Clustering and two-body correlations within extended density functional approaches

XIX Conference on Theoretical Nuclear Physics in Italy (TNPI 2023)

Cortona - 11th-13th October, 2023

Speaker: S. Burrello

INFN - Laboratori Nazionali del Sud

Stefano Burrello Clustering and two-body correlations in EDF-based models

Outline of the presentation

- Theoretical approaches for nuclear many-body problem
 - Ab-initio vs phenomenological models based on energy density functionals (EDF)
 - Effective interaction and nuclear matter (NM) Equation of State (EoS)

2 Extended EDF-based models: recent developments and results

- Bridging ab-initio with phenomenological EDF approaches
 - Benchmark on microscopic pseudo-data for low-density neutron matter
 - Power counting analysis based on many-body perturbative expansion

Beyond mean-field: many-body correlations and clustering phenomena

- Neutron star (NS) crust modelization for a global and unified EoS
- Embedding short-range correlations within relativistic approaches

Further developments and outlooks

- Covariant formulation of the two-body quantal problem for bound states
- Inclusion of light-clusters within non-relativistic transport theories

Summary and perspectives

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Mean-field models for nuclear structure and reaction studies Link to ab-initio: low-density expansion and power counting

Outline of the presentation

- Theoretical approaches for nuclear many-body problem
 - Ab-initio vs phenomenological models based on energy density functionals (EDF)
 - Effective interaction and nuclear matter (NM) Equation of State (EoS)
- Extended EDF-based models: recent developments and results

Beyond mean-field: many-body correlations and clustering phenomenaaas

Further developments and outlooks

- Covariant formulation of the two-body quantal problem for bound states
- Inclusion of light-clusters within non-relativistic transport theories

> > NLO

 $(Q/\Lambda_{\chi})^2$

X

Theoretical models for EoS and finite nuclei

- Ab-initio approaches based on many-body (MB) expansion
 - Realistic or effective field theory (EFT) interactions
 - \Rightarrow Diagrammatic hierarchy (power counting)

- Phenomenological models with effective interaction
 - Self-consistent mean-field (MF) approximation
 - Fit of parameters to reproduce various data
- Energy Density Functional (EDF) theory

$$E = \langle \Psi | \, \hat{\mathcal{H}}_{\mathsf{eff}}(
ho) \, | \Psi
angle = \int \mathcal{E}(\mathsf{r}) d\mathsf{r} \xrightarrow[\mathsf{eq.}]{} \mathsf{EoS}$$

 $|\Psi
angle \equiv$ independent many-particle state

• Isovector component of EoS $\left(\beta \equiv \frac{\rho_n - \rho_p}{\rho}\right)$ \Rightarrow symmetry energy $S(\rho)$ out saturation ρ_0

$$\frac{E}{A}(\rho,\beta)\approx\frac{E}{A}(\rho,0)+S(\rho)\beta^2\quad S(\rho)=\mathsf{J}+\mathsf{L}\left(\frac{\rho-\rho_0}{3\rho_0}\right)+\ldots$$

• Description of ground state and excitations

Mean-field models for nuclear structure and reaction studies Link to ab-initio: low-density expansion and power counting

Nuclear structure: neutron skin and pygmy resonance

- Non-relativistic Skyrme-like EDF
- Structure of neutron-rich nuclei
 [Zheng et al., PRC 94(1), 014313 (2016)]
 [S. Burrello et al., PRC 99(5), 054314 (2019)]
- Neutron skin thickness $\Delta r_{np} \Leftrightarrow L$

- Time-Dependent-Hartree-Fock **(TDHF)** $i\hbar\dot{\rho}(t) + \left[\hat{\rho}, \hat{\mathcal{H}}_{eff}[\rho]\right] = 0$
- Isovector dipole (collective) excitations:
 - Pygmy Dipole Resonance (PDR)

Mean-field models for nuclear structure and reaction studies Link to ab-initio: low-density expansion and power counting

Merging nuclear structure and reaction studies

- Same framework as for nuclear structure \Rightarrow Merging with reaction studies
- Role of different terms of effective interaction (and EoS) on final outcomes
 - Importance of **momentum** dependent + surface terms (+ symmetry energy)
- Heavy ion collisions are reliable tools to extract information of EoS!

