

Two-loop amplitudes for W-boson production in association with two photons at the LHC

Tuesday, 10 September 2024 16:10 (25 minutes)

I will present a computation of two-loop amplitudes contributing to $W+2$ photon production at the Large Hadron Collider. We adopt a hybrid approach where analytic results are derived for the leading colour contribution while the subleading colour amplitudes are evaluated numerically, both within the finite-field framework. The size of subleading colour contribution is studied, by evaluating the amplitudes on a small set of physical phase-space points.
