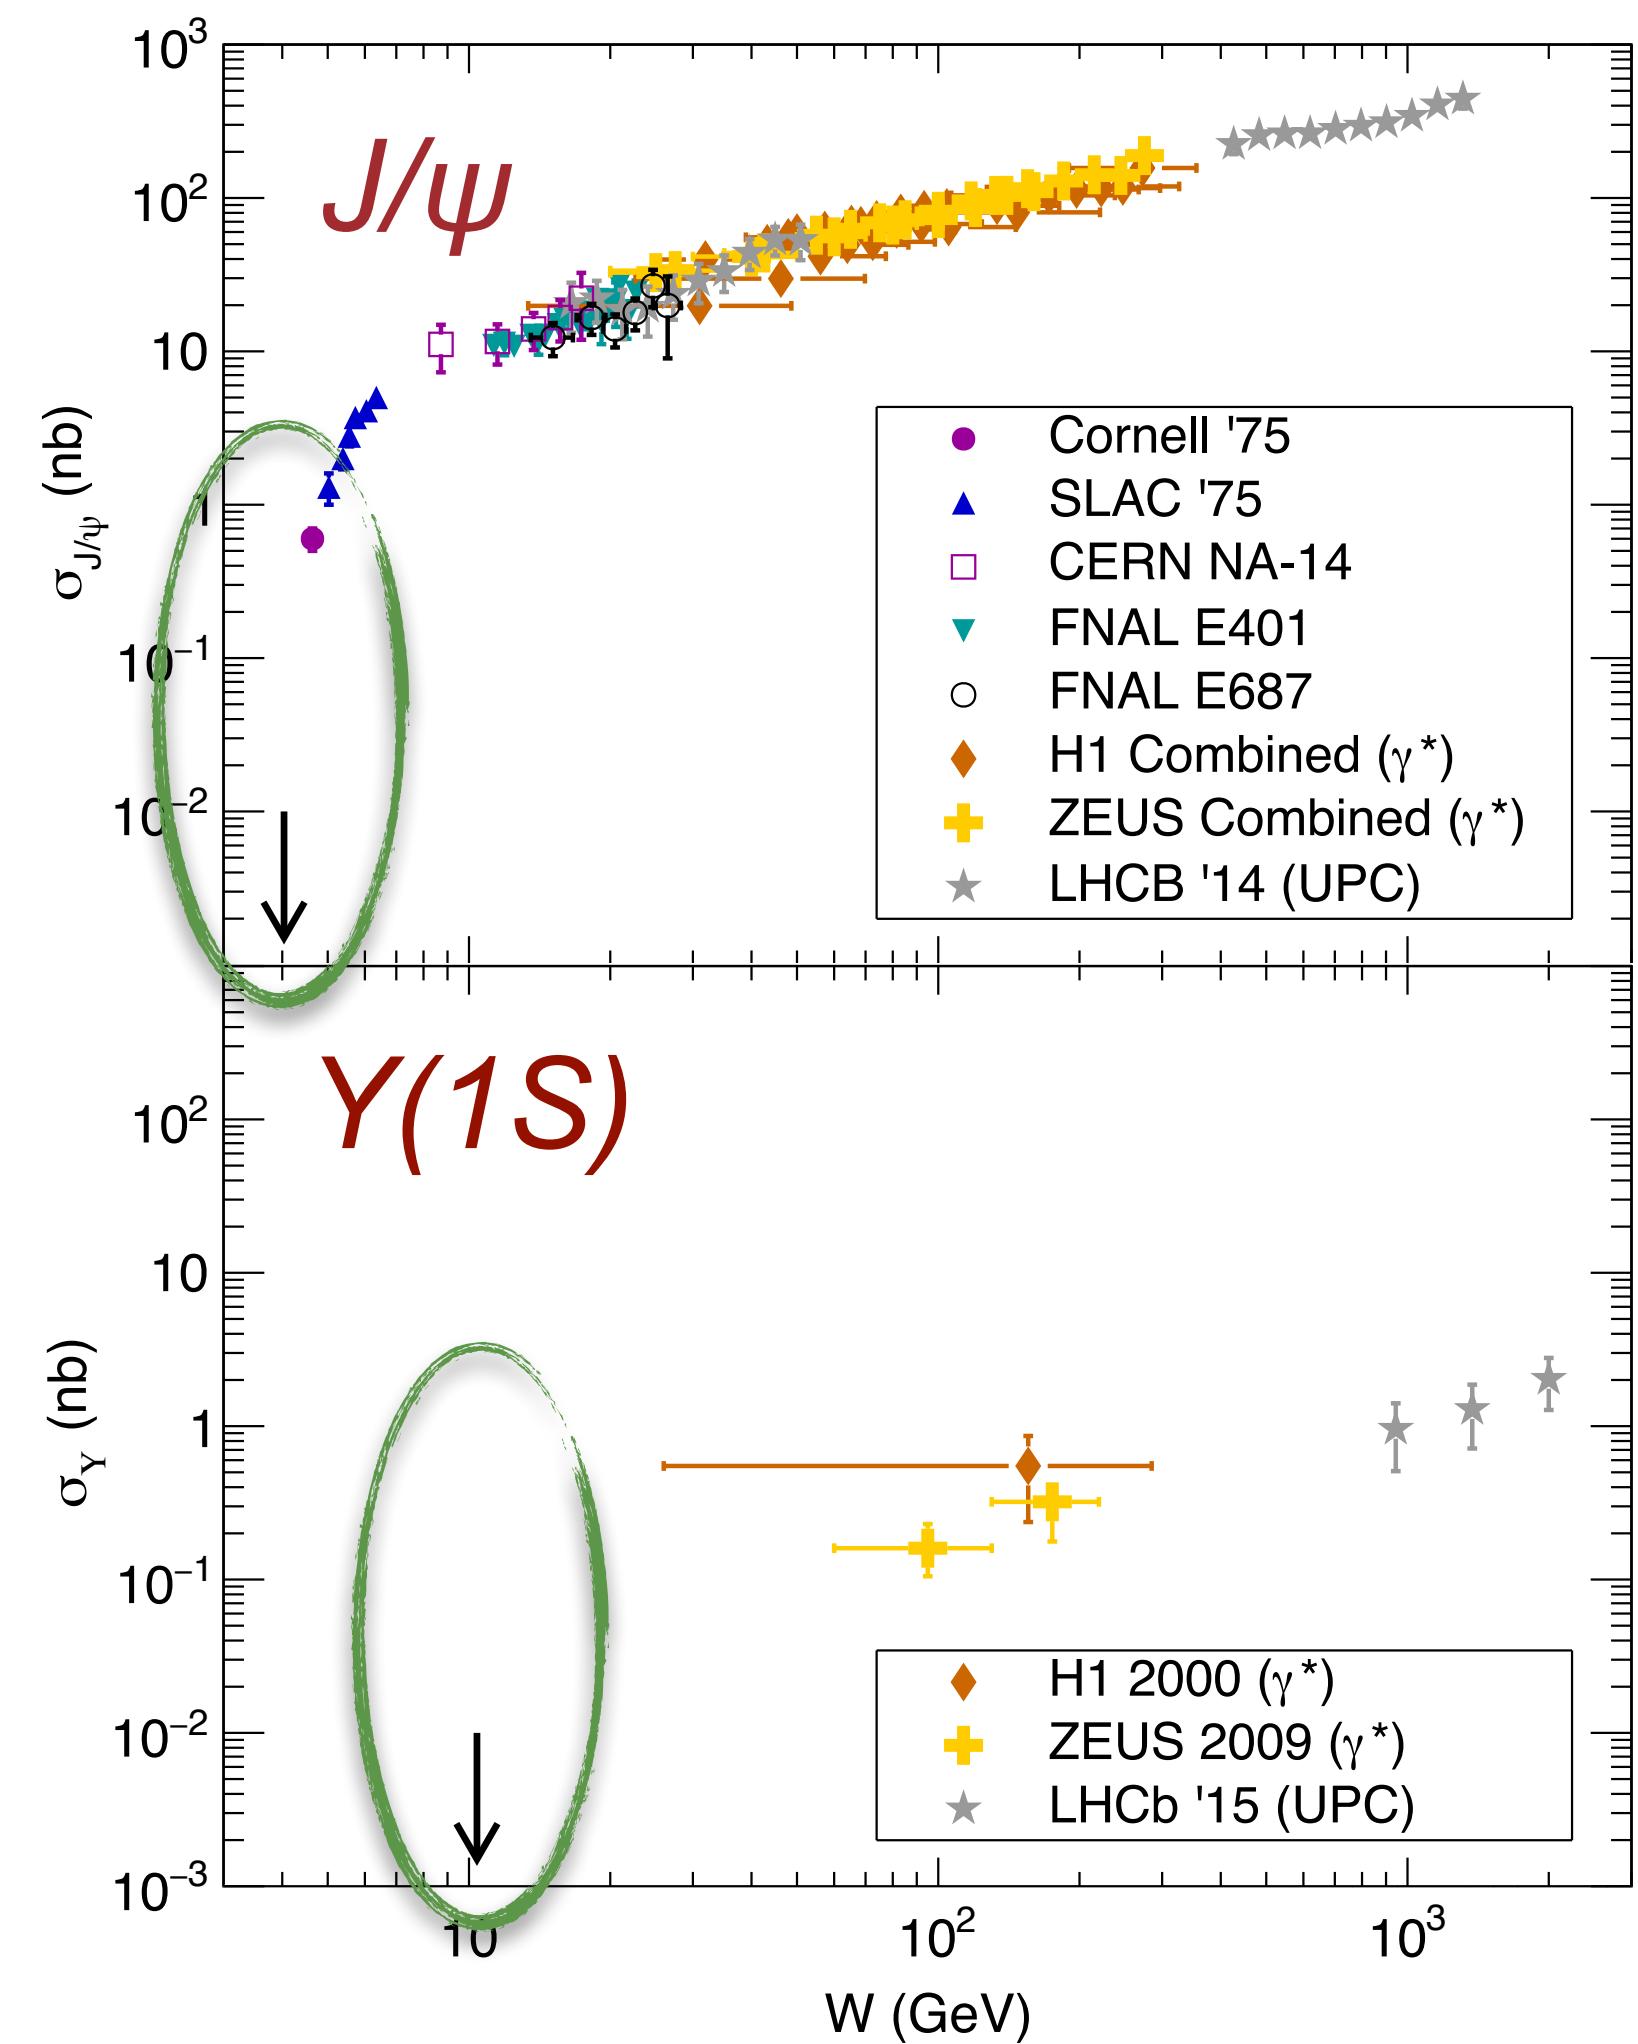

WHAT DID WE KNOW BEFORE 12 GEV AT JLAB?

Exclusive quarkonium photoproduction

- No near-threshold data available
- In case of $Y(1S)$: not much available overall
- **Almost no data near threshold before JLab 12 GeV**

$t \approx -8.1\text{GeV}^2$

- Phase space limits defined by quarkonium direction
