Introduction to Data AcQuisition

Introduzione alle Tecniche di Trigger e Data Acquisition

Napoli, 9 Ottobre 2023

Andrea.Negri@unipv.it

Acknowledgment

- Lecture inherited from Wainer Vandelli
 - Material and ideas taken from: Roberto Ferrari, Clara Gaspar, Niko Neufeld, Lauren Tompkins, ...
- Errors and flaws are mine

Introduction

- Aim of this lesson is to introduce the **basic DAQ concepts** avoiding as many technological details as possible
 - The following lectures will cover these aspects
- Focus on High Energy Physics
 - But key concepts are common to other areas
- w/ links to the agenda
 - the lectures
 - the labs

Outline

- Introduction
 - What is DAQ?
 - Overall framework
- Basic DAQ concepts
 - Digitization, Latency
 - Deadtime, Busy, Backpressure
 - De-randomization
- Scaling up
 - Readout and Event Building
 - Buses vs Network
- Data encoding

ISOTDAQ

International School of Trigger
and Data Acquisition

What is DAQ?

[Wikipedia]

- **Data AcQuisition (DAQ)** is
 - the process of **sampling signals**
 - that **measure** real world physical conditions
 - and **converting** the resulting samples **into digital** numeric values that can be manipulated by a PC
- Components:
 - **Sensors**: convert physical quantities to electrical signals
 - **Analog-to-digital converters**: convert conditioned sensor signals to digital values
 - Processing and storage elements

What is DAQ?

[Wikipedia]

- **Data AcQuisition (DAQ)** is
 - the process of **sampling signals**
 - that **measure** real world physical conditions
 - and **converting** the resulting samples **into digital** numeric values that can be manipulated by a PC
- **Components:**
 - **Sensors**: convert physical quantities to electrical signals
 - **Analog-to-digital converters**: convert conditioned sensor signals to digital values
 - Processing and storage elements

What is DAQ?

- DAQ is an **heterogeneous** field
 - Boundaries not well defined
- An **alchemy** of
 - physics
 - electronics
 - computer science
 - networking
 - hacking
 - experience
- Money and manpower matter as well

It's all about physics

- Experiment/detector
 - Produces **physics**
- Data AcQuisition
 - Extracts **physics** from detector
- (Offline) Analysis
 - Extracts **physics** from data

It's all about physics

- Experiment/detector
 - Produces **physics**
- Data AcQuisition
 - Extracts **physics** from detector
- (Offline) Analysis
 - Extracts **physics** from data

The role of technology

- Technology and Computing are **enablers** of physics programs
 - The **physics** goals **depends** on technology and innovation
- *“Modern computing architectures and emerging technologies are changing the way we do particle physics”*
[Snowmass 2022 report]
- Particle physicists must monitor technological trends and make innovation
 - Especially true in DAQ field

Predictions

- *“Prediction is very difficult, especially about the future.”*
 - Niels Bohr

Predictions

- *“Prediction is very difficult, especially about the future.”*
 - Niels Bohr
- *“There is no reason anyone would want a computer at home.”*
 - Ken Olsen,
Founder of DEC, 1977
- *“Apple is already dead”*
 - N. Myhrvold, former
Microsoft CTO, 1997

Predictions HEP

- *“Thanks to the Moore law, in 2007 our event selection farm will be based on 8 GHz CPUs”*
 - ATLAS TDR, 2003
- *“Machine learning was essentially not a part of the 2013 Snowmass report”*
 - SnowMass report 2022

What about trigger?

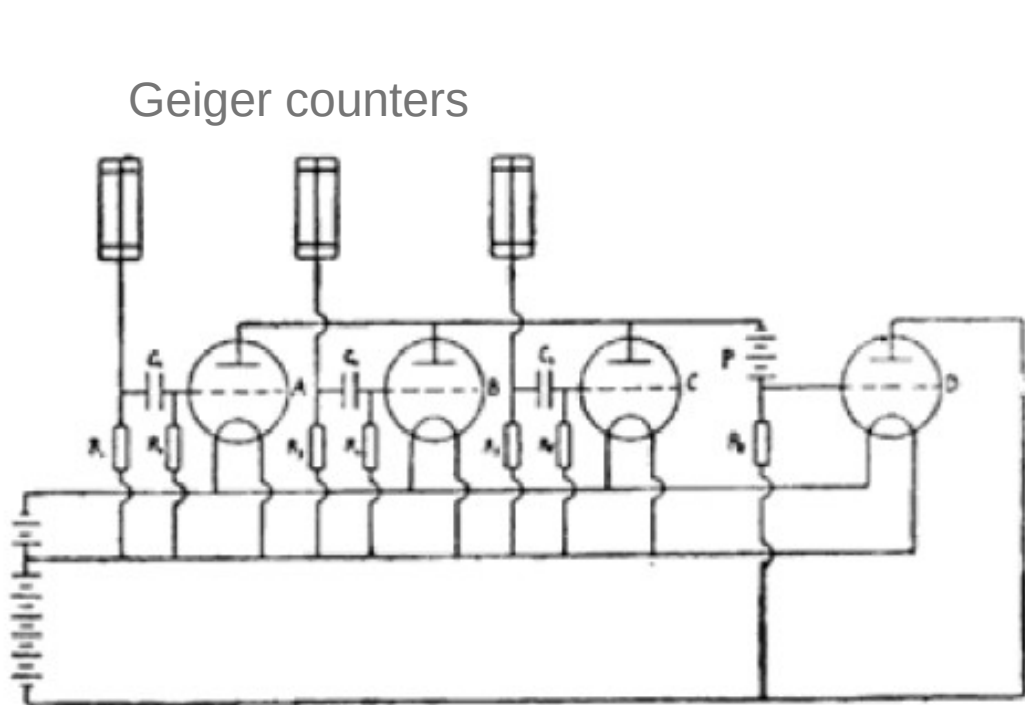

Something interesting

- Main role of DAQ
 - process the signals generated in a detector
 - and saving the **interesting** information on a permanent storage
- What does it mean interesting?
 - When does this happen?
- We need a trigger

Trigger

- *"Method of Registering Multiple Simultaneous Impulses of Several Geiger Counters"*
Bruno Rossi, Nature 1930
 - Online coincidence of three signals

Trigger

- Either selects interesting events or rejects boring ones, in **real time**
 - **Selective**: efficient for “signal” and resistant to “background”
 - **Simple** and **robust**
 - **Quick**
- With minimal *controlled* **latency**
 - time it takes to form and distribute its decision
- The trigger system generates a prompt **signal** used to start the data-acquisition processes
 - To be distributed to front end electronics

Double paths

- **Trigger** path
 - From dedicated detectors to trigger logic
- **Data** path
 - From all the detectors to storage
 - On positive trigger decision

Trigger(less)

- **Triggered:** data is readout from detector only when a trigger signal is raised

0011101
0000101
1100010

10010001
10101001
00011111

0001111
0111110
0110100

DAQ

trigger

- **Triggerless:** the detector push data at its speed and the downstream daq must keep the pace

0101010010001001001000111111010
0100010101001111101011111010101
1010000011111010100011010000111

DAQ

Trigger(less)

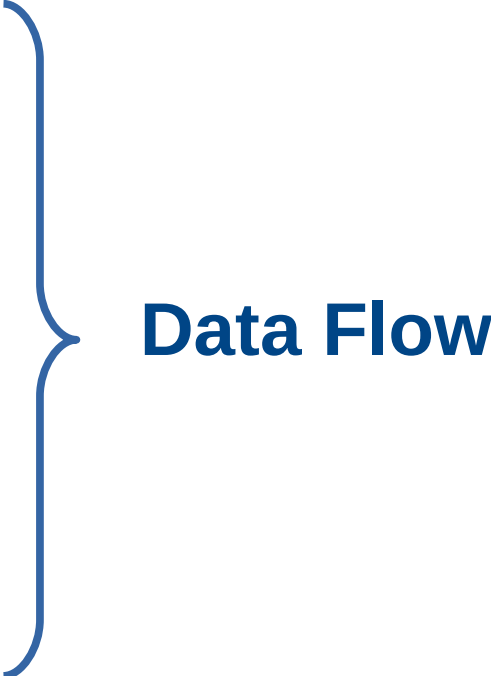

- **Triggered:** data is readout from detector only when a trigger signal is raised

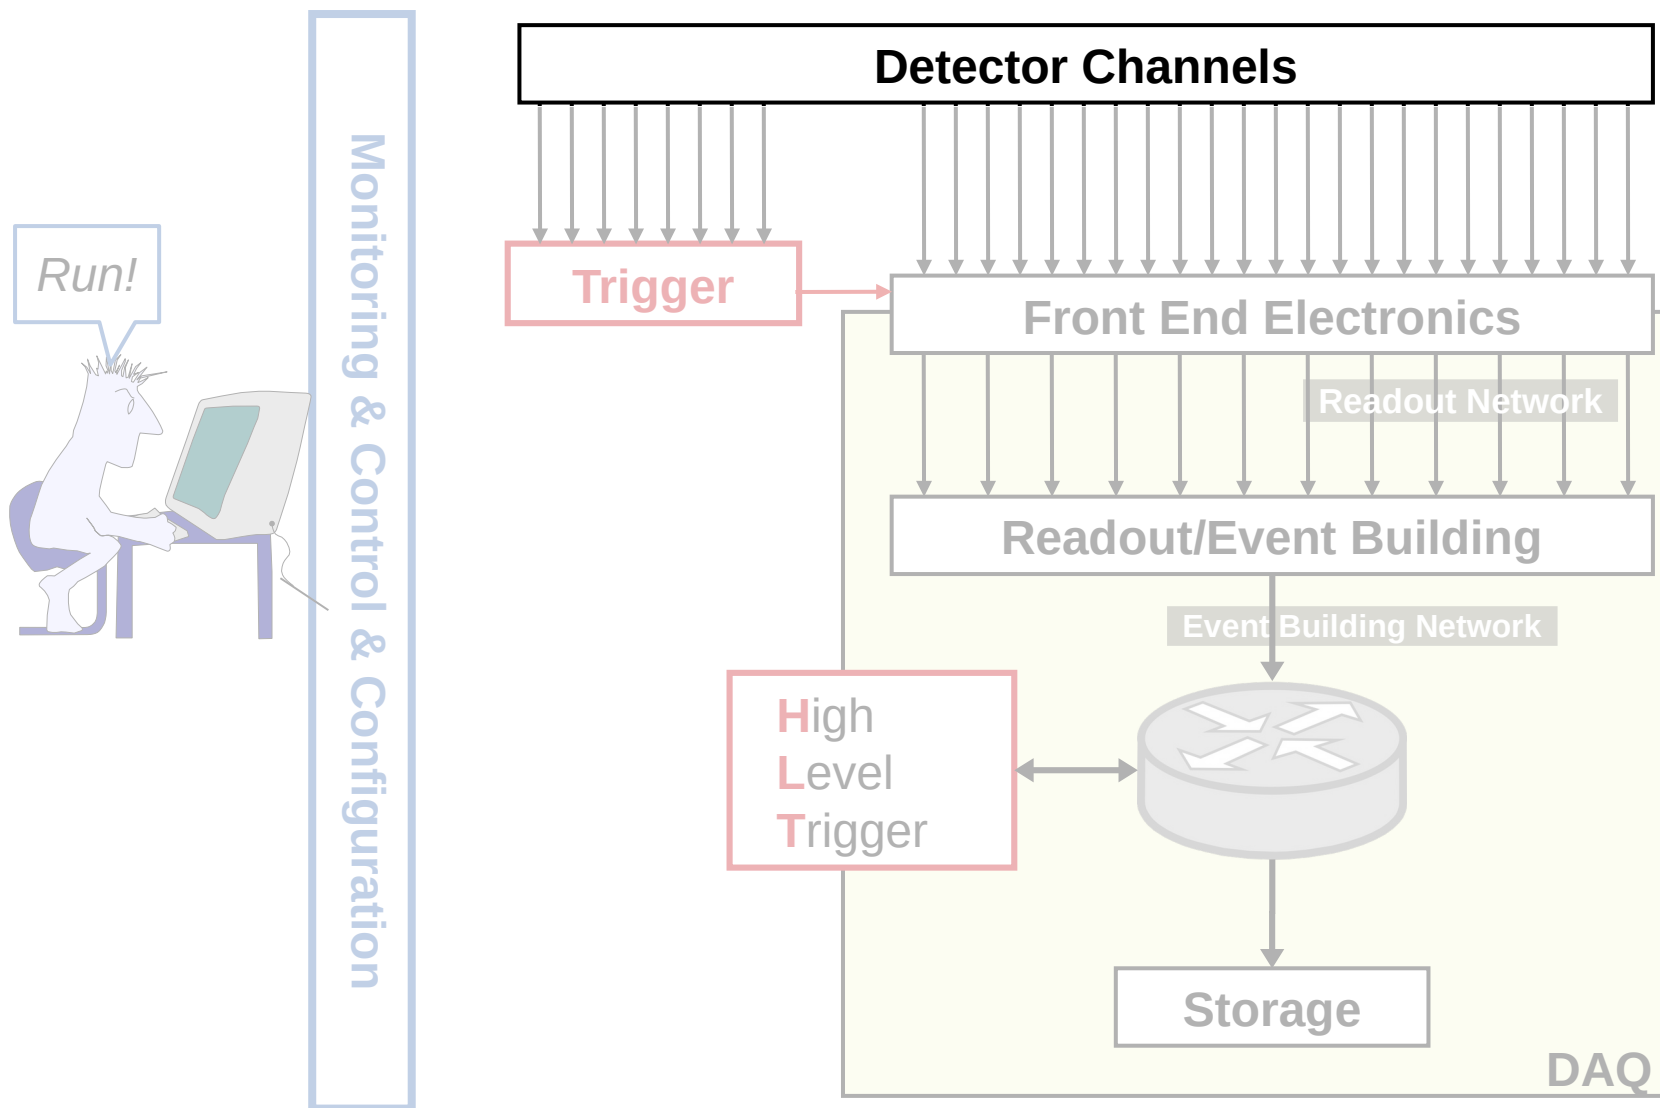

- **Triggerless:** the detector push data at its speed and the downstream daq must keep the pace

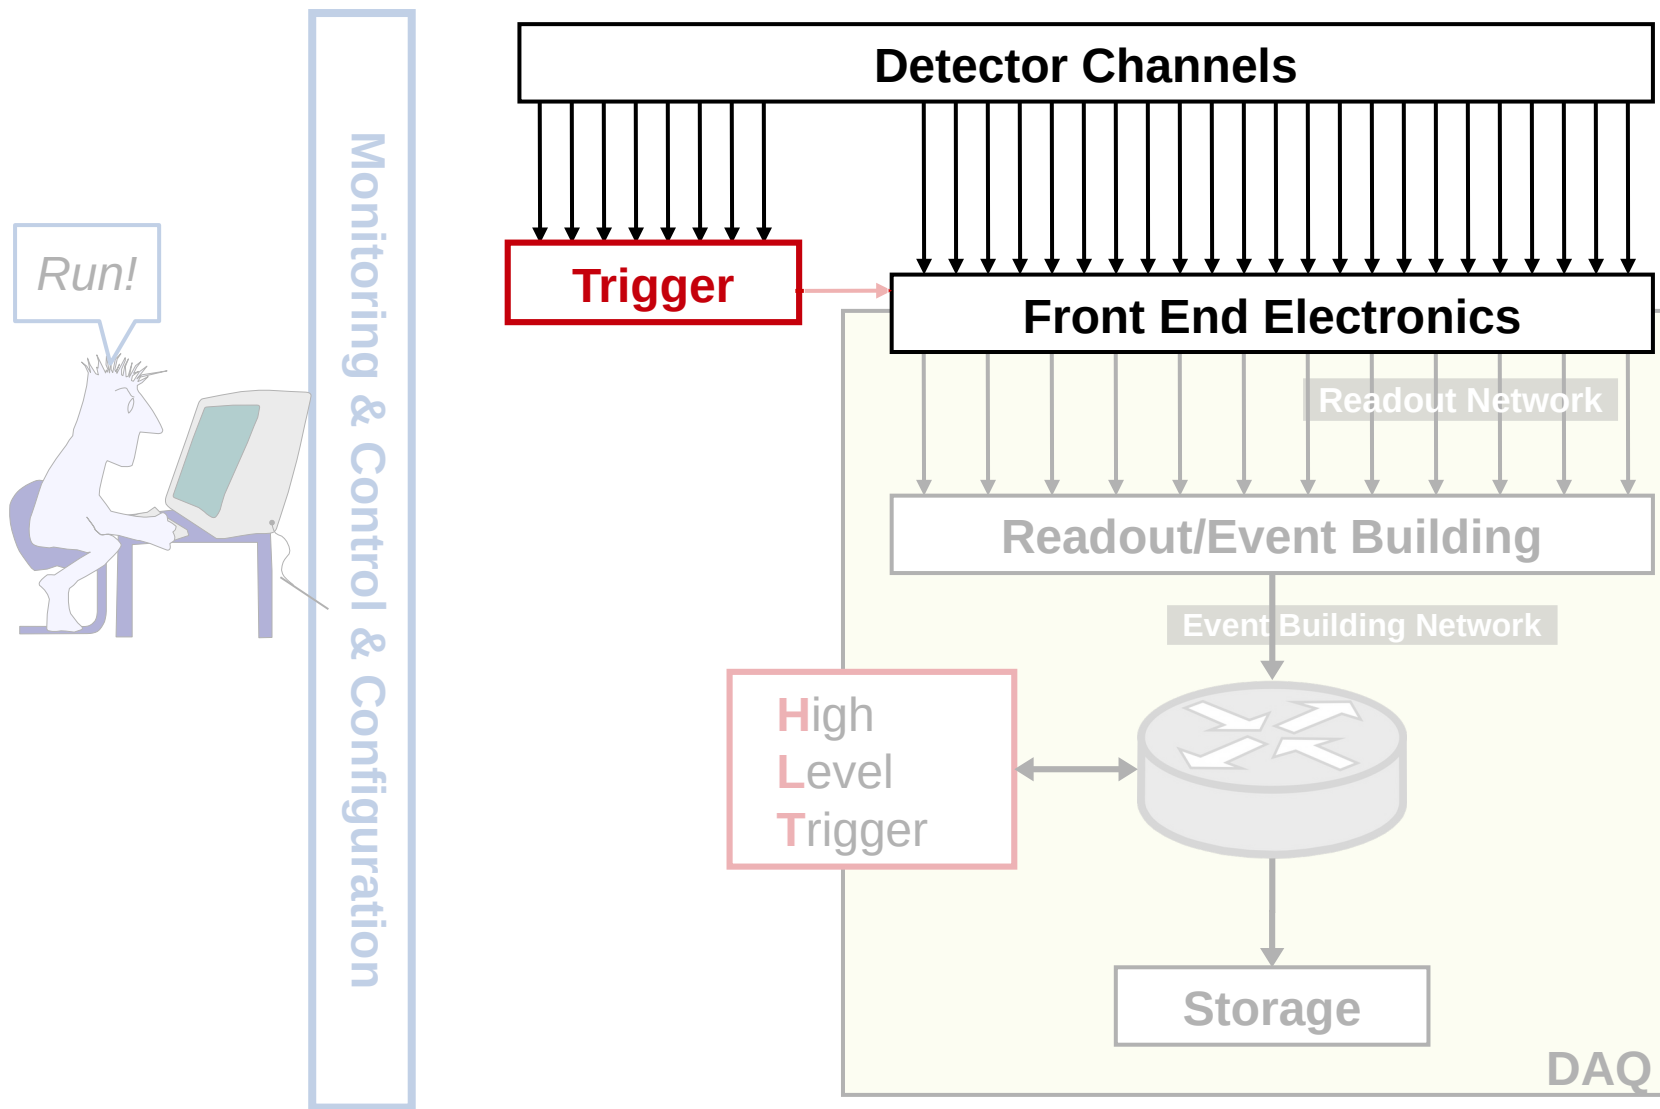

DAQ duties

- Gather data produced by detectors
 - **Readout**
 - Form complete events
 - **Data Collection** and **Event Building**
 - Possibly feed other trigger levels
 - **High Level Trigger**
 - Store event data
 - **Data Logging**
 - Manage the operations
 - **Run Control, Configuration, Monitoring**
- 
- Data Flow**

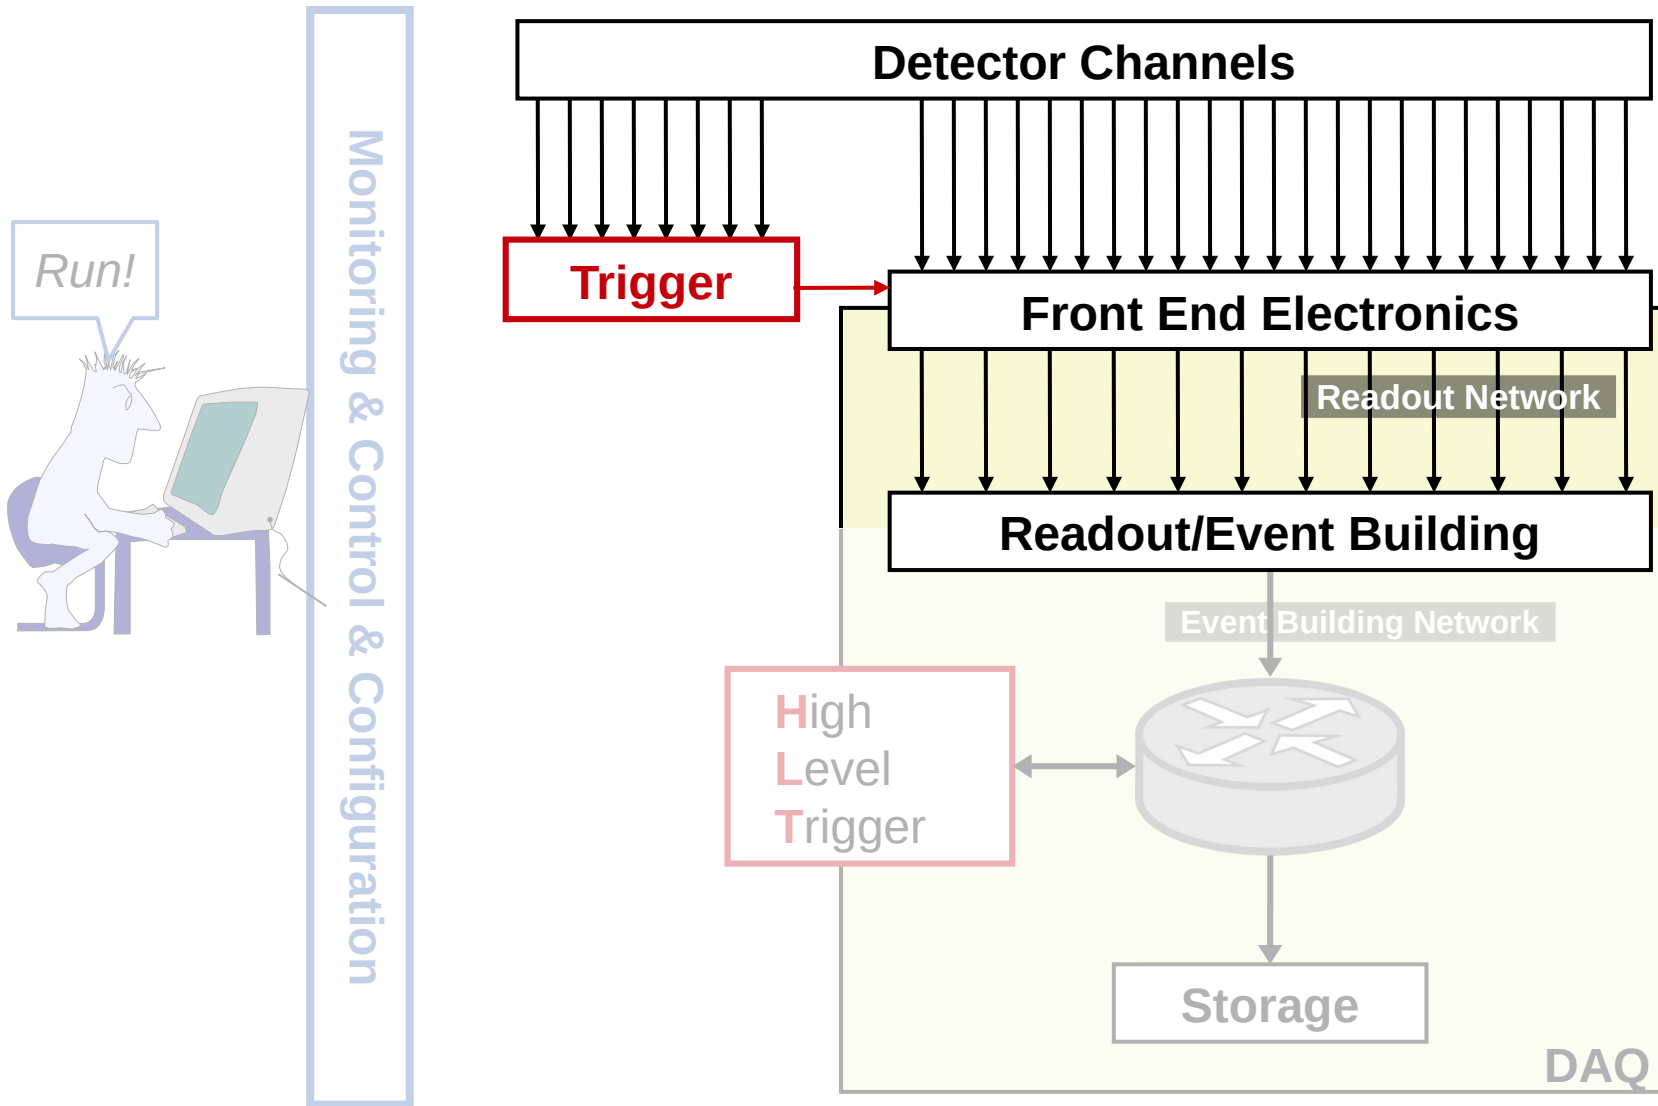

T-DAQ

Event Building

- Associate all data corresponding to the same event
 - E.g.: to the same bunch crossing
- Or collect all data corresponding to the same time frame (ALICE) or the same LHC orbit (CMS)
 - But you still need to associate all the data of the same bunch crossing

