

A portfolio of HEP colliders

*Ursula Bassler*

*Scientific Director IN2P3*

# AdA, ACO, ADONE: paving the way!

## AdA: Anello Di Accumulazione (1963)

- 1,3m diameter, 250 MeV
- first electron-positron collisions
- built in Frascati, shipped to Orsay

## ACO: Anneau de collision Orsay (1967)

- 7 m de diameter, 500 MeV
- Collisions used for physics, later synchrotron light source

## ADONE: (1969)

- 33 m diameter, 1.5 GeV
- 24 years of operation: 22.000 hours of colliding beam

Work on e+e- colliders  
also in Princeton/Stanford (O'Neil),  
Novosibirsk (Budker)

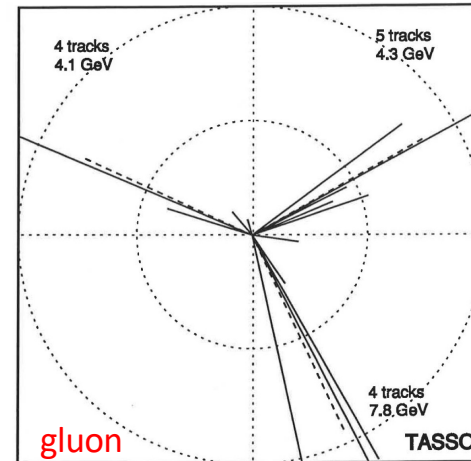

Early e+e- machines also in Novosibirsk  
(VEP-I, VEPP-2), Havard/MIT (CEA)

# Major discoveries at e<sup>+</sup>e<sup>-</sup> colliders

## SPEAR 1972

- 80m diameter, 4 GeV
- Discoveries: Psi (1974), Tau (1976)

## Petra 1978

- 2,3 km, 19 GeV
- Gluon discovery (1979)

## LEP 1989:

- 27 km, 45 – 100 GeV
- More than 1400 publications!

## SLC 1989 :

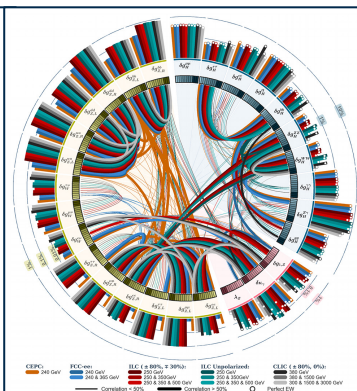

- 3,2 km, 50 GeV
- first linear collider!

*“An electron-positron Higgs factory is the highest-priority next collider.”*

From Higgs discovery towards Higgs precision physics

➔ Explore a the totally new domain of physics of a scalar field

- Completion of the standard model: test of coherence ➔ improve W/top mass
  - Precise measurement of the coupling constants ➔ aim: permille level!
  - Measurement of the self-coupling: Determination of the Higgs potential
  - Search for composite Higgs and additional particles in the Higgs sector
- ➔ Detailed study of the Higgs boson and the physics of scalar fields

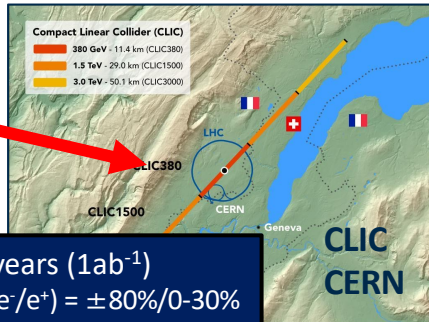

## Links between Particle Physics and Cosmology:

- **Dark Matter** : explanation from new particles?
  - **Matter-Antimatter differences** :
    - Baryogenesis, leptogenesis?
    - Observation of Sphalerons?
  - **Inflation** and scalar fields?
    - Evolution of Higgs potential in the early universe?
  - **Unification** of forces?
  - **Quantification** of Gravity?
- No clear guidelines from theory
- Higgs is not the only physics motivation: EW-precision measurements, flavor physics, BSM searches

*“For the longer term, the European particle physics community has the ambition to operate a proton-proton collider at the highest achievable energy.”*