- Forward (with photon): $t = t_{\min}$
- Backward (with proton): $t = t_{\max}$
- Forward direction preferred: t -dependence \sim exponential

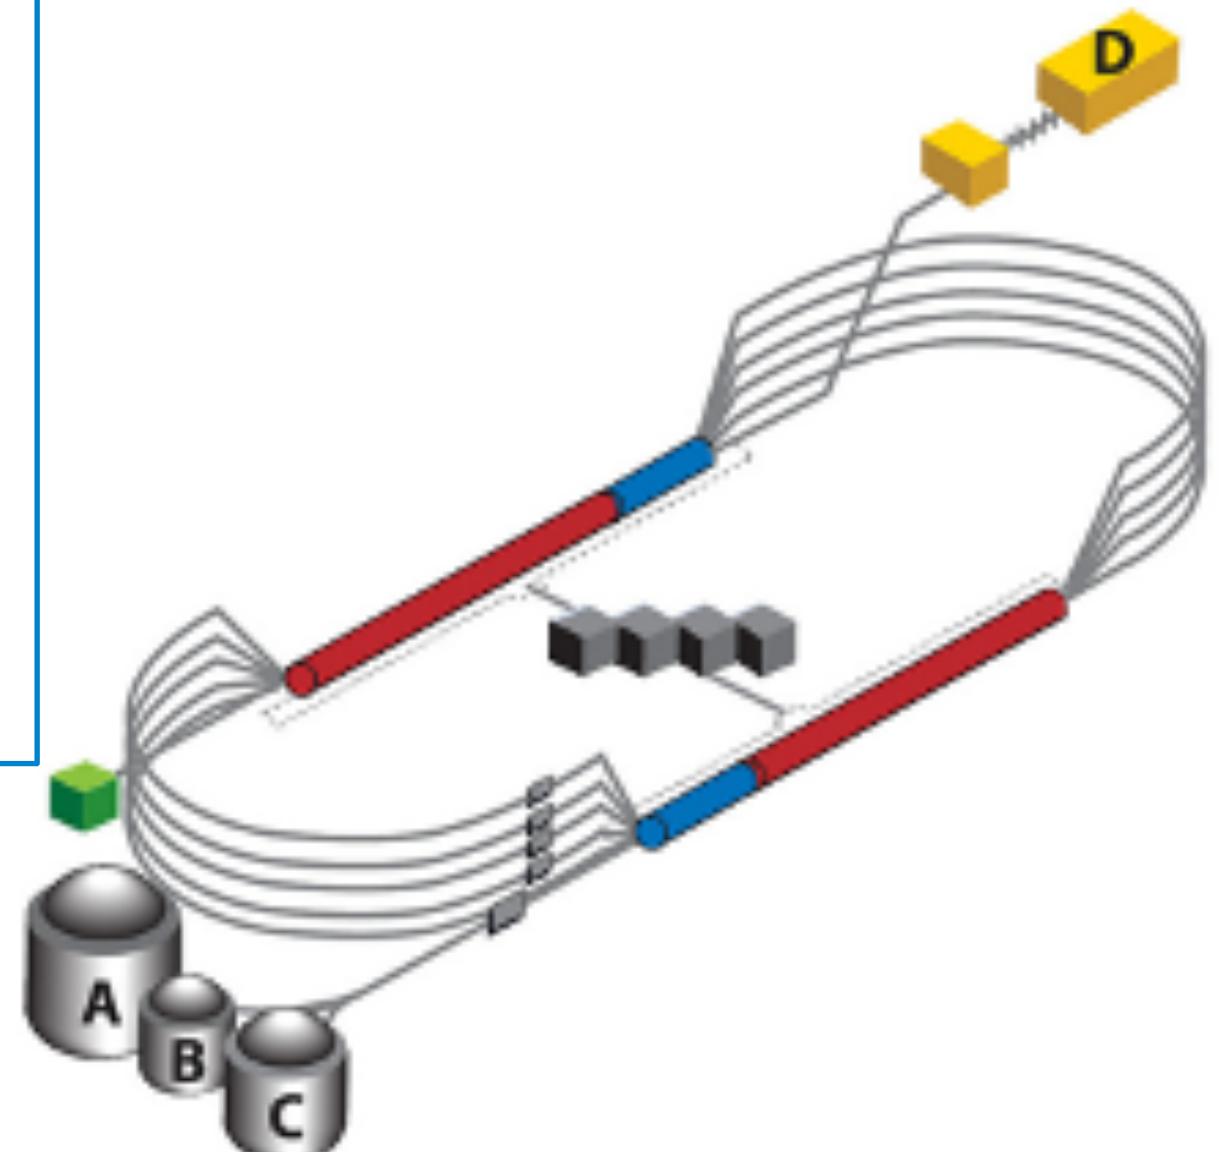

QUARKONIUM AT JEFFERSON LAB AND EIC

Jefferson Lab

CEBAF: very high luminosity (10^{35} - $10^{39} \text{ cm}^{-2}\text{s}^{-1}$) continuous electron beam on fixed target

