These approaches cannot solve the NH problem

Why?

The EFT nature of the SM not properly and fully taken into account

Statement: The SM in an Effective Theory

Meaning:

(A) the parameters (masses, couplings) $g_i(\Lambda)$ in $\mathcal{L}_{SM}^{(\Lambda)}$ result from integrating out the higher energy dof related to the UV completion of the SM

(B) the same parameters $g_i(\mu)$ at scales $\mu < \Lambda$ result from integrating out the modes of the fields that appear in $\mathcal{L}_{SM}^{(\Lambda)}$ in the range $[\mu, \Lambda]$.

Wilson's Lesson

Wilson RG equations - One component Scalar Theory

Action
$$S_{\Lambda}[\Phi] = \int d^4 x \mathcal{L}_{\Lambda}$$
 with $\Phi(x) = \sum_{0 < |p| < \Lambda} \varphi_p e^{ipx}$
 $\Phi(x) = \varphi(x) + \varphi'(x); \quad \varphi(x) = \sum_{0 < |p| < k} \varphi_p e^{ipx} \quad \varphi'(x) = \sum_{k < |p| < \Lambda} \varphi_p e^{ipx}$
Wilsonian Action at $k < \Lambda$ $S_k[\varphi] \Leftrightarrow e^{-S_k[\varphi]} \equiv \int D[\varphi'] e^{-S_{\Lambda}[\varphi + \varphi']}$
Wilsonian Action at $k - \delta k$ $S_{k-\delta k}[\varphi] \Leftrightarrow e^{-S_{k-\delta k}[\varphi]} = \int D[\varphi'] e^{-S_k[\varphi + \varphi']}$
 $\varphi(x) = \sum_{0 < |p| < k - \delta k} \varphi_p e^{ipx} \qquad \varphi'(x) = \sum_{k-\delta k < |p| < k} \varphi_p e^{ipx}$
Legendre Effective Action $\Gamma[\varphi] = S_{k=0}[\varphi]$; Action $S_{\Lambda}[\varphi] = S_{k=\Lambda}[\varphi]$

Wilson's lesson

Scalar ϕ^4 theory 00000

Standard Model 0000000000

$$S_{k-\delta k}[\varphi] = -\ln\left(\int D[\varphi']e^{-S_{k}[\varphi+\varphi']}\right)$$
$$\varphi(x) = \sum_{0 < |p| < k-\delta k} \varphi_{p}e^{ipx} \qquad \varphi'(x) = \sum_{k-\delta k < |p| < k} \varphi_{p}e^{ipx}$$

$$S_{k}[\varphi] = \int d^{4}x \left(\frac{U_{k}(\varphi)}{2} + \frac{Z_{k}(\varphi)}{2} \partial_{\mu}\varphi \partial_{\mu}\varphi + Y_{k}(\varphi) (\partial_{\mu}\varphi \partial_{\mu}\phi)^{2} + W_{k}(\varphi) (\varphi \partial_{\mu}\partial_{\mu}\varphi)^{2} + \cdots \right)$$

Local Potential Approximation $Z_k(\varphi) = 1$, $Y_k(\varphi) = W_k(\varphi) = \cdots = 0$

Homogeneous background
$$\varphi(x) = \varphi_0$$
 $\left(U_k''(\varphi) \equiv \frac{\partial^2 U_k(\varphi)}{\partial \varphi^2} \right)$

Limit $\delta k \rightarrow 0$: Wegner-Houghton equation

$$k\frac{\partial}{\partial k}U_{k}(\varphi_{0}) = -\frac{k^{4}}{16\pi^{2}}\ln\frac{k^{2}+U_{k}^{\prime\prime}(\varphi_{0})}{k^{2}+U_{k}^{\prime\prime}(0)}$$

. . .

