## On the Electron Self-Energy to Three Loops in Quantum Electrodynamics

Tuesday, 10 September 2024 11:50 (25 minutes)

We report on the analytic calculation of the Electron Self Energy in Quantum Electrodynamics at three loops. Feynman integrals appearing in the problem are evaluated via the method of differential equations. In particoular, we will discuss how to cast the system of differential equations – including elliptic secrors – in an eps-factorized form via suitable transformation(s), thus (almost) trivializing the solution.

This is work in progress in collaboration with Claude Duhr, Christoph Nega, Lorenzo Tancredi and Stefan Weinzierl.

**Primary authors:** NEGA, Christoph (TUM); DUHR, Claude (CERN); GASPAROTTO, Federico (JGU Mainz); TAN-CREDI, Lorenzo; WEINZIERL, Stefan (JGU Mainz)

Presenter: GASPAROTTO, Federico (JGU Mainz)

Session Classification: Electroweak and Higgs Physics, EFT and BSM

Track Classification: Electroweak and Higgs Physics, EFT and BSM