T-DAQ

T-DAQ

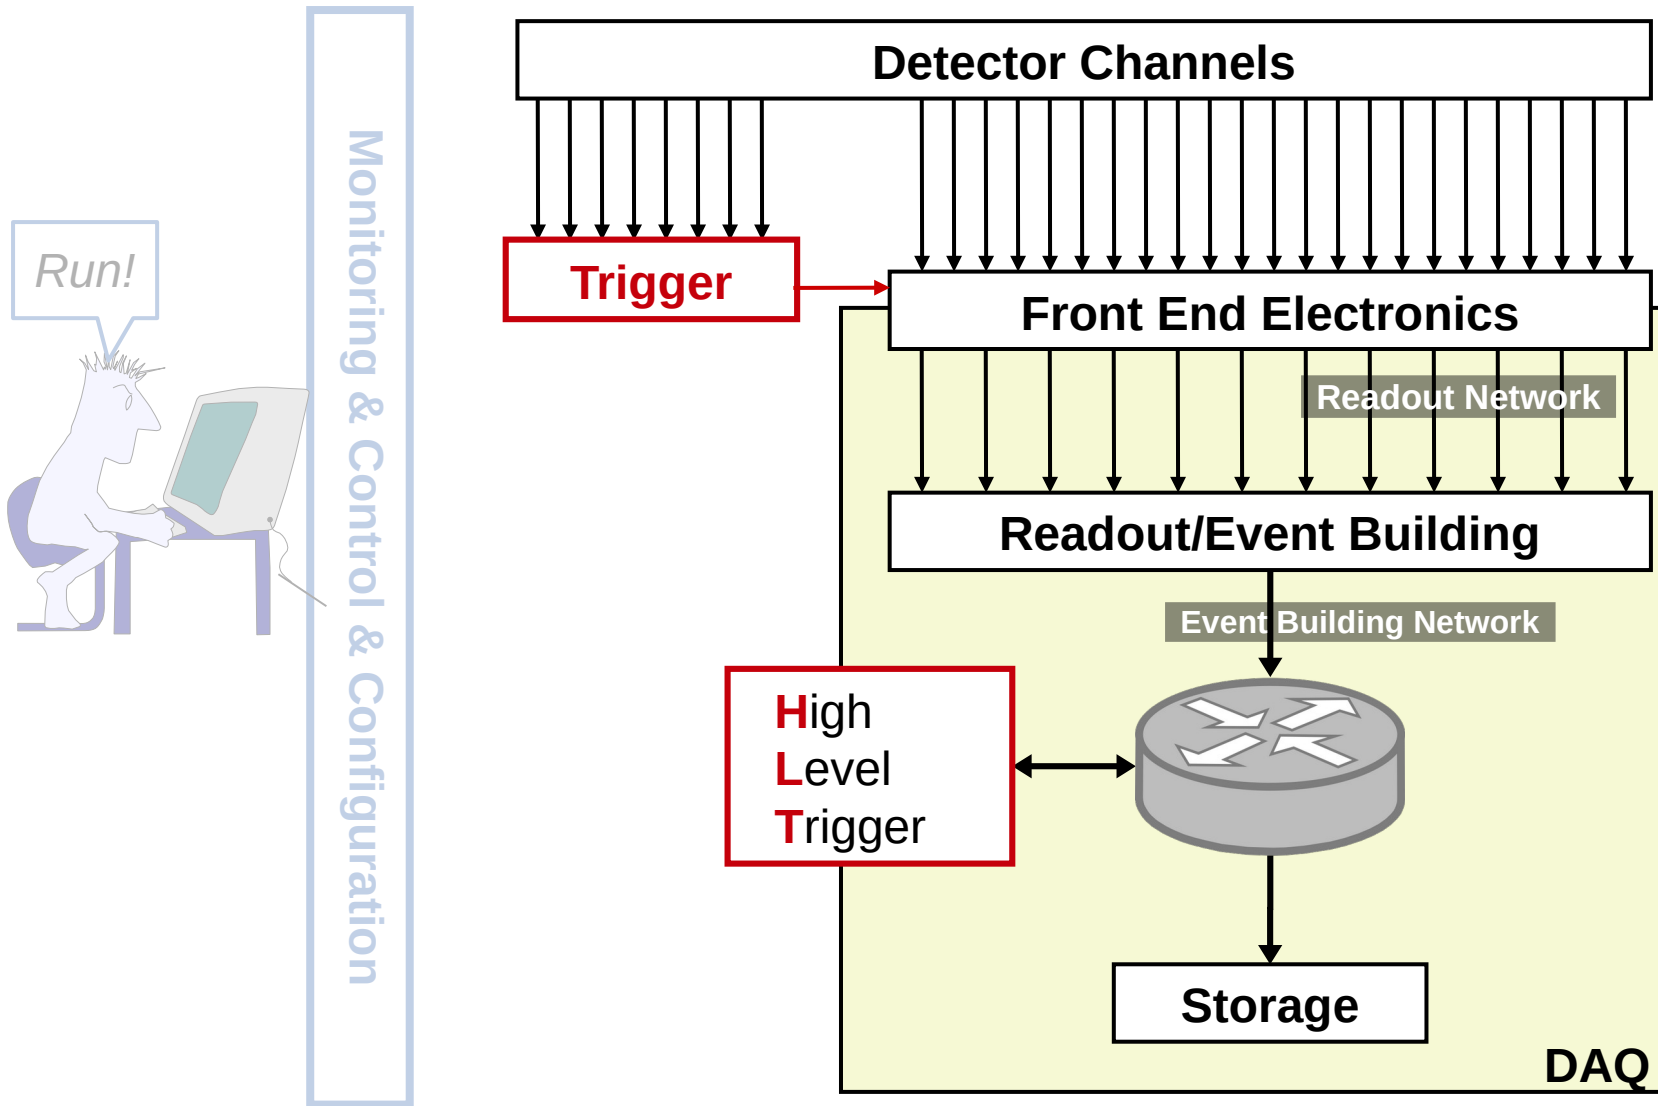

Storage

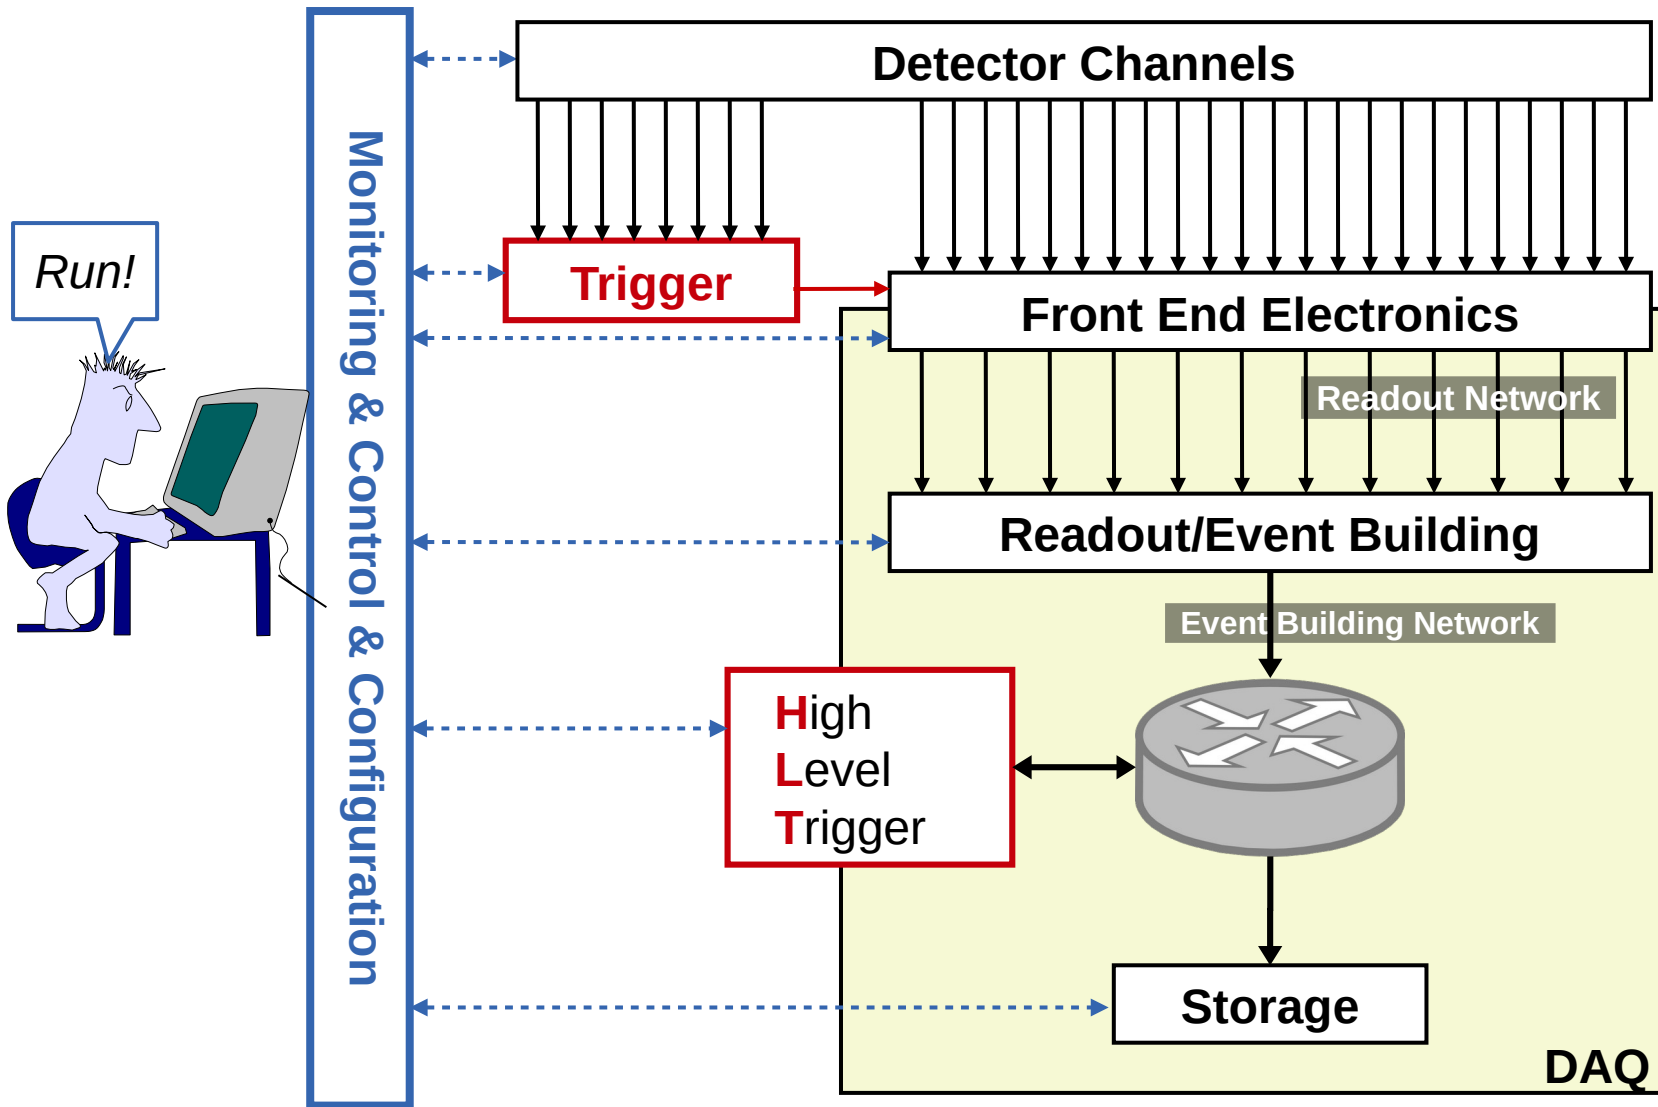

- Storage device technologies gaining importance in HEP
 - Storage data rate increasing with luminosity
 - Distributed file systems being used as data-flow frameworks
 - CMS, ATLAS run 4 (?), ...

T-DAQ

T-DAQ

The glue of your experiment

- Configuration
 - The data taking setup
- Control
 - Orchestrate applications participating to data taking
 - Via distributed **Finite State Machine**
- Monitoring of data taking operations
 - What is going on?
 - What happened?
When? Where?

The screenshot displays the ATLAS TDAQ Software interface, titled "ATLAS TDAQ SOFTWARE - Partition ATLAS". The interface includes a menu bar with "File", "Commands", "Access Control", "Settings", "Logging Level", and "Help". Below the menu bar are buttons for "Commit & Reload" and "Load Panels".

The main interface is divided into several sections:

- RUN CONTROL STATE:** A green box indicates the system is "RUNNING".
- Run Control Commands:** A grid of buttons for "SHUTDOWN", "BOOT", "TERMINATE", "INITIALIZE", "UNCONFIG", "CONFIG", "STOP", "START", "HOLD TRG", and "RESUME TRG".
- Beam Stable:** A green indicator and buttons for "Warm Start" and "Warm Stop".
- Run Information & Settings:** A table showing run details:

Run type	Physics
Run number	143792
Super Master Key	690
LHC Clock Type	
Recording	Enabled
Start time	21-Jan-2010 20:33:13
Stop time	
Total time	0 h, 45 m, 31 s
- Run Control Segments & Resources:** A tree view showing the status of various components:
 - RootController (RUNNING)
 - TDAQ:pc-tdq-on (RUNNING)
 - RPC (RUNNING)
 - TRT (RUNNING)
 - DBManager (UP)
 - TRT_LTPi (RUNNING)
 - TRTSyncContro (RUNNING)
 - TRT-MDA (RUNNING)
 - TRTBarrelA (RUNNING)
 - TRTBarrelC (RUNNING)
 - TRTEndcapA (RUNNING)
 - TRTEndcapC (RUNNING)
 - TRTMonitorin (RUNNING)
 - DQMController (RUNNING)
 - MDT (RUNNING)

At the bottom, there is a "Subscription criteria" section with checkboxes for "WARNING", "ERROR", "FATAL", "INFORMATION", and "Expression". Below this is a log table:

TIME	SEVERITY	APPLICATION	NAME	Message
21:16:58	INFORMATION	IGUI	INTERNAL	All done! IGUI is goi
21:16:58	INFORMATION	IGUI	INTERNAL	Waiting for the "Dat
21:16:58	INFORMATION	IGUI	INTERNAL	Waiting for the "Seg
21:16:58	ERROR	IGUI	INTERNAL	Failed to subscribe Igui.IguiException\$

Outline

- Introduction
 - What is DAQ?
 - Overall framework
- **Basic DAQ concepts**
 - Digitization, Latency
 - Deadtime, Busy, Backpressure
 - De-randomization
- Scaling up
 - Readout and Event Building
 - Buses vs Network
- Data encoding

Via a toy model

Basic DAQ: periodic trigger

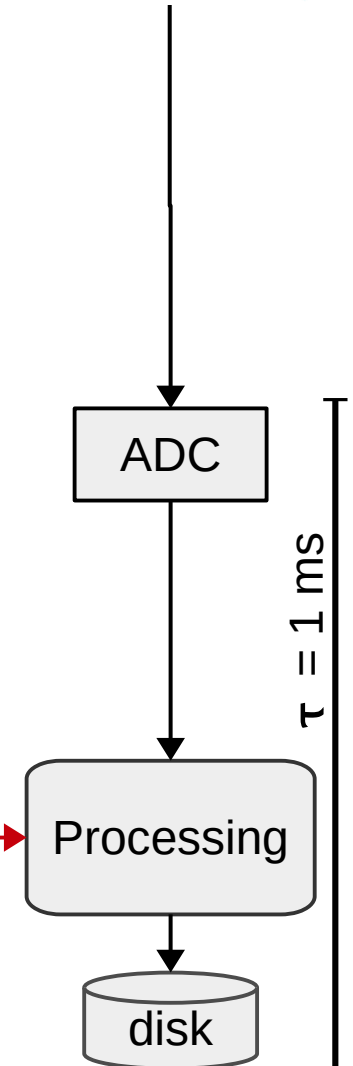

- Eg: measure temperature at a fixed frequency
 - Clock trigger
- ADC performs analog to digital conversion, **digitization** (our front-end electronics)
 - Encoding analog value into binary representation
- CPU does
 - Readout, Processing, Storage

Basic DAQ: periodic trigger

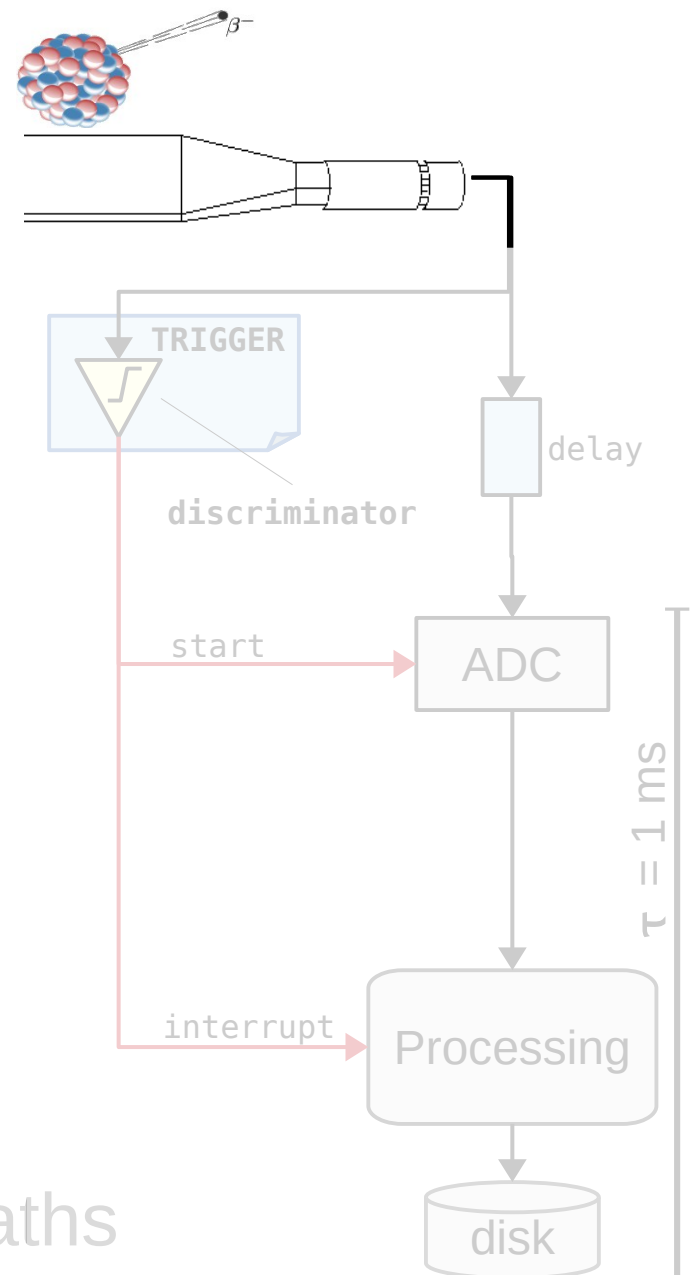

- System clearly limited by the time τ to process an “event”
 - ADC conversion + CPU processing + Storage
- The DAQ maximum sustainable rate is simply the inverse of τ , e.g.:
 - E.g.: $\tau = 1 \text{ ms} \rightarrow R = 1/\tau = 1 \text{ kHz}$

Physical View

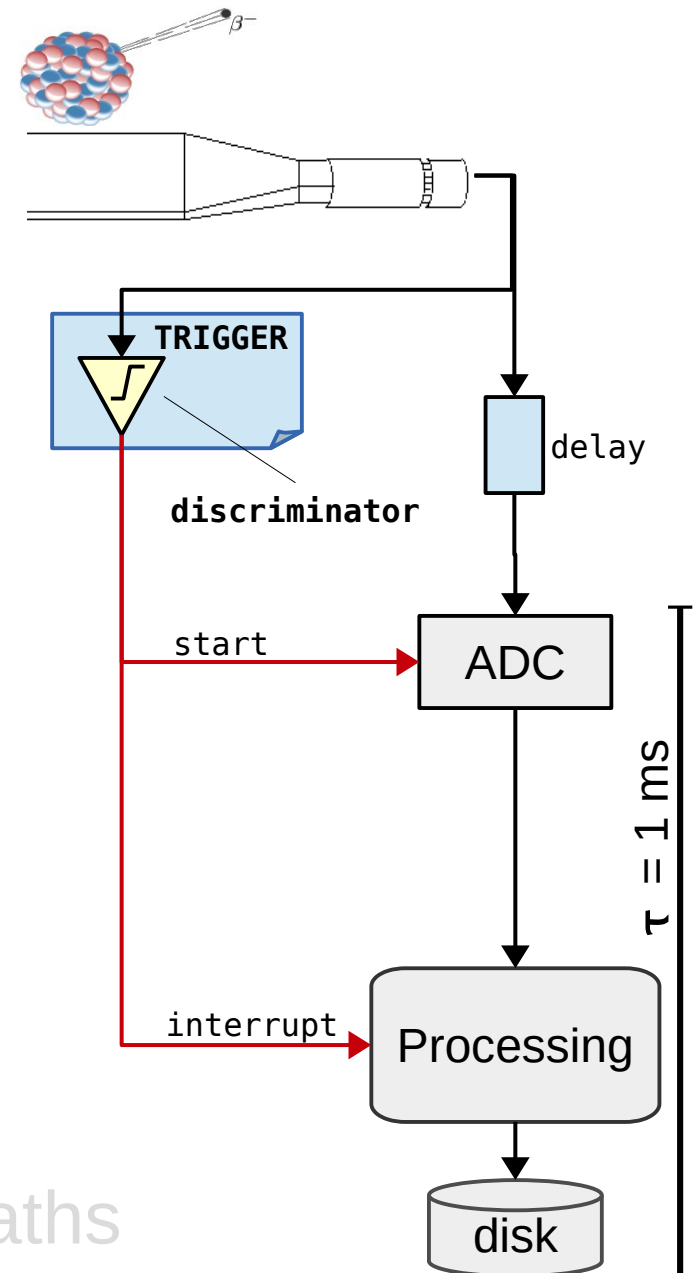

Basic DAQ: “real” trigger

- Events asynchronous and unpredictable
 - E.g.: beta decay studies
- A physics trigger is needed
 - **Discriminator**: generates an output digital signal if amplitude of the input pulse is greater than a given threshold
- NB: delay introduced to compensate for the **trigger latency**
 - Signal split in trigger and data paths

Basic DAQ: “real” trigger

- Events asynchronous and unpredictable
 - E.g.: beta decay studies
- A physics trigger is needed
 - **Discriminator**: generates an output digital signal if amplitude of the input pulse is greater than a given threshold
- NB: delay introduced to compensate for the **trigger latency**
 - Signal split in trigger and data paths

Discriminator

- Generates a digital output signal
 - if the amplitude of the input pulse is greater than a given **threshold**

- *LAB: NIM electronics and Constant Fraction Discriminator*
 - Vincenzo Izzo, Valentina Scotti
- *LAB: acquisizione con scintillatori*
 - Roberto Ferrari, Francesca Pastore

Coincidences

- With a “digital” signal, it is possible to make coincidences
 - generates a digital output signal