Scalar ϕ^4 theory 00000

Non-perturbative RG equation for $U_k(\varphi_0)$. Inserting in this equation the polynomial expansion (Z(2) symmetry $\varphi_0 \rightarrow -\varphi_0$ assumed)

$$U_k(\varphi_0) = \frac{1}{2}m_k^2\varphi_0^2 + \frac{\lambda_k}{4!}\varphi_0^4 + \frac{\lambda_k^{(6)}}{6!}\varphi_0^6 + \frac{\lambda_k^{(8)}}{8!}\varphi_0^8 + \cdots$$

 \Rightarrow **RG Equations for the couplings** (here for d = 4, but more general)

$$k \frac{dm_k^2}{dk} = -\frac{k^4}{16\pi^2} \frac{\lambda_k}{k^2 + m_k^2}$$
$$k \frac{d\lambda_k}{dk} = -\frac{k^4}{16\pi^2} \left[\frac{\lambda_k^{(6)}}{k^2 + m_k^2} - 3\frac{\lambda_k^2}{(k^2 + m_k^2)^2} \right]$$
$$k \frac{d\lambda_k^{(6)}}{dk} = -\frac{k^4}{16\pi^2} \left[\frac{\lambda_k^{(8)}}{k^2 + m_k^2} - 15\frac{\lambda_k\lambda_k^{(6)}}{(k^2 + m_k^2)^2} + 30\frac{\lambda_k^3}{(k^2 + m_k^2)^3} \right]$$

Scalar ϕ^4 theory \bullet 0000 Standard Model 0000000000

Wilson RG equations for ϕ^4 theory

 $\begin{array}{ll} \text{Wilsonian action} & S_k[\phi] = \int d^4 \, x \left(\frac{1}{2} \, \partial_\mu \phi \, \partial_\mu \phi + U_k(\phi) \right) \\ \text{Truncating the potential} & U_k(\phi) = \frac{1}{2} m_k^2 \phi^2 + \frac{1}{4!} \lambda_k \phi^4 \quad \Rightarrow \end{array}$

$$krac{dm_k^2}{dk} = -rac{k^4}{16\pi^2}rac{\lambda_k}{k^2+m_k^2} \ krac{d\lambda_k}{dk} = rac{k^4}{16\pi^2}rac{3\lambda_k^2}{(k^2+m_k^2)^2}$$

When $m_k^2 \ll k^2$ in the whole range of integration, well approximated by

$$krac{dm_k^2}{dk}=-rac{\lambda_k}{16\pi^2}k^2+rac{\lambda_k}{16\pi^2}m_k^2
krac{d\lambda_k}{dk}=rac{3\lambda_k^2}{16\pi^2}$$

Taking "SM-like" boundaries, $m(\mu_F) = 125.7$ GeV and $\lambda(\mu_F) = 0.1272$, numerical solutions to the two systems coincide with **great accuracy** (!) Vilson's lesson DOOO ◆□▶ ◆□▶ ◆□▶ ◆□▶ ●□□ のQ@

Non-perturbative, excellent approximate solution, obtained replacing $\lambda_k \to \lambda$ in the rhs of the RG equation for m_k^2

$$m^{2}(\mu) = \left(\frac{\mu}{\Lambda}\right)^{\frac{\lambda}{16\pi^{2}}} \underbrace{\left(m_{\Lambda}^{2} + \frac{\lambda\Lambda^{2}}{32\pi^{2} - \lambda}\right)}_{\text{UV completion fine-tuning}} - \underbrace{\frac{\lambda\mu^{2}}{32\pi^{2} - \lambda}}_{\text{Quadratic running}}$$

Non-perturbative, excellent approximate solution, obtained replacing $\lambda_k \to \lambda$ in the rhs of the RG equation for m_k^2

Contains several lessons

1. Shows how **fine-tuning** operates in **Wilsonian framework**. Boundary at Λ : m_{Λ}^{2} and $\frac{\lambda \Lambda^{2}}{32\pi^{2}-\lambda}$ need to be fine-tuned if at μ_{F} we have $m_{\mu_{F}} \sim O(100)$ GeV.