## Linear colliders: nm-beamsize

**Normal conducting**  
accelerator cavities  
72-100MV/m and  
drive beam  
technology

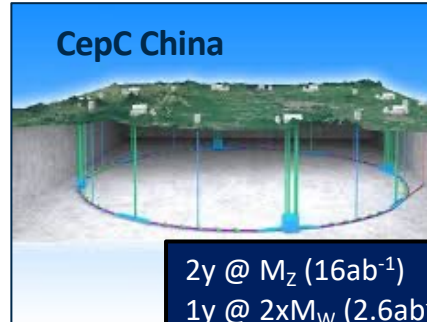

8 years ( $1ab^{-1}$ )  
 $\mathcal{P}(e^+/e^+) = \pm 80\%/0-30\%$

**Super conducting**  
accelerator cavities  
35-45 MV/m

11.5 years ( $2ab^{-1}$ )  
 $\mathcal{P}(e^+/e^+) = \pm 80\%/ \pm 30\%$

## Circular collider: synchrotron radiation

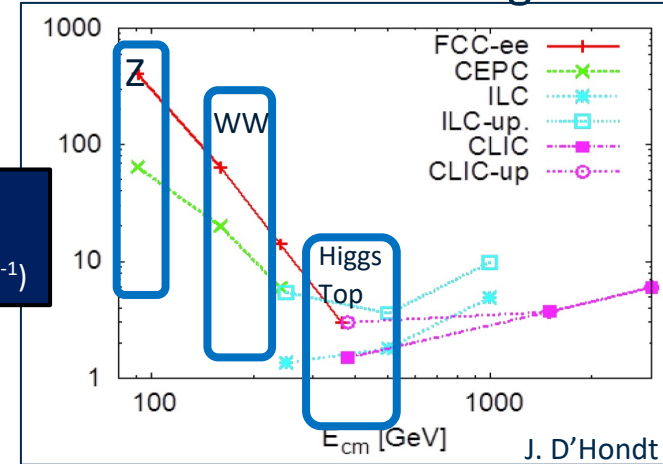

2y @  $M_Z$  ( $16ab^{-1}$ )  
1y @  $2xM_W$  ( $2.6ab^{-1}$ )  
7y @ 240 GeV ( $5.6ab^{-1}$ )

4y @  $M_Z$  ( $150ab^{-1}$ )  
1-2y @  $2xM_W$  ( $10ab^{-1}$ )  
3y @ 240 GeV ( $5ab^{-1}$ )  
5y @  $2xm_t$  ( $1.5ab^{-1}$ )

## 4 possible colliders: Linear or circular design

### Differences :

- Energy reach
- Flavour physics
- Luminosity performance
- ➔ Precision frontier vs energy frontier

**FCC-ee: Collaboration:** FCC-week 2023 London  
150 institutes, 32 companies, 34 countries

- Feasibility study updating 2919 CDR:
  - mid-term review end of 2023,
  - final report 2025:
    - Infrastructure and placement, Technical Infrastructure, Accelerator designs, Physics, Financing and Organization
- Cost estimation  $\approx 11$  G
- Additional contributions beyond CERN budget  $\approx 20-50\%$
- Particular focus: environmental impact and local implementation
  - Input to the next European Strategy around 2026/2027

## CepC: CEPC-week 2023 Edinburgh

Collaboration 221 institutes, 140 non-domestic (20 MoU), 70 companies

- CDR published 2018, TDR tbc 2023, EDR 2025
- Cost estimation  $\approx$  5 G
- International participation foreseen  $\approx$ 15-20%
- Highest ranked HEP/NP project in strategy exercise of the Chinese Academy of Science :  
→ Decision for possible construction start in 2027 at the next 5-year plan in 2025

# Circular collider with Energy Recovery Linacs: CERC

V.Litvinenko et al (BNL - 2019)

## « Squaring the circle » !

**Linear collider:** bunches collide only once

→ efficient collisions (collisions per beam particles)