- 4 experimental halls:
- 11GeV in Hall A, B & C
 - 12GeV in Hall D

Jefferson Lab is the ideal laboratory to measure J/ψ near threshold, due to luminosity, resolution and energy reach

QUARKONIUM AT JEFFERSON LAB AND EIC

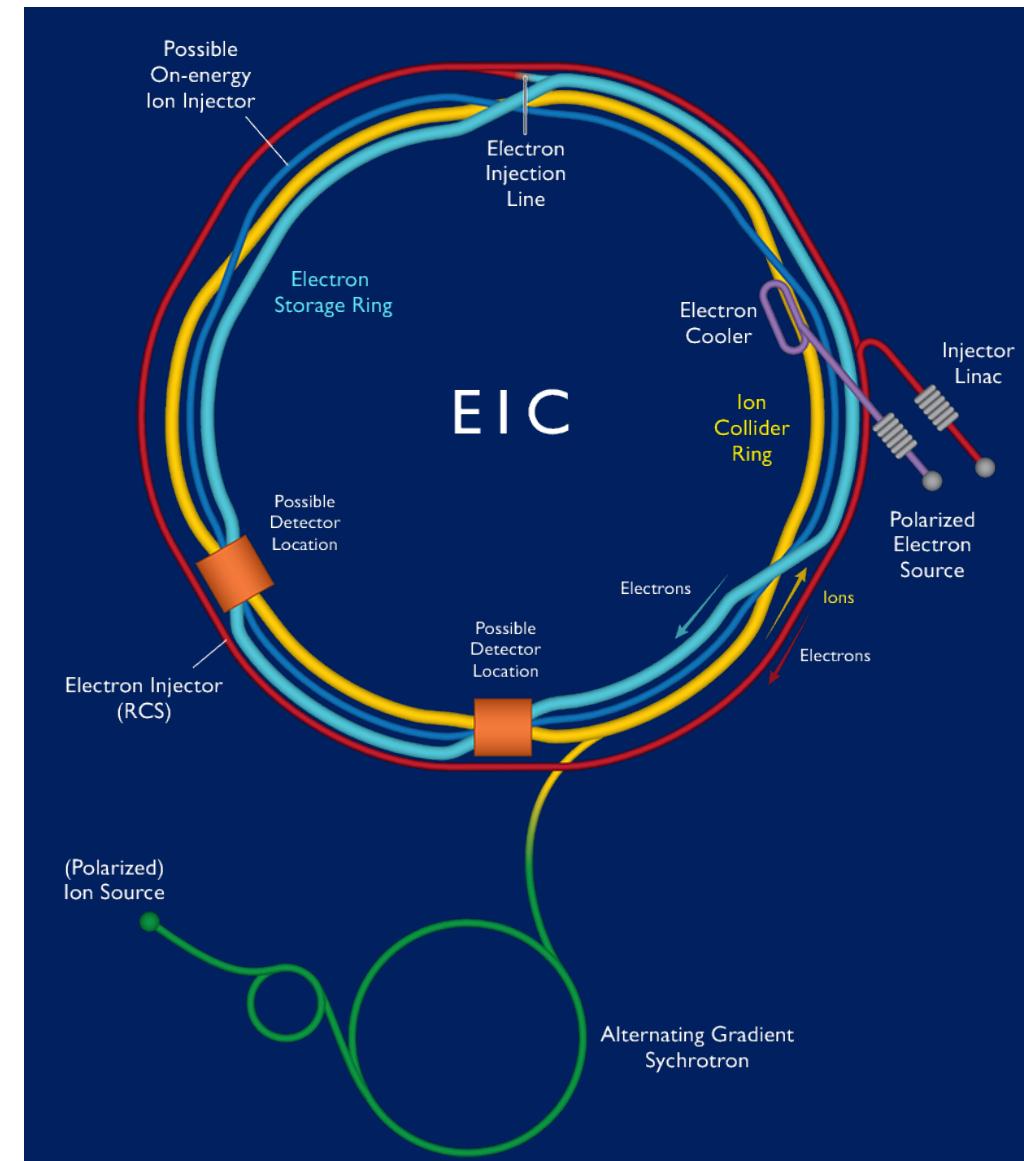

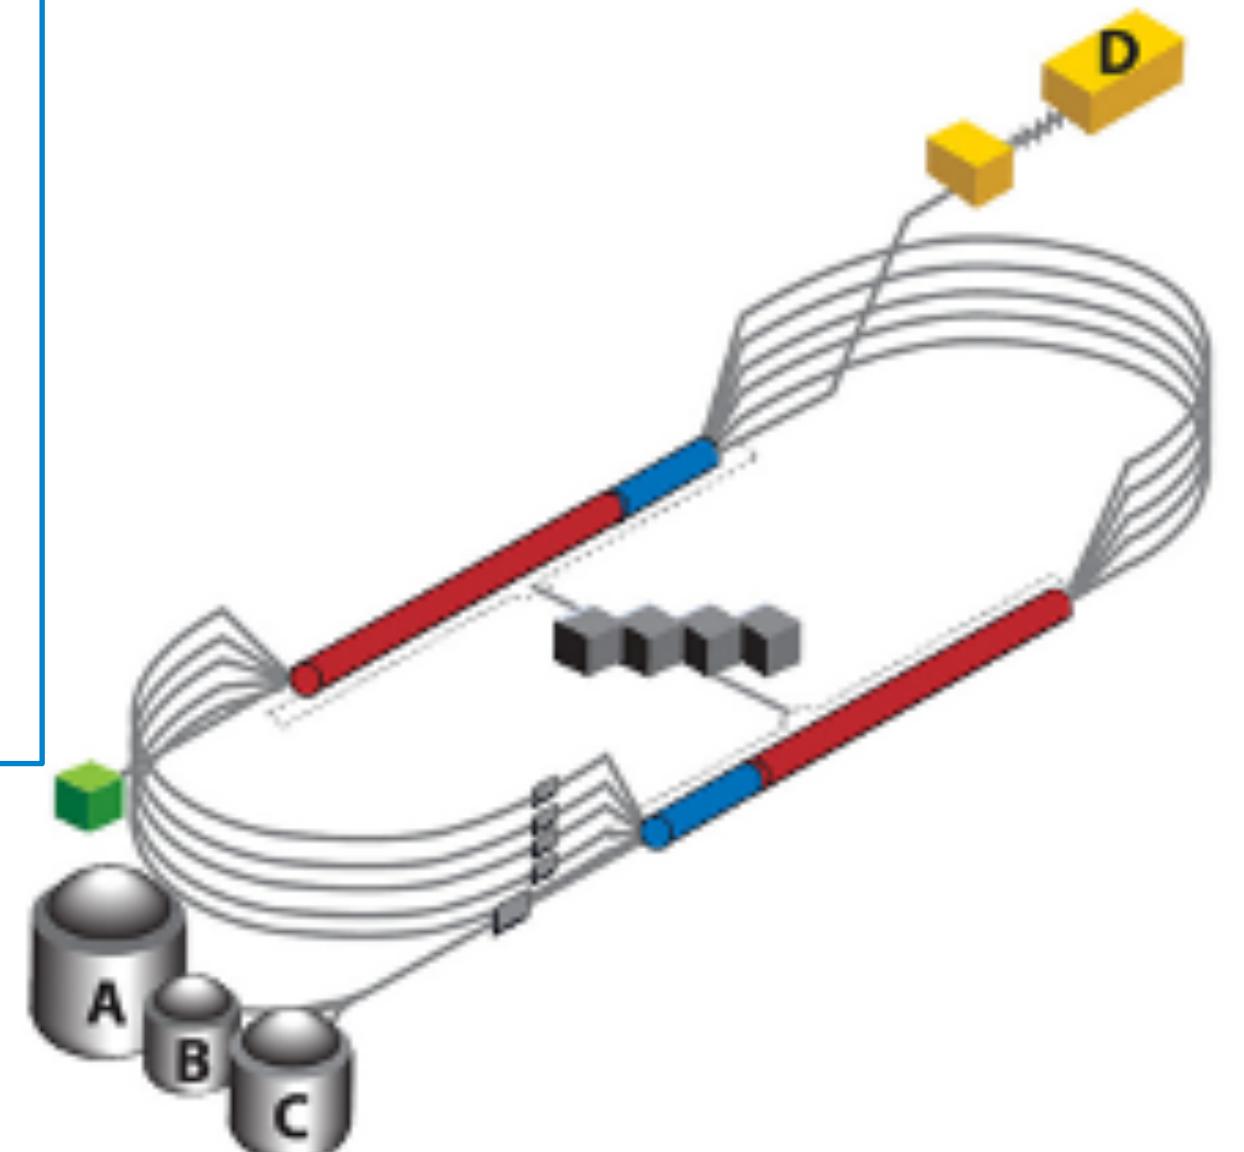

Jefferson Lab

CEBAF: very high luminosity (10^{35} - $10^{39} \text{ cm}^{-2}\text{s}^{-1}$) continuous electron beam on fixed target

4 experimental halls:

- 11GeV in Hall A, B &C
- 12GeV in Hall D

Jefferson Lab is the ideal laboratory to measure J/ψ near threshold, due to luminosity, resolution and energy reach

Electron-ion Collider

EIC: high luminosity (10^{33} - $10^{34} \text{ cm}^{-2}\text{s}^{-1}$) polarized electron polarized ion collider

Variable CM energies: 29-140 GeV with 2 possible interactions regions

Ideally suited to study to J/ψ electroproduction at higher energies, sufficient energy and luminosity to produce $\text{Y}(1\text{S})$.