Scalar ϕ^4 theory 0000

▲□▶ ▲□▶ ▲□▶ ▲□▶ ヨ□ のへで

Non-perturbative, excellent approximate solution, obtained replacing $\lambda_k \to \lambda$ in the rhs of the RG equation for m_k^2

Contains several lessons

- 1. Shows how fine-tuning operates in Wilsonian framework. Boundary at Λ : m_{Λ}^{2} and $\frac{\lambda \Lambda^{2}}{32\pi^{2}-\lambda}$ need to be fine-tuned if at μ_{F} we have $m_{\mu_{F}} \sim \mathcal{O}(100)$ GeV.
- 2. For most of the running towards the IR, flow dominated by the μ^2 term. When $\left(m_{\Lambda}^2 + \frac{\lambda\Lambda^2}{32\pi^2 - \lambda}\right) \sim \frac{\lambda\mu^2}{32\pi^2 - \lambda}$, first term takes over (perturbative running)

Wilson's lesson 0000 Scalar ϕ^4 theory 00000

Standard Model 0000000000

$$m^{2}(\mu) = \left(\frac{\mu}{\Lambda}\right)^{\frac{\lambda}{16\pi^{2}}} \left(m_{\Lambda}^{2} + \frac{\lambda\Lambda^{2}}{32\pi^{2} - \lambda}\right) - \frac{\lambda\mu^{2}}{32\pi^{2} - \lambda}$$

Wilson's lesson 0000 Scalar ϕ^4 theory 00000

Standard Model 0000000000

$$m^{2}(\mu) = \left(rac{\mu}{\Lambda}
ight)^{rac{\lambda}{16\pi^{2}}} \left(m_{\Lambda}^{2} + rac{\lambda\Lambda^{2}}{32\pi^{2} - \lambda}
ight) - rac{\lambda\mu^{2}}{32\pi^{2} - \lambda}$$

3. Defining the critical mass $m_{cr}^2(\mu)$ and the combination $m_r^2(\mu)$

$$m_{cr}^2(\mu) \equiv -rac{\lambda \, \mu^2}{32\pi^2 - \lambda} \quad \Rightarrow \quad m_r^2(\mu) \equiv m^2(\mu) - m_{cr}^2(\mu)$$

we see that $m_r^2(\mu)$ obeys the RG equation

 $(\gamma = \frac{\lambda}{16\pi^2} = \text{mass anomalous dimension at one-loop})$

$$\mu \frac{d}{d\mu} m_r^2(\mu) = \gamma m_r^2(\mu) \quad \Rightarrow \quad m_r^2(\mu) = \left(\frac{\mu}{\mu_0}\right)^{\frac{\lambda}{16\pi^2}} m_r^2(\mu_0)$$

きょう きょう きょう きょう きょう

Wilson's lesson 0000 Scalar ϕ^4 theory 00000

Standard Model 0000000000

$$m^2(\mu) = \left(rac{\mu}{\Lambda}
ight)^{rac{\lambda}{16\pi^2}} \left(m_{\Lambda}^2 + rac{\lambda\Lambda^2}{32\pi^2 - \lambda}
ight) - rac{\lambda\mu^2}{32\pi^2 - \lambda}$$

3. Defining the critical mass $m_{cr}^2(\mu)$ and the combination $m_r^2(\mu)$

$$m_{cr}^2(\mu) \equiv -rac{\lambda \, \mu^2}{32\pi^2 - \lambda} \quad \Rightarrow \quad m_r^2(\mu) \equiv m^2(\mu) - m_{cr}^2(\mu)$$

we see that $m_r^2(\mu)$ obeys the RG equation

 $(\gamma = \frac{\lambda}{16\pi^2} =$ mass anomalous dimension at one-loop)

$$\mu \frac{d}{d\mu} m_r^2(\mu) = \gamma m_r^2(\mu) \quad \Rightarrow \quad m_r^2(\mu) = \left(\frac{\mu}{\mu_0}\right)^{\frac{\lambda}{16\pi^2}} m_r^2(\mu_0)$$

 \Rightarrow The above equation is nothing but the one-loop improved RG equation for the renormalized running mass $\Rightarrow m_r^2(\mu)$ is the renormalized running mass

▲□▶ ▲□▶ ▲□▶ ▲□▶ ヨ□ のへで

Comments: We derived the equation

$$\mu \frac{d}{d\mu} m_r^2(\mu) = \frac{\lambda}{16\pi^2} m_r^2(\mu)$$
(2)

in the Wilsonian framework, namely from the Wilsonian RG flow equation

$$\mu \frac{d}{d\mu} m^2(\mu) = -\frac{\lambda}{16\pi^2} \mu^2 + \frac{\lambda}{16\pi^2} m^2(\mu)$$
(3)

after subtracting $m_{cr}^2(\mu)$. Usually Eq. (2) derived in the context of "**technical** schemes": dimensional, heat kernel, zeta function regularization, ...