- Embedding short-range correlations within relativistic approaches

Further developments and outlooks

- Covariant formulation of the two-body quantal problem for bound states
- Inclusion of light-clusters within non-relativistic transport theories

Summary and perspectives

.

Mean-field models for nuclear structure and reaction studies Link to ab-initio: low-density expansion and power counting

Pure neutron matter (PNM) low-density expansion

- Dilute PNM ($a_s = -18.9 \text{ fm}$) \Rightarrow close to unitary limit of interacting Fermi gas
- Lee-Yang expansion in (a_sk_F) from EFT $(\nu_i = 2, 4$ for PNM, symmetric NM)

$$\frac{E}{N} = \frac{\hbar^2 k_F^2}{2m} \left[\frac{3}{5} + (\nu_i - 1) \frac{2}{3\pi} (k_F a_s) + (\nu_i - 1) \frac{4}{35\pi^2} (11 - 2\ln 2) (k_F a_s)^2 + \dots \right]$$

• New class of EDFs inspired by EFT \checkmark Application to drops & nuclei \Rightarrow surface

Mean-field models for nuclear structure and reaction studies Link to ab-initio: low-density expansion and power counting

Beyond MF: towards a power counting in EDF

- Beyond MF (BMF) ⇒ correlations taken into account (double-counting)
 - Hierarchy of interaction (and EoS) contributions \Rightarrow power counting in EDF
- EoSs at next-to-leading order (NLO) for symmetric NM (SNM) and PNM

- (t₀, t₃) Skyrme-like V_{LO}
- Renormalizability analysis
 - ✓ perturbative scheme
- Next-to-NLO (EFT-analysis):
 - 🗴 Expansion parameter
 - 🗡 Breakdown scale

[S. Burrello, C.J. Yang, M. Grasso, PLB 811, 13593 (2020)]

✓ BMF study of closed-shell nuclei [C.J. Yang et al., PRC 106 (1), L011305 (2022)]

Nuclear clusters, neutron stars EoS and Mott effect Short-range correlations, quasi-deuterons and dynamics

Outline of the presentation

Theoretical approaches for nuclear many-body problem
 Ab-initio vs phenomenological models based on energy density functionals (EDF)
 Effective interaction and nuclear matter (NM) Equation of State (EoS)

Extended EDF-based models: recent developments and results

- Bridging ab-initio with phenomenological EDF approaches
 - Benchmark on microscopic pseudo-data for low-density neutron matter
 - Power counting analysis based on many-body perturbative expansion.

Beyond mean-field: many-body correlations and clustering phenomena

- Neutron star (NS) crust modelization for a global and unified EoS
- Embedding short-range correlations within relativistic approaches

Further developments and outlooks

- Covariant formulation of the two-body guantal problem for bound states
- Inclusion of light-clusters within non-relativistic transport theories

Summary and perspectives

.

Nuclear clusters, neutron stars EoS and Mott effect Short-range correlations, guasi-deuterons and dynamics

Clustering phenomena and neutron star crust

- Many-body (short-range) correlations below ρ_0
 - Formation of **bound** state of nucleons (clustering)
- Phenomenological models with clusters
 - Dilute matter as a mixture of nucleons and nuclei \Rightarrow Nuclear statistical equilibrium (NSE) model

[A. R. Raduta, F. Gulminelli, PRC 82, 065801 (2010)]

Unified description of NS EoS & crust-core transition

Composition and heat capacity of NS inner crust [S. Burrello et al., PRC 92, 055804 (2015)]

Cell 4

Cell 10

T [MeV]

0.5

Nuclear clusters, neutron stars EoS and Mott effect Short-range correlations, quasi-deuterons and dynamics