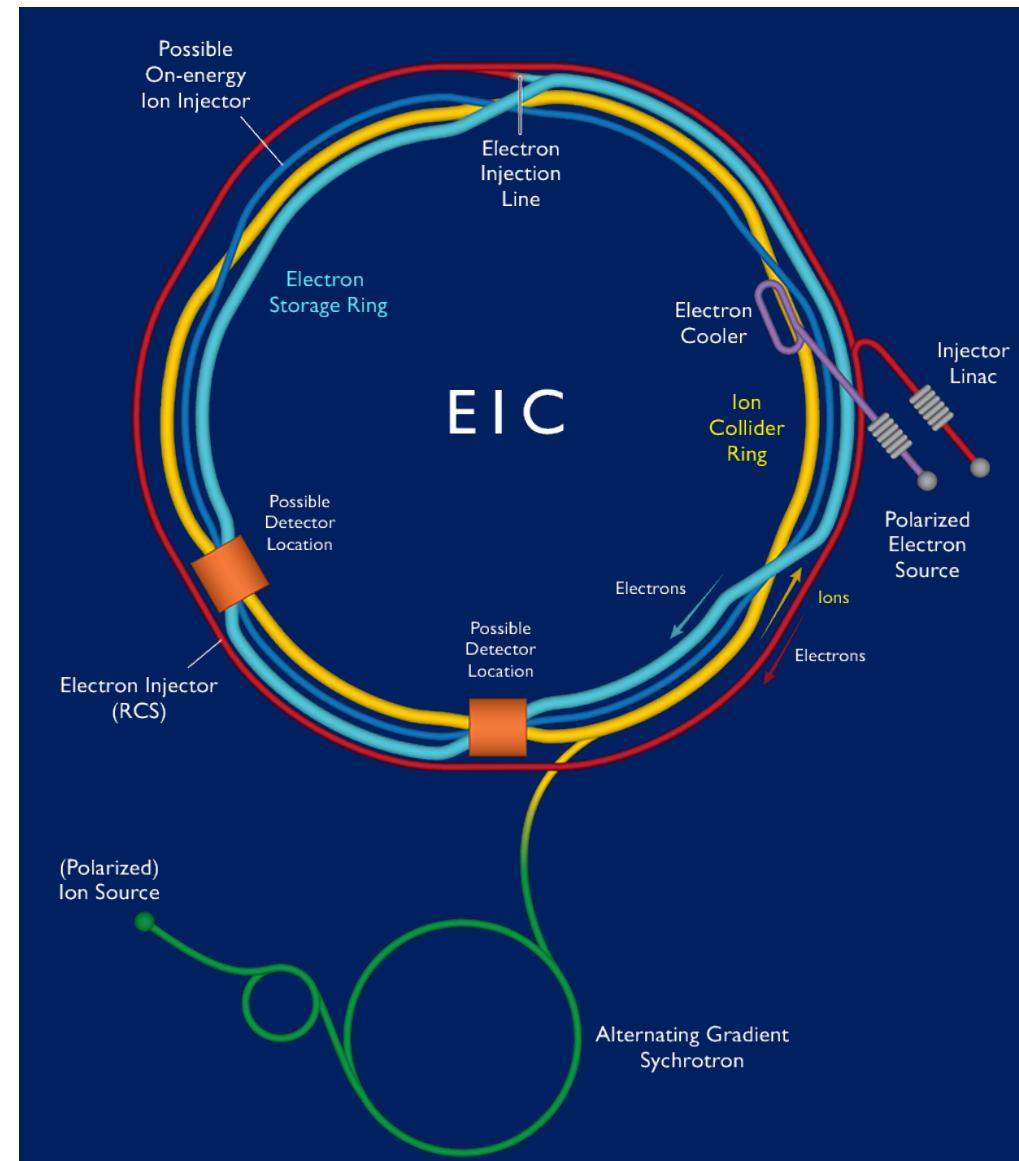

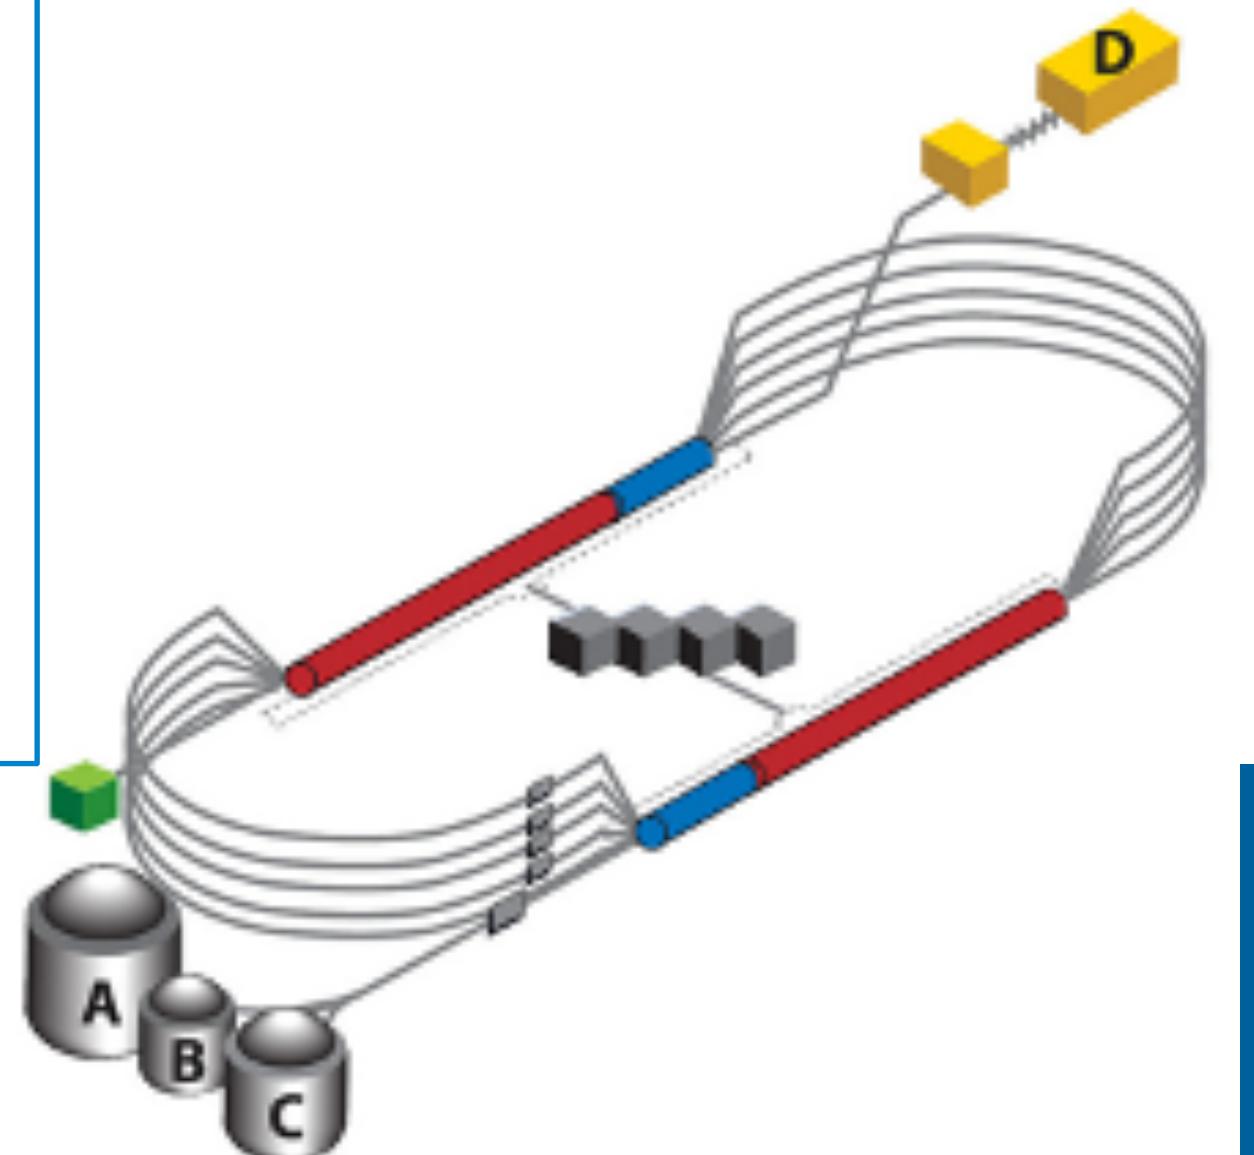

QUARKONIUM AT JEFFERSON LAB AND EIC

Jefferson Lab

CEBAF: very high luminosity (10^{35} - $10^{39} \text{ cm}^{-2}\text{s}^{-1}$) continuous electron beam on fixed target

- 4 experimental halls:

Spin-2 : $\langle p_2 | T^{xy}(0) | p_1 \rangle$

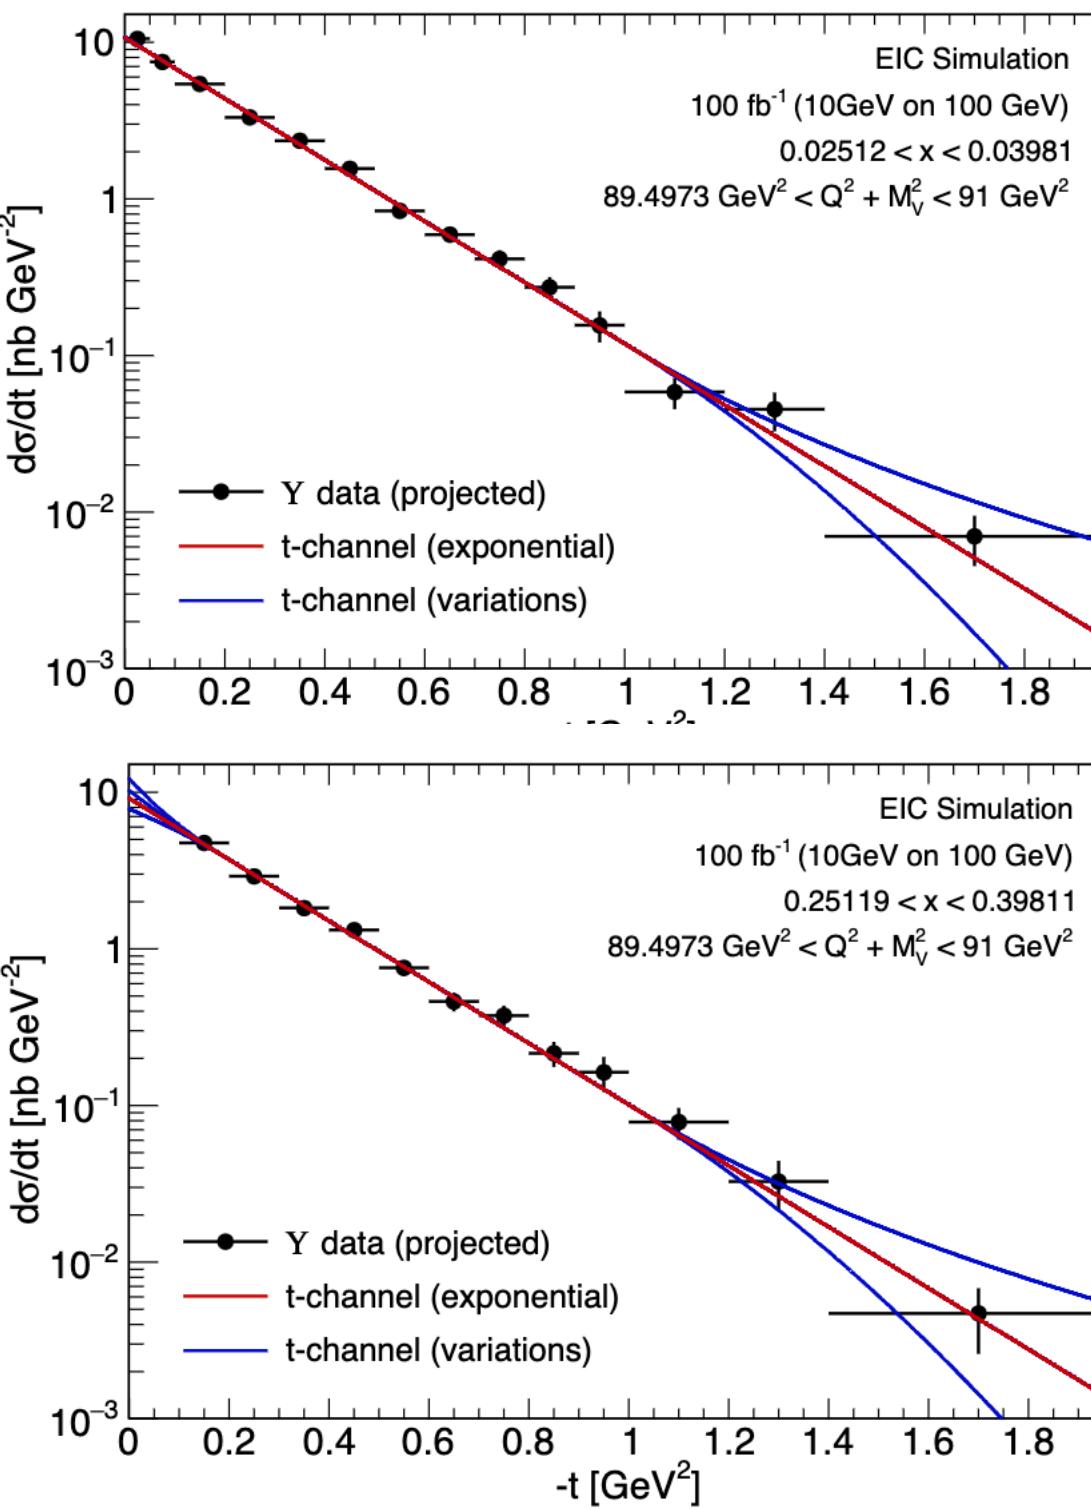

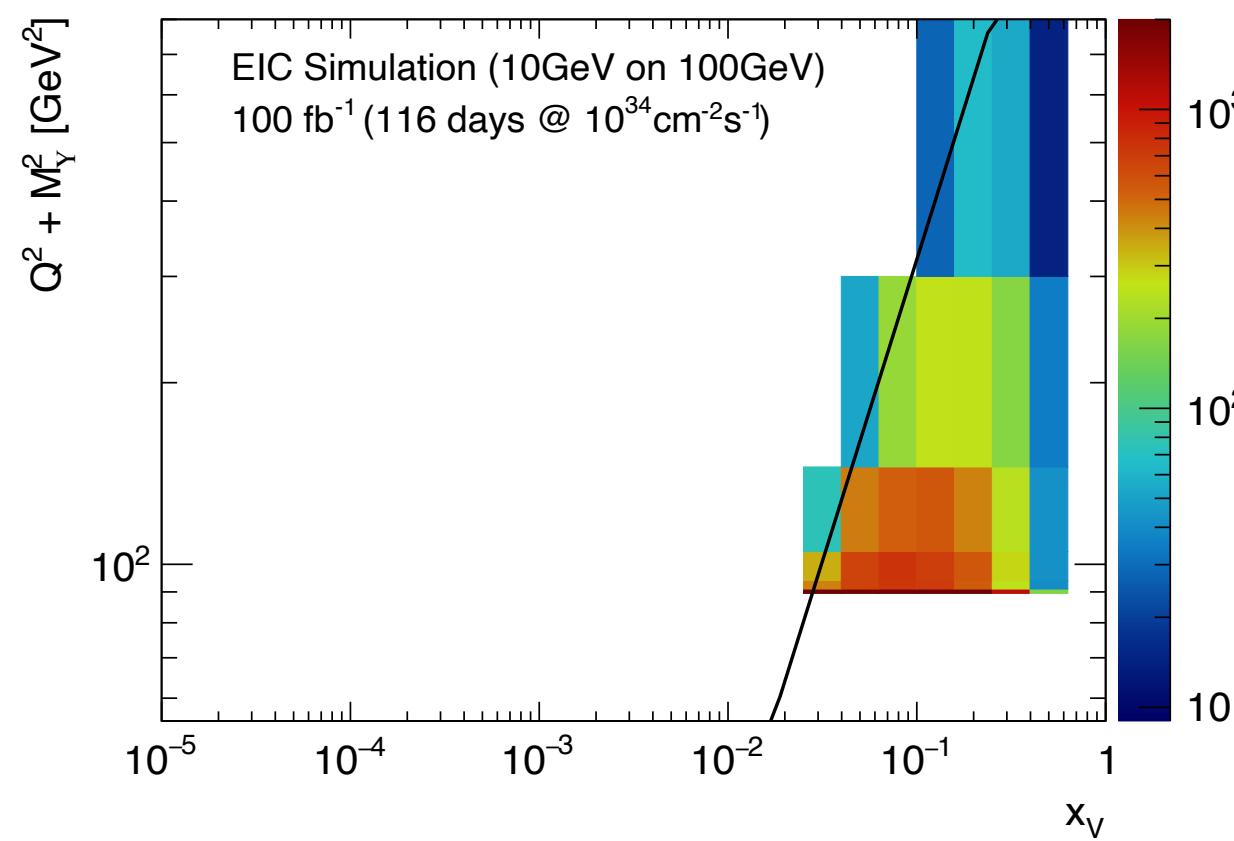

Spin-0 : $\langle p_2 | T_\mu^\mu(0) | p_1 \rangle$

$$\frac{d\sigma}{dt} = \mathcal{N} \times \frac{e^2}{64\pi(s - m_N^2)^2} \times \frac{A(-t, \kappa_T) + \eta^2 D(-t, \kappa_T, \kappa_S)]^2}{A^2(0)} \times F(\tilde{s}) \times 8$$