This gives direct access to Eq. (2). Info that $m_r^2(\mu)$ is physically obtained only after the subtraction: $m^2(\mu) \rightarrow m_r^2(\mu) \equiv m^2(\mu) - m_{cr}^2(\mu)$ lost!

When quantum fluctuations calculated within the Wilsonian "physical scheme"

⇒ we see how the renormalized mass emerges

Questions

Question 1: Should we identify the **physical** running mass $m_{phys}^2(\mu)$ with the original (Wilsonian) $m^2(\mu)$, or with the subtracted (renormalized) $m_r^2(\mu)$?

Running couplings $g_i(\mu) \Leftarrow$ integrating out quantum fluctuations in $[\mu, \Lambda]$ $g_i(\mu)$: effective couplings at the scale μ . True, in particular, for the mass.

 \Rightarrow Identify $m_{phys}^2(\mu)$ with $m^2(\mu)$ not with the subtracted $m_r^2(\mu)$

Scalar ϕ^4 theory 0000

Standard Model 0000000000

Questions

Question 1: Should we identify the **physical** running mass $m_{phys}^2(\mu)$ with the original (Wilsonian) $m^2(\mu)$, or with the subtracted (renormalized) $m_r^2(\mu)$?

Running couplings $g_i(\mu) \Leftarrow$ integrating out quantum fluctuations in $[\mu, \Lambda]$ $g_i(\mu)$: effective couplings at the scale μ . True, in particular, for the mass.

 \Rightarrow Identify $m_{phys}^2(\mu)$ with $m^2(\mu)$ not with the subtracted $m_r^2(\mu)$

Question 2: in QFT textbooks $m_{phys}^2(\mu)$ usually identified with $m_r^2(\mu)$!?!?

Let us focus on how $m^2(\mu)$ and $m_r^2(\mu)$ depend on μ ... and note that:

For sufficiently low values of μ (IR regime) $m^2(\mu)$ and $m_r^2(\mu)$ coincide

$$\frac{\lambda\mu^2}{32\pi^2 - \lambda} \ll \left(\frac{\mu}{\Lambda}\right)^{\frac{\lambda}{16\pi^2}} \left(m_{\Lambda}^2 + \frac{\lambda\Lambda^2}{32\pi^2 - \lambda}\right)$$

The above relation shows the **limitations** of the renormalized RG equation (2). If we are interested in energy scales μ above this region, we must go back to the original flow equation (3), that has a much wider range of validity

Scalar ϕ^4 theory 00000

Standard Model •000000000

Standard Model - RG Equation for the Higgs mass

$$\mu rac{d}{d\mu} m_H^2 = rac{lpha(\mu)}{16\pi^2} \mu^2 + \gamma(\mu) m_H^2$$

 $\alpha(\mu)$: combination of SM couplings (gauge, Yukawa, scalar). At one-loop: $16\pi^2\alpha(\mu) = 12y_t^2 - 12\lambda - \frac{3}{2}g_1^2 - \frac{9}{2}g_2^2$

 $\gamma(\mu)$: mass anomalous dimension

$$16\pi^2\gamma(\mu) = 6y_t^2 + 12\lambda - rac{3}{2}g_1^2 - rac{9}{2}g_2^2$$

Integrating the RG equation for $m_H^2(\mu)$

$$m^{2}(\mu) = \left(\frac{\mu}{\Lambda}\right)^{\gamma} \underbrace{\left(m^{2}_{H}(\Lambda) - \frac{\alpha\Lambda^{2}}{2-\gamma}\right)}_{\text{UV completion fine-tuning}} - \underbrace{\frac{\alpha\mu^{2}}{2-\gamma}}_{\text{Quadratic running}}$$

Very good analytical approximation to the flow

Scalar ϕ^4 theory 00000

As for Scalar Theory: critical mass $m_{H,cr}^2(\mu)$ and subtracted mass $m_{H,r}^2(\mu)$

$$m_{H,\mathrm{cr}}^2(\mu)\equiv rac{lpha\,\mu^2}{2-\gamma} \qquad ext{ and } \qquad m_{H,r}^2(\mu)\equiv m_H^2(\mu)-m_{H,\mathrm{cr}}^2(\mu)$$