Discriminator output channel 1

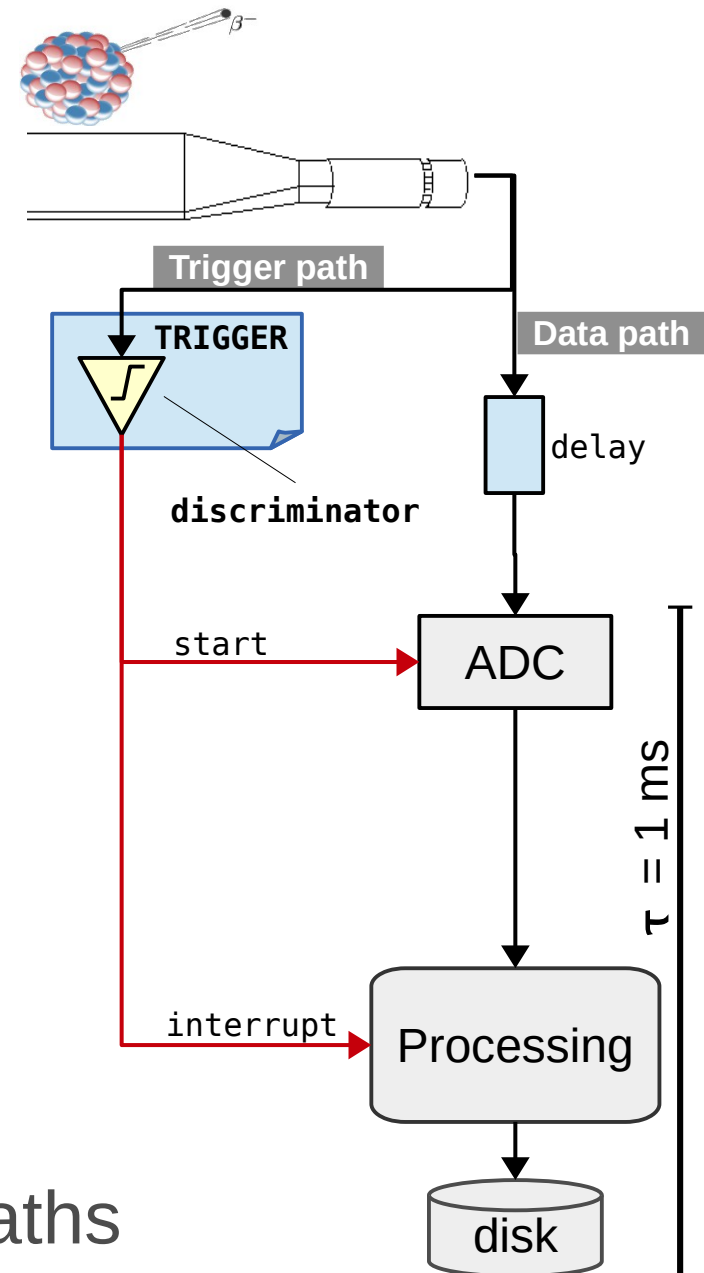

Discriminator output channel 2

Coincidence output

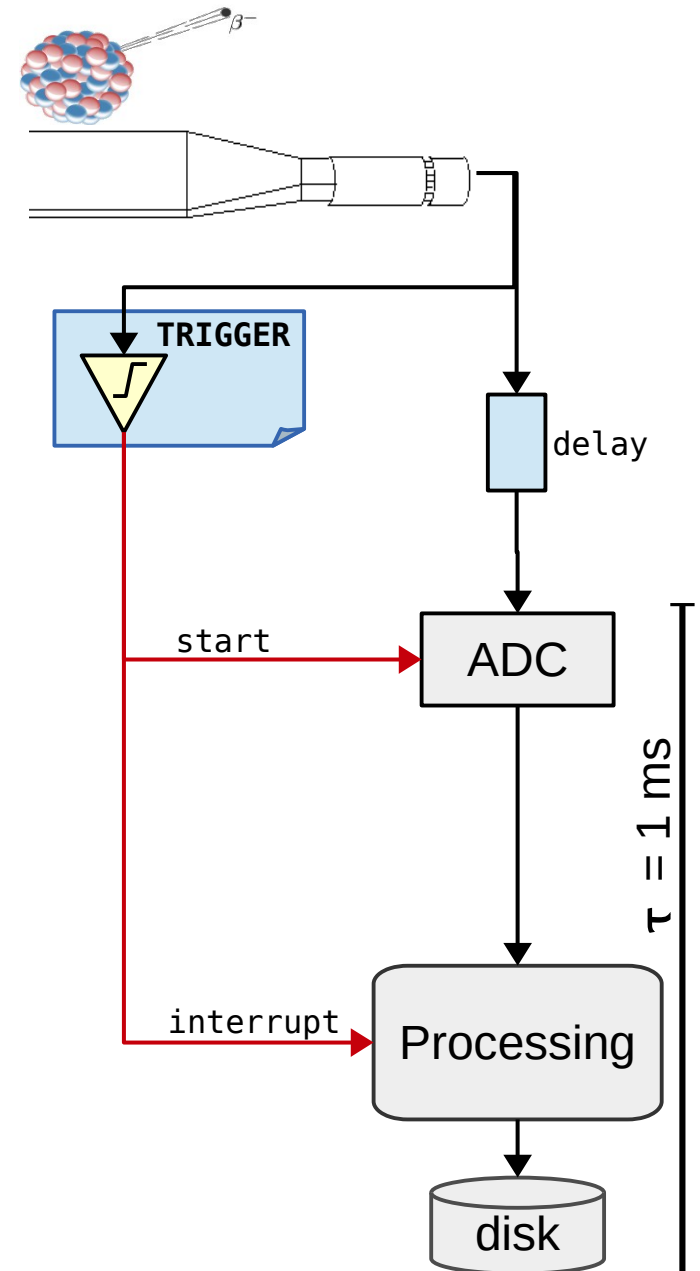

Basic DAQ: “real” trigger

- Events asynchronous and unpredictable
 - E.g.: beta decay studies
- A physics trigger is needed
 - **Discriminator**: generates an output digital signal if amplitude of the input pulse is greater than a given threshold
- NB: delay introduced to compensate for the **trigger latency**
 - Signal split in trigger and data paths

Basic DAQ: “real” trigger

- Stochastic process
 - Fluctuations in time between events
- Let's assume for example
 - physics rate $f = 1$ kHz, i.e. $\lambda = 1$ ms
 - and, as before, $\tau = 1$ ms

Basic DAQ: “real” trigger

- Stochastic process
 - Fluctuations in time between events
- Let's assume for example
 - physics rate $f = 1$ kHz, i.e. $\lambda = 1$ ms
 - and, as before, $\tau = 1$ ms

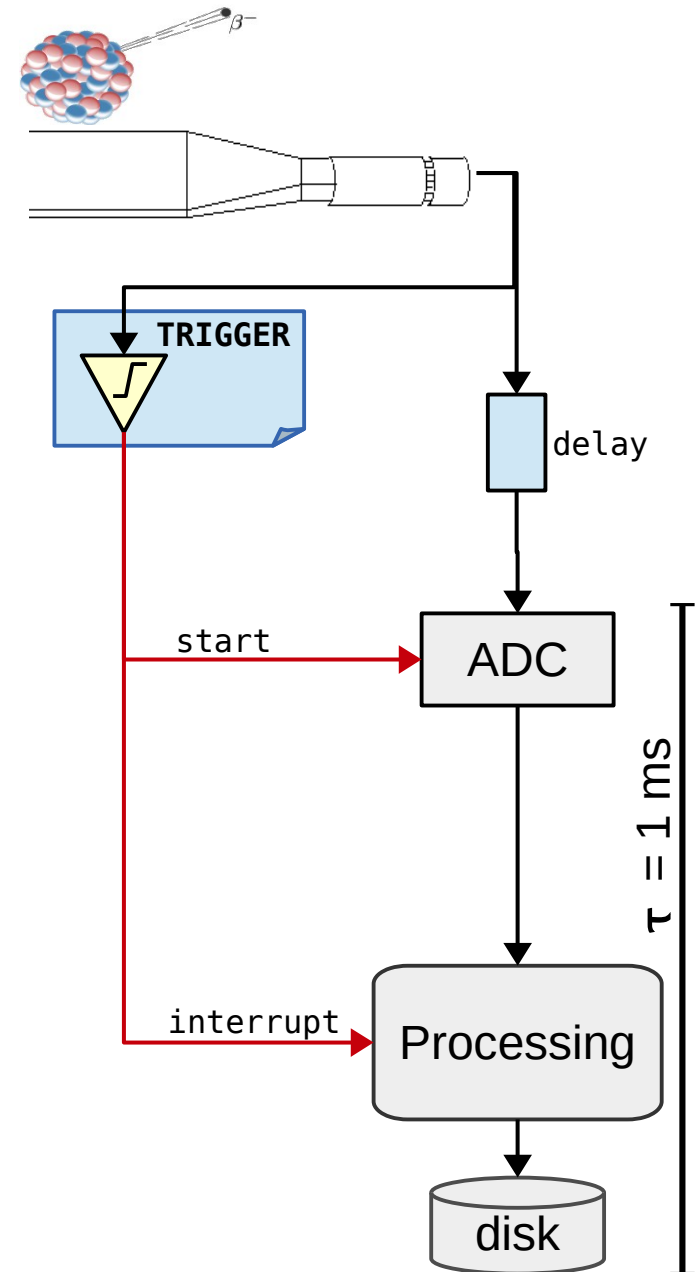

Basic DAQ: “real” trigger

- Stochastic process
 - Fluctuations in time between events
- Let's assume for example
 - physics rate $f = 1$ kHz, i.e. $\lambda = 1$ ms
 - and, as before, $\tau = 1$ ms

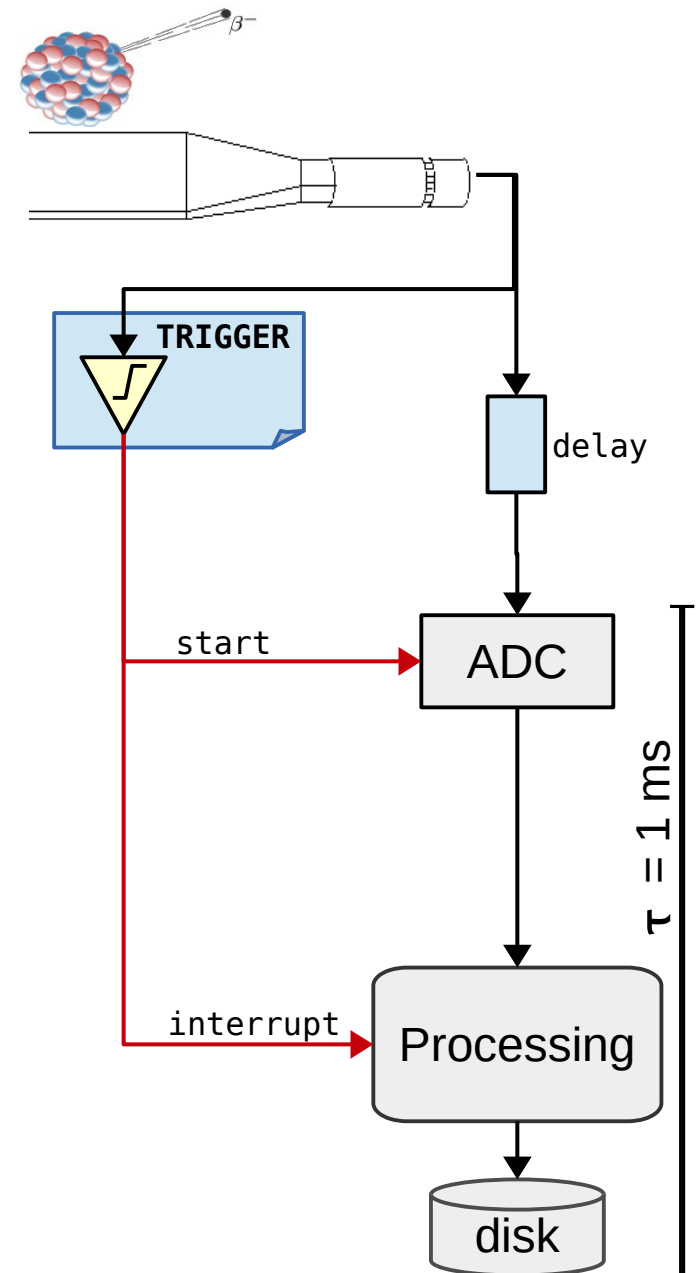

Basic DAQ: “real” trigger

- Stochastic process
 - Fluctuations in time between events
- Let's assume for example
 - physics rate $f = 1$ kHz, i.e. $\lambda = 1$ ms
 - and, as before, $\tau = 1$ ms

System still processing ...

- If a new trigger arrives when the system is still processing the previous event
 - The processing of the previous event could be screwed up

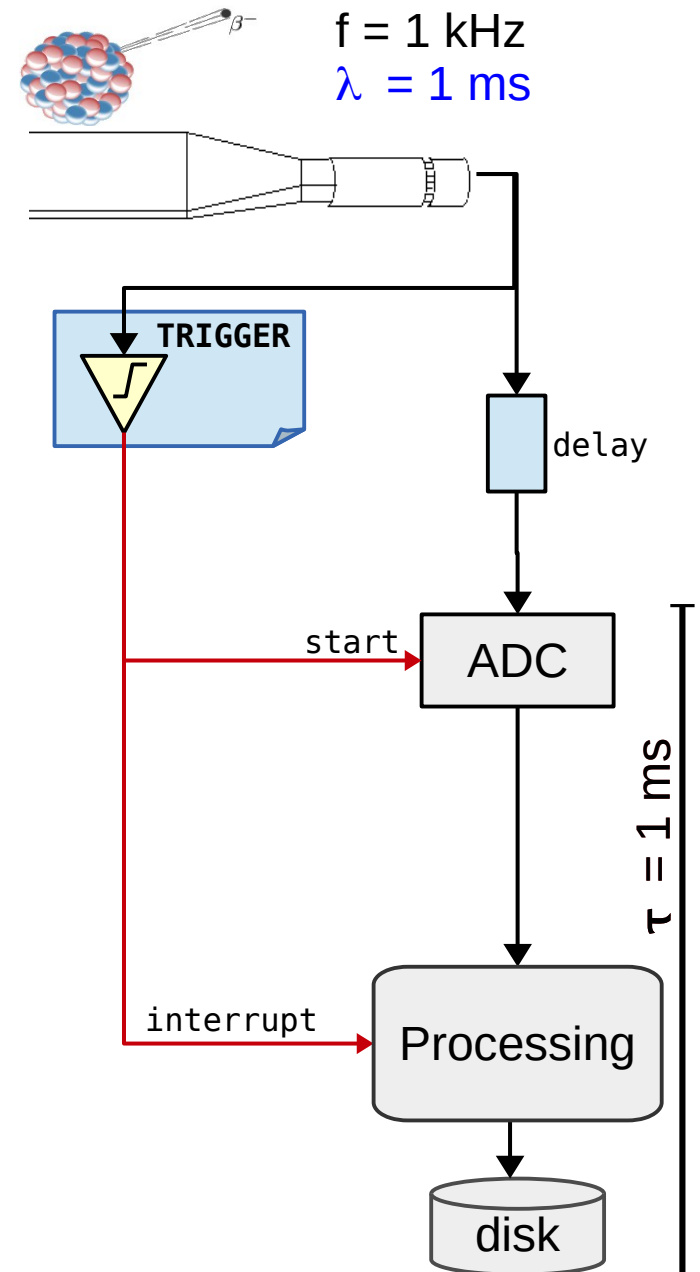

Pause to regroup

- For stochastic processes, our trigger and daq system needs to be able to:
 - determine if there is an “event” (**trigger**)
 - process and store the data from the event (**daq**)
 - w/o getting paralysed by new events
- Need a feedback mechanism, to know if the data processing pipeline is free to process a new event:
 - **busy logic**

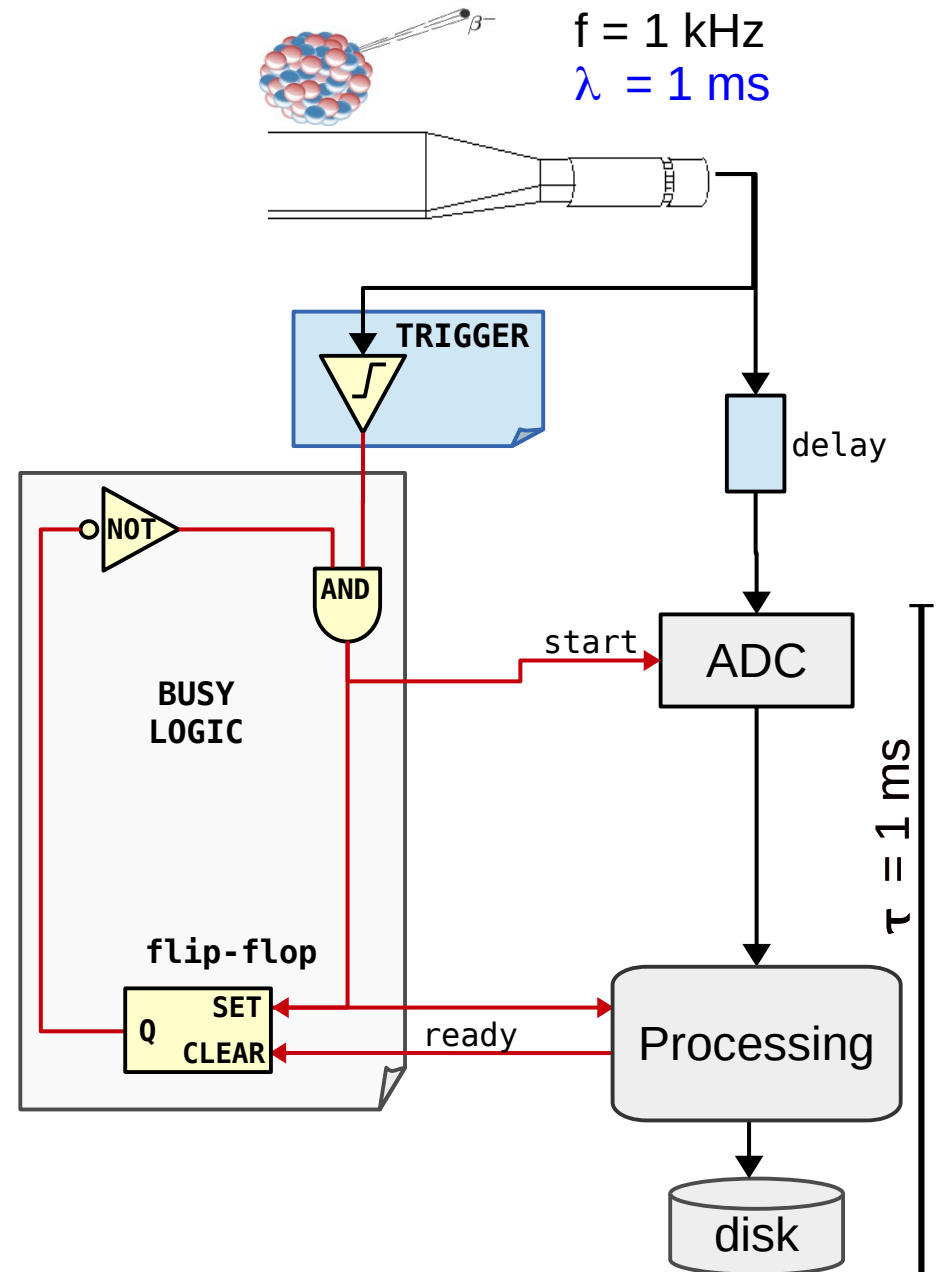

Busy logic

- The **busy logic** avoids triggers while the system is busy in processing
- A minimal **busy logic** can be implemented with
 - an **AND** gate
 - a **NOT** gate
 - a flip-flop (**flip-flop**)
- More in lab 2

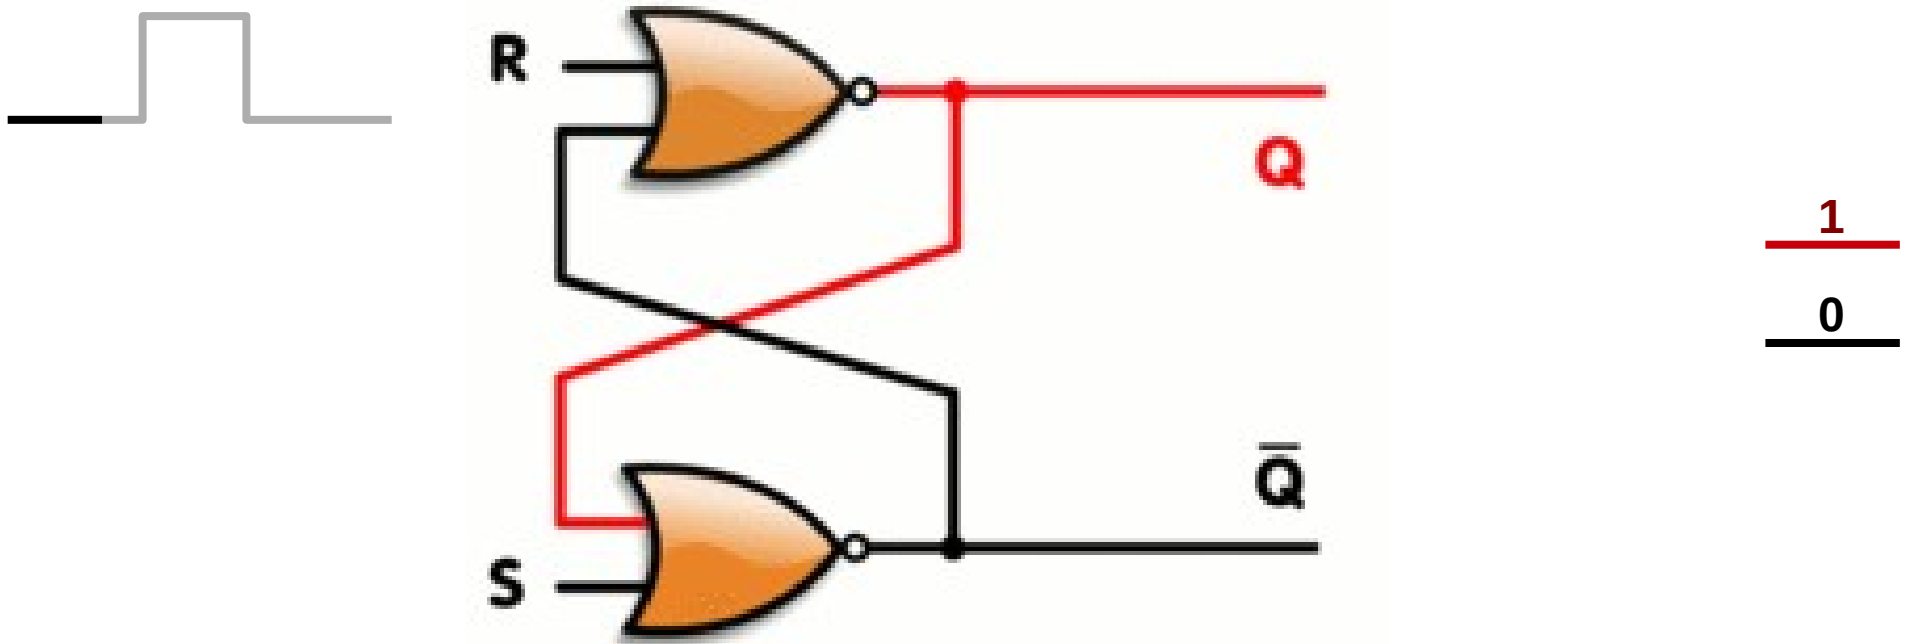

Busy logic

- The **busy logic** avoids triggers while the system is busy in processing
- A minimal **busy logic** can be implemented with
 - an **AND** gate
 - a **NOT** gate
 - a flip-flop (**flip-flop**)
- More in lab 2

Flip Flop 1/5

- Flip-flop
 - a **bistable** circuit that changes state (Q) by signals applied to the control inputs (SET, CLEAR)
- Before: stable state, Q up and \bar{Q} down

Flip Flop 2/5

- Flip-flop
 - a **bistable** circuit that changes state (Q) by signals applied to the control inputs (SET, CLEAR)
- At some point, signal injected in R

1
0

Flip Flop 3/5

- Flip-flop
 - a **bistable** circuit that changes state (Q) by signals applied to the control inputs (SET, CLEAR)
- At some point, signal injected in R
 - Q switched down and the feedback travels to S

1
0

Flip Flop 4/5

- Flip-flop
 - a **bistable** circuit that changes state (Q) by signals applied to the control inputs (SET, CLEAR)
- At some point, signal injected in R
 - \bar{Q} becomes up and the feedback travels to R

1
0

Flip Flop 5/5

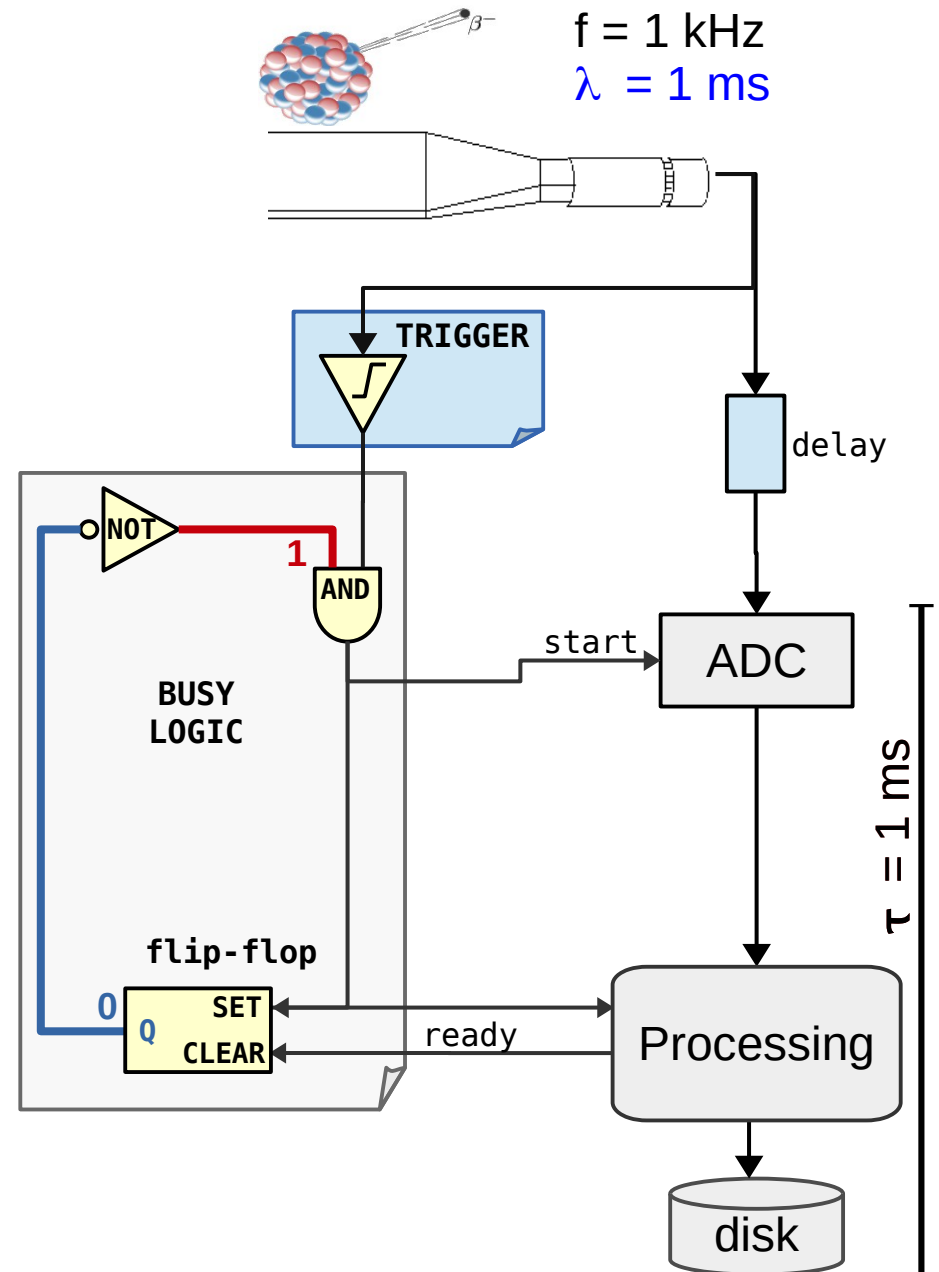

- Flip-flop
 - a **bistable** circuit that changes state (Q) by signals applied to the control inputs (SET, CLEAR)
- After: stable state, Q down and \bar{Q} up:
 - End of pulse