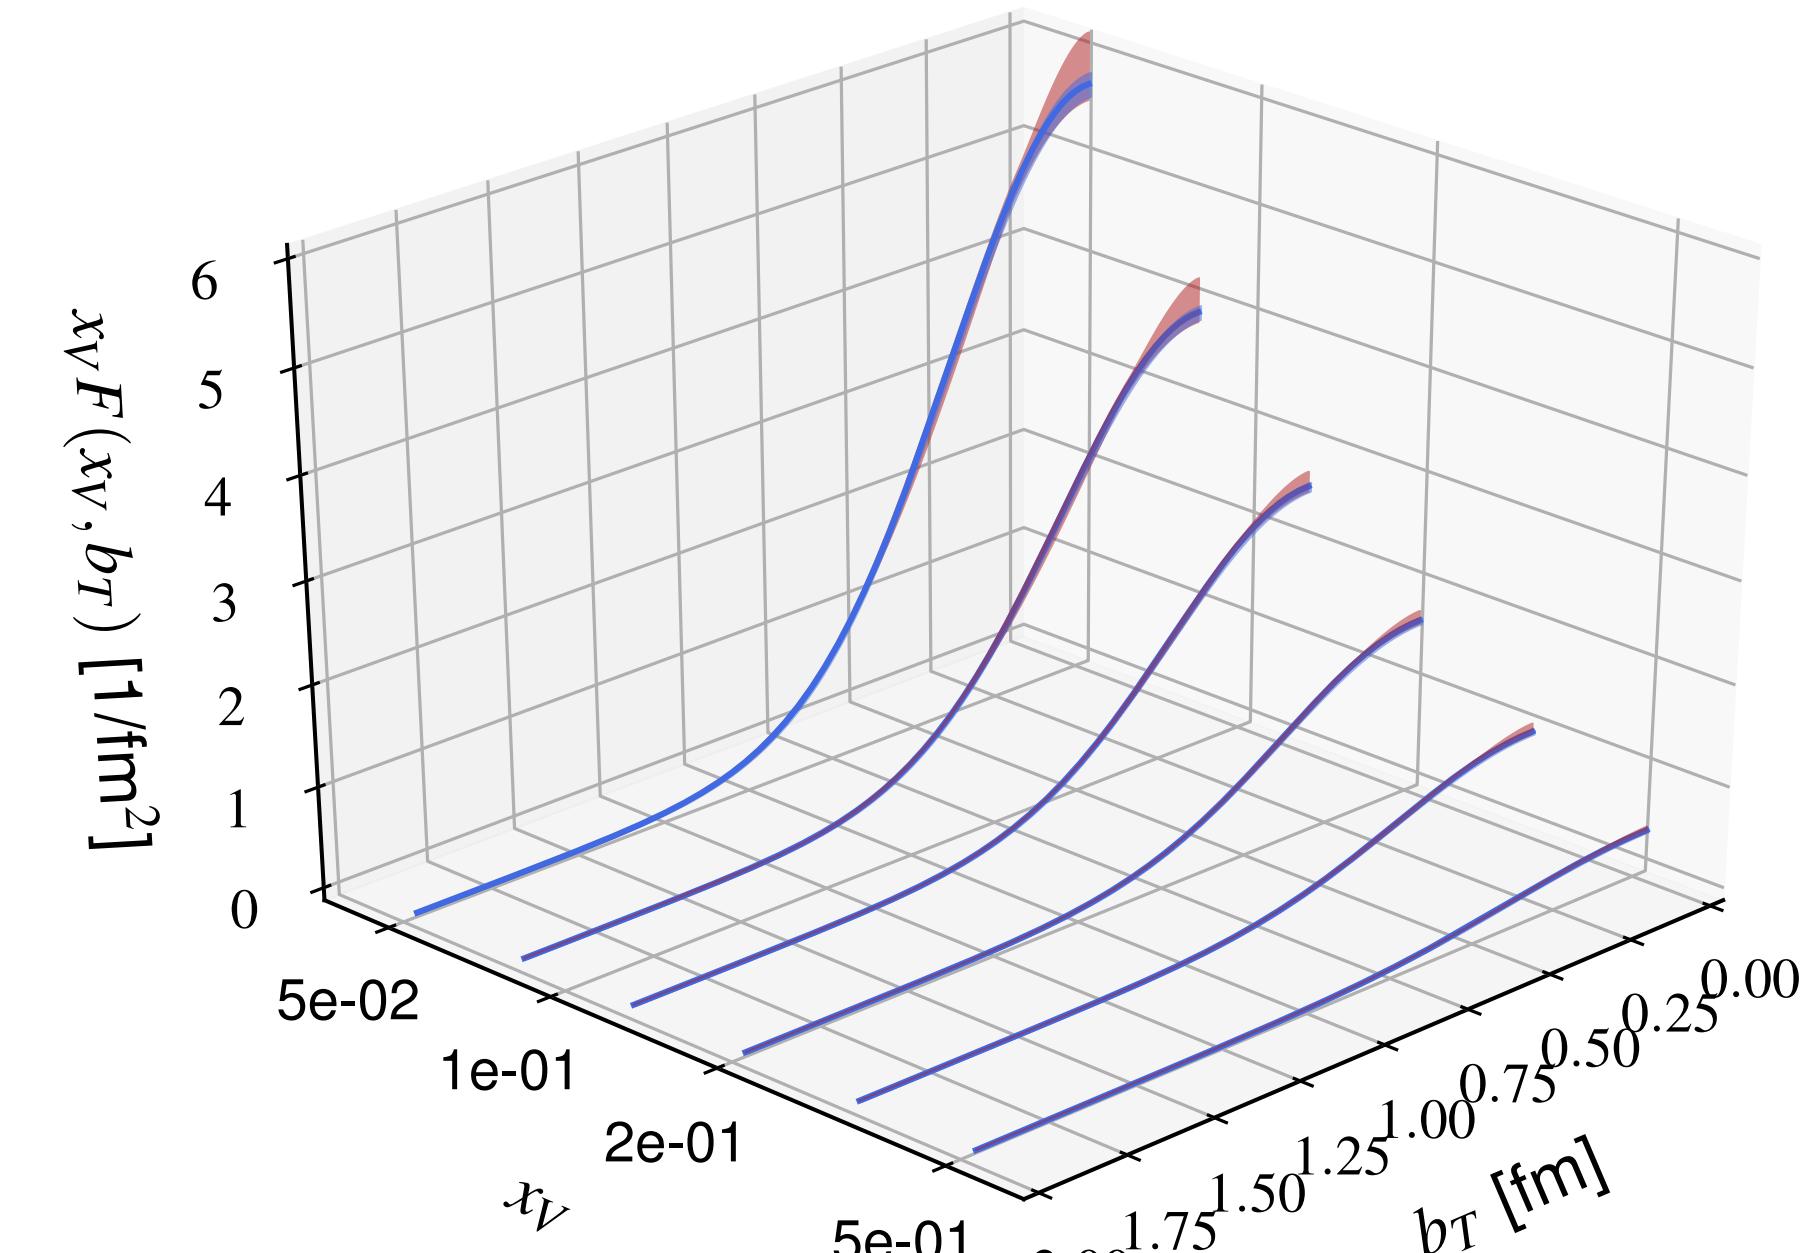

- $A(t)$ and $D(t)$ shapes are fully calculated; However, dipole forms are assumed as very good approximations and are used in the fits to the data. $A_g(0) = \langle x_q \rangle$ is fixed to the DIS value from global fit CT18.
- $B(t)$ is neglected and \mathcal{N} is normalized to the cross section.