→ higher luminosity

**Storage ring collider:** recovery of beam energy during deceleration

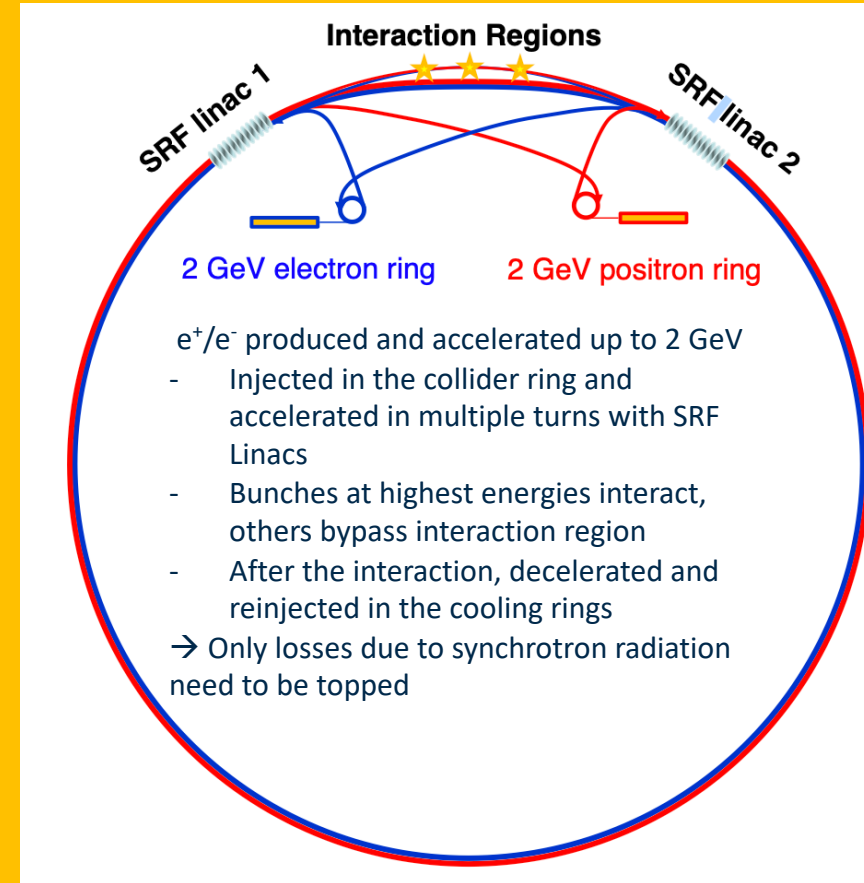

→ Recycling of beam energy and particles

### Requires:

- R&D !

→ BNL-ERL, Cornell (Cbeta), HZB (berlinPro), IJClab (Perle)

→ European Project iSAS accepted

Also linear collider concepts : Relic, ERLC

**ILC:** First LCWS 1991, Saariselka, Finland

- 3 linear collider concepts (JLC/GLC – Japan, NLC – SLAC, TESLA – DESY)
- 2004 : ILC – choice of superconducting technology, setup by ICFA of GDE and FALC
- 2007: Reference design report 500 GeV-1 TeV
- 2013: TDR published, Japan proposed as site by Japanese HEP community
- 2020: setup of an International Develop team (IDT) → 250 GeV ILC
- Studies for upgrades up to 3 TeV
- International Technology Network : KEK-CERN agreement 7/7/2023: cooperation with CERN and CERN as European hub → other collaborations looked for

**CLIC:** two beam concept proposed in 1986

- CDR in 2012 focus on 3 TeV, update in 2018 with focus on 380 GeV
- Project Readiness Report
- 50 institutes from 28 countries
- R&D on luminosity optimization and power efficiency
- X-band studies for use of small, compact Linacs for applications.

## C<sup>3</sup> - 8 km footprint for 250/550 GeV

10 years ( $2ab^{-1}$ @250 GeV)  
4 years ( $4ab^{-1}$ @550 GeV)

Higgs factory on FNAL site:  $\approx 7$ km

## C<sup>3</sup>: Cool Copper Collider (SLAC/FNAL)

- new RF technology
- Cryogenic temperatures (liquid Nitrogen  $\sim 80$ K)
- High gradient: 70-120 MeV/m  
→ improving efficiency and breakdown rate
- Scalable to multi-TeV operation

Presentation during US Snowmass process:

- Large portions of accelerator complex compatible between LC technologies
- Damping rings and injectors to be optimized with CLIC as baseline

Proposal for 5-year demonstrator development@ SLAC → TDR:

3 C<sup>3</sup> cryomodules  $\approx 120$  M (Total Project cost+contingency)

→ Evaluation during P5 process to be presented October 2023

## HALHF: Hybrid Asymmetric Linear Higgs Factory (DESY)

- PWFA  $e^-$  accelerator, low energy conventional  $e^+$  accelerator
- Most innovative concept : small (3,3km) and cheap ( $\approx 1,5$  G€)  $\rightarrow$  national facility
- (+) Efficient energy consumption (-) luminosity
- Towards higher energies: trade off between Linac length and boost
- Major R&D areas  $\rightarrow$  10% demonstrator?