1
0

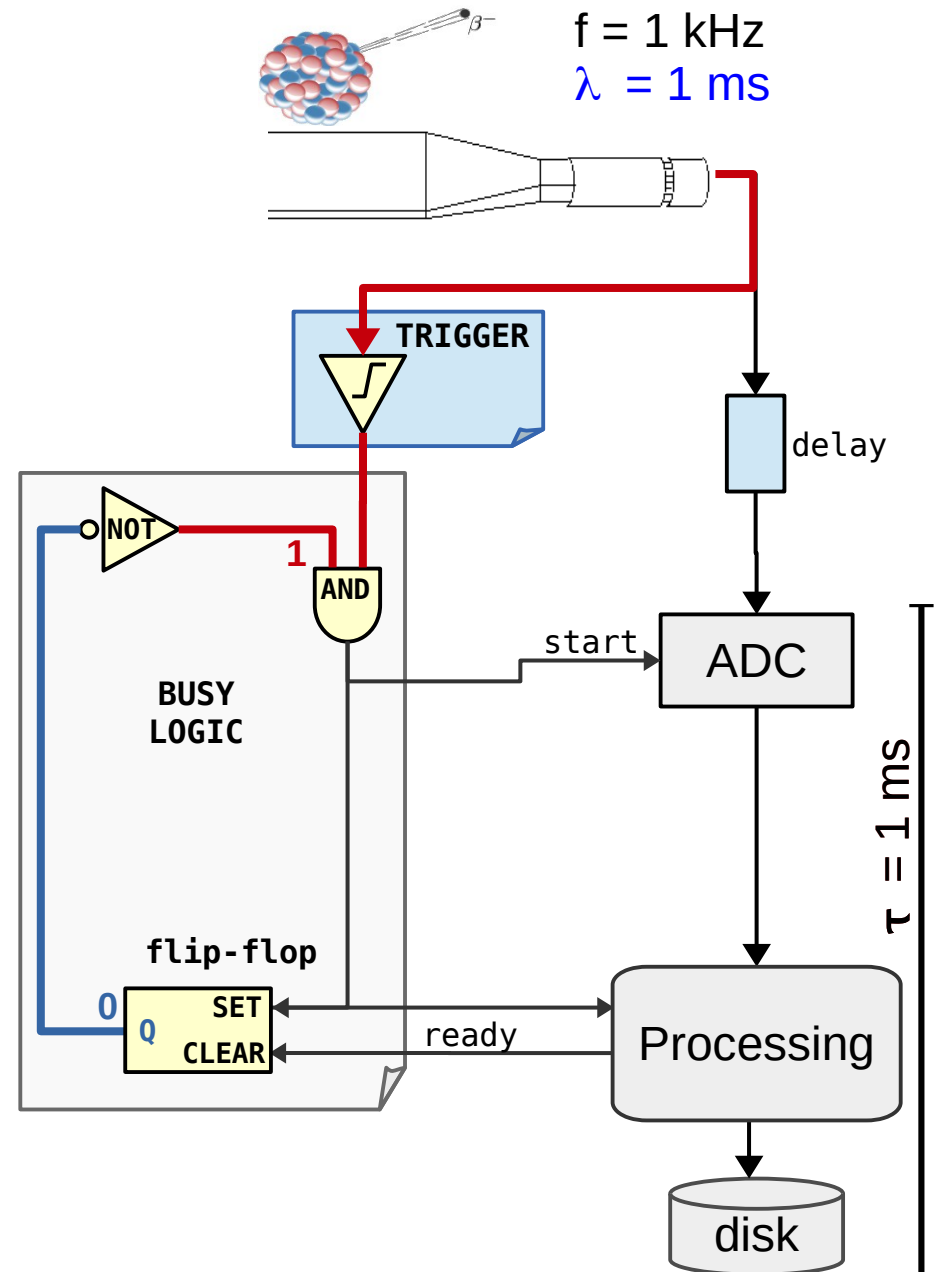

Busy logic

- Start of run
 - the flip-flop output is down (ground state)
 - via the NOT, one of the port of the AND gate is set to up (opened)
- i.e. system ready for new triggers

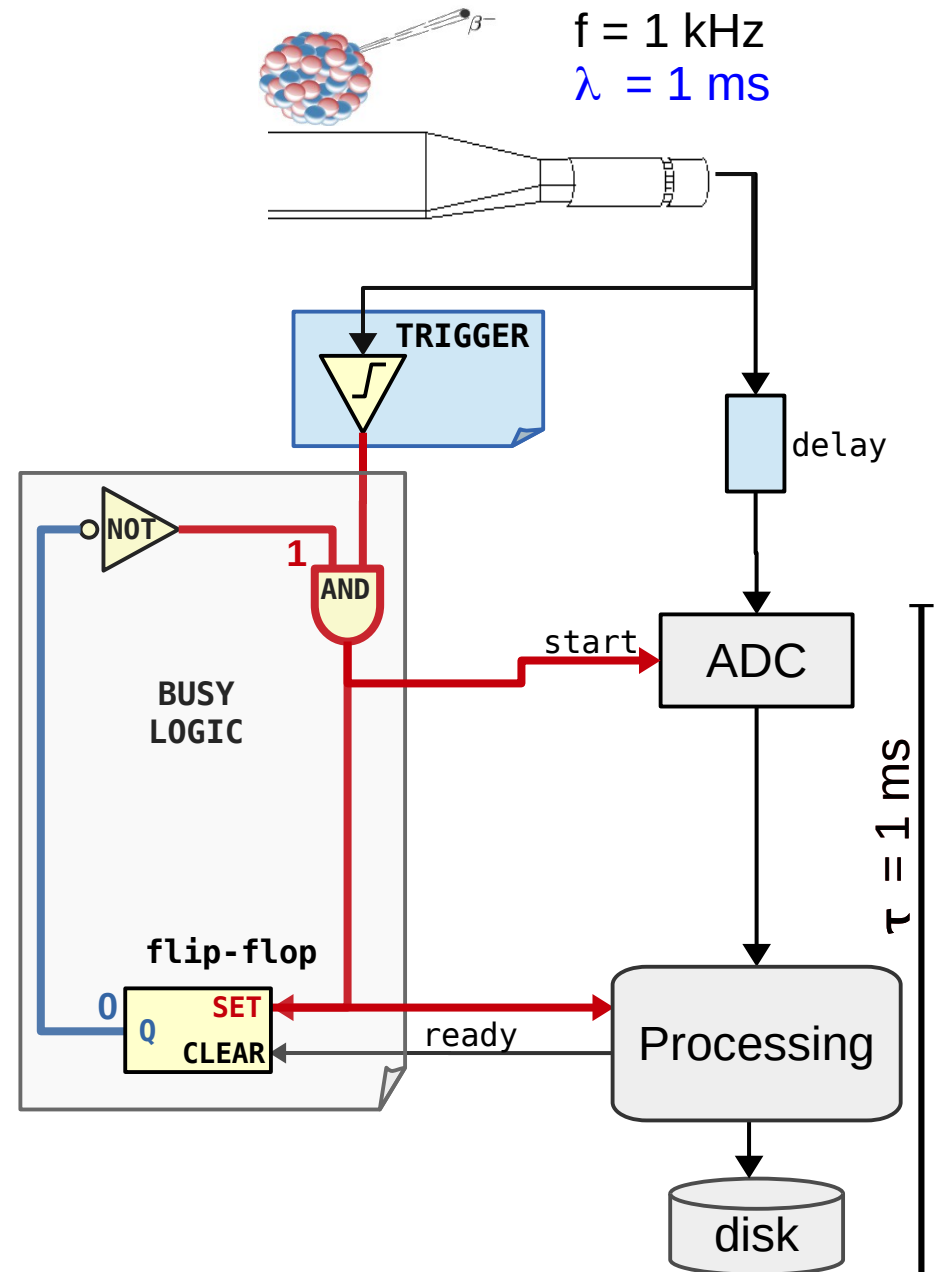

Busy logic

- If a trigger arrives, the signal finds the AND gate open, so:
 - The ADC is started
 - The processing is started
 - The flip-flop is flipped
 - One of the AND inputs is now steadily down (closed)
- Any new trigger is inhibited by the AND gate (busy)

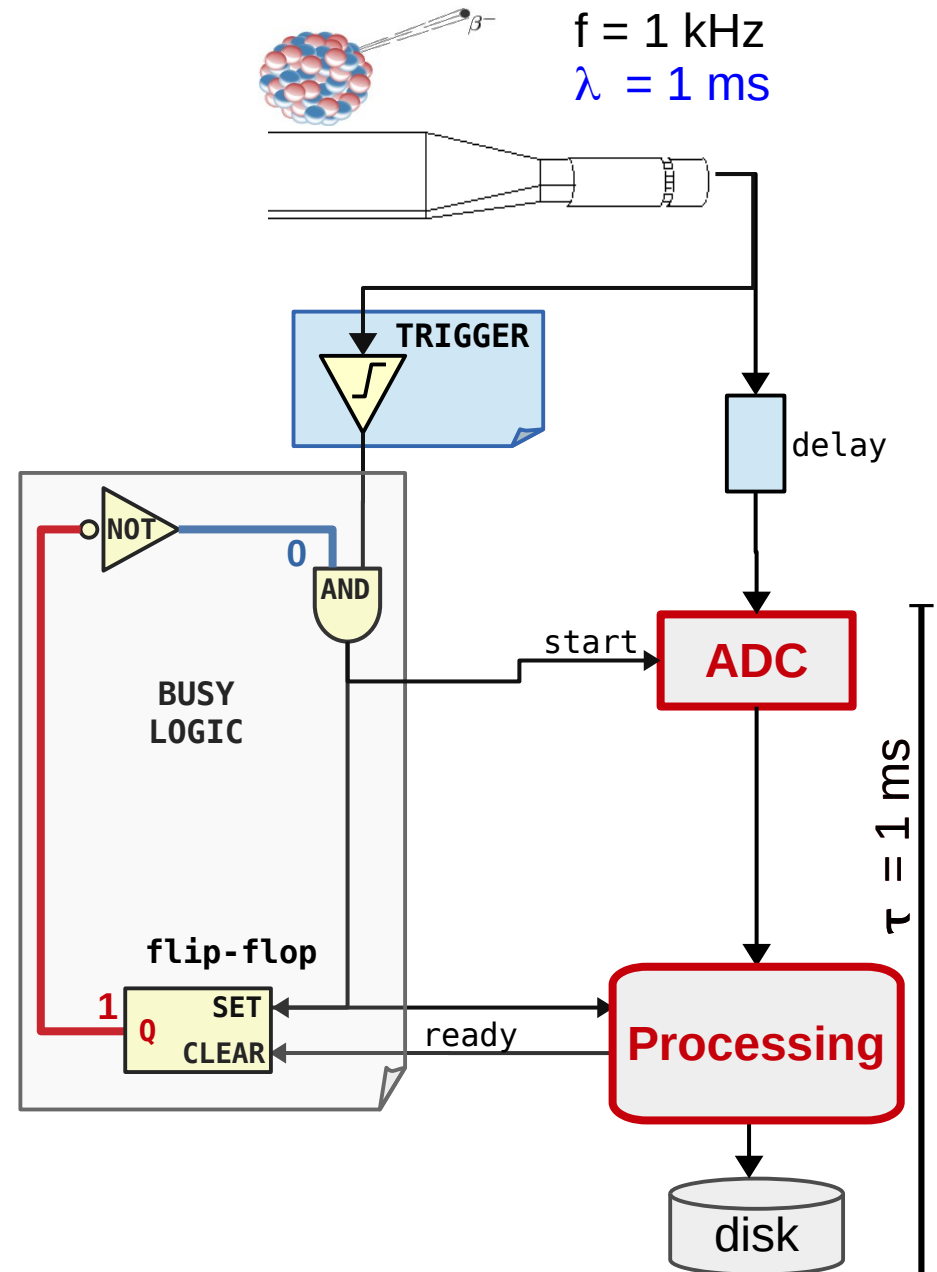

Busy logic

- If a trigger arrives, the signal finds the AND gate open, so:
 - The ADC is started
 - The processing is started
 - The flip-flop is flipped
 - One of the AND inputs is now steadily down (closed)
- Any new trigger is inhibited by the AND gate (busy)

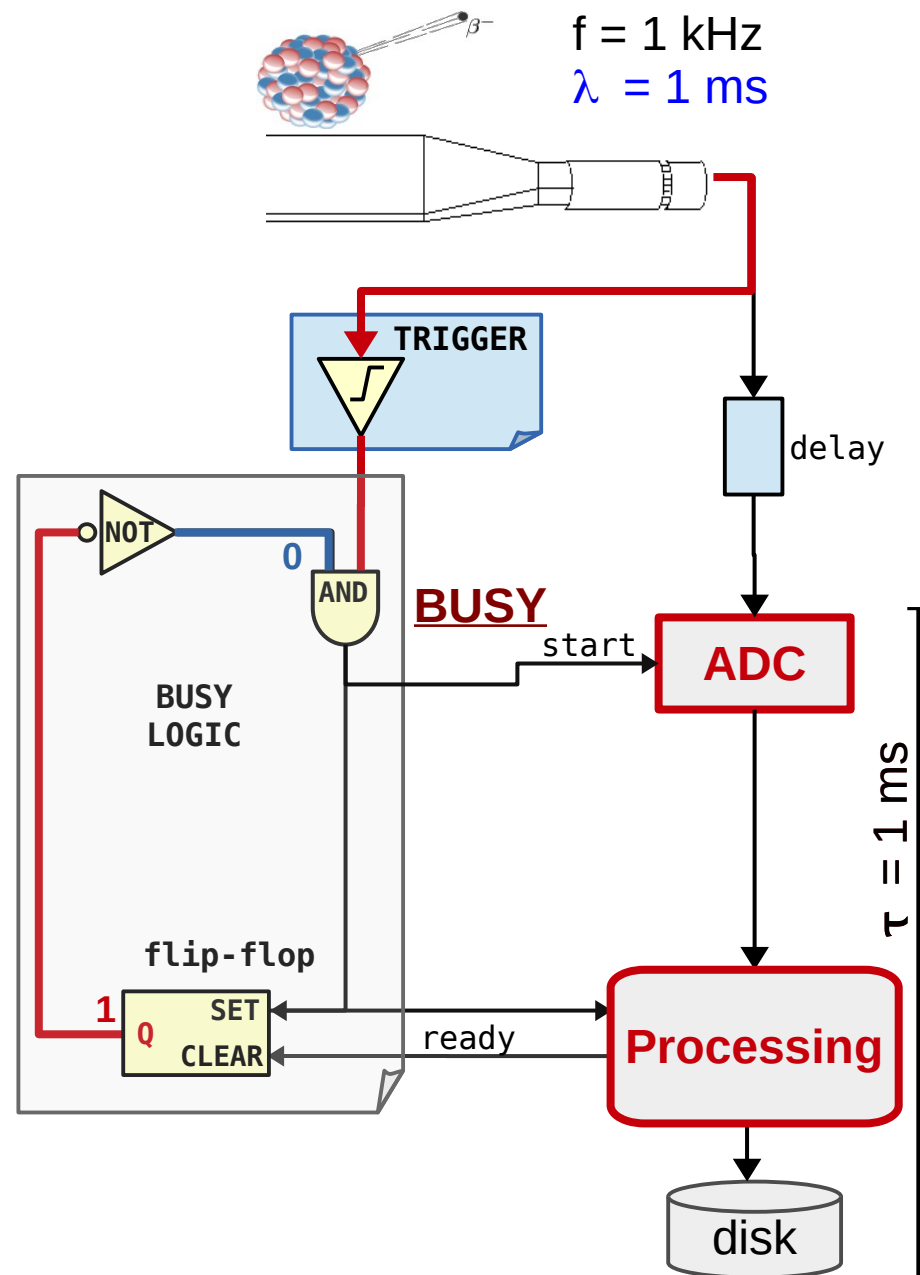

Busy logic

- If a trigger arrives, the signal finds the AND gate open, so:
 - The ADC is started
 - The processing is started
 - The flip-flop is flipped
 - One of the AND inputs is now steadily down (closed)
- Any new trigger is inhibited by the AND gate (busy)

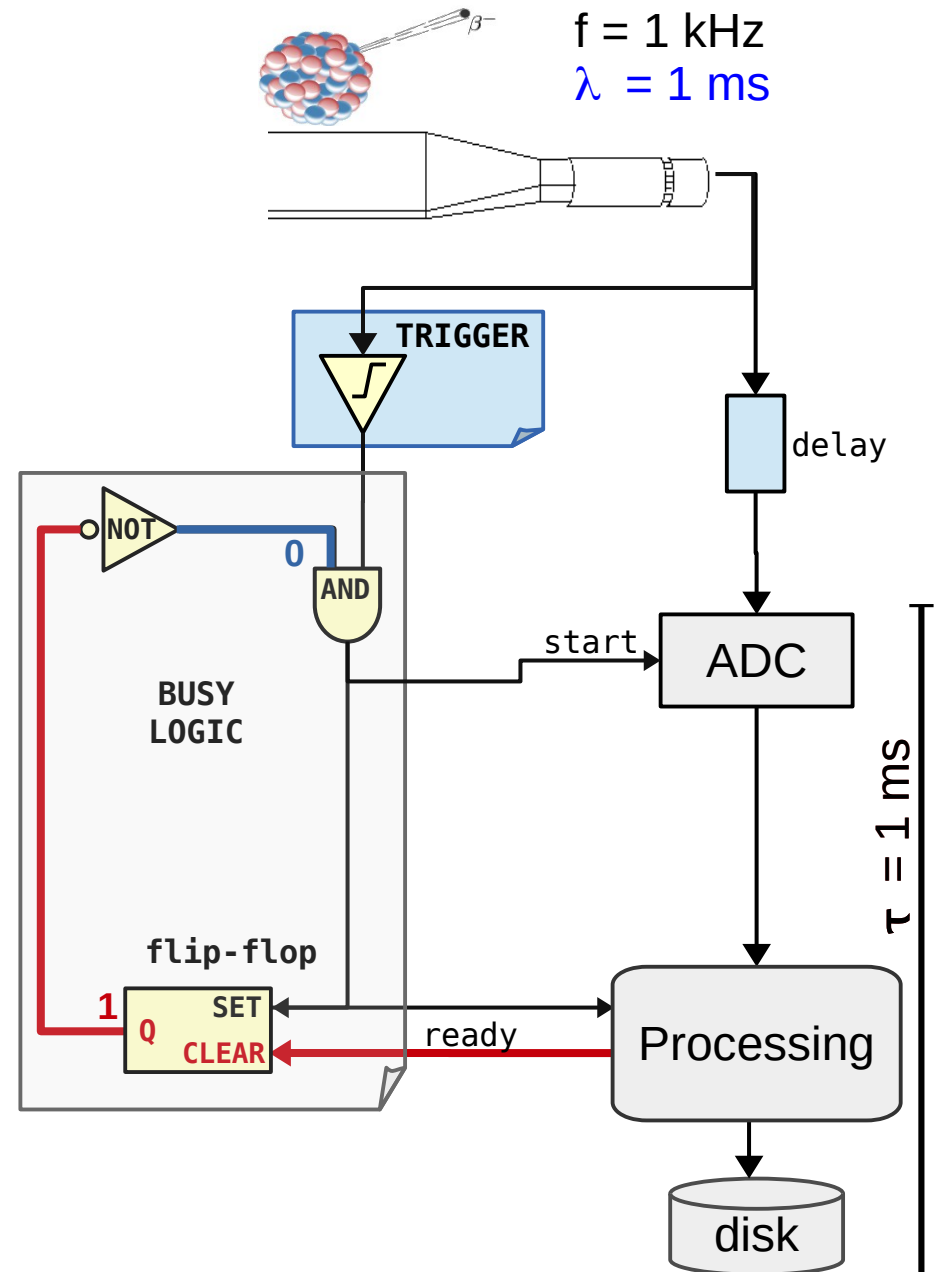

Busy logic

- If a trigger arrives, the signal finds the AND gate open, so:
 - The ADC is started
 - The processing is started
 - The flip-flop is flipped
 - One of the AND inputs is now steadily down (closed)
- Any new trigger is inhibited by the AND gate (busy)

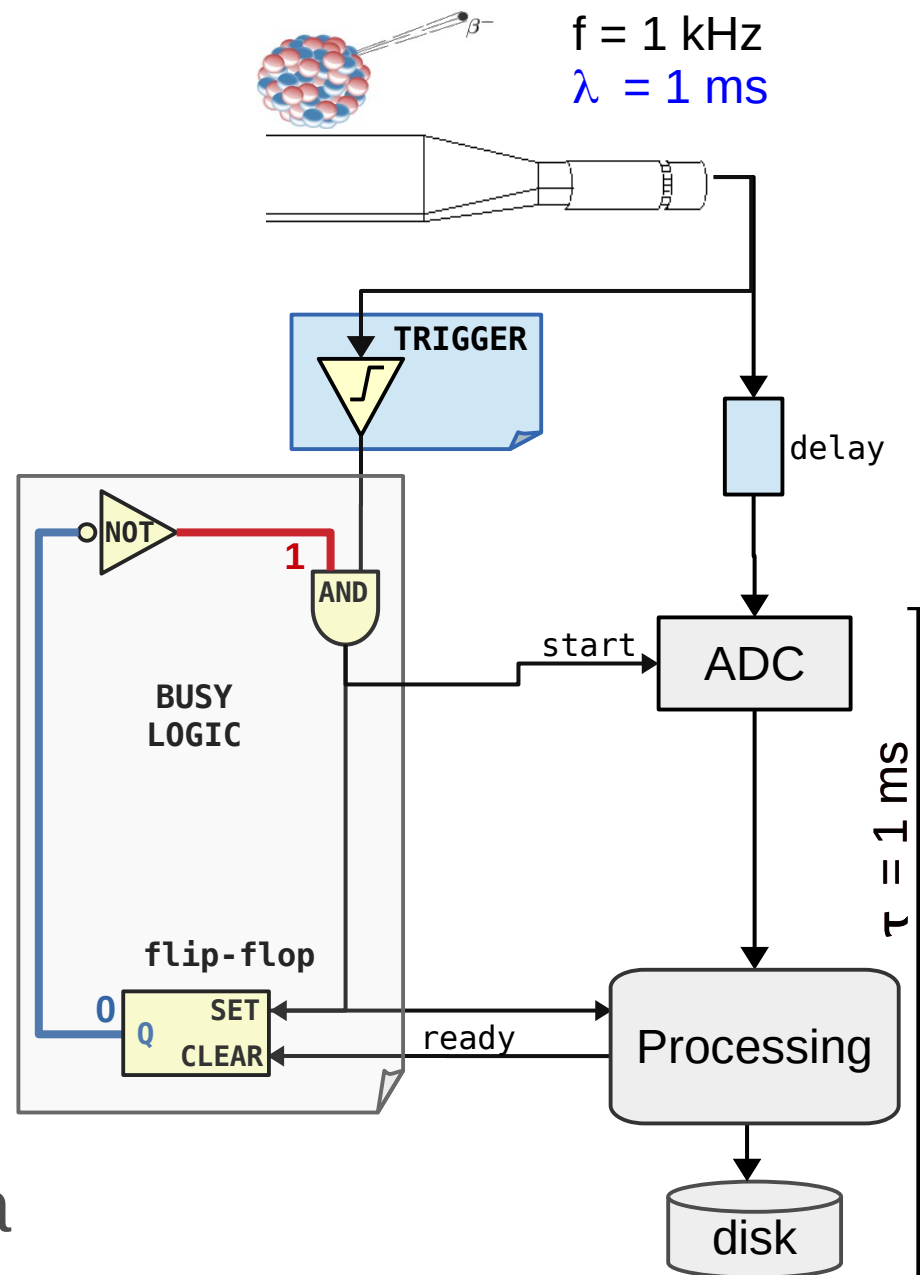

Busy logic

- At the end of processing a ready signal is sent to the flip-flop
 - The flip-flop flips again
 - The gate is now opened
 - The system is ready to accept a new trigger

Busy logic

- At the end of processing a ready signal is sent to the flip-flop
 - The flip-flop flips again
 - The gate is now opened
 - The system is ready to accept a new trigger
- i.e. busy logic avoids triggers while daq is busy in processing
 - New triggers do not interfere w/ previous data

Deadtime and efficiency

- So the **busy** mechanism protects our electronics from unwanted triggers
 - New signals are accepted only when the system is ready to process them

- Which (average) DAQ rate can we achieve now?
 - How much we lose with the busy logic?
 - Reminder: with a clock trigger and $\tau = 1 \text{ ms}$ the limit was 1 kHz

Deadtime and efficiency

- Definitions

- **f**: average rate of physics (input)
- **v**: average rate of DAQ (output)
- **τ : deadtime**, needed to process an event, without being able to handle other triggers

- probabilities: $P[\text{busy}] = v \tau$; $P[\text{free}] = 1 - v \tau$

- Therefore:

$$v = f P[\text{free}] \Rightarrow v = f (1 - v \tau) \Rightarrow v = \frac{f}{1 + f \tau}$$

Deadtime and efficiency

- Definitions

- **f**: average rate of physics (input)
- **v**: average rate of DAQ (output)
- **τ : deadtime**, needed to process an event, without being able to handle other triggers

- probabilities: $P[\text{busy}] = v \tau$; $P[\text{free}] = 1 - v \tau$

- Therefore:

$$v = f P[\text{free}] \Rightarrow v = f (1 - v \tau) \Rightarrow v = \frac{f}{1 + f \tau}$$

Deadtime and efficiency

- Definitions

- **f**: average rate of physics (input)
- **v**: average rate of DAQ (output)
- **τ : deadtime**, needed to process an event, without being able to handle other triggers
- probabilities: $P[\text{busy}] = v \tau$; $P[\text{free}] = 1 - v \tau$

- Therefore:

$$v = f P[\text{free}] \Rightarrow v = f (1 - v \tau) \Rightarrow v = \frac{f}{1 + f \tau}$$

Deadtime and efficiency

- Definitions

- **f**: average rate of physics (input)
- **v**: average rate of DAQ (output)
- **τ : deadtime**, needed to process an event, without being able to handle other triggers
- probabilities: $P[\text{busy}] = v \tau$; $P[\text{free}] = 1 - v \tau$

- Therefore:

$$v = f P[\text{free}] \Rightarrow v = f (1 - v \tau) \Rightarrow v = \frac{f}{1 + f \tau}$$

Deadtime and efficiency

- Due to stochastic fluctuations

- DAQ rate always $<$ physics rate $\nu = \frac{f}{1+f\tau} < f$

- Efficiency always $<$ 100% $\epsilon = \frac{N_{\text{saved}}}{N_{\text{tot}}} = \frac{1}{1+f\tau} < 100\%$

- So, in our specific example

- Physics rate 1 kHz

- Deadtime 1 ms

$$\left| \begin{array}{l} f = 1 \text{ kHz} \\ \tau = 1 \text{ ms} \end{array} \right. \rightarrow \left| \begin{array}{l} \nu = 500 \text{ Hz} \\ \epsilon = 50\% \end{array} \right.$$

Deadtime and efficiency

- Due to stochastic fluctuations

- DAQ rate always $<$ physics rate $\nu = \frac{f}{1+f\tau} < f$

- Efficiency always $<$ 100% $\epsilon = \frac{N_{\text{saved}}}{N_{\text{tot}}} = \frac{1}{1+f\tau} < 100\%$

- So, in our specific example

- Physics rate 1 kHz

- Deadtime 1 ms

$$\left| \begin{array}{l} f = 1 \text{ kHz} \\ \tau = 1 \text{ ms} \end{array} \right. \rightarrow \left| \begin{array}{l} \nu = 500 \text{ Hz} \\ \epsilon = 50\% \end{array} \right.$$

Deadtime and efficiency

- In order to obtain $\epsilon \sim 100\%$ (i.e.: $v \sim f$) $\rightarrow f\tau \ll 1 \rightarrow \tau \ll \lambda$
 - E.g.: $\epsilon \sim 99\%$ for $f = 1$ kHz $\rightarrow \tau < 0.01$ ms $\rightarrow 1/\tau > 100$ kHz
 - To cope with the input signal fluctuations, we have to **over-design** our DAQ system by a factor 100!
- How can we mitigate this effect?