In-medium effects and cluster dissolution

- Geometrical excluded-volume mechanism
- Microscopic in-medium effects \Rightarrow Mass-shift (Δm)
- Generalized relativistic density functional (GRDF)
 ⇒ Meson exchange with density dependent couplings

[S. Typel et al., PRC 81, 015803 (2010)]

- $\Delta m^{(\text{low})}$ from in-medium MB Schrödinger equation $\rightarrow \Delta m(\rho, \beta, T)$
 - Modification of the (effective) binding energy $\mathsf{B} \to B^{\mathrm{eff}} = B \Delta m$
- Heuristic extrapolation beyond Mott density to prevent the clusters to reappear

Stefano Burrello

Nuclear clusters, neutron stars EoS and Mott effect Short-range correlations, quasi-deuterons and dynamics

Mean-field framework and short-range correlations

- Cluster-free NM above n₀: Free Fermi gas (FFG)
 ⇒ step function in momentum distribution at zero T
- Nucleon knock-out in inelastic electron scattering [O. Hen et al. (CLAS Coll.), Science 346, 614 (2014)]
 - Smearing of Fermi surface in cold nucleonic matter
 - High momentum tail (HMT) decreasing with $\sim |{f k}|^{-4}$
- Nucleon-nucleon short-range correlations (SRCs)
 - Tensor components or repulsive core of nuclear forces
 - Two-body (2B) correlations in np ³S₁ channel ⇒ quasi-deuteron
 - $\bullet\,$ Pairs amount to $\approx\,20\%\,$ of the nucleon density
- Embedding SRCs in **GRDF** model through in-medium modifications of $\Delta m_i^{\text{(high)}}$

Nuclear clusters, neutron stars EoS and Mott effect Short-range correlations, quasi-deuterons and dynamics

Quasi-deuterons as surrogate for SRCs in GRDF

- $T = 0 \Rightarrow$ **boson condensate** of deuterons under chemical potentials **equilibrium**
 - With scalar (S_i) , vector (V_i) and rearrangement $(W_i, W_i^{(r)})$ potentials (i = nuc, d)

$$\mu_{d} = \mu_{n} + \mu_{p} \Rightarrow \qquad m_{d}^{*} + \Delta m_{d}^{(\text{high})} + V_{d}' = \sqrt{k_{n}^{2} + (m_{n}^{*})^{2}} + V_{n}' + \sqrt{k_{p}^{2} + (m_{p}^{*})^{2}} + V_{p}'$$

$$\begin{split} m_i^* &= m_i - S_i \qquad S_i = \chi_i A_i C_\sigma n_\sigma \qquad V_i = \chi_i A_i \left(C_\omega n_\omega + C_\rho n_\rho \right) \\ W_i &= \frac{1}{2} \left(C'_\omega n_\omega^2 + C'_\rho n_\rho^2 - C'_\sigma n_\sigma^2 \right) \qquad V'_i = V_i + W_i + W_i^{(r)} \end{split}$$

$$W_i^{(r)} = n_d \frac{\partial \Delta m_d^{(\text{high})}}{\partial n_i} \qquad C_j = \frac{\Gamma_j^2(n_b)}{m_j^2} \qquad C'_j = \frac{dC_j}{dn_b}, \qquad j = \sigma, \omega, \rho$$

•
$$m_{\text{nuc}}^* \ge 0 \Rightarrow 0 \le X_d \le \min\left\{X_d^{(\max)}, 1 - |\beta|\right\}, \ X_d^{(\max)} = \frac{m_{\text{nuc}}}{\chi_d \, C_\sigma \, n_b} \xrightarrow[n_b \to \infty]{} 0$$

- Crucial role of scaling factor $\chi_d \equiv \chi$ for the deuteron-meson coupling strenght
- $\chi = 1 \Rightarrow$ same strength as for free nucleons
- $\chi < 1 \Rightarrow$ in-medium effects and description of chemical equilibrium constant [L. Qin et al., PRL 108, 172701 (2012); R. Bougault et al., J. Phys. G 47, 025103 (2020)]