EVENT SELECTION WITH CLAS12

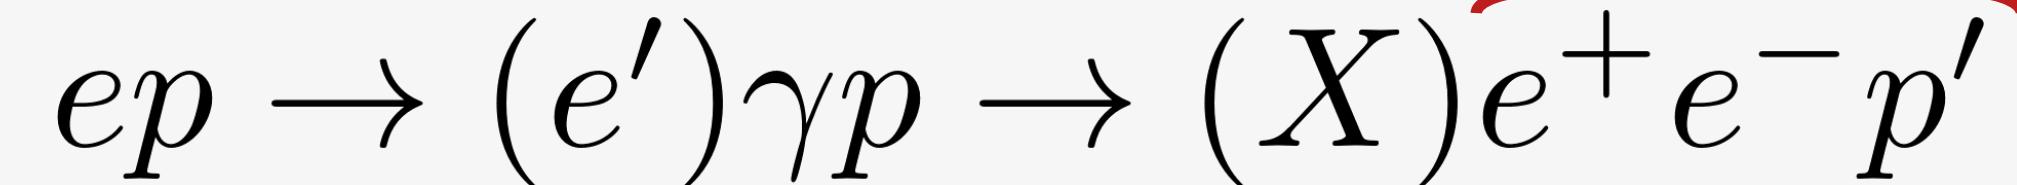

From TCS to near-threshold J/ψ photoproduction

9/16

(Quasi-)Photoproduction events selection

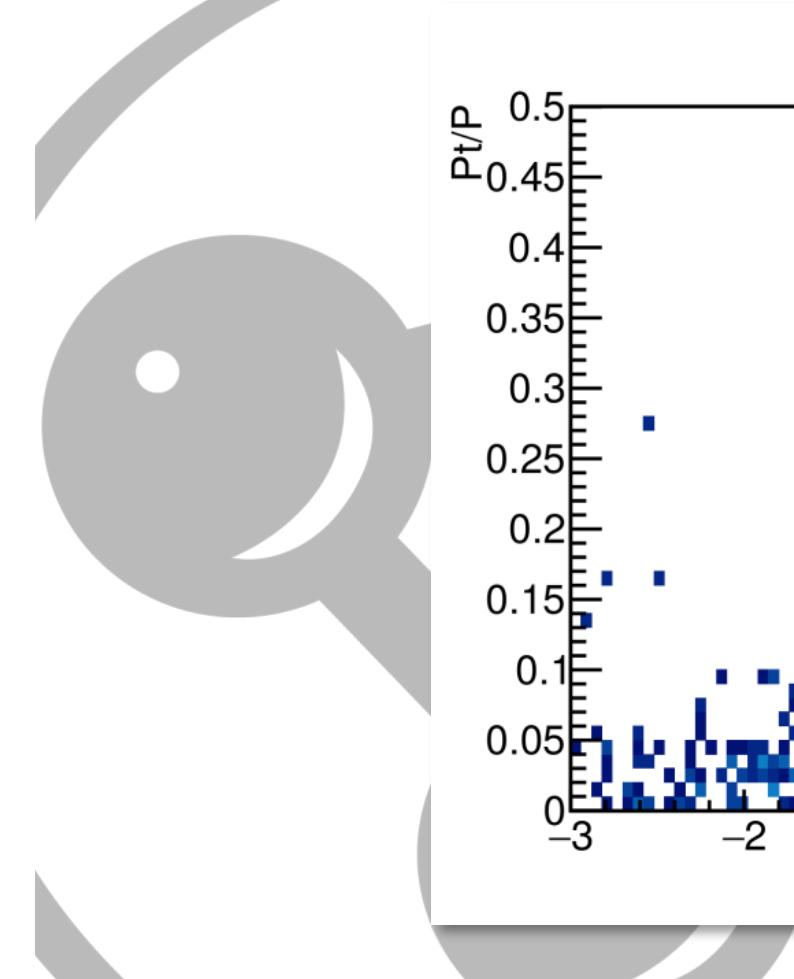

1) CLAS12 PID + Positron NN PID

