

Quick update on MSD

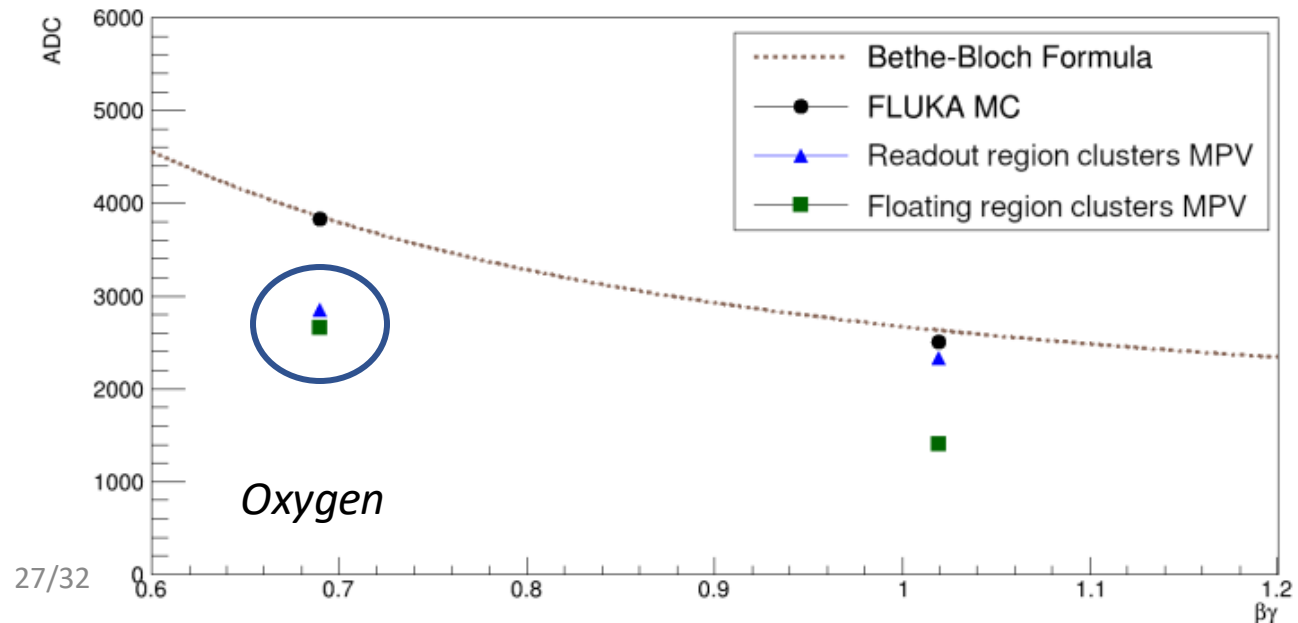

Gianluigi Silvestre

01/02/2023

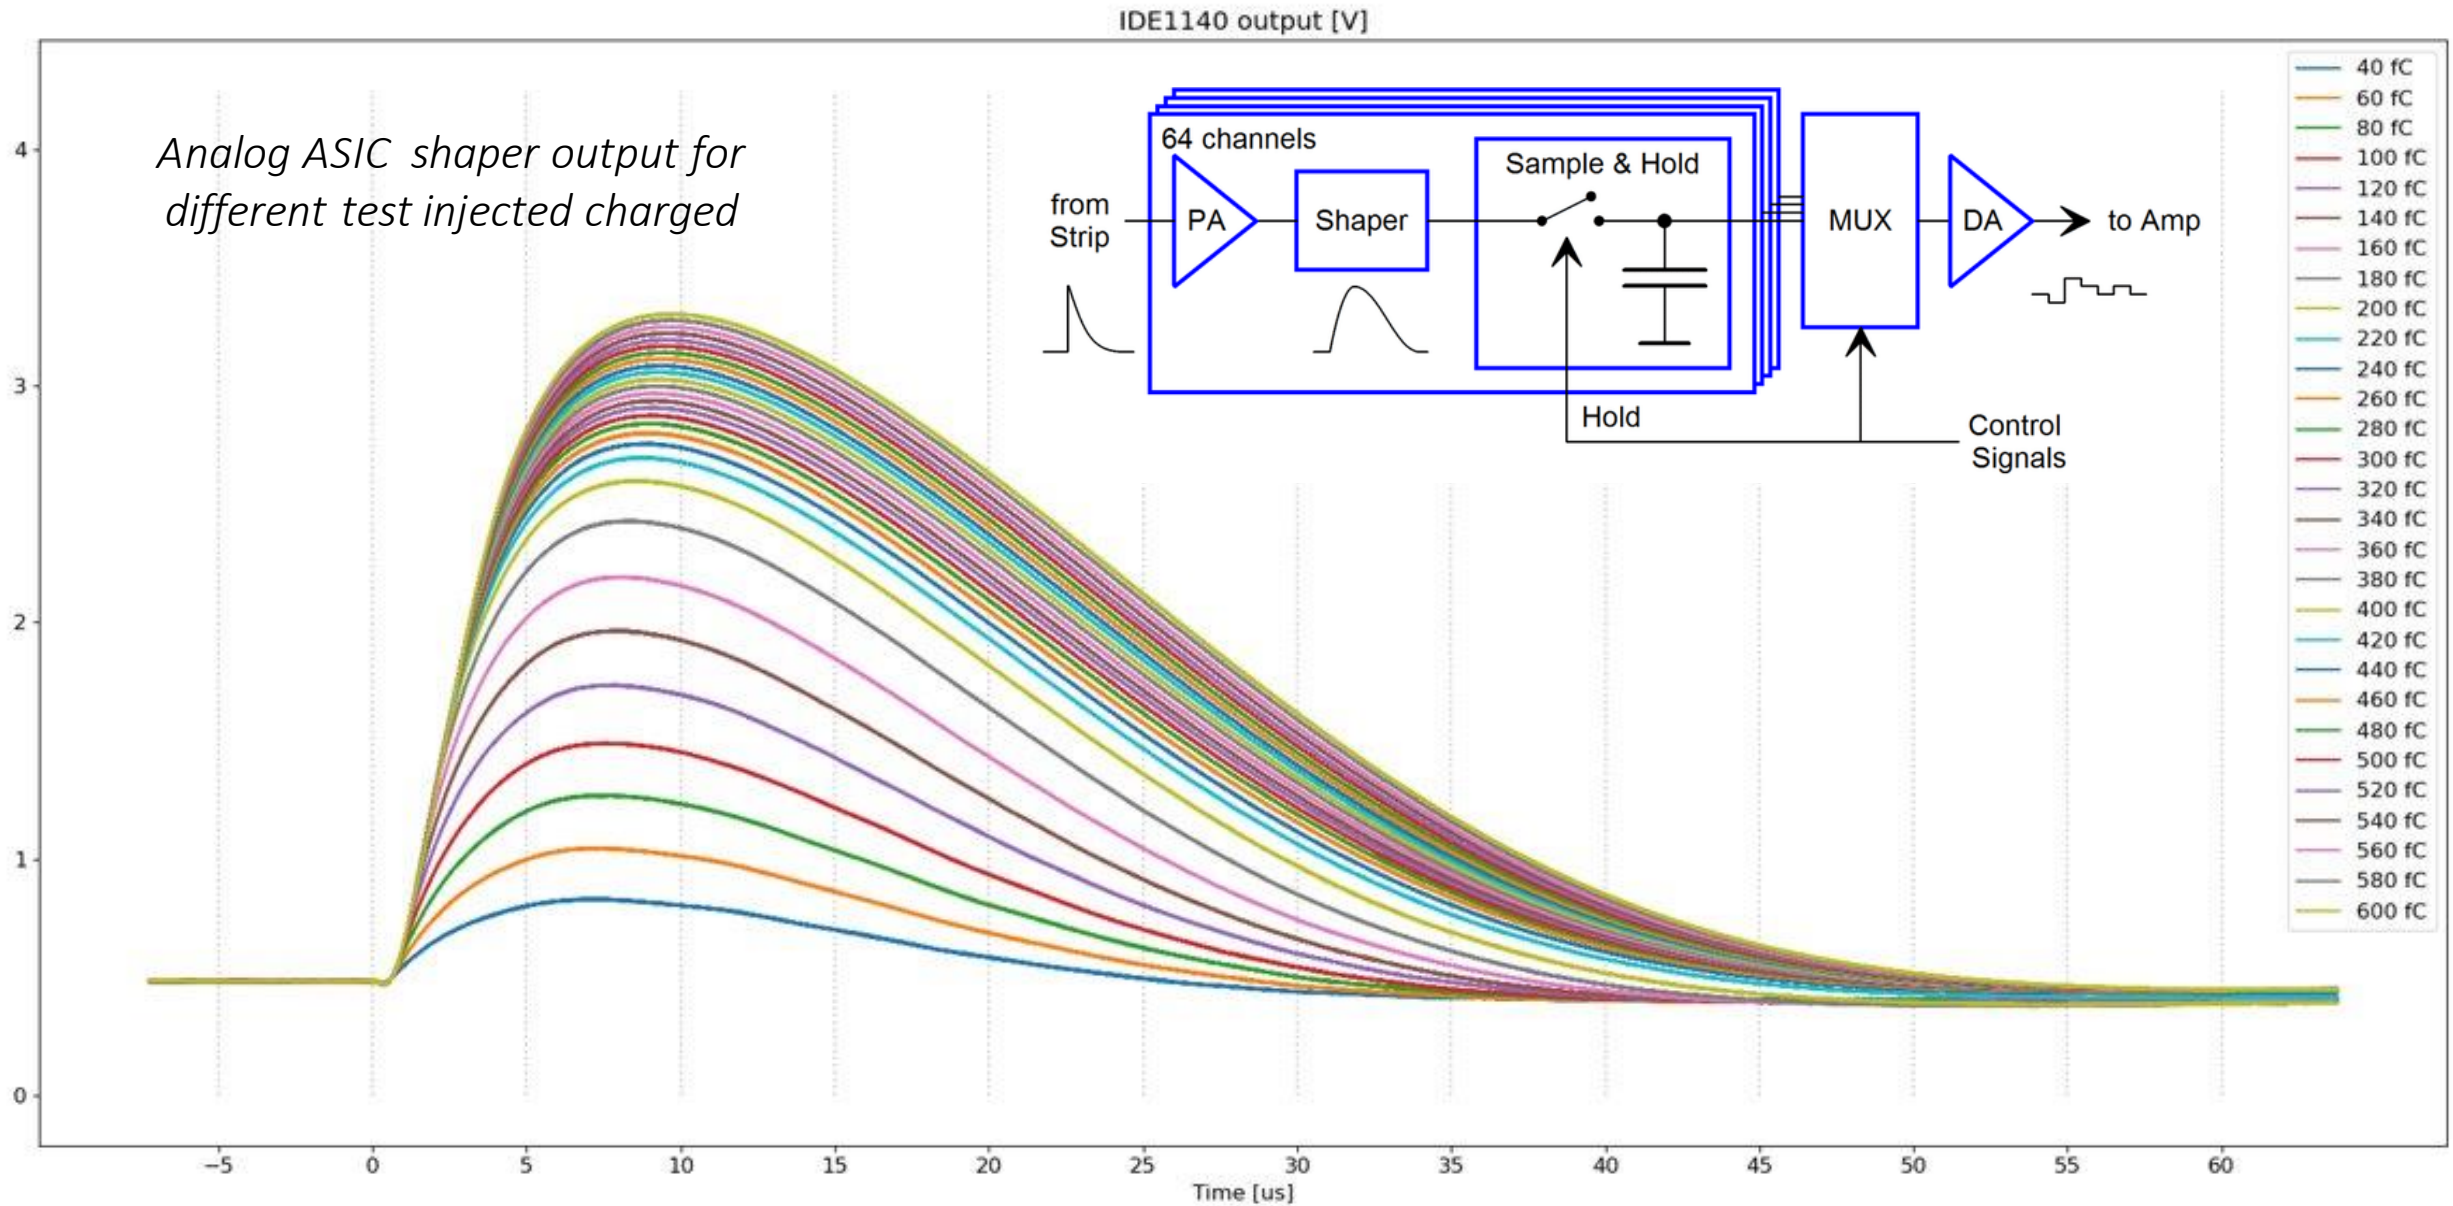

Tests on the readout chain

Data from Carbon and Oxygen

- Reconstructed clusters ADC comparison with FLUKA MC predictions
 - Good agreement for Readout region cluster
 - Down to 200 MeV/u for Carbon ions
 - For 400 MeV/u Oxygen ions
 - Discrepancies for the other energies for Carbon ions
- Data from 200 MeV/u Oxygen ions show a deviation from the predictions for both families of clusters
- Apparent charge loss dependence on the energy of the incoming particle
- *Hypothesis: analog readout saturation for heavy ions*

