## Commissioning and calibration of the ALICE Zero Degree Calorimeters

*Thursday, 29 May 2008 11:50 (20 minutes)*

### Summary

The Zero Degree Calorimeters (ZDCs) for the ALICE experiment will measure the energy of the spectator nucleons in heavy ion collisions at the CERN LHC.

The ZDCs consist of a neutron (ZN) calorimeter, placed between the two beam

pipes, and a proton (ZP) calorimeter, positioned externally to the outgoing

beam pipe at 116 m from the interaction point.

The ZDCs are spaghetti calorimeters, which detect the Cherenkov light

produced by the shower particles in silica optical fibers embedded in a dense absorber.

In summer 2007 the ZN and ZP calorimeters have been integrated on the surface

on a movable platform and then installed in the LHC tunnel.

The results of the commissioning on the surface, in particular the solutions adopted to control the stability of the PMTs response will be shown: light injection with a laser diode and cosmic rays.

The foreseen physical calibration in Pb-Pb collisions will be also discussed.

Finally the first measurements of the commissioning in the LHC tunnel will be presented.