Deadtime and efficiency

- In order to obtain $\epsilon \sim 100\%$ (i.e.: $v \sim f$) $\rightarrow f\tau \ll 1 \rightarrow \tau \ll \lambda$
 - E.g.: $\epsilon \sim 99\%$ for $f = 1 \text{ kHz}$ $\rightarrow \tau < 0.01 \text{ ms} \rightarrow 1/\tau > 100 \text{ kHz}$
 - To cope with the input signal fluctuations, we have to **over-design** our DAQ system by a factor 100!
- How can we mitigate this effect?

Deadtime and efficiency

- In order to obtain $\varepsilon \sim 100\%$ (i.e.: $v \sim f$) $\rightarrow f\tau \ll 1 \rightarrow \tau \ll \lambda$
 - E.g.: $\varepsilon \sim 99\%$ for $f = 1 \text{ kHz}$ $\rightarrow \tau < 0.01 \text{ ms} \rightarrow 1/\tau > 100 \text{ kHz}$
 - To cope with the input signal fluctuations, we have to **over-design** our DAQ system **by a factor 100!**
- How can we mitigate this effect?

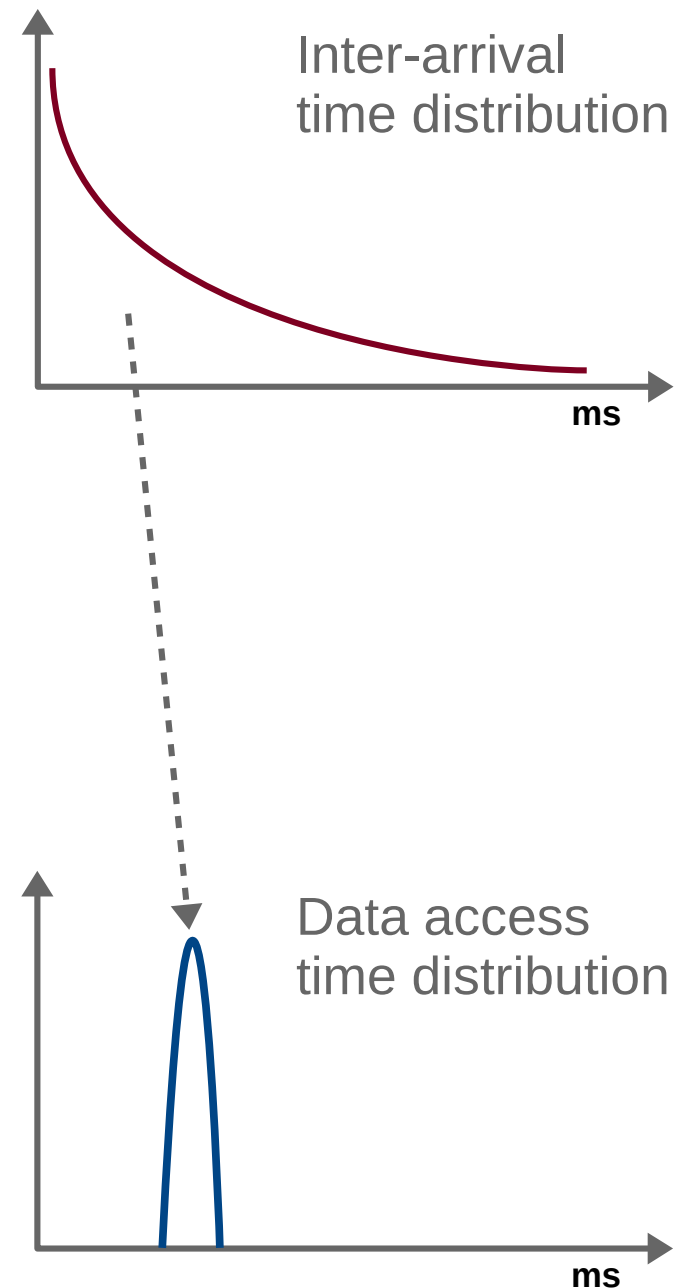

De-randomization

- What if we were able to make the system more **deterministic** and less dependent on the arrival time of our signals?
 - Then we could ensure that events don't arrive when the system is busy
 - This is called **de-randomization**
- How it can be achieved?

De-randomization

- What if we were able to make the system more **deterministic** and less dependent on the arrival time of our signals?
 - Then we could ensure that events don't arrive when the system is busy
 - This is called **de-randomization**
- How it can be achieved?

De-randomization

- What if we were able to make the system more **deterministic** and less dependent on the arrival time of our signals?
 - Then we could ensure that events don't arrive when the system is busy
 - This is called **de-randomization**
- How it can be achieved?
 - by **buffering** the data (having a holding queue where we can slot it up to be processed)

De-randomization

- What if we were able to make the system more **deterministic** and less dependent on the arrival time of our signals?
 - Then we could ensure that events don't arrive when the system is busy
 - This is called **de-randomization**
- How it can be achieved?
 - by **buffering** the data (having a holding queue where we can slot it up to be processed)

Queuing theory

- Efficiency vs traffic intensity ($\rho = \tau / \lambda$) for different queue depths
 - $\rho > 1$: the system is overloaded ($\tau > \lambda$)
 - $\rho \ll 1$: the output is over-designed ($\tau \ll \lambda$)
 - $\rho \sim 1$: using a queue, high efficiency obtained even w/ moderate depth
- Analytic calculation possible for very simple systems only
 - Otherwise MonteCarlo simulation is required

Queuing theory

- Efficiency vs traffic intensity ($\rho = \tau / \lambda$) for different queue depths
 - $\rho > 1$: the system is overloaded ($\tau > \lambda$)
 - $\rho \ll 1$: the output is over-designed ($\tau \ll \lambda$)
 - $\rho \sim 1$: using a queue, high efficiency obtained even w/ moderate depth
- Analytic calculation possible for very simple systems only
 - Otherwise MonteCarlo simulation is required

Queuing theory

- Efficiency vs traffic intensity ($\rho = \tau / \lambda$) for different queue depths
 - $\rho > 1$: the system is overloaded ($\tau > \lambda$)
 - $\rho \ll 1$: the output is over-designed ($\tau \ll \lambda$)
 - $\rho \sim 1$: using a queue, high efficiency obtained even w/ moderate depth
- Analytic calculation possible for very simple systems only
 - Otherwise MonteCarlo simulation is required

Queuing theory

- Efficiency vs traffic intensity ($\rho = \tau / \lambda$) for different queue depths
 - $\rho > 1$: the system is overloaded ($\tau > \lambda$)
 - $\rho \ll 1$: the output is over-designed ($\tau \ll \lambda$)
 - $\rho \sim 1$: using a queue, high efficiency obtained even w/ moderate depth
- Analytic calculation possible for very simple systems only
 - Otherwise MonteCarlo simulation is required

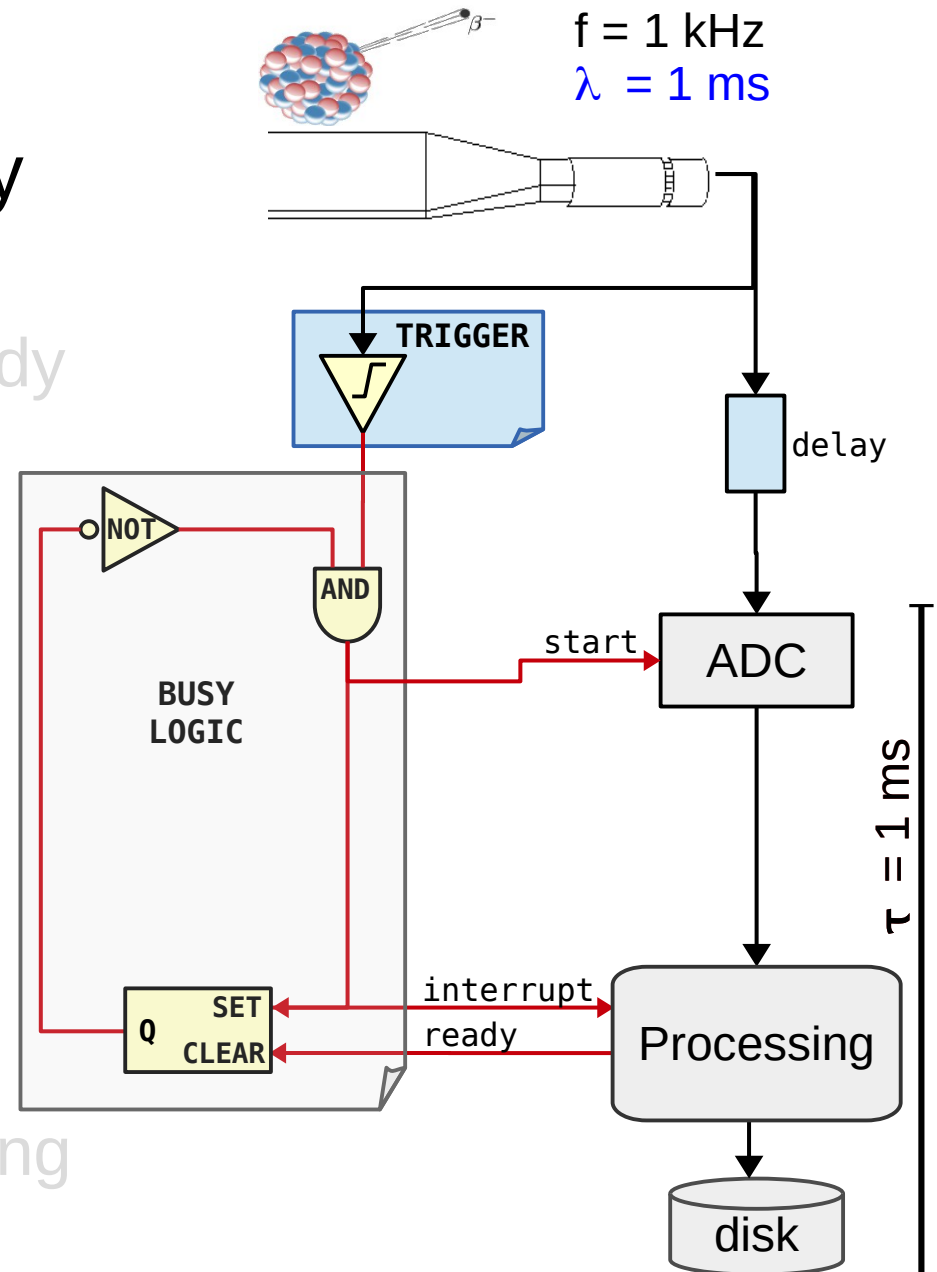

Queuing theory

- Efficiency vs traffic intensity ($\rho = \tau / \lambda$) for different queue depths
 - $\rho > 1$: the system is overloaded ($\tau > \lambda$)
 - $\rho \ll 1$: the output is over-designed ($\tau \ll \lambda$)
 - $\rho \sim 1$: using a queue, high efficiency obtained even w/ moderate depth
- Analytic calculation possible for very simple systems only
 - Otherwise MonteCarlo simulation is required

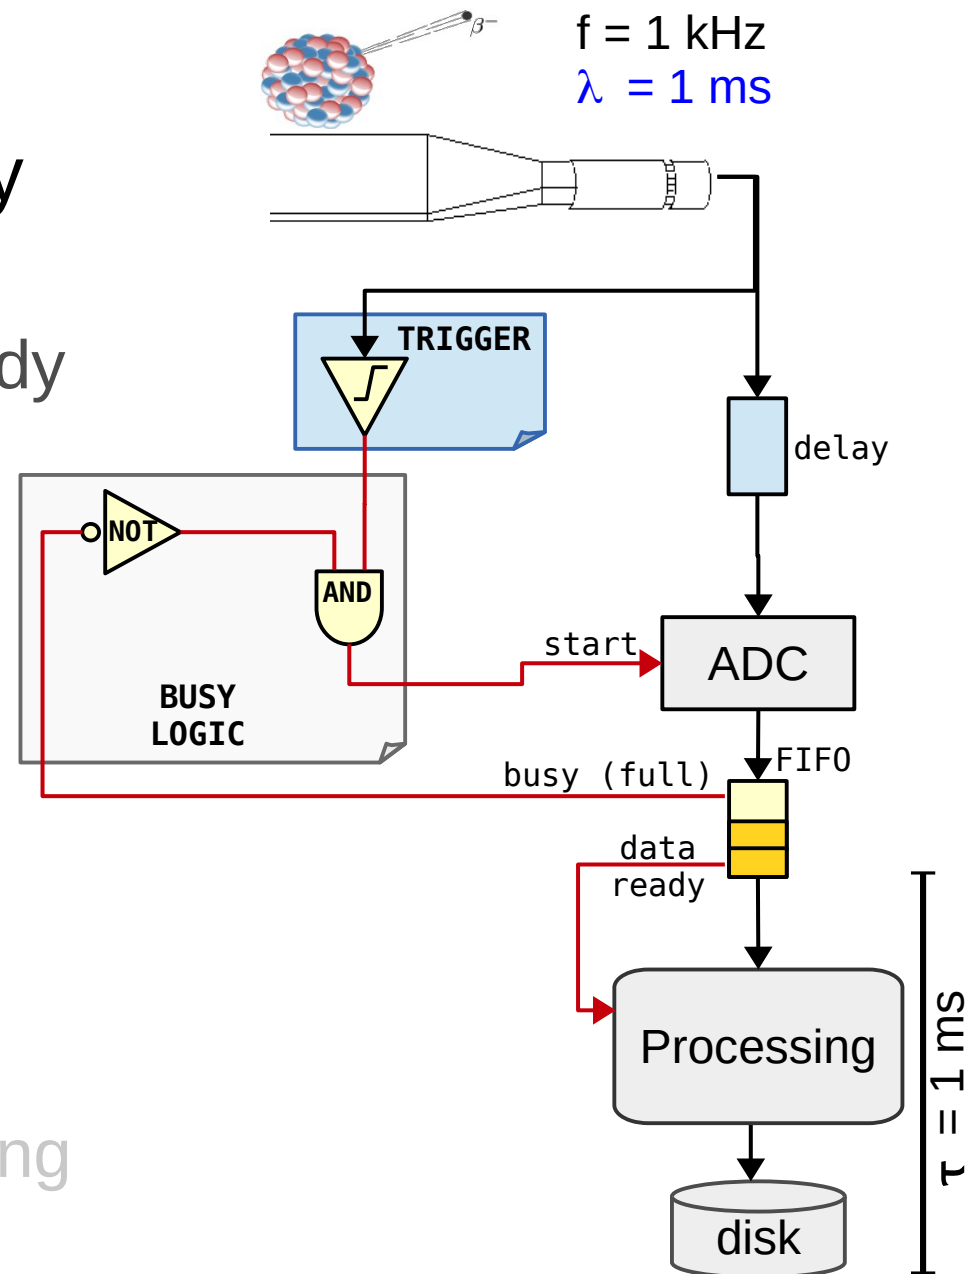

De-randomization

- Input fluctuations can be absorbed and smoothed by a queue
 - A FIFO can provide a \sim steady and **de-randomized** output rate
 - The effect of the queue depends on its depth
- Busy is now defined by the buffer occupancy
 - Processor pulls data from the buffer at fixed rate, separating the event receiving and data processing steps

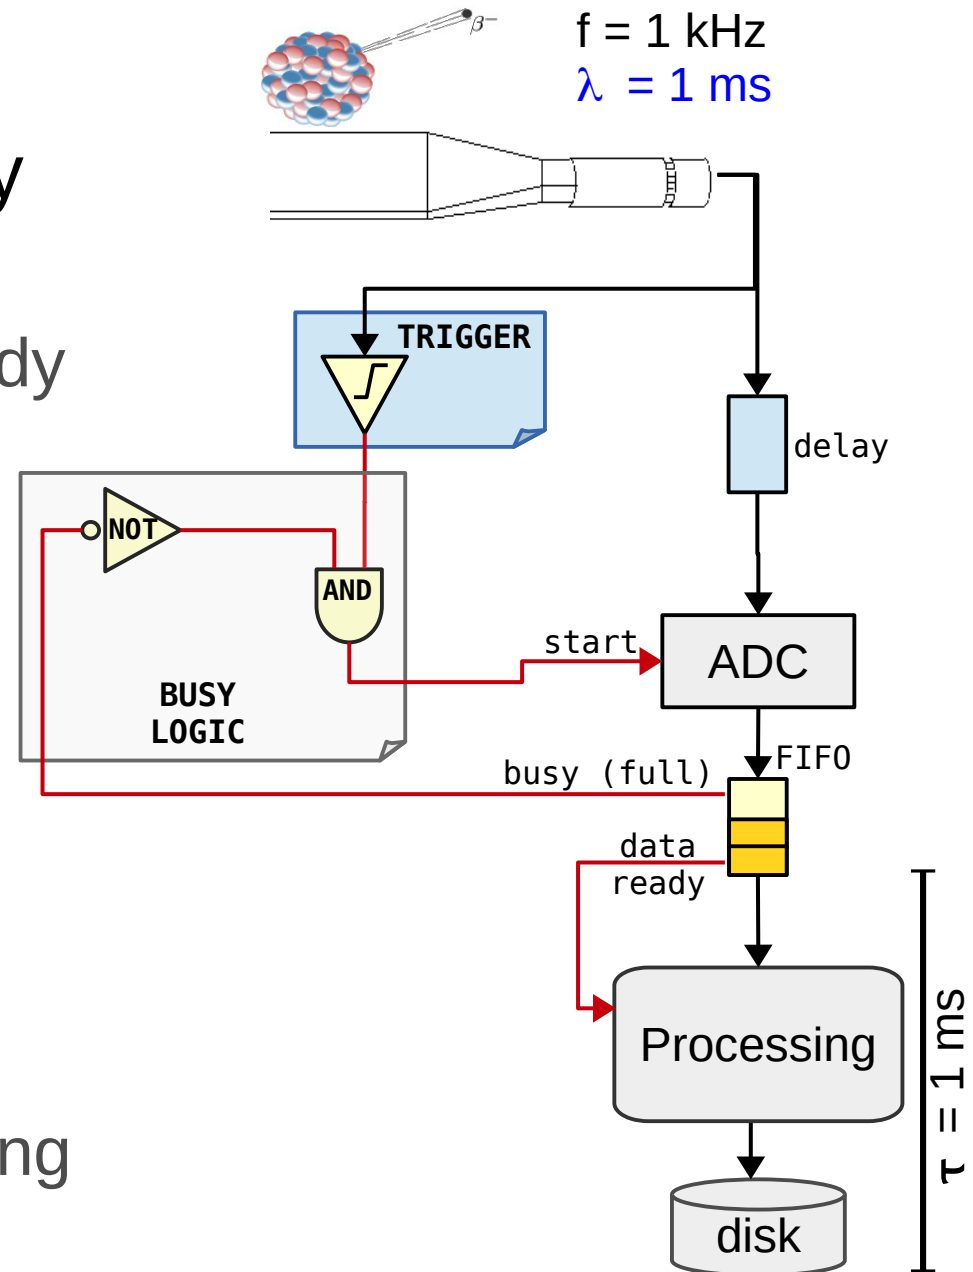

De-randomization

- Input fluctuations can be absorbed and smoothed by a queue
 - A FIFO can provide a \sim steady and **de-randomized** output rate
 - The effect of the queue depends on its depth
- Busy is now defined by the buffer occupancy
 - Processor pulls data from the buffer at fixed rate, separating the event receiving and data processing steps

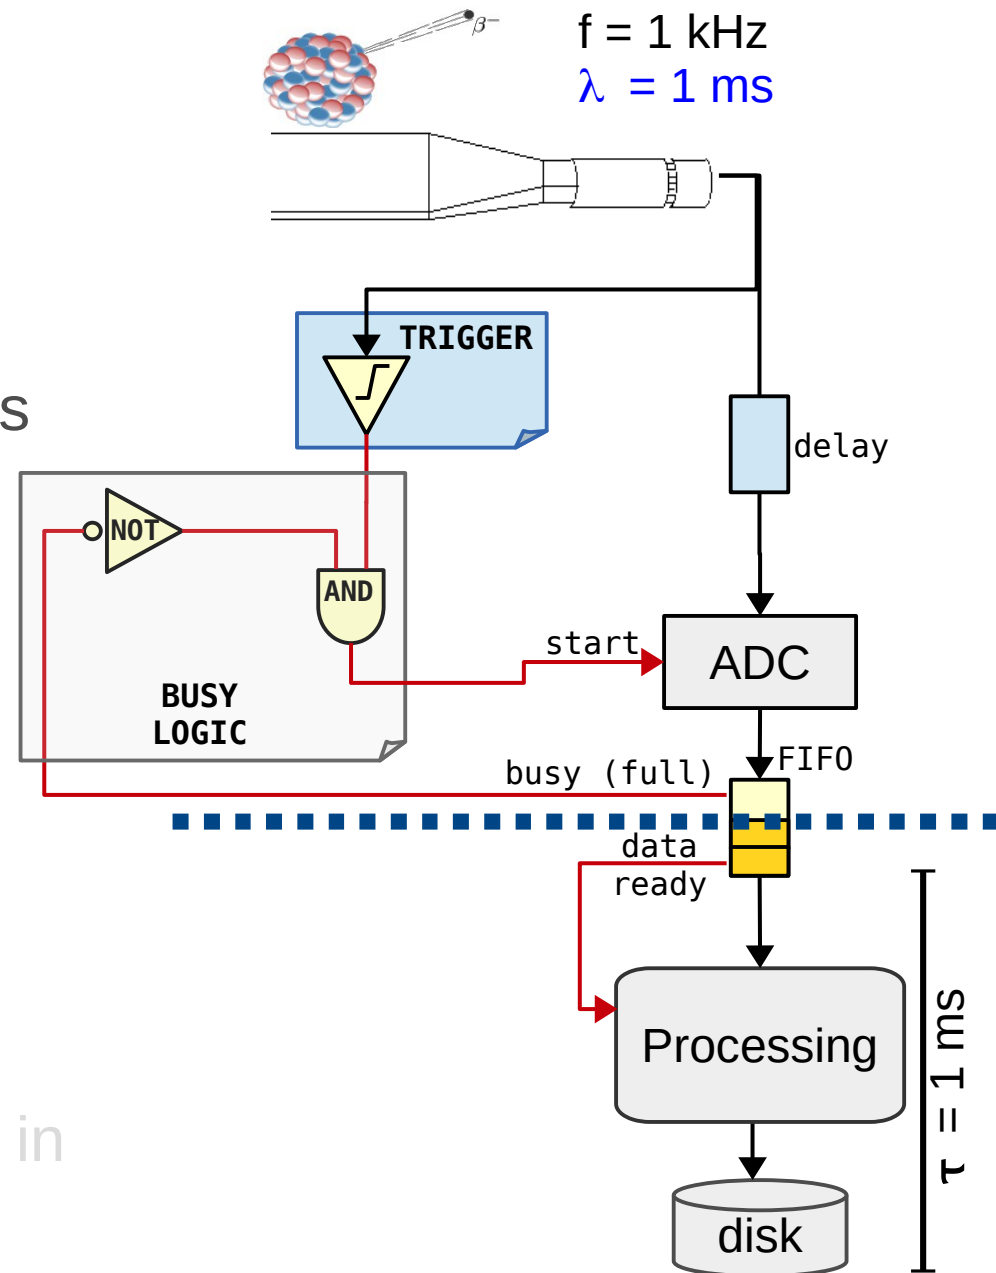

De-randomization

- Input fluctuations can be absorbed and smoothed by a queue
 - A FIFO can provide a \sim steady and **de-randomized** output rate
 - The effect of the queue depends on its depth
- Busy is now defined by the buffer **occupancy**
 - Processor pulls data from the buffer at fixed rate, separating the event receiving and data processing steps

