# $A^b_{FB}@FCCee$ Current status and future plans

---

IDEA Physics and Software Meeting  
30 March 2023

# Current status

- Key point: ***b*-quark charge determination**
- Two classes of methods implemented:
  - a. ***Jet charge***: weighted sum of charges of jet constituents tracks
    - private Madgraph+Pythia8+Delphes
  - b. ***Semi-leptonic b-hadron decay***: charge of electron/muon
    - central **FCCAnalysis** framework + different tools

Precise measurement of Forward-Backward asymmetry in  $e^+e^- \rightarrow Z \rightarrow b\bar{b}$  events at FCCee

**IDEA**

# Ongoing tasks

- Implementing the *jet-charge method* within the official **FCCAnalyses** framework (see next slides)

HEP-FCC/  
**FCCAnalyses**

- Studying other sources of **systematics**
- Documentation** of the analysis (see next slides)
  - will be finalized by end of April
- Working for the presentation of **final results** at the **FCC week** in London

Precise measurement of Forward-Backward asymmetry in  $e^+e^- \rightarrow Z \rightarrow b\bar{b}$  events at FCCee

# Ongoing tasks: Analysis code

Implementation of the *jet-charge method* by Leonardo:

- will allow to study vertexing requirements (*b*-tagging)

# Ongoing tasks: Analysis code

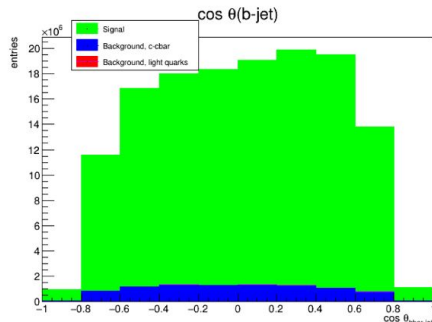

Plot from Krakow

## Jet-charge study

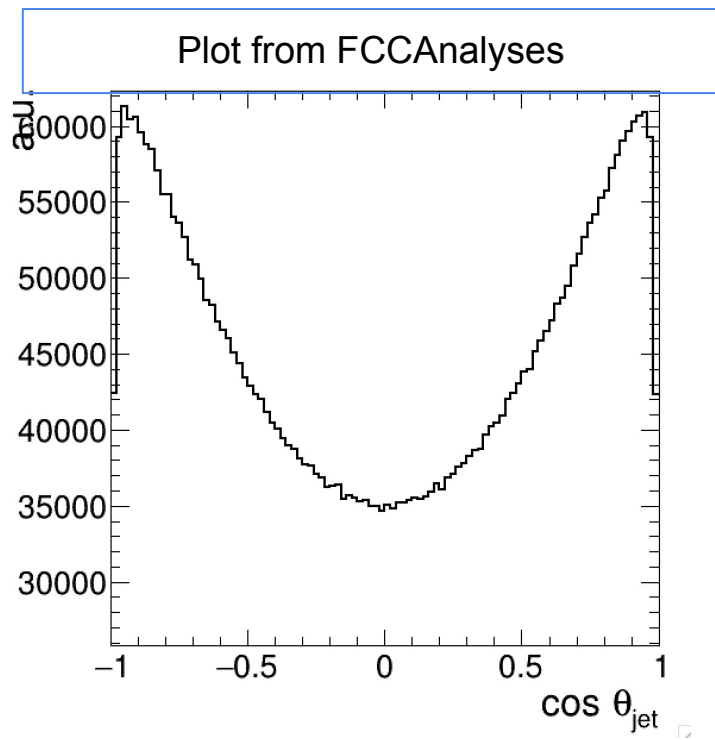

- Based on private [MadGraph+Delphes](#) simulation (with IDEA card)
- Durham jet algorithm used
- Simplified b-tagging (flat 80% eff., 10%/1% c/light-mis-tagging)
- Jet charge built with weighted sum of charges of tracks (as saved by Delphes)
  - $\Delta R < 0.4$  from jet axis
  - weight =  $p_T$  (track) w.r.t. jet axis

### Event Selection

- $\geq 2$  b-tagged jets
- $\geq 1$  jet with charge  $> 0$
- $\geq 1$  jet with charge  $< 0$

# Ongoing tasks: Analysis code

Why we think that moving to official framework is going to (partially) help

(Dated: March 30, 2023)

In this work, we present our study on the  $b$ -quark forward-backward (FB) asymmetry at the future collider FCC-ee at the Z pole. The Standard Model (SM) prediction for the  $b$ -quarks FB asymmetry is calculated to be  $(A_{FB}^{0,b})_{th} = 0.1030 \pm 0.0002$ . From the experimental point of view, the  $A_{FB}^b$  in electron-positron collisions measured by large electron-positron (LEP) collider at the Z pole is  $A_{FB}^{0,b} = 0.0992 \pm 0.0016$  which remains today the electroweak precision observable with the largest disagreement with respect to the SM prediction. The LEP measurements suffer from both the dominant statistical and the different sources of systematic uncertainties as well. We show that the proposed high-luminosity electron-positron collider FCC-ee in which collecting orders-of-magnitude more data at the Z pole with respect to the LEP could significantly reduce the  $A_{FB}^{0,b}$  statistical uncertainties. We also have studied and discussed to what extent the new tools, the QCD developments in the last years, the new official FCCAnalysis framework, .... could have improved our understanding of the different sources of systematic uncertainties.

### CONTENTS

### I. INTRODUCTION

- Finalizing the first draft of the note for the midterm report
- By 15 April, it will be finished to shared with the internal Udine/ICTP FCC group members
- By end of April, we will have the final draft

## Other possible related studies in the near future

---

- Probing the  $bbe^+e^-$  four fermions contact interaction at a future electron-positron collider
  - Analysis almost done considering the simulation with IDEA detector in Delphes
  - Preliminary note ready
