# Grafana (<https://grafana.cygno.cloud.infn.it/>)

# Grafana (<https://grafana.cygno.cloud.infn.it/>)

We also want to invite people to use it and give us feedback:

- what is missing?
- what could be modified/improved?
- what is not clear?
- etc.

# Auto Reco

# Auto Reco overview

Virtual machine

Sentinel process with the following tasks:

- Check the **SQL database** to see if new run have arrived.
- If yes, Submit the Job using the **Official Reconstruction code**.
- Whole bunch of routines made to **monitor all the process** of: Submitting job, checking status, retrieve the output from the Queue machine, clean the Queue, update SQL database, upload the Output on the cloud storage, etc.
- Local dataframe create to show in **real-time the auto reco status** on Grafana Dashboard

HTCondor settings and Reco time:

- We have a dedicated queue only for the auto reco jobs with:
  - the possibility to run 16 jobs in parallel
  - Machines: 4 cores and 8Gb RAM (which give us 1 core per 2gb RAM)
- The reconstruction code is taking **3 seconds** (using the cythonize noise reduction) in average for each image (using 4 cores), ~20 minutes per Run.

# Auto Reco overview

Virtual machine

Sentinel process with the following tasks:

- Check the **SQL database** to see if new run have arrived.
- If yes, Submit the Job using the **Official Reconstruction code**.
- Whole bunch of routines made to **monitor all the process** of: Submitting job, checking status, retrieve the output from the Queue machine, clean the Queue, update SQL database, upload the Output on the cloud storage, etc.
- Local dataframe create to show in **real-time the auto reco status** on Grafana Dashboard

# Online Data Quality Monitor

# Online Data Quality Monitor

Here we have two options:

1. Develop a process similar to the autoreco to run over the reco output (but also accessing the .mid) and retrieve the relevant information to be shown by Grafana.
2. Add to the Reconstruction code the relevant Data Quality variables, in this way the AutoReco process will do all the job once, save it and Grafana is able to do the work of averaging the information in bunches of N seconds (Runs).

# Post Processing

# Post Processing

(more details on Emanuele's presentation)

Add to the Automatic Workflow also a second step taking the reco as input:

- This should be done for sure once, asap the reco is done;
- But also have the possibility to run async when we have an update of corrections, calibrations, output of discriminator algorithms that we want to make persistent in the friend ROOT trees.

**THANK YOU!**