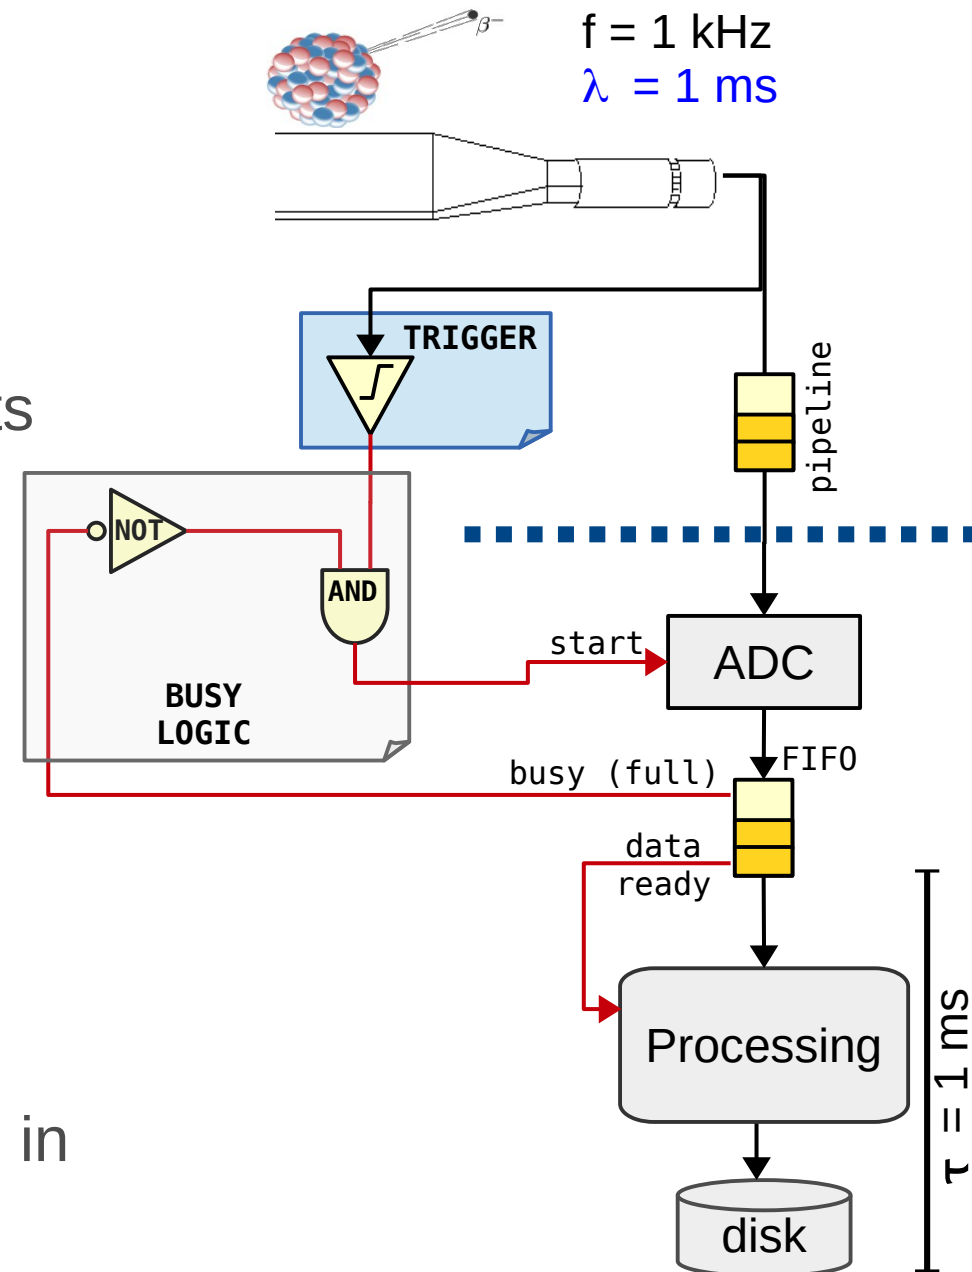

De-randomization summary

- The FIFO **decouples** the low latency front-end from the data processing
 - Minimize the amount of “unnecessary” fast components
- ~100% efficiency w/ minimal deadtime achievable if
 - ADC can operate at rate $\gg f$
 - Data processing and storing operate at a rate $\sim f$
- Could the delay be replaced with a “FIFO”?
 - Analog pipelines, heavily used in LHC DAQs

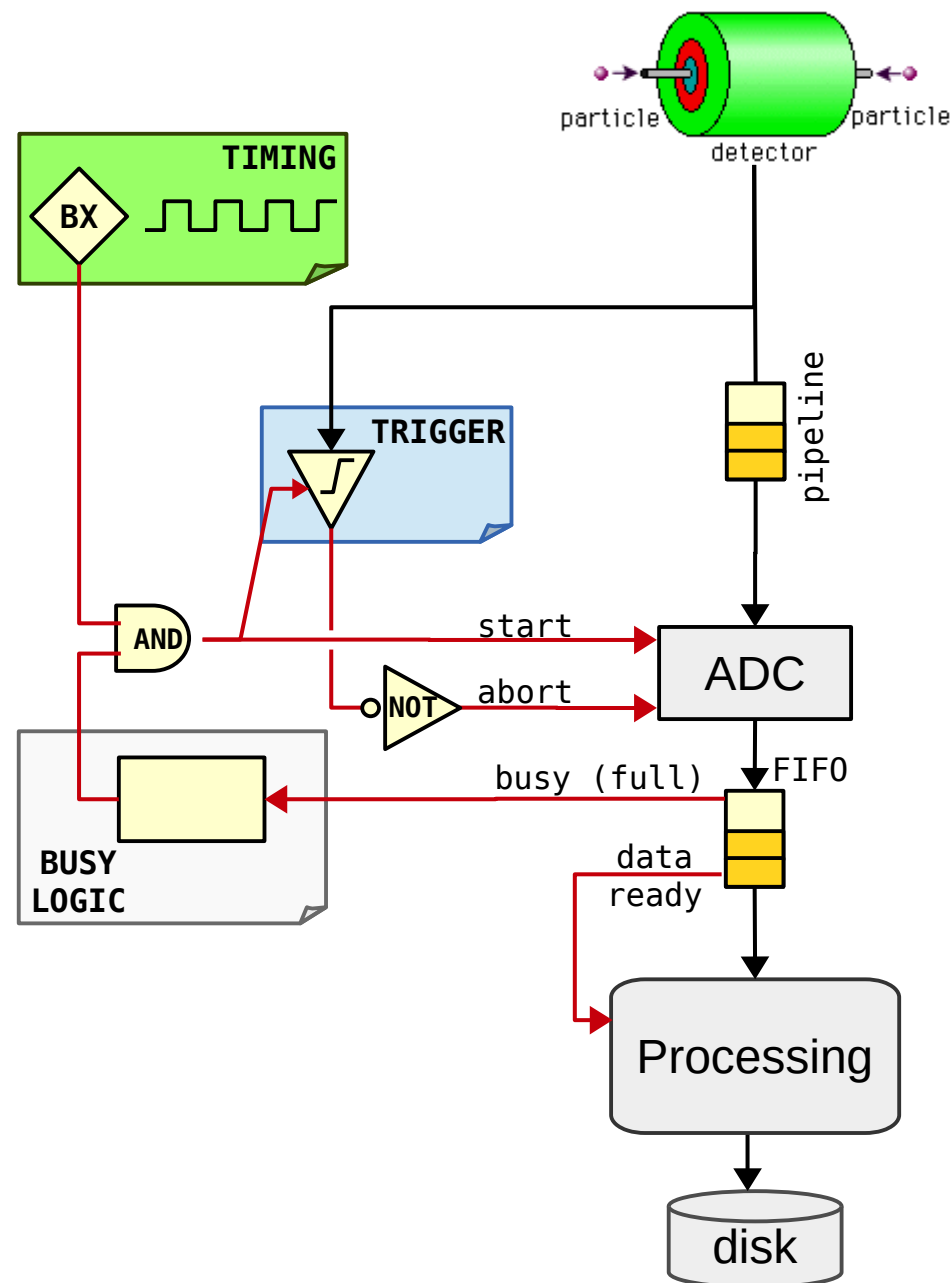

De-randomization summary

- The FIFO **decouples** the low latency front-end from the data processing
 - Minimize the amount of “unnecessary” fast components
- ~100% efficiency w/ minimal deadtime achievable if
 - ADC can operate at rate $\gg f$
 - Data processing and storing operate at a rate $\sim f$
- Could the delay be replaced with a “FIFO”?
 - Analog pipelines, heavily used in LHC DAQs

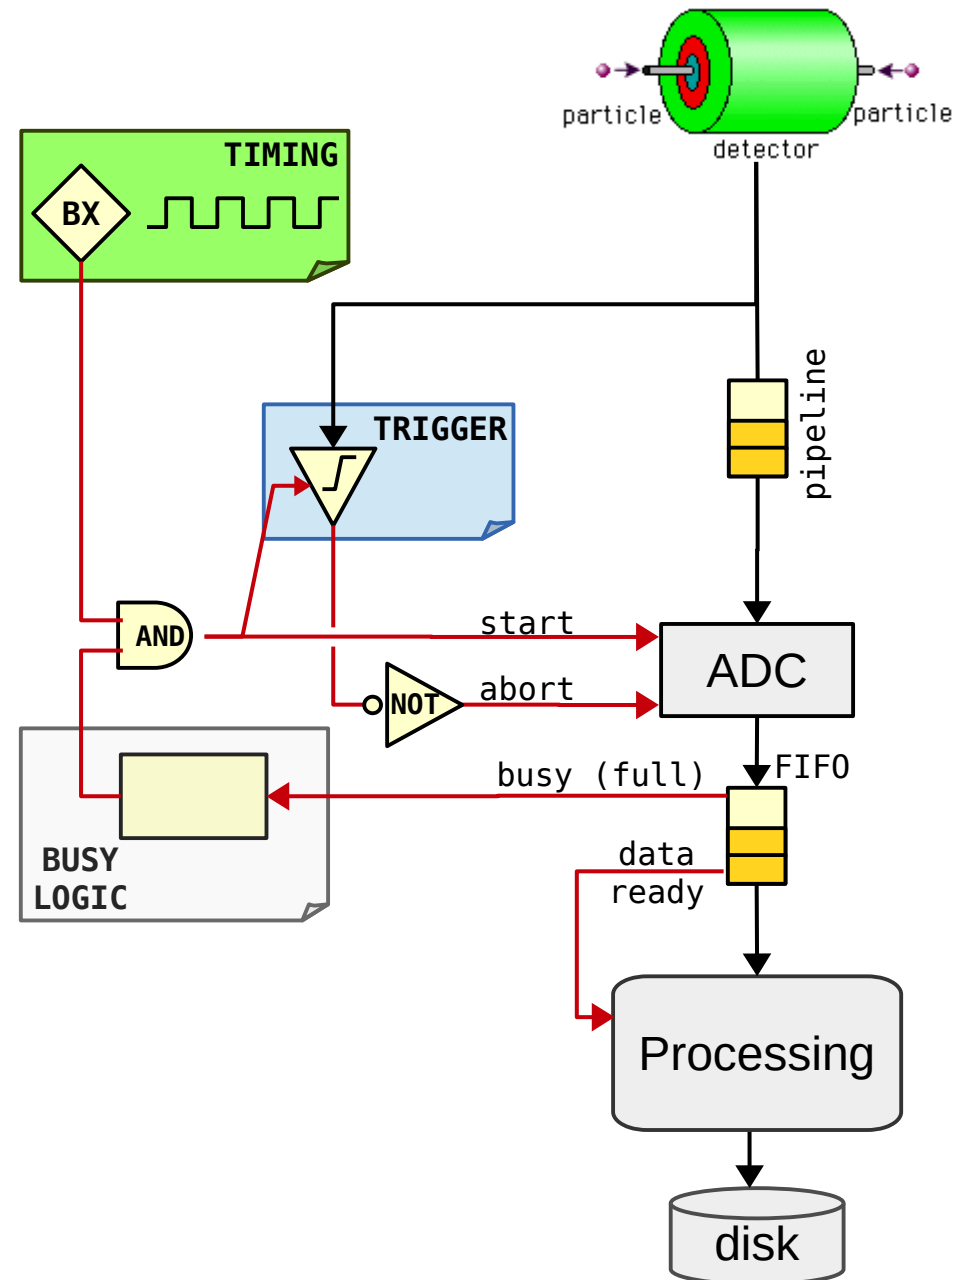

Collider setup

- Do we need de-randomization buffers also in collider setups?
 - Particle collisions are synchronous
 - But the time distribution of triggers is random: good events are unpredictable
- De-randomization still needed
- More complex busy logic to protect buffers and detectors
 - Eg: accept n events every m bunch crossings
 - Eg: prevent some dangerous trigger patterns

Collider setup

- Do we need de-randomization buffers also in collider setups?
 - Particle collisions are synchronous
 - But the time distribution of triggers is random: good events are unpredictable
- De-randomization still needed
- More complex busy logic to protect buffers and detectors
 - Eg: accept n events every m bunch crossings
 - Eg: prevent some dangerous trigger patterns

Outline

- Introduction
 - What is DAQ?
 - Overall framework
- Basic DAQ concepts
 - Digitization, Latency
 - Deadtime, Busy, Backpressure
 - De-randomization
- **Scaling up**
 - Readout and Event Building
 - Buses vs Network
- Data encoding

ScalingUp

- *TDAQ design: from test beam to medium size experiment*
 - **Roberto Ferrari**
- *TDAQ for the LHC experiments and upgrades*
 - **Francesca Pastore**

Non solo HEP

- *Esperimenti nello spazio: problematiche, test, esempi*
 - **Valentina Scotti**
- *Trigger in esperimenti underground*
 - **Stefano Mastroianni**
- *Esperimenti per misure di precisione: MEG*
 - **Marco Francesconi**

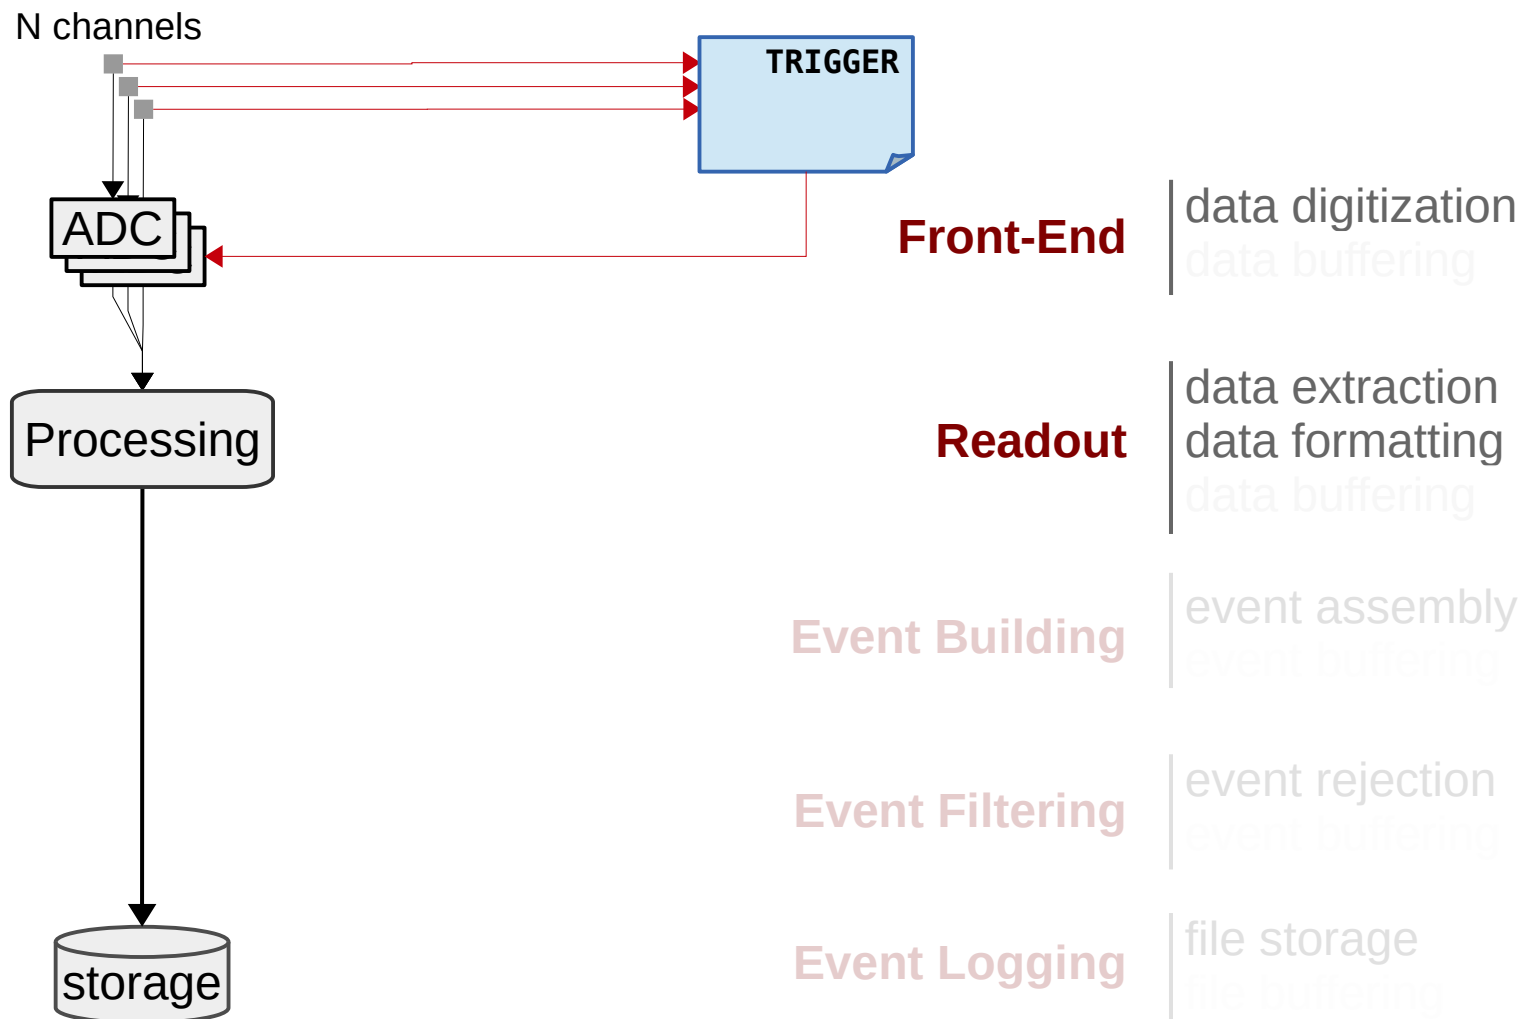

Adding more channels

- Adding more channels requires a hierarchical structure committed to the data handling and conveyance

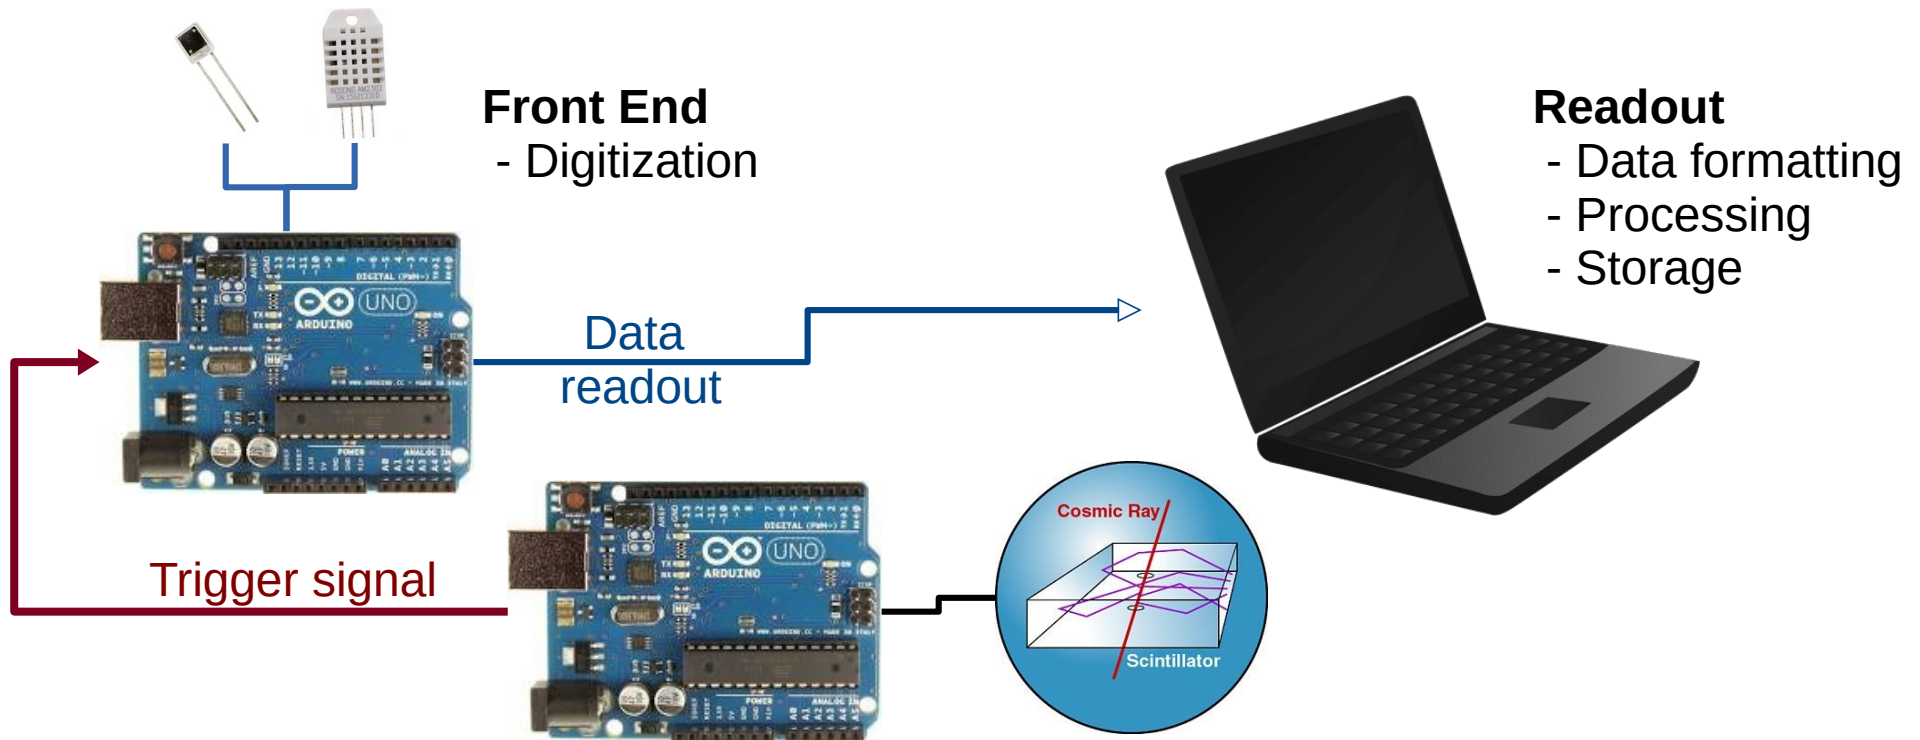

Adding more channels

- Adding more channels requires a hierarchical structure committed to the data handling and conveyance

For example

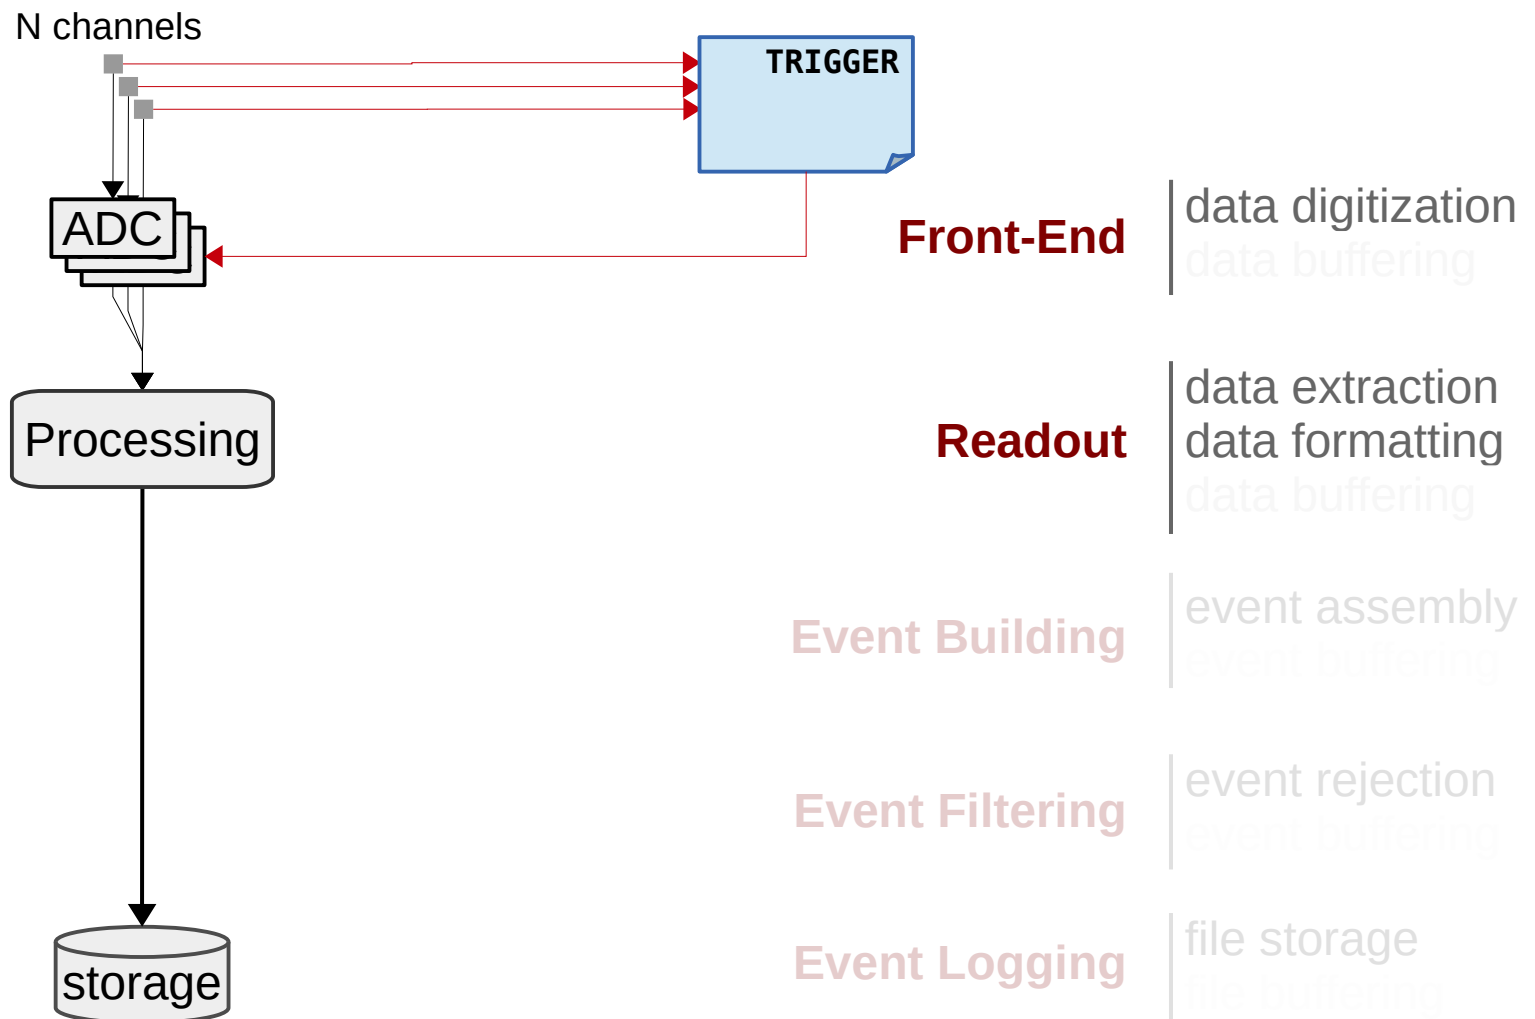

- Minimal setup with Arduino and a PC
 - Arduino has ADCs to read sensors

- *Acquisizione di SiPM con Arduino*
 - Valerio Bocci

Adding more channels

- Adding more channels requires a hierarchical structure committed to the data handling and conveyance