From which we immediately have

$$\mu \frac{d}{d\mu} m_{H,r}^2(\mu) = \gamma \ m_{H,r}^2(\mu) \qquad \Rightarrow \qquad m_{H,r}^2(\mu) = \left(\frac{\mu}{\mu_0}\right)^{\gamma} m_{H,r}^2(\mu_0)$$

The above equation **coincides** with the one-loop improved RG equation for the renormalized running mass $\Rightarrow m_{H,r}^2(\mu)$ = **renormalized running Higgs mass**

However the original equation (together with the solution) is

$$\mu \frac{d}{d\mu} m_{H}^{2} = \frac{\alpha(\mu)}{16\pi^{2}} \mu^{2} + \gamma(\mu) m_{H}^{2} \Rightarrow m_{H}^{2}(\mu) = \left(\frac{\mu}{\Lambda}\right)^{\gamma} \left(m_{H}^{2}(\Lambda) - \frac{\alpha \Lambda^{2}}{2 - \gamma}\right) + \frac{\alpha \mu^{2}}{2 - \gamma}$$

Change in the usual paradigm

$$\mu \frac{d}{d\mu} m_{H}^{2} = \frac{\alpha(\mu)}{16\pi^{2}} \mu^{2} + \gamma(\mu) m_{H}^{2} \quad ; \quad \mu \frac{d}{d\mu} m_{H,r}^{2}(\mu) = \gamma m_{H,r}^{2}(\mu)$$

The two flows $\operatorname{\mathbf{coincide}}$ for values of μ such that

$$\frac{\alpha \mu^2}{2-\gamma} \ll \left(\frac{\mu}{\Lambda}\right)^{\gamma} \left(m_{\mathcal{H}}^2(\Lambda) - \frac{\alpha \Lambda^2}{2-\gamma}\right)$$

Physical Lessons

 Fine-tuning of m²_H(Λ) has a profound physical meaning: provides the boundary at the UV scale Λ for the RG flow of m²_H(μ)

Vilson's lesson

Scalar ϕ^4 theory 00000

Standard Model

▲□▶ ▲□▶ ▲□▶ ▲□▶ ヨ□ のへで

Change in the usual paradigm

$$\mu \frac{d}{d\mu} m_{H}^{2} = \frac{\alpha(\mu)}{16\pi^{2}} \mu^{2} + \gamma(\mu) m_{H}^{2} \quad ; \quad \mu \frac{d}{d\mu} m_{H,r}^{2}(\mu) = \gamma m_{H,r}^{2}(\mu)$$

The two flows coincide for values of $\boldsymbol{\mu}$ such that

$$\frac{\alpha \, \mu^2}{2 - \gamma} \ll \left(\frac{\mu}{\Lambda}\right)^{\gamma} \left(m_{H}^2(\Lambda) - \frac{\alpha \, \Lambda^2}{2 - \gamma}\right)$$

Physical Lessons

- Fine-tuning of m²_H(Λ) has a profound physical meaning: provides the boundary at the UV scale Λ for the RG flow of m²_H(μ)
- Large hierarchy between UV and IR values of m_H^2 is physically necessary

Vilson's lesson 0000 Scalar ϕ^4 theory 00000

Standard Model

Change in the usual paradigm

- Quadratic running lasts for most of the $m_H^2(\mu)$ flow towards the IR
- Multiplicative renormalization emerges flowing towards IR. The "elbow" signals the "transition" additive \rightarrow multiplicative renormalization

Scalar ϕ^4 theory 00000

Standard Model

▲□▶ ▲□▶ ▲□▶ ▲□▶ ヨ□ のへで

Change in the usual paradigm

Usual **connection** between **QFT** and **Statistical Physics**: correspondence between the request $\xi \gg a$ in the **Theory of Critical Phenomena** (a =lattice spacing, $\xi =$ correlation length) and the request $m^2 \ll \Lambda^2$ in **QFT**

Phrased in RG language \rightarrow tuning towards the "critical surface", achieved through the subtraction of the "critical mass": $m_{ren}^2(\mu) = m^2(\mu) - m_{cr}^2(\mu)$

