Briefly review of what is Middleware

Briefly review of what is Middleware

Middleware is a framework capable of **processing the data** acquired by the detector and its sensors, **delivery quality information** about the runs **online** and **send** all the information to a **central Database**.

From proposal to nowadays

From proposal to nowadays

Middleware

- Retrieve the information
- Quasi-online analysis
- Visualization
- Monitoring

- SQL Databases
 - Run Table
 - Slow Control
 - Reco Table
 - Macro Table

Database on Cloud

Problems we are facing

Problems we are/were facing

- ⦿ Desynchronized the acquisition system and the Middleware → Solved thanks to Stefano
- ⦿ Middleware is too slow (taking over 10 seconds to analyse one image).

Very next steps

Very next steps

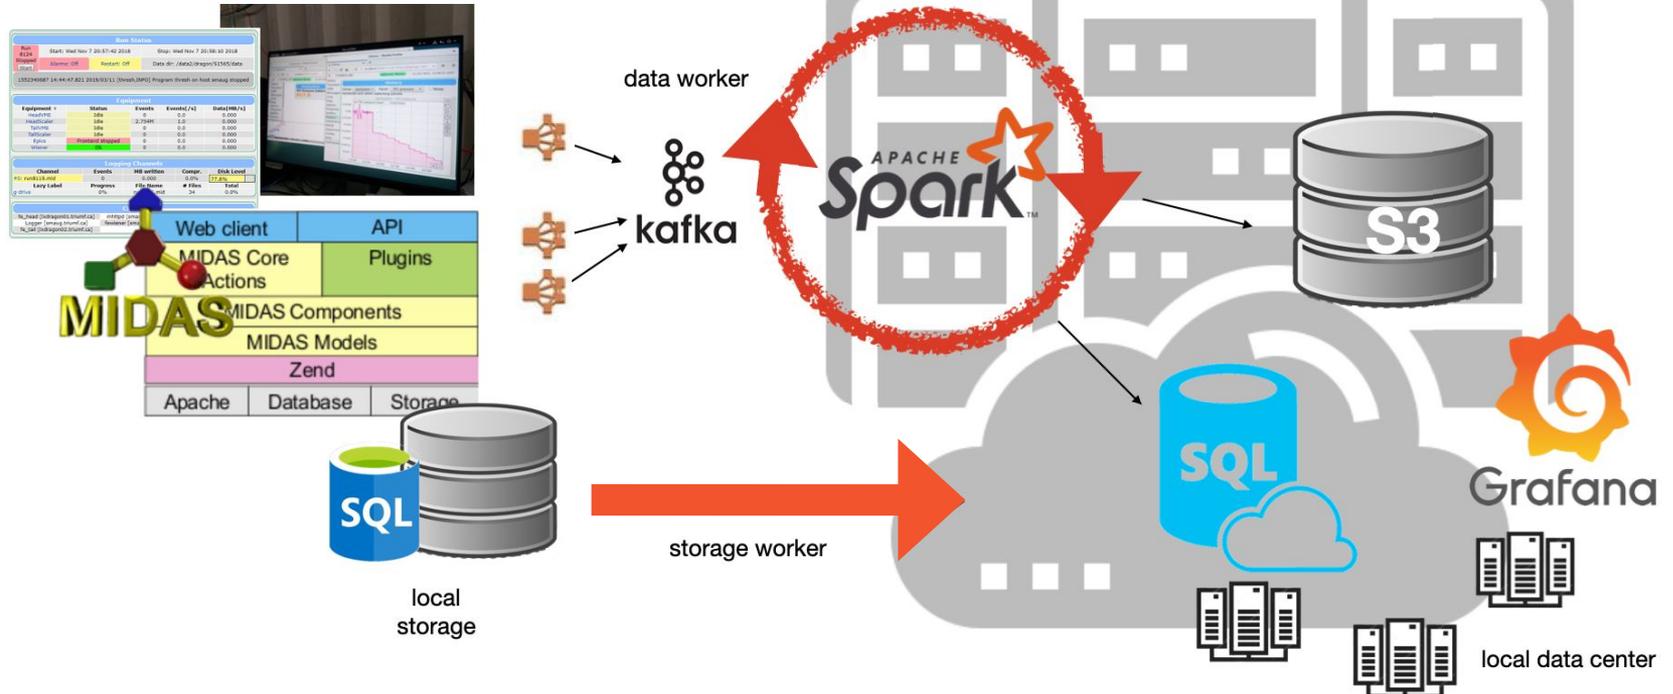

- ◎ Bring Middleware completely to the cloud:
 - ◎ Set a worker that will **just and only** take the information from MIDAS and **send to the cloud** (without any analysis);
 - ◎ Receive this information on the cloud and then **run the quasi-online analysis** with the possibility to **parallelize** the work as needed.