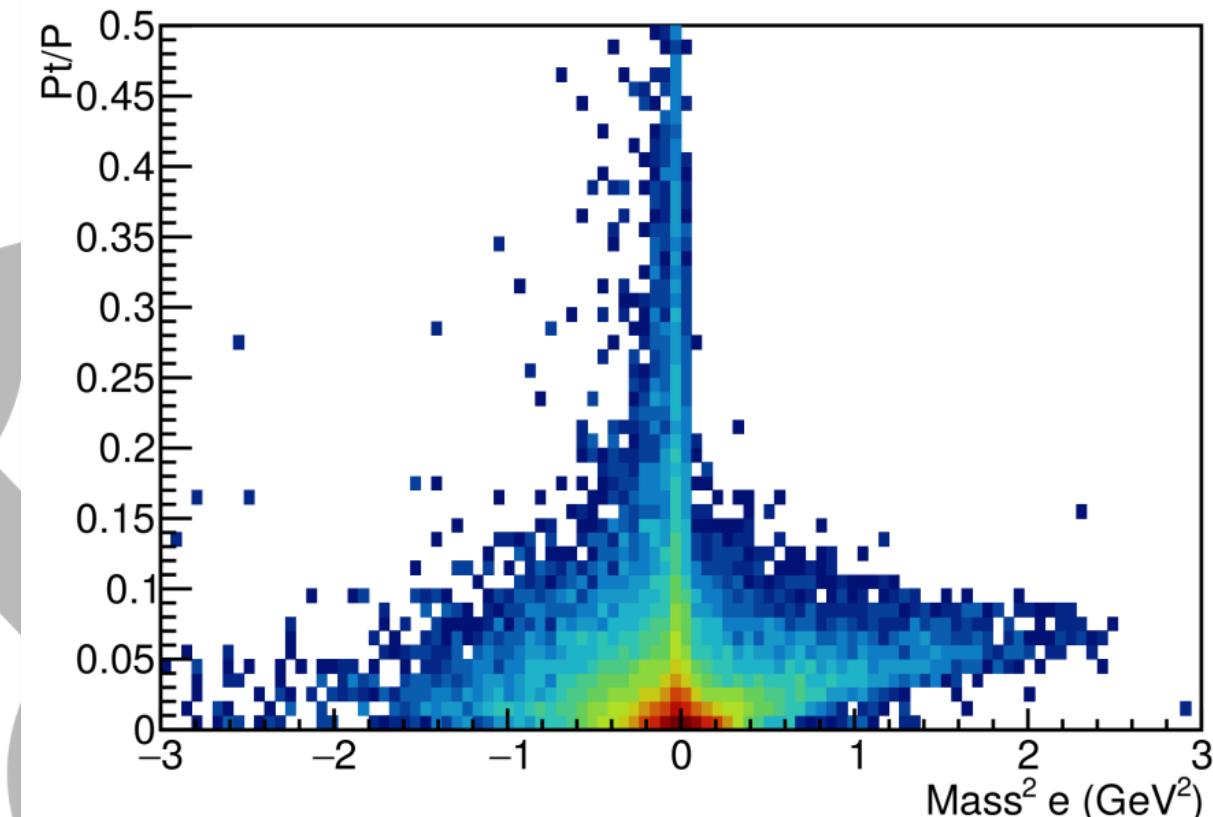

$$p_X = p_{beam} + p_p - p_{e^+} - p_{e^+} - p_{p'}$$

2) $|M_X^2| < 0.4 GeV^2$

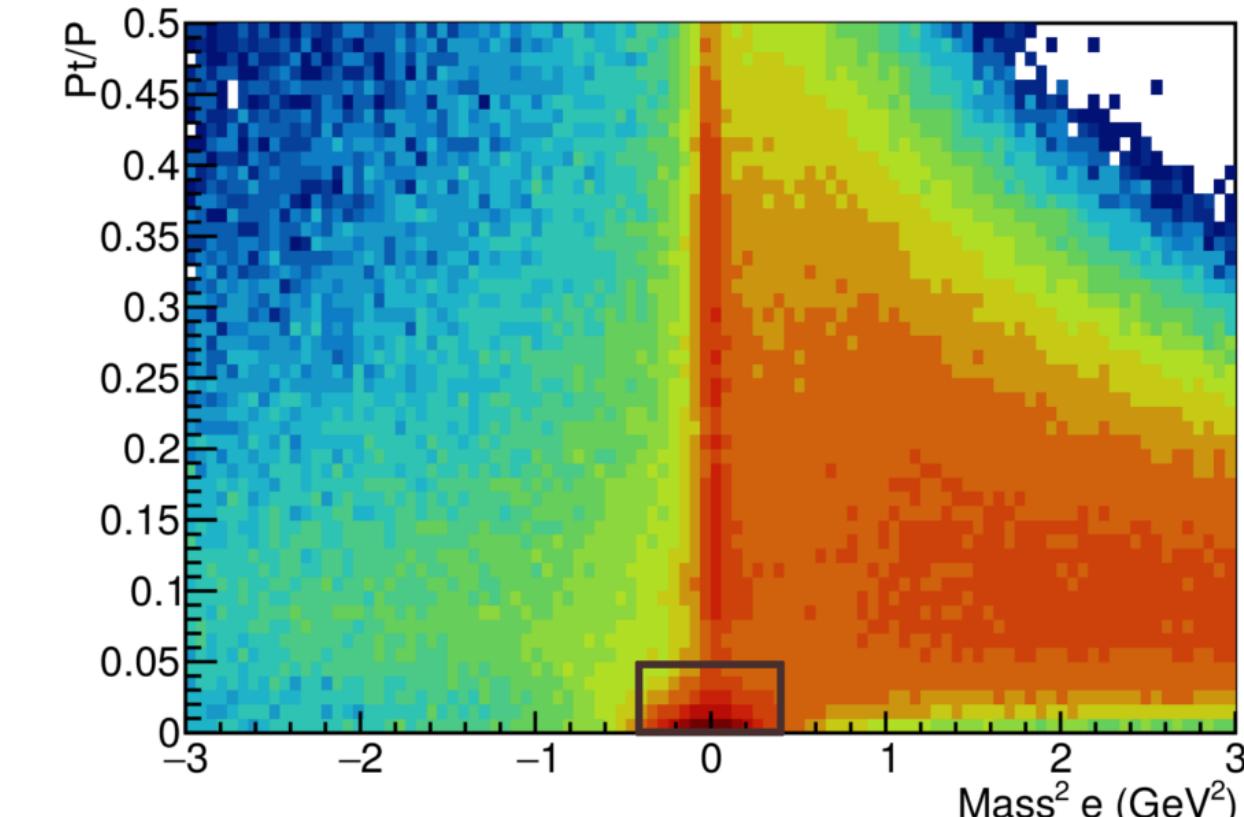

3) $\frac{P_{tX}}{P_X} < 0.05$
 $\rightarrow Q^2 < 0.1 GeV^2$