Adding more channels

- Adding more channels requires a hierarchical structure committed to the data handling and conveyance

Adding more channels

- Adding more channels requires a hierarchical structure committed to the data handling and conveyance

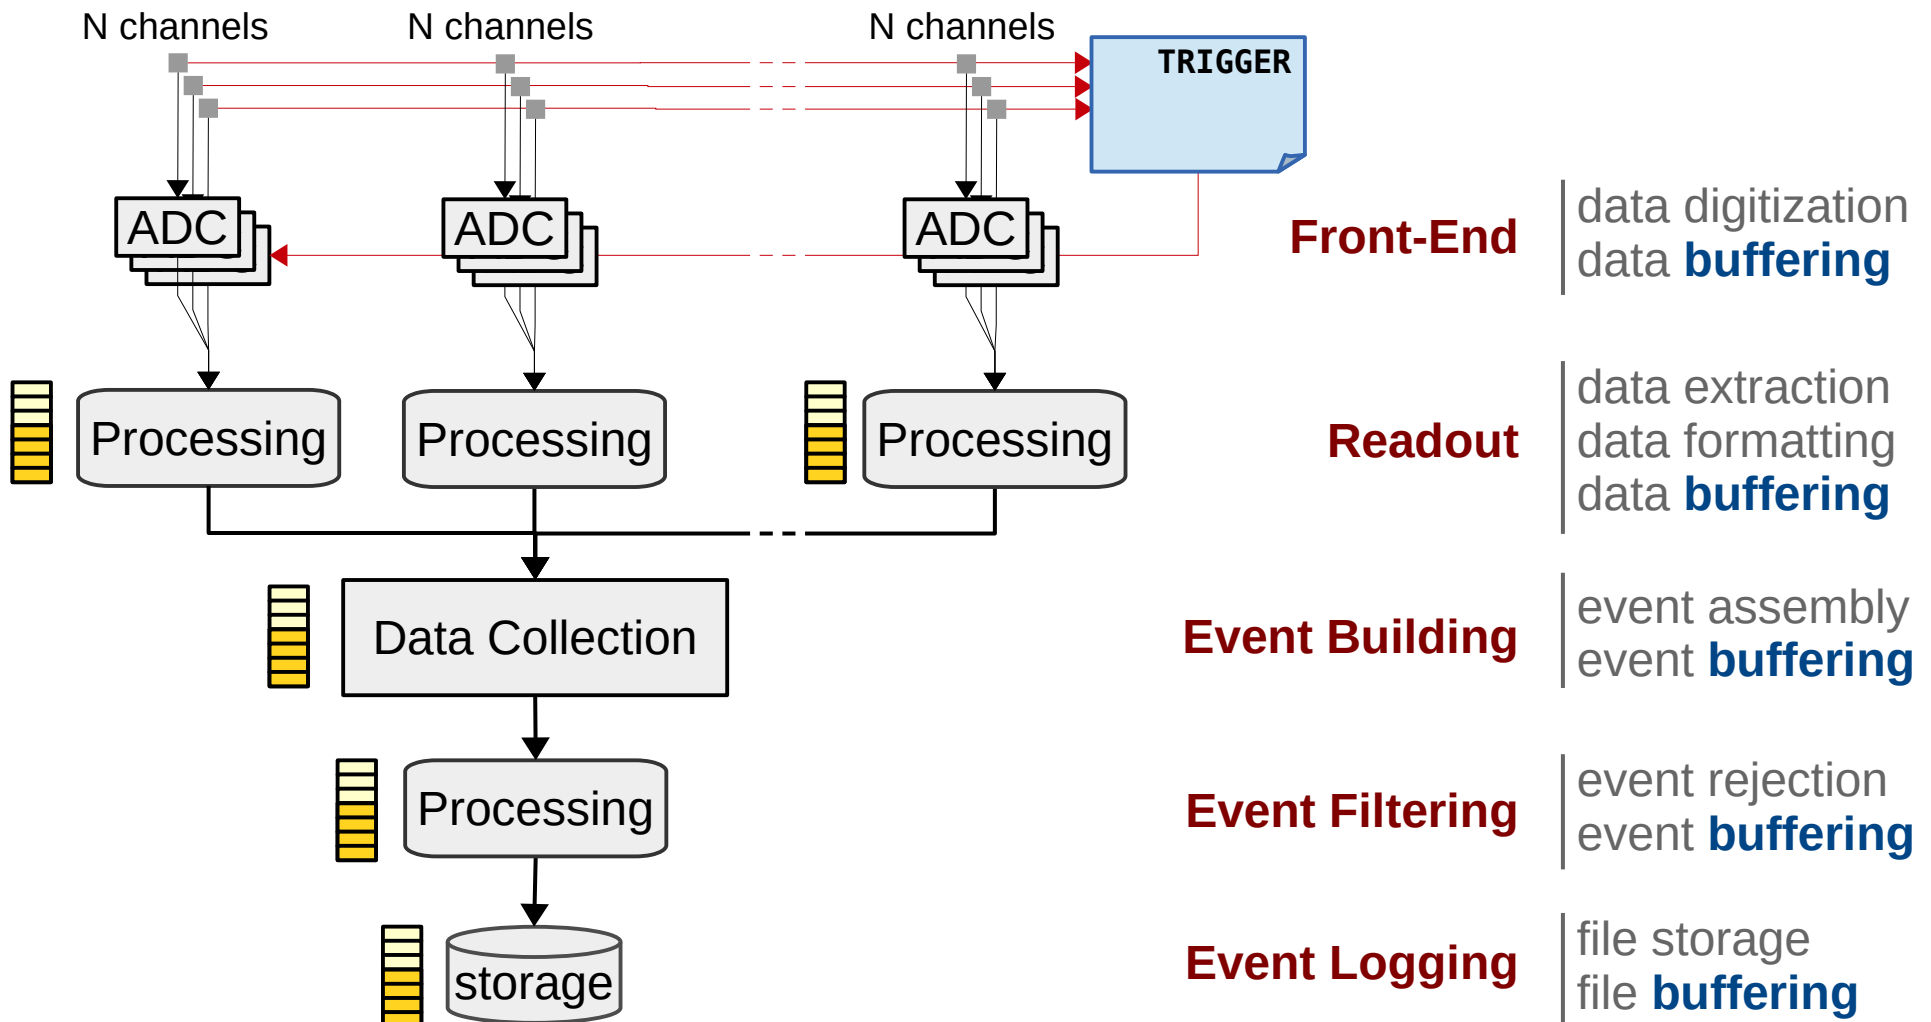

Adding more channels

- Adding more channels requires a hierarchical structure committed to the data handling and conveyance

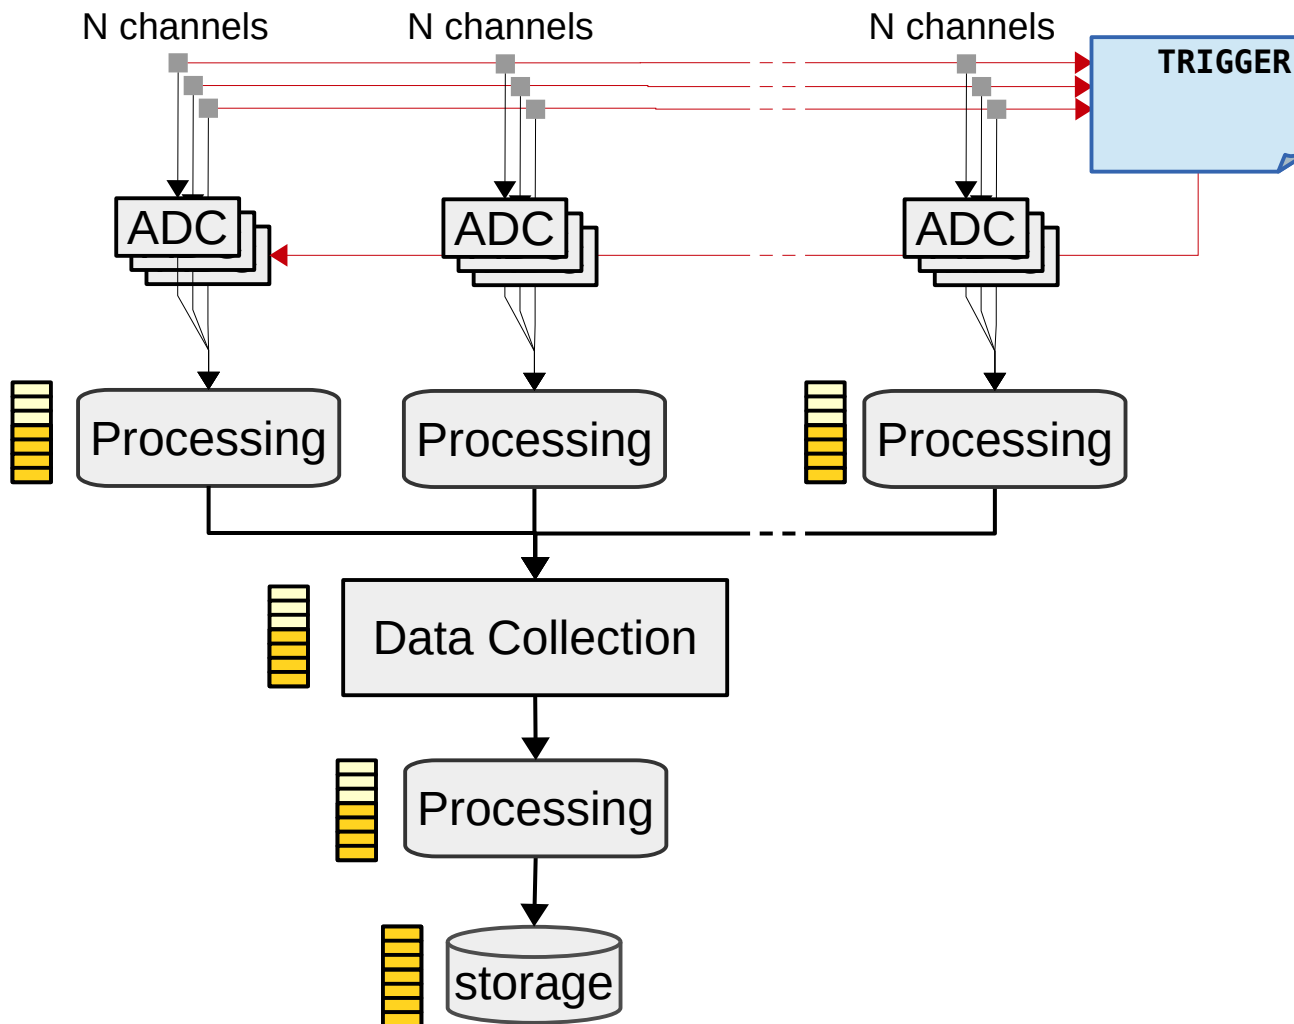

Adding more channels

- **Buffering** usually needed at every level
 - DAQ can be seen as a multi level buffering system

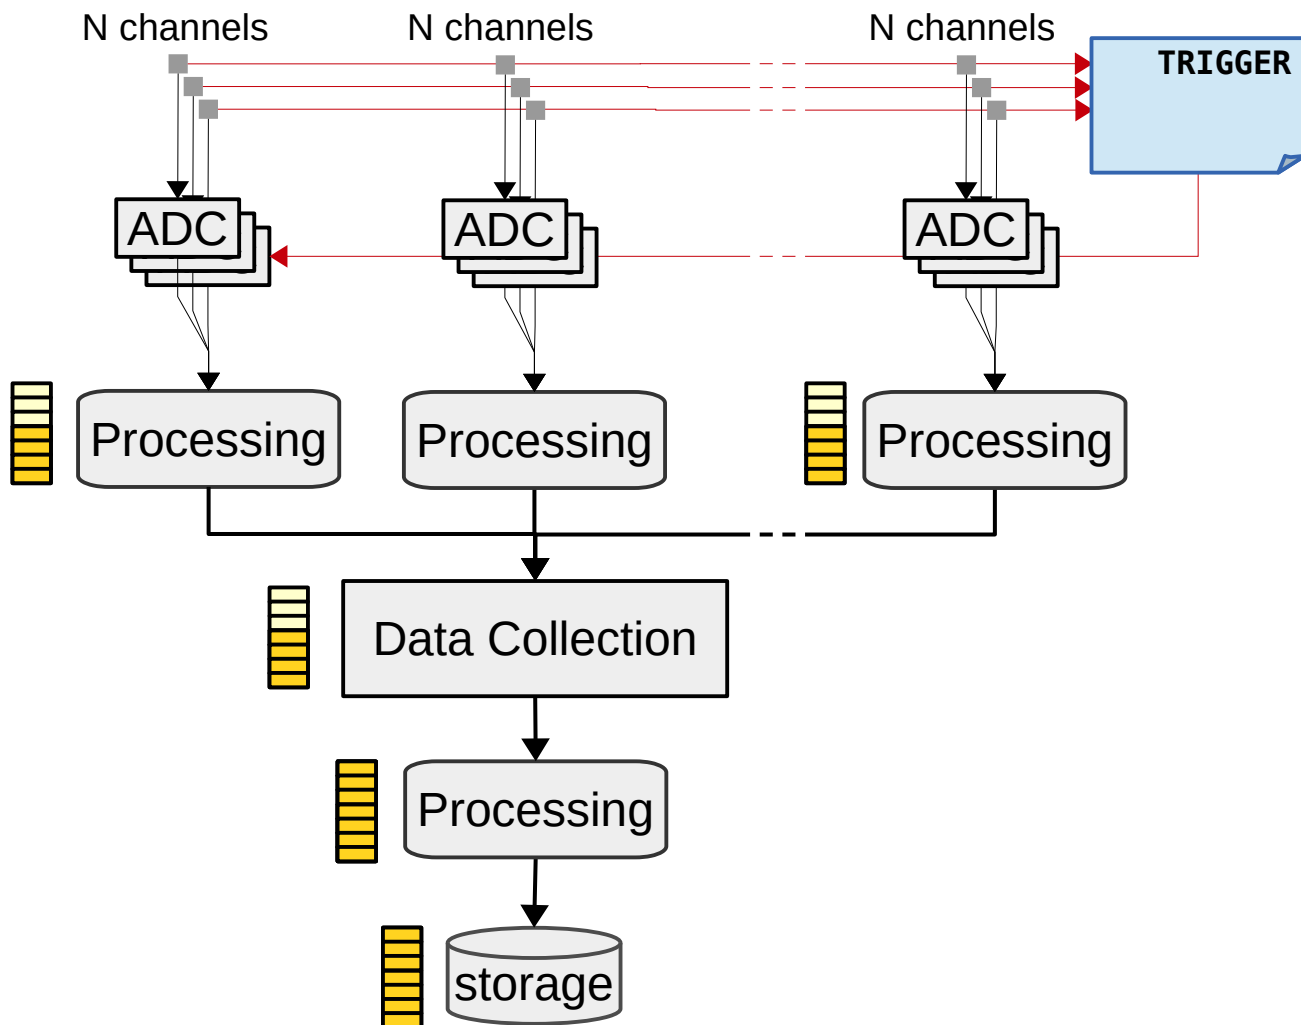

Backpressure

- If a system/buffer gets saturated
 - the “pressure” is propagated upstream (**back-pressure**)

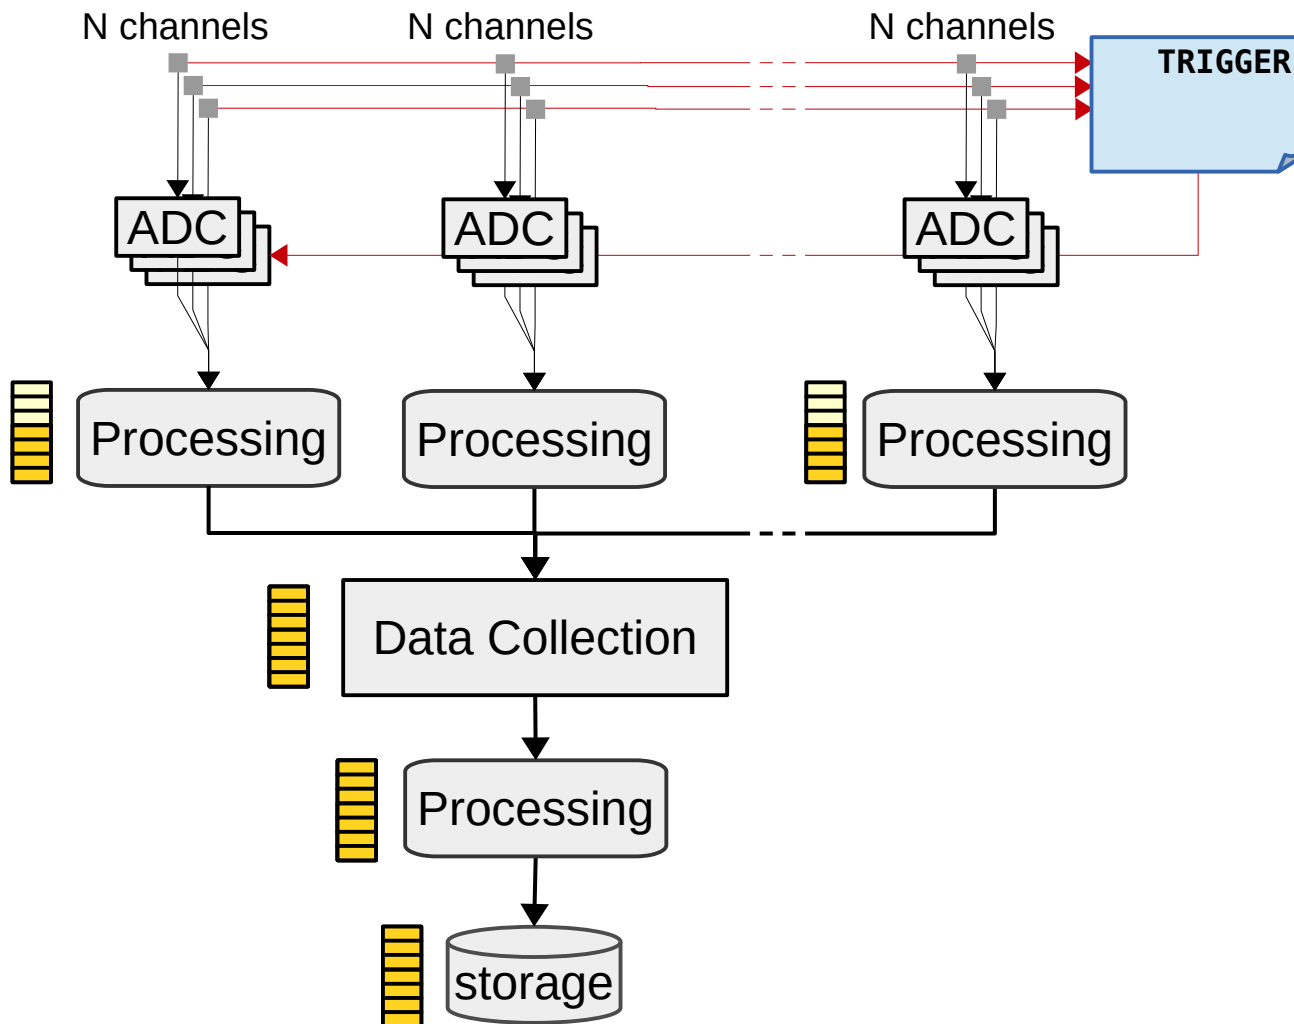

Backpressure

- If a system/buffer gets saturated
 - the “pressure” is propagated upstream (**back-pressure**)

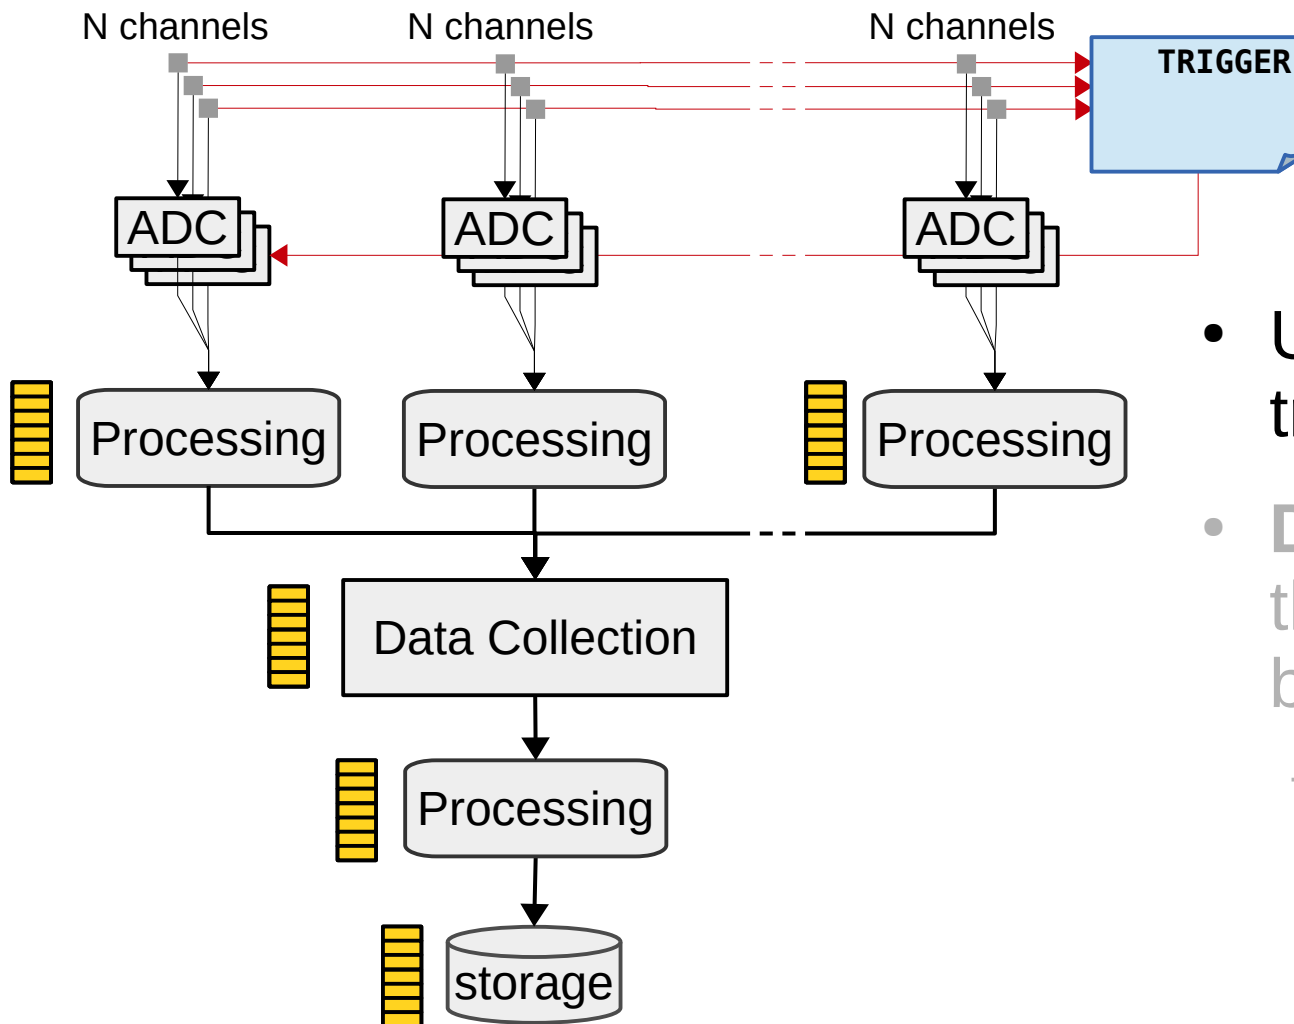

Backpressure

- If a system/buffer gets saturated
 - the “pressure” is propagated upstream (**back-pressure**)

Backpressure

- If a system/buffer gets saturated
 - the “pressure” is propagated upstream (**back-pressure**)

- Up to exert **busy** to the trigger system
- **Debugging:** where is the source of backpressure?
 - follow the buffers occupancy via the monitoring system

Backpressure

- If a system/buffer gets saturated
 - the “pressure” is propagated upstream (**back-pressure**)

- Up to exert **busy** to the trigger system
- **Debugging:** where is the source of backpressure?
 - follow the buffers occupancy via the monitoring system

Backpressure

- If a system/buffer gets saturated
 - the “pressure” is propagated upstream (**back-pressure**)

- Up to exert **busy** to the trigger system
- **Debugging:** where is the source of backpressure?
 - follow the buffers occupancy via the monitoring system

Building blocks

- Reading out data or building events out of many channels requires many components

- In the design of our hierarchical data-collection system, we have better define “**building blocks**”
 - Readout crates
 - HLT racks
 - event building groups
 - daq slices

Front End electronics

Limitations:

- Max. average hit rate per tube ≈ 50 kHz.
- Long latency, as readout starts only after L1 accept ($\approx 8.5 \mu\text{s}$ after L1 accept).

