g-2 trolley system

Student: Matteo Bartolini

Supervisors: Peter Winter, Joseph Grange

09/24/2015

Today we will talk about

- g-2 introduction
- My work
- Future improvements

- Superconducting magnets generate 1.45 Tesla magnet field
- 7.1 metres radius

Introduction

- g-2 experiment at Fermilab aims at measuring the anomalous magnetic moment of muons
- Previous experiment at Brookhaven (E821) measured a 3.6 sigma deviation from the theoretical value
- Fermilab goal is to improve precision to 140 ppb to see if hints of new physics beyond the SM are confirmed

Introduction

- Fermilab new muon production facility can deliver 21 times more muons to the ring, thus increasing statistic
- Muons originate from decaying pions produced by protons hitting a nickel target
- First data scheduled in 2017

B-field

- Magnetic field around the ring will be mapped using a trolley system made of 17 fixed petroleum jelly (more stable over time) NMR probes
- Each of these probes will measure the field with a precision of 30 ppb
- These probes must be calibrated using a very homogeneous field generated by a MRI solenoid and compare the value to the one measured by absolute water probes

- 1) Put water probes in the solenoid to measure B_{Abs}
- 2) Measure the same field with gelly petroleum probes to get B_{Trolley}
- 3) Take the difference $B_{\text{Abs}} - B_{\text{Trolley}}$

Trolley system

360 fixed NMR probes

17 NMR probes on trolley to take map at 6000 azimuthal locations

But

- We want
$$\Delta B = B_{\text{abs}} - B_{\text{trolley}}$$
- We measure instead:
- $$\Delta B = \Delta B + \frac{dB}{dx} \Delta x$$

We would like to have a stable system that places probes always $\frac{dB}{dx}$ in the same spot. This is crucial to get an accurate value of the field

This solenoid has a gradient of about 10 ppb/mm.

Basic idea:

- Bring trolley system inside the solenoid
- Try to bring water probes in the same spot of the trolley probes

How do we move probes? Galil motion control

- 6 axes motion control
- Each axes has 6 pins to communicate with the motor
- Can be programmed using C++ libraries

It can be integrated into MIDAS,
g-2 data acquisition system

MIDAS

- Data acquisition is being built using MIDAS software package
- It provides:
 - 1) Framework for an event builder
 - 2) Datas can be output into a binary data format that will be processed using ROOT
 - 3) Web interface for control of the experiment

My work

My work was to :

- learn how to communicate with Galil through c++ code
- Develop the interface using MIDAS software package

Interface

galil monitor

Run Status

Run 47 Stopped

Start: Tue Sep 22 16:36:26 2015 Stop: Tue Sep 22 16:45:10 2015

First test: repeatability

First test: repeatability

- We measured the number of centimeters per encoder counts:

$$(3.242 \pm 0.003) * 10^{-3} \text{ cm/encodercounts}$$

- We used a switch to limit the motion in the forward direction

3 counts spread from the histogram

this corresponds to 0.1 mm resolution