# Plasma Wakefield accelerators towards 10 TeV scale

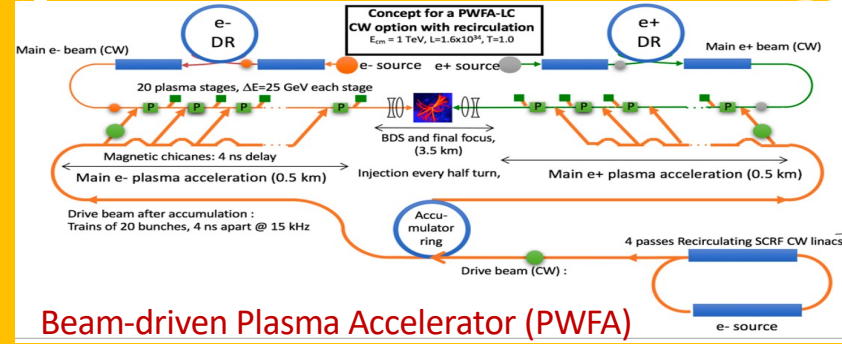

Impressive progress over the last years in Plasma Wakefield Acceleration !

**Alegro:** ICFA initiated international collaboration PWA

## Laser-driven Plasma Accelerator (LWFA)

Schroeder et al. – LBNL

## Beam-driven Plasma Accelerator (PWFA)

© Adli et al., Chen et al.

- Ultra high gradients opens path to 10+ TeV colliders
- Main challenges: staging of plasma modules, consistent high beam quality, emittance preservation, low energy spread, efficient energy transfer, high repetition rate, reduction of power consumption ...