Front End electronics

Limitations:

- Max. average hit rate per tube ≈ 50 kHz.
- Long latency, as readout starts only after L1 accept ($\approx 8.5 \mu\text{s}$ after L1 accept).

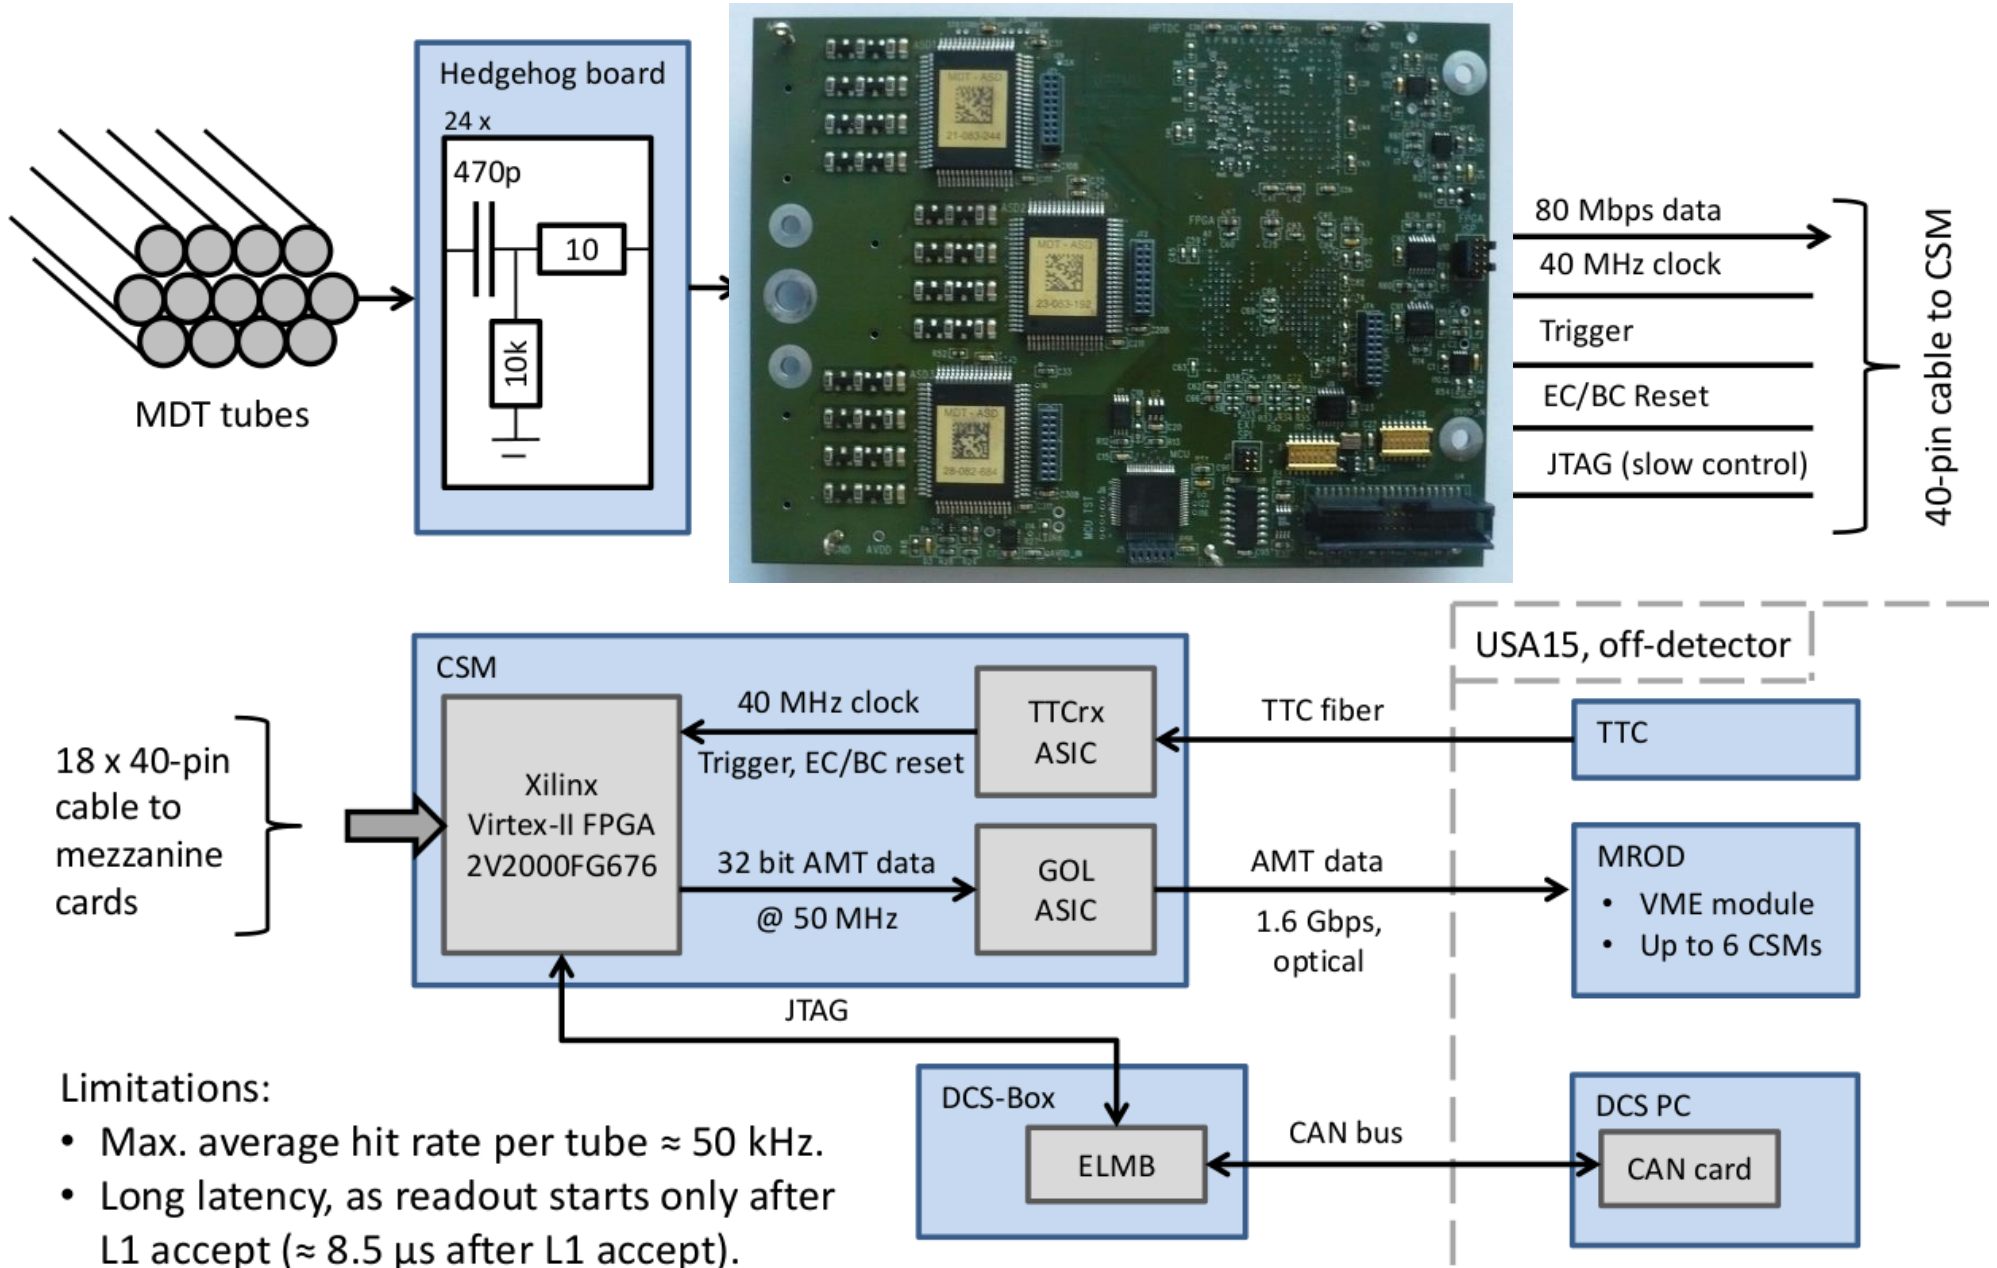

Front End electronics

Limitations:

- Max. average hit rate per tube ≈ 50 kHz.
- Long latency, as readout starts only after L1 accept ($\approx 8.5 \mu\text{s}$ after L1 accept).

Front End electronics

Limitations:

- Max. average hit rate per tube ≈ 50 kHz.
- Long latency, as readout starts only after L1 accept ($\approx 8.5 \mu\text{s}$ after L1 accept).

Readout Boards (Counting Room)

Readout Topology

- How to organize the interconnections inside the building blocks and between building blocks?
 - How to connect data sources and data destinations?
 - Two main classes: **bus** or **network**

Readout Topology

- How to organize the interconnections inside the building blocks and between building blocks?
 - How to connect data sources and data destinations?
 - Two main classes: **bus** or **network**

Buses

- Devices connected via a **shared bus**
 - Bus → group of electrical lines
- Sharing implies **arbitration**
 - Devices can be **master** or **slave**
 - Devices can be addresses (uniquely identified) on the bus
- E.g.: SCSI, Parallel ATA, VME, PCI ...
 - local, external, crate, long distance, ...

Bus facts

- Simple :-)

- Fixed number of lines (bus-width)
- Devices have to follow well defined interfaces
 - Mechanical, electrical, communication, ...

- **Scalability** issues :-)

- Bus bandwidth is shared among all the devices
- Maximum bus width is limited
- Maximum number of devices depends on bus length
- Maximum bus frequency is inversely proportional to the bus length
- On the long term, other “effects” might limit the scalability of your system

On the long term, other “effects” might limit the scalability of your system

Network

- All devices are **equal**
 - They communicate directly with each other via messages
 - No arbitration, simultaneous communications
- Eg: Telephone, Ethernet, Infiniband, ...

Network

- In switched networks, **switches** move messages between sources and destinations
 - Find the right path
- How **congestions** (two messages with the same destination at the same time) are handled?
 - The key is ...

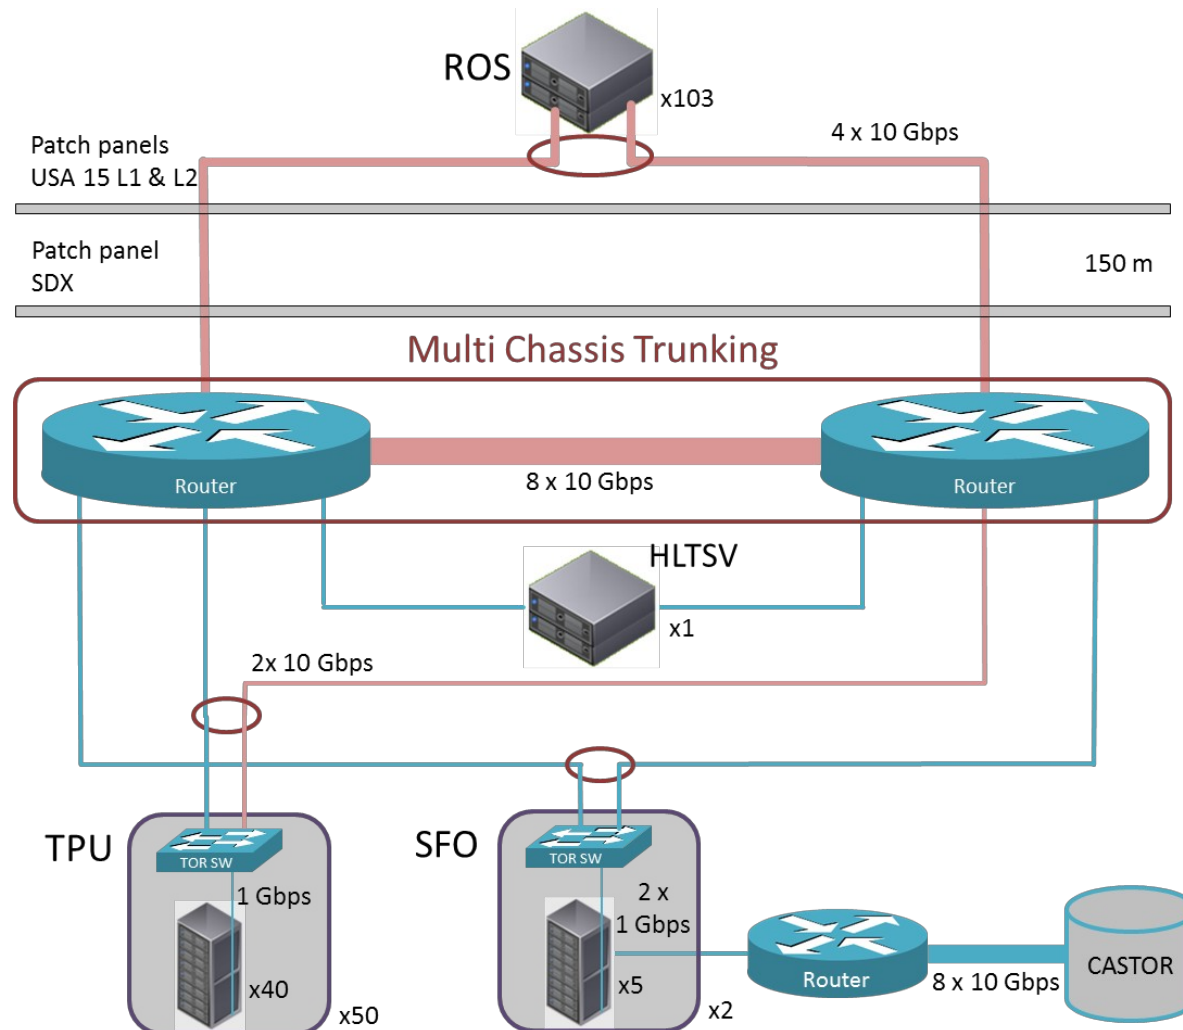

Network

- In switched networks, **switches** move messages between sources and destinations
 - Find the right path
- How **congestions** (two messages with the same destination at the same time) are handled?
 - The key is **buffering**

Network

- Networks scale well (and allow redundancy)
 - They are the backbones of LHC DAQ systems

Recap

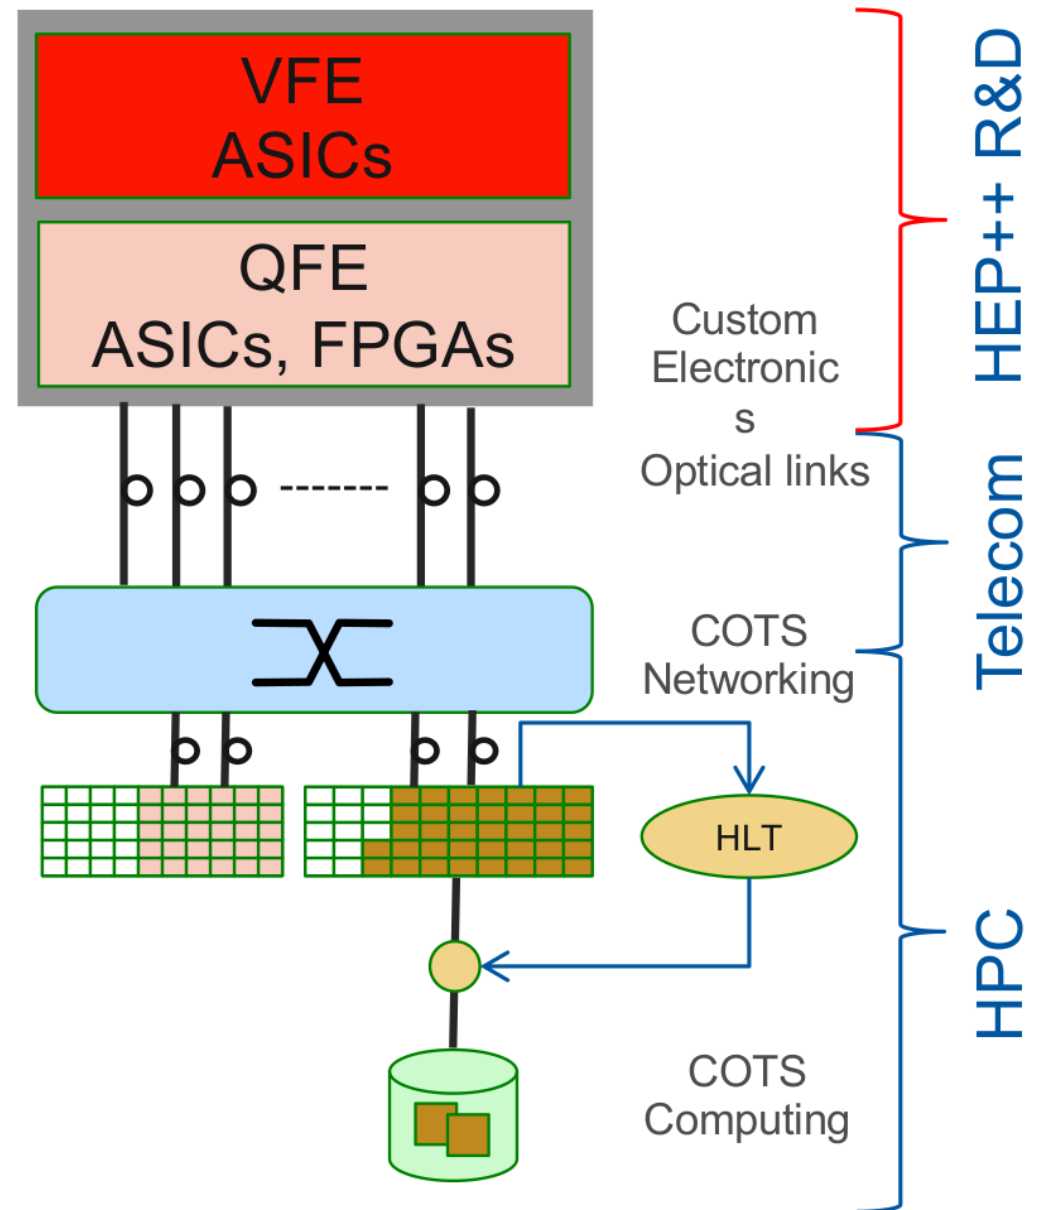

- Very Front End
 - does the analog part
 - ADC, low-level calibration, zero suppression, lossless compression
 - low-power, rad-tolerant
- Quasi Front End
 - medium scale aggregation, local reconstruction, "lossy" compression, transition to standard protocol on optical links

E. Meschi, Summer Student Lectures 2022

Recap

- **Commodity Of The Shelf**
- **COTS switched networks**
 - provide further aggregation, up to and including event building
- **COTS servers**
 - with co-processors (GPU, FPGA)
 - do the final selection

E. Meschi, Summer Student Lectures 2022

Trends

- Experiment/detector
 - Produces **physics**
- Data AcQuisition
 - Extracts **physics** from detector
- (Offline) Analysis
 - Extracts **physics** from data

ISOTDAQ 2013: S. Cittolin

Trends

- Sfumato il confine **online/offline**
 - L'analisi inizia in T/DAQ
- Più **dati** per aumentare la statistica
 - Sotto la spinta degli obiettivi di fisica
- **Triggerless** o ricostruzione già in **hardware**
 - Alice/LHCb vs ATLAS/CMS
- Sempre meno **raw data** salvati
 - Necessari meccanismi di controllo
- Ricerca di **soluzioni commerciali**
 - FPGA, GPU, file system, containers, ...

Data Encoding

- Data encoded in **digital** format
 - Arrays of words of fixed size: 2, 4, 8 bytes
- The quantum of information must contain
 - A digital value + an unique channel identifier
- Example
 - Drift chambers: channel ID and TDC counts
 - Calorimeters: channel ID and ADC counts
- For example, one can split a word in two
 - e.g. n bits for module id, $32-n$ bits for TDC/ADC counts
 - Number of used bits depends on ADC/TDC range

In case of multiple subdetectors

- Several data **fragments**
 - from different parts of the detector (**sources**)
- **flowing** via buses and networks from readout system to event filter to data storage
 - to be **assembled** together in the event builder
 - to be **stored** on self consistent files

Event Format

- Necessary to define an **event format**
 - How event data is encoded, stored and decoded
- It is the core of your experiment
 - The bridge between **online** and **offline** worlds
 - Online for shipping data among data-flow components and for storage
 - Offline to access and decode the data for analysis
- The library implementing the format must be unique and shared between online and offline

Event Format

- Identify every chunk of data, w/ a **source id**
 - Both during data taking and offline
- Associate data to the proper **bunch-crossing**
 - to collect all fragments belonging to the same event
- Keep track of the event format **version number**
 - That may evolve during experiment lifetime
- Possibility to easily extend the format
 - e.g.: adding sub-detectors
- w/ some redundancies
 - For debugging purpose

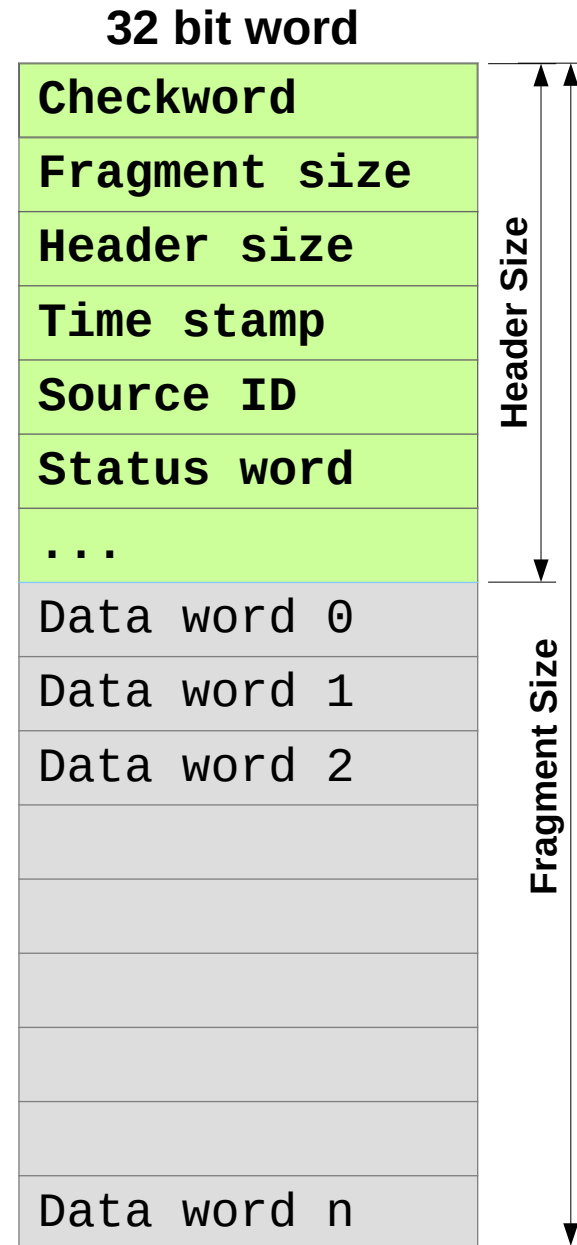

Header and payload

- Each data fragment composed by
 - A **payload**: the actual detector data
 - An **header**: that describes the payload
 - In some cases a **trailer**
- Header structure
 - **Checksum**: begin of frag. (0xEE1234EE)
 - **Fragment size**: where actual data ends
 - **Header size**: where actual data starts
 - **Time/bunchID**: timestamp
 - **Source ID**: where data is coming from
 - **Event ID**: event counter
 - **Error/status word(s)**: truncations, bad detector status, missing elements, ...

Header and payload

- Each data fragment composed by
 - A **payload**: the actual detector data
 - An **header**: that describes the payload
 - In some cases a **trailer**
- Header structure
 - **Checksum**: begin of frag. (0xEE1234EE)
 - **Fragment size**: where actual data ends
 - **Header size**: where actual data starts
 - **Time/bunchID**: timestamp
 - **Source ID**: where data is coming from
 - **Event ID**: event counter
 - **Error/status word(s)**: truncations, bad detector status, missing elements, ...

Full event

- A full **event** is a collection of **fragments**
 - There could be intermediate containers
- A full event is composed by
 - A **payload**: the “array” of data fragments
 - An **header**: that describes the event and is the portal to the collection of fragments
- Application reading a file must be able to
 - Find the 1st full event header
 - Navigate among the fragments
 - NB: fragment size word in each header
 - Up to the next event or the end of file

Full event

- A full **event** is a collection of **fragments**
 - There could be intermediate containers
- A full event is composed by
 - A **payload**: the “array” of data fragments
 - An **header**: that describes the event and is the portal to the collection of fragments
- Application reading a file must be able to
 - Find the 1st full event header
 - Navigate among the fragments
 - NB: fragment size word in each header
 - Up to the next event or the end of file

Full event header

- **Checksum:** begin of frag (e.g.: 0xAA1234AA)
- **Fragment size:** where actual data ends
- **Header size:** where actual data starts
- **Time/bunchID:** timestamp
- **Run number**
- **Event classification**
- **Error words**
- Array of offset (one for each fragment)
 - Implemented only if random access is required
 - Otherwise, just navigate from fragment to fragment