However: $m_{ren}^2(\mu)$ captures the IR final part of the running of $m_{phys}^2(\mu)$

Flow physically meaningful even far from critical surface and fixed points

▲□▶ ▲□▶ ▲□▶ ▲□▶ ヨ□ のへで

Nice Example. Landau-Ginzburg Theory - Ferromagnetic Transition

$$F_{k}[\phi] = \int d^{3}x \left(\frac{1}{2}(\vec{\nabla}\phi)^{2} + U_{k}(\phi)\right) \qquad U_{k}(\phi) = \frac{1}{2}m_{k}^{2}\phi^{2} + \frac{\lambda_{k}}{4!}\phi^{4}$$

$$k\frac{dm_{k}^{2}}{dk} = -\frac{k^{3}\lambda_{k}}{4\pi^{2}\left(k^{2} + m_{k}^{2}\right)} \qquad k\frac{d\lambda_{k}}{dk} = \frac{3k^{3}\lambda_{k}^{2}}{4\pi^{2}\left(k^{2} + m_{k}^{2}\right)^{2}}$$

Dimensionless couplings $\widetilde{m}_k^2 \equiv k^{-2} m_k^2$ and $\widetilde{\lambda}_k \equiv k^{-1} \lambda_k$

$$k\frac{d\widetilde{m}_{k}^{2}}{dk} = -2\widetilde{m}_{k}^{2} - \frac{\widetilde{\lambda}_{k}}{4\pi^{2}(1+\widetilde{m}_{k}^{2})} \qquad \qquad k\frac{d\widetilde{\lambda}_{k}}{dk} = -\widetilde{\lambda}_{k} + \frac{3\widetilde{\lambda}_{k}^{2}}{4\pi^{2}(1+\widetilde{m}_{k}^{2})^{2}}$$

Gaussian G and Wilson-Fisher WF fixed points. G is IR repulsive (UV attractive)

Blue and Red IR flows: Different boundaries in the UV region around G (Green: linearization) UV linearly divergent boundary (d=3) crucial for physics at WF: Ferromagnetic transition

Fine-tuning Physically needed

Vilson's lesson 2000 Scalar ϕ^4 theory 00000

Standard Model

▲□▶ ▲□▶ ▲□▶ ▲□▶ ヨ□ のへで

Physical tuning and Cosmological Constant

 $\Lambda_{cc}(\Lambda)$ needs to be fine-tuned to obtain $\Lambda_{cc}^{exp}\sim 10^{-120}M_p^2$ at the Fermi scale

Vilson's lesson

Standard Model

A D > < 回 > < 回 > < 回 > < 回 > < 回 > < 0 < 0</p>

Conclusions and outlook

- Wilson mandatory \Rightarrow Fine-tuning at the UV of the boundaries physically meaningful and mandatory
- IR region dictated by the UV completion: the Theory of Everything.
- In schemes as DR: direct access to the renormalized flow, but no physical content

Wilsonian RG

versus

Dimensional Regularization

Very useful example: Scalar Theory in *d*-dimensions

d = integer dimension (no dim reg)

• Wilsonian Effective Action: $S_k[\phi] = \int d^d x \left[\frac{1}{2} (\partial_\mu \phi)^2 + V_k(\phi) \right]$

Wilson (Polchinski) RG Equation (LPA)

$$k\frac{\partial}{\partial k}V_k(\phi) = -\frac{k^d}{(4\pi)^{\frac{d}{2}}\Gamma\left(\frac{d}{2}\right)}\ln\left(\frac{k^2 + V_k''(\phi)}{k^2}\right)$$

• UV boundary: $V_{\Lambda}(\phi) \equiv V_0(\phi) = \Omega_0 + \frac{m_0^2}{2}\phi^2 + \frac{\mu^{4-d}\lambda_0}{4!}\phi^4$

Approximating $V_k(\phi)$ in the rhs as $V_k(\phi) \rightarrow V_{\Lambda}(\phi)$ One-loop effective potential

$$V_{1l}(\phi) = V_0(\phi) + \underbrace{\frac{1}{2} \int^{(\Lambda)} \frac{d^d k}{(2\pi)^d} \ln\left(1 + \frac{m_0^2 + \frac{1}{2}\mu^{4-d}\lambda_0 \phi^2}{k^2}\right)}_{\delta V(\phi)}$$