→ Possibility of  $\gamma\gamma$ -collider → no positron source

**Some facilities:** BELLA (LBNL), FLASHForward (DESY), FACET-II (SLAC), AWA (ANL), AWAKE (CERN)

**To come:** EuPraxia (LNF)

## Structure Wakefield Accelerator (SWFA)

© C. Jing et al. ANL

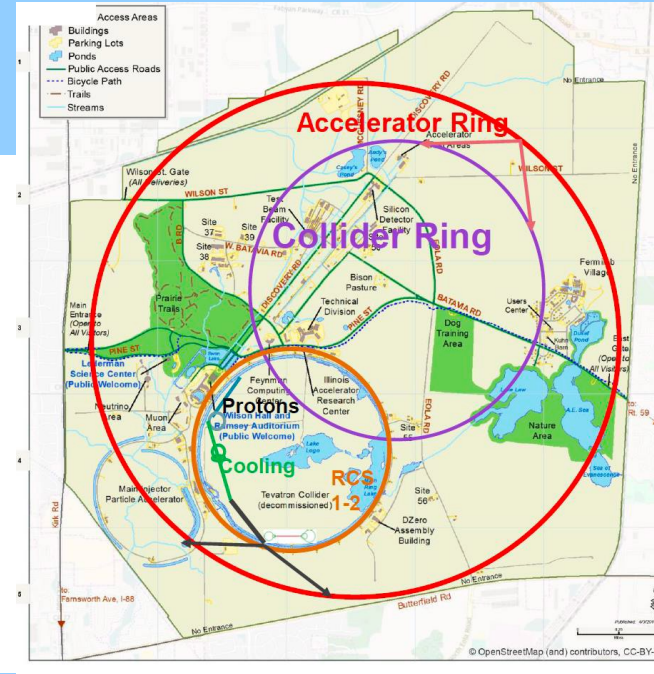

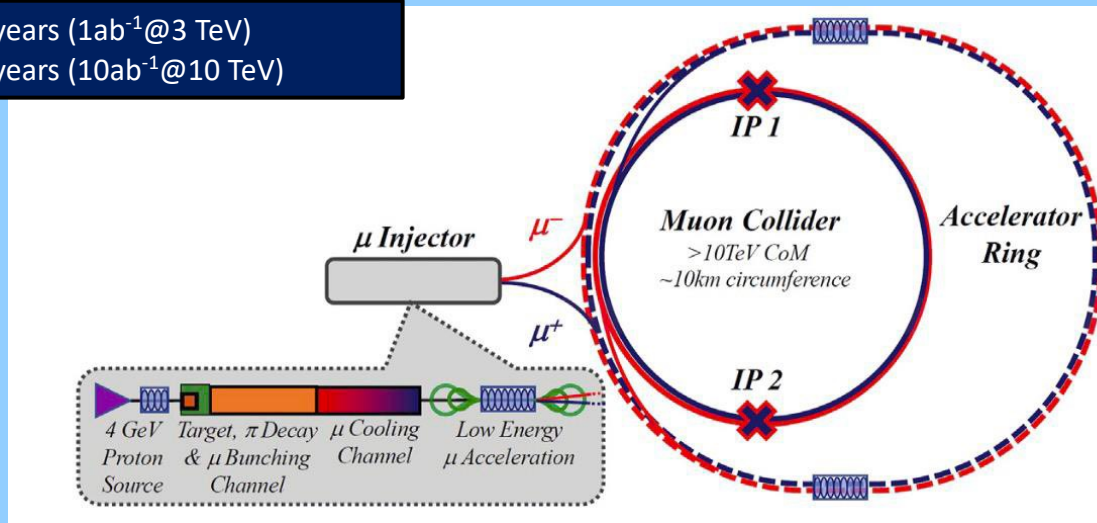

Initial Concept of Muon Collider from 1983: Skrinsky et al, Neuffer et al.

- R&D activities in the mid-1990

2022: International Muon Collider Collaboration (IMCC) hosted at CERN

5 years ( $1\text{ab}^{-1}$ @3 TeV)

5 years ( $10\text{ab}^{-1}$ @10 TeV)

© Diktys Stratakis (FNAL)

Possible Fermilab implementation

- Requiring high power proton source (1-4 MW) and suitable targets (C or W promising)  
→ Synergies with proton accelerator developments for neutrinos experiments
- Cooling, high field magnets, neutrino flux mitigation (radiation protection)  
→ Timescales : R&D phase (7 years), demonstrator phase (10 years) → TDR by 2030

# 100 TeV hadron colliders: FCC-hh, SppC

Hadron colliders may reach about 100 TeV or beyond

→ magnets drive:

- Physics/Energy reach
- Cost : about  $\approx 70\%$

→ Important place on the Roadmap for magnet development

→ CERN led effort in Europe

Funding from nuclear physics:

- Nucleon spin
- Hadron masses
- Polarized electrons beams on protons and light ions

**2025:** TDR and construction start

**2034:** Begin of physics programme

Rich R&D and pre-production prototypes:

- Polarized electron source
- Fast kickers
- Polarimeters
- Cavities

# High energy ep collider

**LHeC (>50 GeV electron beams)  
 Ecms = 0.2 – 1.3 TeV**

HERA → pdf for LHC physics simulations

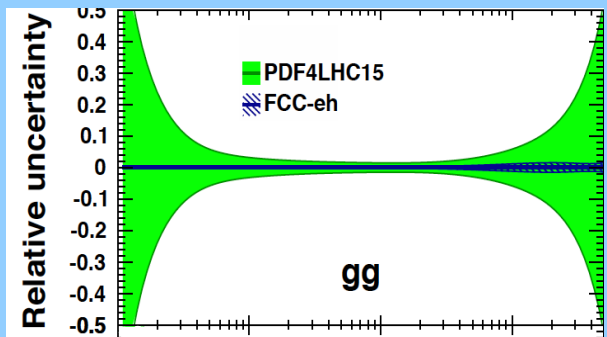

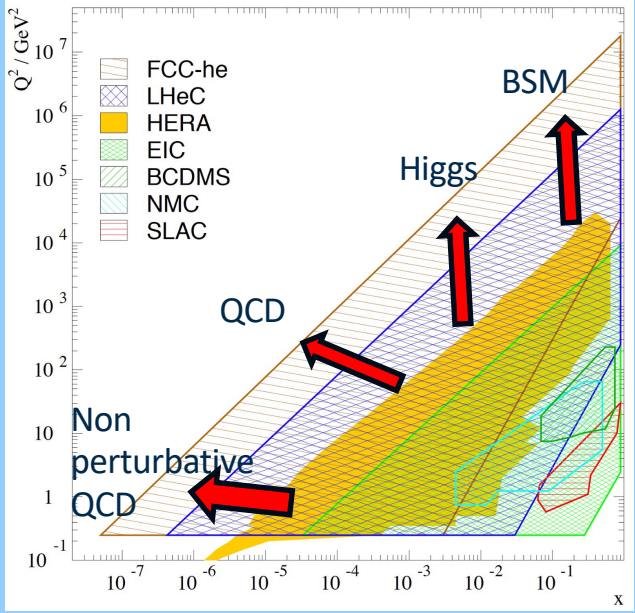

FCC-eh → tremendous improvement in pdf precision, but also contribute to Higgs measurements and BSM searches

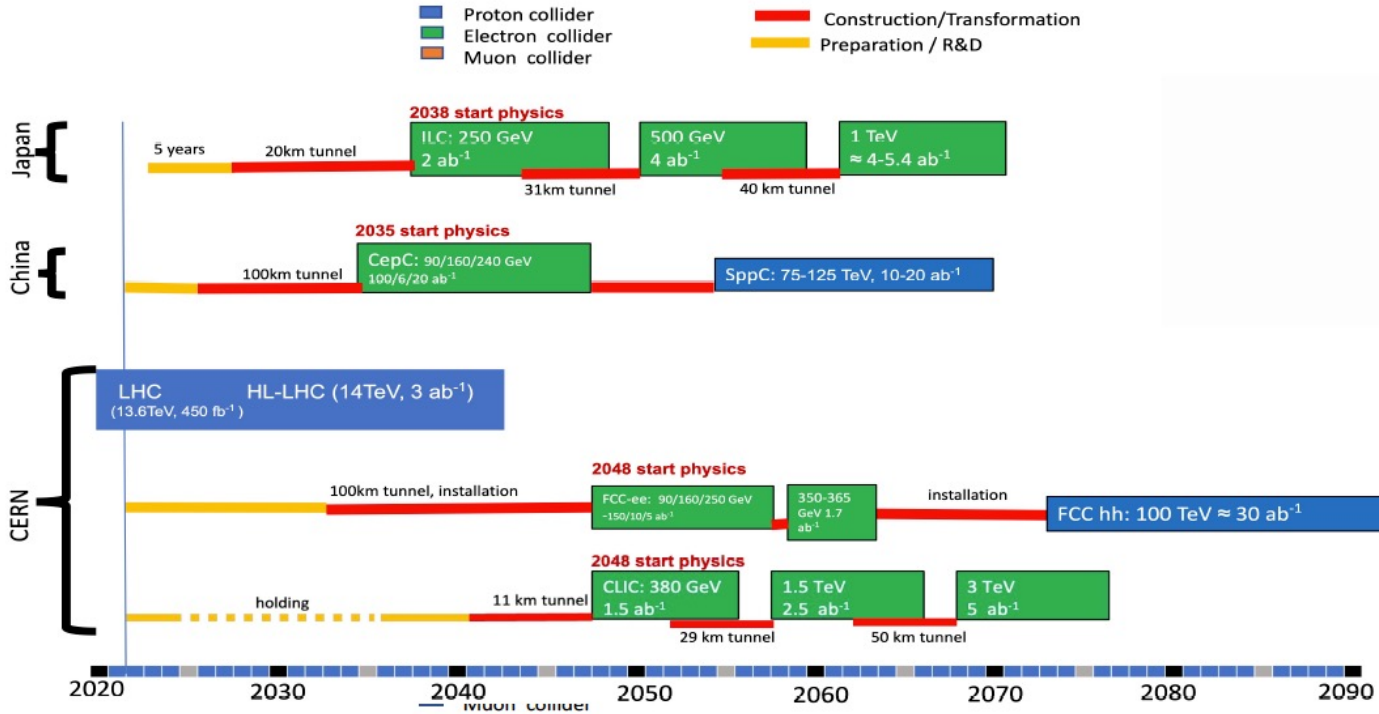

**FCC-eh (60 GeV electron beams)  
 Ecms = 3.5 TeV, CDR of the FCC**

ep-collisions in parallel with normal pp operation of hadron colliders

e-beam could be produced used ERLs !