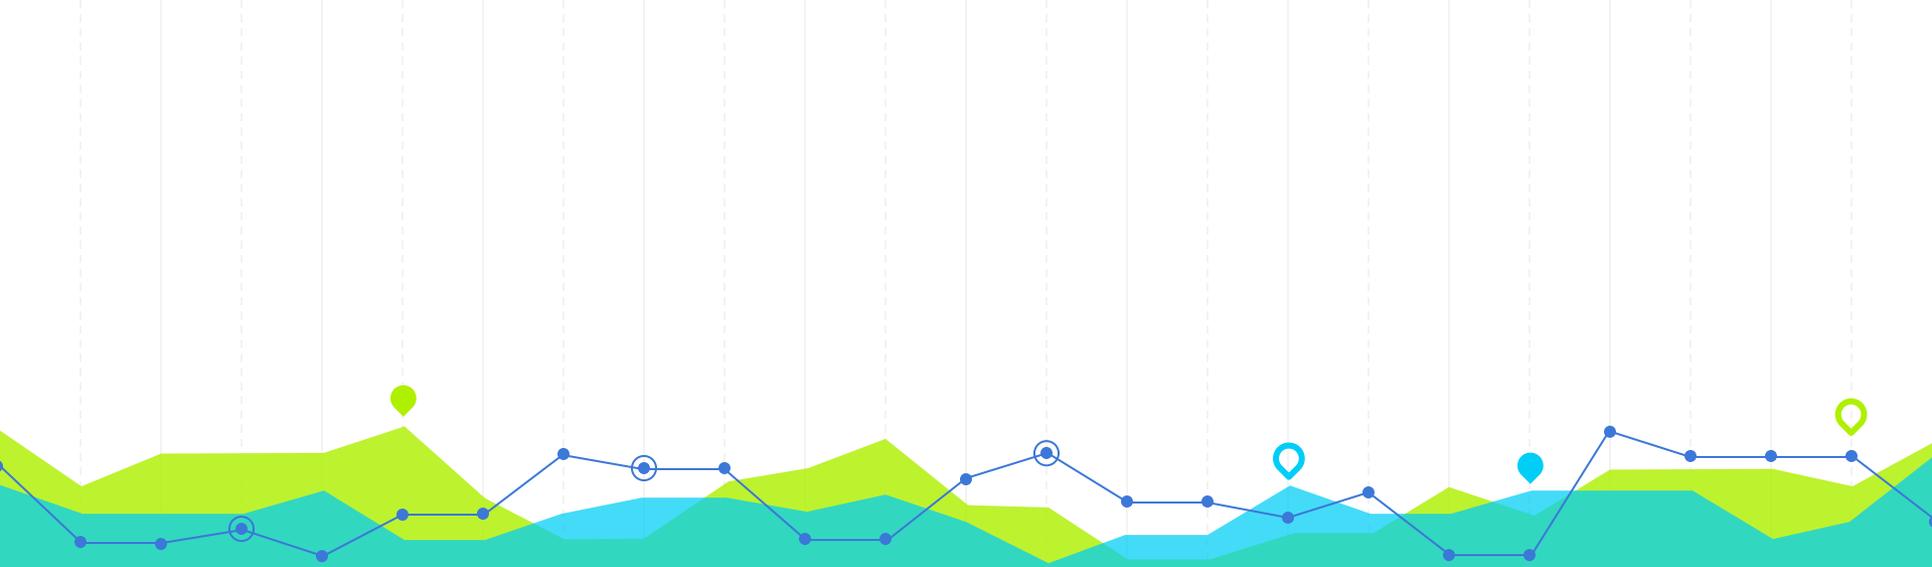

Very next steps

- Finalize the Grafana configuration to authentication using IAM:
 - This will allow all cygners access to the monitoring plots.
- Develop a function at CYGNO_LIB able to retrieve the SQL Reco/Macro/SlowControl information easily.