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Nuclear clusters, neutron stars EoS and Mott effect Short-range correlations, quasi-deuterons and dynamics

Deuteron mass-shift parametrization: $\chi = 1/\sqrt{2}$

• Unified mass-shift parameterization ($\gamma=1$) [S. Burrello, S. Typel, EPJA 58, 120 (2022)]

$$\Delta m_d(x) = \frac{ax}{1+bx} + cx^{\eta+1} \left[1 - \tanh(x)\right] + fx^{\gamma} \tanh(gx), \qquad x = \frac{n_b}{n_0}$$

Clustering and two-body correlations in EDF-based models

Stefano Burrello

Nuclear clusters, neutron stars EoS and Mott effect Short-range correlations, quasi-deuterons and dynamics

Deuteron mass-shift parametrization: $\chi = 1/\sqrt{2}$

• Unified mass-shift parameterization $(\gamma=1)$ [S. Burrello, S. Typel, EPJA 58, 120 (2022)]

$$\Delta m_d(x) = \frac{ax}{1+bx} + cx^{\eta+1} \left[1 - \tanh(x)\right] + fx^{\gamma} \tanh(gx), \qquad x = \frac{n_b}{n_0}$$

Nuclear clusters, neutron stars EoS and Mott effect Short-range correlations, quasi-deuterons and dynamics

Impact on SNM EoS and symmetry energy

• Softening of the SNM EoS at ho_0 and stiffening of symmetry energy at high-ho

Nuclear clusters, neutron stars EoS and Mott effect Short-range correlations, quasi-deuterons and dynamics

Outline of the presentation

- Theoretical approaches for nuclear many-body problem
 - Ab-initio vs phenomenological models based on energy density functionals (EDF)
 - Effective interaction and nuclear matter (NM) Equation of State (EoS).

Extended EDF-based models: recent developments and results

🗢 Bridging ab-initio with phenomenological 606 approaches

Beyond mean-field many-body correlations and clustering phenomena.

Further developments and outlooks

- Covariant formulation of the two-body quantal problem for bound states
- Inclusion of light-clusters within non-relativistic transport theories

Summary and perspectives

.

Nuclear clusters, neutron stars EoS and Mott effect Short-range correlations, quasi-deuterons and dynamics

Covariant formulation of 2B quantal problem

- Single-nucleon momentum distribution \Rightarrow in-medium 2B wave function (wf)
- Self-consistent calculation with relativistic MF effective interaction
- Covariant formulation of 2B quantal problem
 - Bethe-Salpeter approach (existence of negative-norm "ghost" states)
 - Breit equation (singular operators unmanageable non-perturbatively)
 - Two-body Dirac equations (2BDEs) of Dirac's constrained dynamics

[H. W. Crater & P. Van Alstine, Annals Phys. 148 (1983) 57-94]

Covariant description of deuteron bound and scattering states through 2BDEs

[S. Typel & S. Burrello, in preparation]

Stefano Burrello

Nuclear clusters, neutron stars EoS and Mott effect Short-range correlations, quasi-deuterons and dynamics

Clusters in non-relativistic transport theories

- Kinetic approach to production of light nuclei undergoing the Mott effect
 - BUU equations for distribution functions $f_i^{A \le 4}$ + cut-off ($\epsilon_j \equiv$ single-particle E)

 $\left(\partial_t + \nabla_{\mathbf{p}}\epsilon_j \cdot \nabla_{\mathbf{r}} - \nabla_{\mathbf{r}}\epsilon_j \cdot \nabla_{\mathbf{p}}\right)f_j = I_{coll}[f_j] \qquad \Rightarrow \qquad \partial_t(\delta f_j) + \nabla_{\mathbf{r}}(\delta f_j) \cdot \nabla_{\mathbf{p}}\epsilon_j^0 - \nabla_{\mathbf{p}}f_j^0 \cdot \nabla_{\mathbf{r}}(\delta \epsilon_j) = 0$