Lesson: One-loop Effective Potential Approx. of the Wilsonian Potential

4 日 > 4 日 > 4 日 > 4 日 > 4 日 > 9 0 0

Let us focus on the Radiative Correction $\delta V(\phi)$

$$\delta V(\phi) = \frac{1}{2} \int^{(\Lambda)} \frac{d^d k}{(2\pi)^d} \ln\left(1 + \frac{M^2(\phi)}{k^2}\right) \equiv \delta V_1(\phi) + \delta V_2(\phi)$$

where

 $M^2(\phi) \equiv m_0^2 + rac{1}{2}\mu^{4-d}\lambda_0 \phi^2$

$$\begin{split} \delta \mathbf{V_1}(\phi) &\equiv \frac{\mu^d}{d(4\pi)^{\frac{d}{2}} \Gamma\left(\frac{d}{2}\right)} \left(\frac{M^2(\phi)}{\mu^2}\right)^{\frac{d}{2}} \int_{\frac{M^2}{M^2 + \Lambda^2}}^1 dt \, (1-t)^{\frac{d}{2}-1} \, t^{-\frac{d}{2}} \\ \delta \mathbf{V_2}(\phi) &\equiv \frac{\mu^d}{d(4\pi)^{\frac{d}{2}} \Gamma\left(\frac{d}{2}\right)} \left(\frac{\Lambda}{\mu}\right)^d \ln\left(1 + \frac{M^2(\phi)}{\Lambda^2}\right) \end{split}$$

Backup slides

Calculating $\delta V(\phi)$

For any integer d:

$$\delta V_1(\phi) = \frac{\mu^d}{d(4\pi)^{\frac{d}{2}} \Gamma\left(\frac{d}{2}\right)} \left(\frac{M^2(\phi)}{\mu^2}\right)^{\frac{d}{2}} \int_{\frac{M^2}{M^2 + \Lambda^2}}^1 dt \ t^{-\frac{d}{2}} (1-t)^{\frac{d}{2}-1} = \\ = \lim_{z \to d} \left[A_1(z) - A_2(z)\right]$$

where z is complex, and

$$A_{1}(z) \equiv F(z) \cdot \overline{B}\left(1 - \frac{z}{2}, \frac{z}{2}\right) \qquad A_{2}(z) \equiv F(z) \cdot \overline{B}_{i}\left(1 - \frac{z}{2}, \frac{z}{2}; \frac{M^{2}(\phi)}{M^{2}(\phi) + \Lambda^{2}}\right)$$
$$F(z) \equiv \frac{\mu^{z}}{z(4\pi)^{\frac{z}{2}}\Gamma\left(\frac{z}{2}\right)} \left(\frac{M^{2}(\phi)}{\mu^{2}}\right)^{\frac{z}{2}}$$

 \overline{B} and \overline{B}_i are (the analytic extensions of) the Beta functions Both \overline{B} and \overline{B}_i have poles in z = 2, 4, 6, ...

 $\delta V_1(\phi)$ finite \Rightarrow the poles of A_1 and A_2 have to cancel each other

Example: $\delta V(\phi)$ in d = 4 dimensions

 $z \equiv 4 - \epsilon$. Expanding in powers of ϵ and M^2/Λ^2

$$\begin{aligned} A_1(4-\epsilon) &= \frac{\mu^{-\epsilon} \left[M^2(\phi) \right]^2}{64\pi^2} \left(-\frac{2}{\epsilon} + \gamma + \ln \frac{M^2(\phi)}{4\pi\mu^2} - \frac{3}{2} \right) + \mathcal{O}(\epsilon) \\ A_2(4-\epsilon) &= \frac{\mu^{-\epsilon} \left[M^2(\phi) \right]^2}{64\pi^2} \left(-\frac{2}{\epsilon} + \gamma + \ln \frac{M^2(\phi)}{4\pi\mu^2} - \frac{3}{2} \right) + \mathcal{O}(\epsilon) + \mathcal{O}\left(\frac{M^2}{\Lambda^2} \right) \\ &- \frac{\mu^{-\epsilon}}{64\pi^2} \left[M^2(\phi) \right]^2 \left(\frac{\Lambda^2}{M^2(\phi)} - \log \frac{\Lambda^2}{M^2(\phi)} \right) \end{aligned}$$