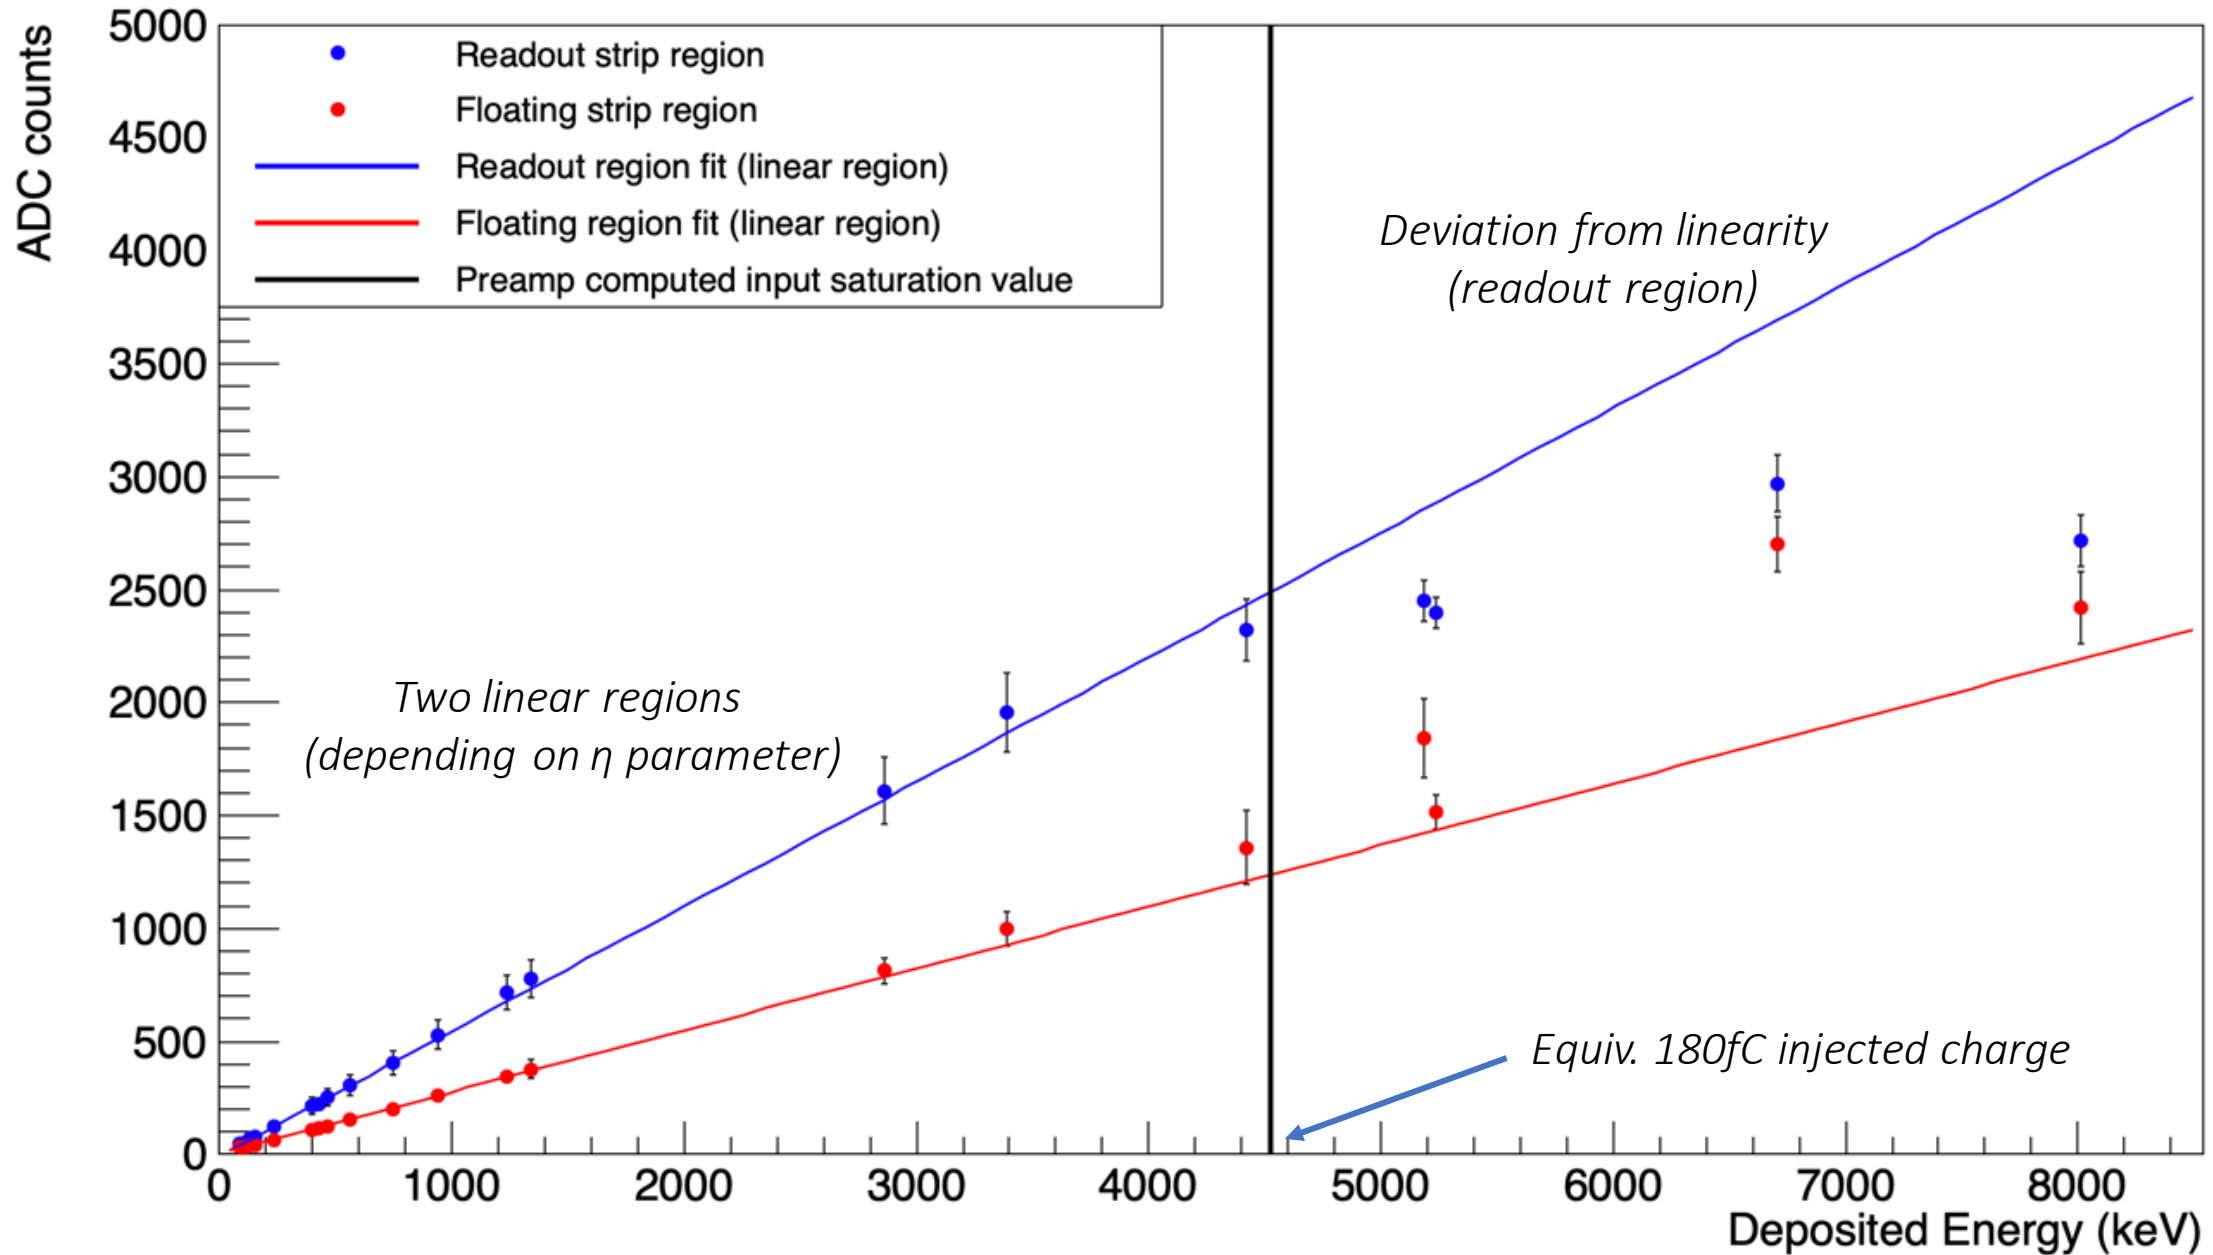

Tests on analog preamp/shaper ASIC

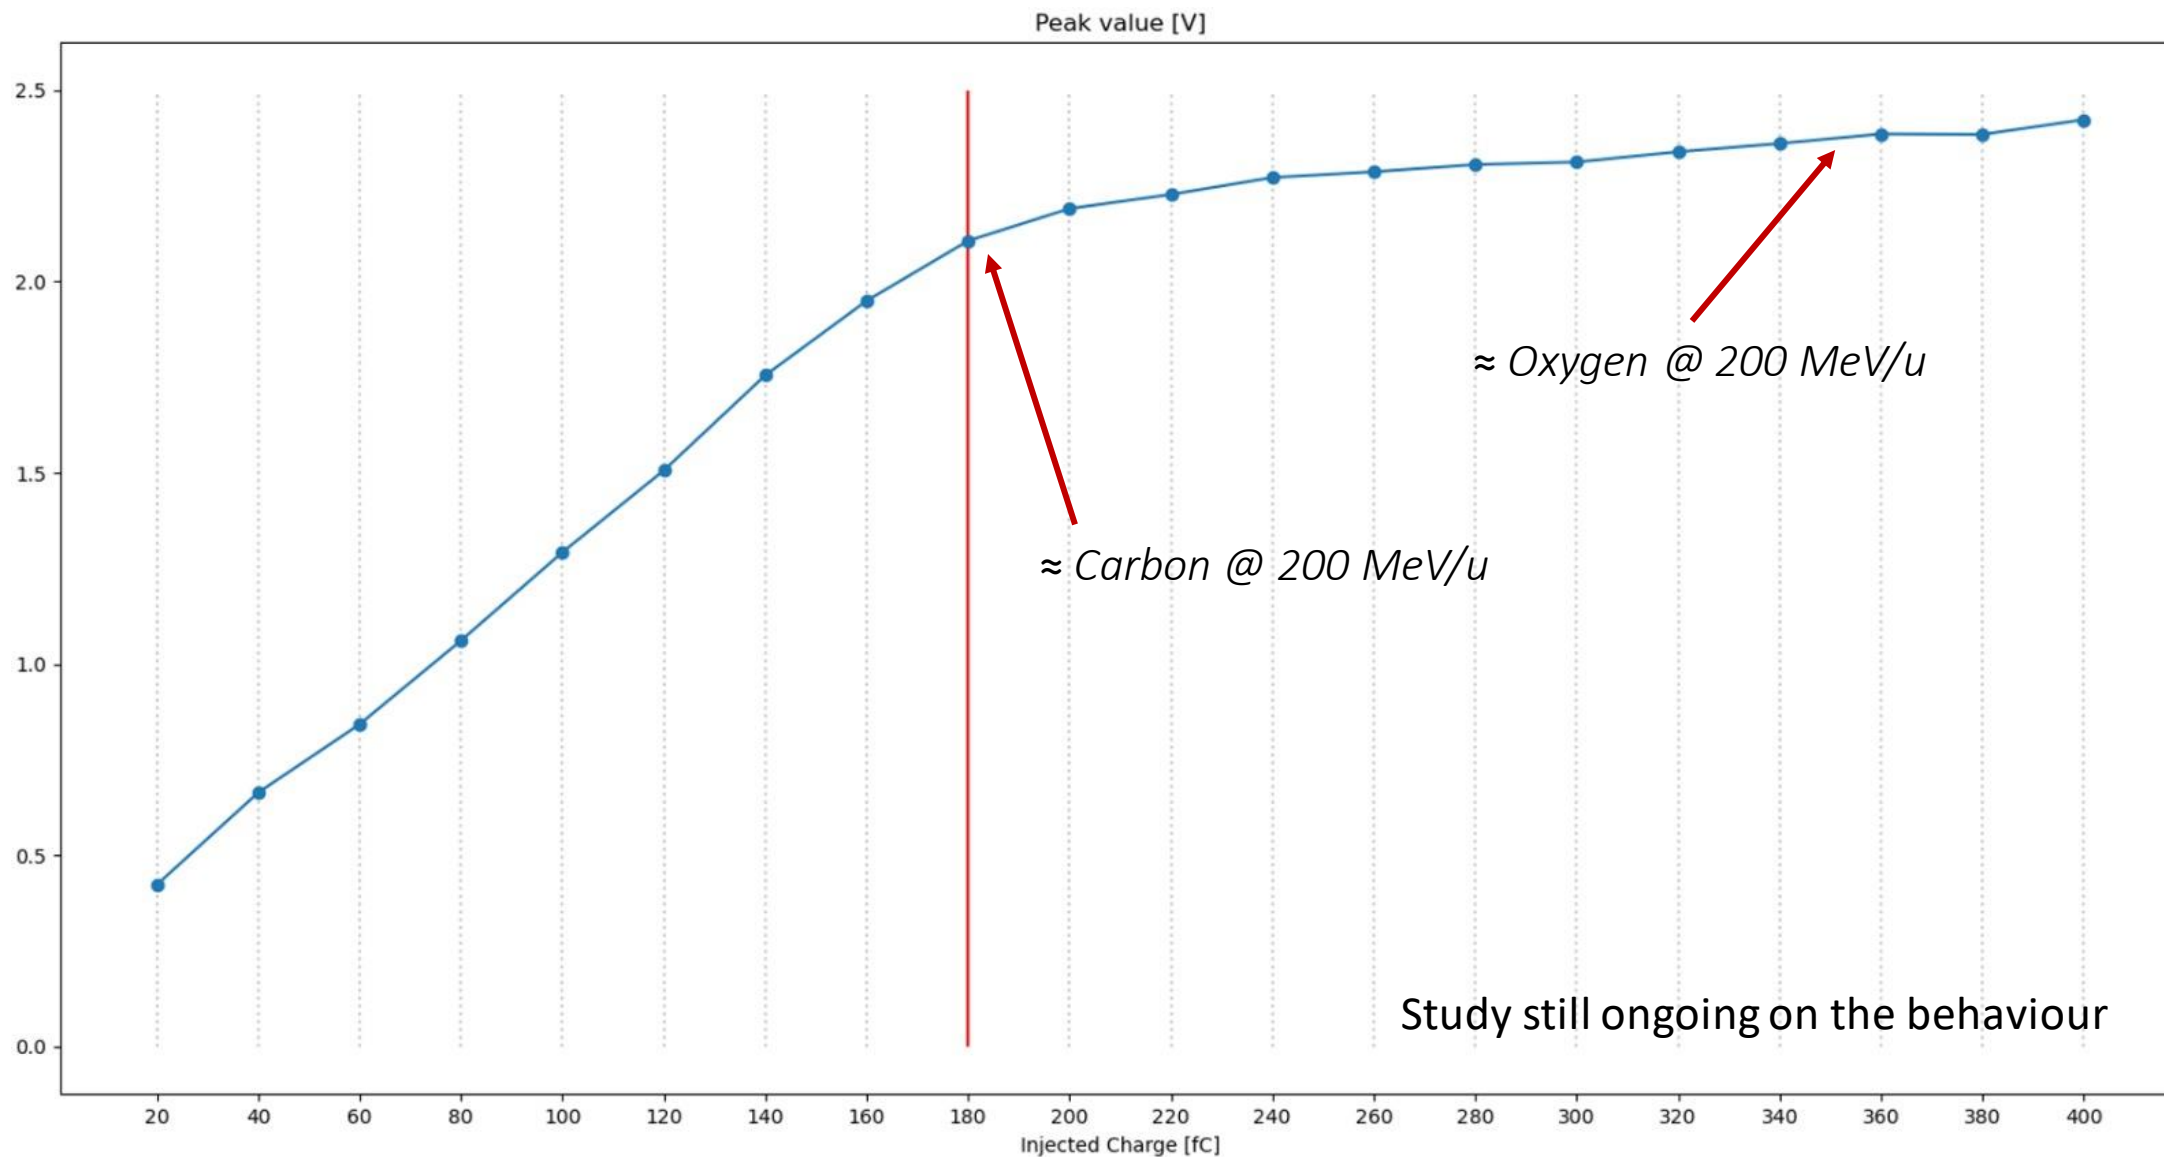

Tests on analog preamp/shaper ASIC

Deposited energy vs reconstructed clusters

Mechanics

First 3D printed support

Successfully used in Nov/Dec data takings

New 3D printed support (W.I.P.)

"Quick" 9h test print from yesterday

New 3D printed support (W.I.P.)

Beam window center

0.115887 m

What's the biggest footprint we can use?

Is $\approx 2\text{cm}$ gap between the boxes good enough for the final mechanics?

0.135935 m

0.299754 m

- *3D printer just arrived*
- *Bit thicker than first version*
- *Slightly wider footprint*
- *Might be a starting point for final support*