- Inclusion of Δm_j and P_{Mott} in collision integral I_{coll} (in progress) [see R. Wang's talk]
- Impact on spinodal instabilities (underlying larger fragments formation)
 - Linearized Vlasov equations for SNM+d under small fluctuations $f_j \approx f_j^0 + \delta f_j$
- Enhanced **instability growth** rate Γ/k of **density** fluctuations $\delta \rho$
 - Large effect at higher T ($X_d \neq 0$ for (ρ, T) \lesssim (0.1 fm⁻³,15 MeV))

Stefano Burrello

Clustering and two-body correlations in EDF-based models

 $\lambda = 2\pi/k$

Nuclear clusters, neutron stars EoS and Mott effect Short-range correlations, quasi-deuterons and dynamics

Clusters in non-relativistic transport theories

- Kinetic approach to production of light nuclei undergoing the Mott effect
 - BUU equations for distribution functions $f_i^{A \le 4}$ + cut-off ($\epsilon_j \equiv$ single-particle E)

 $\left(\partial_{t} + \nabla_{\mathsf{p}}\epsilon_{j} \cdot \nabla_{\mathsf{r}} - \nabla_{\mathsf{r}}\epsilon_{j} \cdot \nabla_{\mathsf{p}}\right)f_{j} = I_{coll}[f_{j}] \qquad \Rightarrow \qquad \partial_{t}(\delta f_{j}) + \nabla_{\mathsf{r}}(\delta f_{j}) \cdot \nabla_{\mathsf{p}}\epsilon_{j}^{0} - \nabla_{\mathsf{p}}f_{j}^{0} \cdot \nabla_{\mathsf{r}}(\delta\epsilon_{j}) = 0$

- Inclusion of Δm_j and P_{Mott} in collision integral I_{coll} (in progress) [see R. Wang's talk]
- Impact on spinodal instabilities (underlying larger fragments formation)
 - Linearized Vlasov equations for SNM+d under small fluctuations $f_j \approx f_j^0 + \delta f_j$
- Enhanced **instability growth** rate Γ/k of **density** fluctuations $\delta \rho$
 - Large effect at higher T ($X_d \neq 0$ for (ρ, T) \lesssim (0.1 fm⁻³,15 MeV))

Stefano Burrello

Nuclear clusters, neutron stars EoS and Mott effect Short-range correlations, quasi-deuterons and dynamics

Outline of the presentation

- Theoretical approaches for nuclear many-body problem
 - Ab-initio vs phenomenological models based on energy density functionals (EDF)
 - Effective interaction and nuclear matter (NM) Equation of State (EoS).

Extended EDF-based models: recent developments and results

🗢 Bridging ab-initio with phenomenological 606 approaches

Dependencean-fields many-bady-correlations and clustering-phenomenaand clusteringphenomenaand clusteringphenomenaand clusteringphenomenaand clusteringphenomenaphenom

Further developments and outlooks

- Covariant formulation of the two-body guantal problem for bound states
- Inclusion of light-clusters within non-relativistic transport theories

Summary and perspectives

→ 3 → < 3</p>

Nuclear clusters, neutron stars EoS and Mott effect Short-range correlations, quasi-deuterons and dynamics

Final remarks and conclusions

Main topic

- Bridging ab-initio with phenomenological EDF approaches
- Beyond mean-field extension: many-body correlations and clustering

Main results

- Application to neutron drops and nuclei of ab-initio-benchmarked EDFs
- NLO perturbativity of renormalized scheme compatible with power counting
- Neutron star crust composition and effects of clusters on cooling process
- Embedding SRCs through quasi-deuterons within relativistic approach

Further developments and outlooks

- Improving properties of EFT-inspired EDFs and full EFT-analysis
- Inclusion of SRCs at finite T and light clusters within a kinetic approach
- Momentum distribution from in-medium wf + comparison with experiments