# Collider timescales after Snowmass 2021

## Proposals emerging from Snowmass 2021 for a US based collider

© Snowmass 2023 : Collider implementation Task Force

Technical risk categories (darker blue is higher risk).

”Design status”:

I - TDR complete

II - CDR complete

III - substantial documentation

IV - limited documentation and parameter table

V - parameter table

“Overall risk tier”:

1 – lower overall technical risk

...

4 – multiple technologies require further R&D

Proposal Name (c.m.e. in TeV)	Collider Design Status	Lowest TRL Category	Technical Validation Requirement	Cost Reduction Scope	Performance Achievability	Overall Risk Tier
FCCee-0.24	II					1
CEPC-0.24	II					1
ILC-0.25	I					1
CCC-0.25	III					2
CLIC-0.38	II					1
CERC-0.24	III					2
ReLiC-0.24	V					2

## Power, complexity, environmental impact

Summary table of categories of electric power consumption, size, complexity and required radiation mitigation.

Darker blue means more impact.

Proposal Name	Power Consumption	Size	Complexity	Radiation Mitigation
FCC-ee (0.24 TeV)	290	91 km	I	I
CEPC (0.24 TeV)	340	100 km	I	I
ILC (0.25 TeV)	140	20.5 km	I	I
CLIC (0.38 TeV)	110	11.4 km	II	I
CCC (0.25 TeV)	150	3.7 km	I	I
CERC (0.24 TeV)	90	91 km	II	I
ReLiC (0.24 TeV)	315	20 km	II	I
ERLC (0.24 TeV)	250	30 km	II	I
XCC (0.125 TeV)	90	1.4 km	II	I
MC (0.13 TeV)	200	0.3 km	I	II
ILC (3 TeV)	~400	59 km	II	II
CLIC (3 TeV)	~550	50.2 km	III	II
CCC (3 TeV)	~700	26.8 km	II	II
ReLiC (3 TeV)	~780	360 km	III	I
MC (3 TeV)	~230	10-20 km	II	III
LWFA (3 TeV)	~340	1.3 km (linac)	II	I
PWFA (3 TeV)	~230	14 km	II	II
SWFA (3 TeV)	~170	18 km	II	II
MC (14 TeV)	~300	27 km	III	III
LWFA (15 TeV)	~1030	6.6 km	III	I
PWFA (15 TeV)	~620	14 km	III	II
SWFA (15 TeV)	~450	90 km	III	II
FCC-hh (100 TeV)	~560	91 km	II	III
SPPC (125 TeV)	~400	100 km	II	III

# Luminosity per power consumption

Peak Luminosity (per IP) per Input Power and Integrated Luminosity per TWh.

Luminosity is per IP and integrated luminosity assumes  $10^7$  sec/year

Data points are provided to the ITF by proponents of the respective machines.

The bands around the data points reflect approximate power consumption uncertainty for the different collider concepts

- **Initiatives for future colliders** are generally taken by a major laboratory and since HERA with contributions from international partners.
- For a **global initiative**, the field lacks the adequate coordination structure:
  - **CERN Council** includes government representatives and allows for shared governance and risk management, but is limited to the Member States
  - **ICFA** has a global representation but no forum for intergovernmental exchanges, binding exchanges.
  - Regional strategic exercises with cross-representation, but no “**global strategy**”
- **Is it necessary ? Or can we go without?**  
Depends on the funding options:
  - Predominant funding through the host laboratory carrying risks and having the final decision power:
    - **international** project (HERA, LHC...)
  - Shared funding, risk and decision taking
    - **global** project planning required (ITER, SKA...)
- Operations has so far been born by the host laboratory → may become a subject

- **Higgs factory** is the highest priority physics case, yet we also need to do **EW** and **QCD** precision measurements, **flavor physics**, **BSM** searches....
- **Strategic exercises** in Europe, the US, etc... lead to a detailed comparison of currently studied collider concepts and initiated new ideas
  - The **variety** of the developments and the innovation in the field is impressive !
- Mandatory to address **environmental aspects** in technical developments
  - HTS materials, klystron efficiencies, ERL, AI for beam design and control...
  - Major R&D efforts need to be understood globally
- **Collider concepts** are developed with different aims and time scales:
  - soon to be built Higgs factories
  - multi-TeV lepton colliders
  - 100 TeV hadron colliders
  - **Rich landscape for physics programs to come**