data flow – schematic view from detector to cloud (future plans)

INFN cloud storage
interactive and batch data analyse and simulation

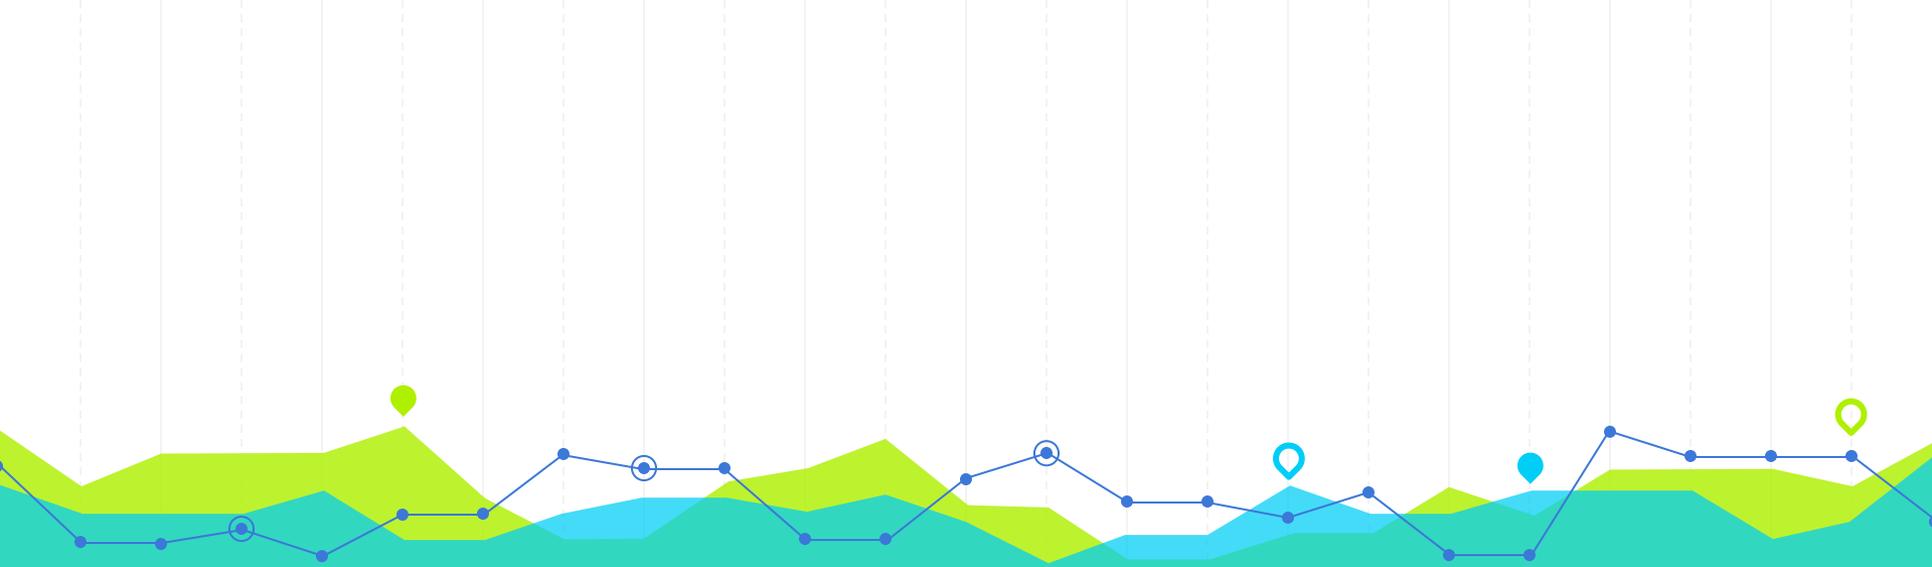

Publications related to this work

Publications related to this work

- Talk + Proceedings at ISGC 2022
- Talk + Conference Record at IEEE 2022
- Abstract accepted as 'Poster' to the CHEP 2023

Should we try to write a full paper?

THANK YOU!