Remember: $\delta V_1(\phi) = \lim_{\epsilon \to 0} [A_1(4-\epsilon) - A_2(4-\epsilon)]$. Adding $\delta V_2(\phi)$

$$\delta V(\phi) = \delta V_1 + \delta V_2 = \frac{\Lambda^2 M^2(\phi)}{32\pi^2} - \frac{\left[M^2(\phi)\right]^2}{64\pi^2} \left(\ln\frac{\Lambda^2}{M^2(\phi)} + \frac{1}{2}\right) + \mathcal{O}\left(\frac{\phi^5}{\Lambda^2}\right)$$

$$\Rightarrow \quad V_{1/}(\phi) = \Omega_0 + \frac{m_0^2}{2}\phi^2 + \frac{\lambda_0}{4!}\phi^4 + \frac{\Lambda^2 M^2}{32\pi^2} - \frac{\left(M^2\right)^2}{64\pi^2} \left(\ln\frac{\Lambda^2}{M^2} + \frac{1}{2}\right)$$

No reference whatsoever to ϵ (of course!)

きょう きょう きょう きょう きょう

"Dim Reg" versus "Wilson" (= "successive elimination of modes")

Views on "Dim Reg" and "Wilson"

1) Typical textbook statement ... "Dimensional Regularization has no direct physical interpretation" (J. Zinn-Justin - Quantum field theory of critical phenomena)

2) Recent ideas (gaining lot of followers)

"Maybe power divergences vanish because the ultimate unknown physical cut-off behaves like dimensional regularization" (M. Farina, D. Pappadopulo and A. Strumia, JHEP 08 (2013) 022)

"Wilsonian computation techniques attribute physical meaning to momentum shells of loop integrals" ... "The naturalness problem can be more generically formulated as a problem of the **Effective Theory Ideology**" (A. Salvio and A. Strumia, JHEP 06 (2014) 080)

Accordingly **DR** should have special physical properties that make it the **correct way** to calculate the quantum fluctuations ... while **Wilson** ... **incorrect** ...

Dim Reg.: Physical Meaning? ... Special Physical Properties?

$$\begin{split} V_{0}(\phi) &= \Omega_{0} + \frac{m_{0}^{2}}{2}\phi^{2} + \frac{\lambda_{0}}{4!}\phi^{4} = (\Omega + \delta\Omega_{\Lambda}) + \frac{1}{2}(m^{2} + \delta m_{\Lambda}^{2})\phi^{2} + \frac{1}{4!}(\lambda + - \delta\lambda_{\Lambda})\phi^{4} \\ &= (\Omega + \delta\Omega_{int} + \delta\Omega_{\epsilon}) + \frac{1}{2}(m^{2} + \delta m_{int}^{2} + \delta m_{\epsilon}^{2})\phi^{2} + \frac{1}{4!}(\lambda + \delta\lambda_{int} + \delta\lambda_{\epsilon})\phi^{4} \\ \Rightarrow \text{ Ren.Pot.}: \quad V_{1l}(\phi) &= \frac{1}{2}m^{2}\phi^{2} + \frac{\lambda}{4!}\phi^{4} + \frac{1}{64\pi^{2}}\left(m^{2} + \frac{\lambda}{2}\phi^{2}\right)^{2}\left[\ln\left(\frac{m^{2} + \frac{\lambda}{2}\phi^{2}}{\mu^{2}}\right) - \frac{3}{2}\right] \end{split}$$

Dim Reg.: Physical Meaning? ... Special Physical Properties?

DR secretly realizes the fine-tuning:

$$\begin{split} \delta\Omega_{int} &= -\frac{m^2\Lambda^2}{32\pi^2} + \frac{m^4}{64\pi^2} \left[\ln\left(\frac{\Lambda^2}{\mu^2}\right) - 1 \right] - \frac{m^4}{32\pi^2\overline{\epsilon}}\mu^{-\epsilon} \\ \delta m_{int}^2 &= -\frac{\lambda\Lambda^2}{32\pi^2} + \frac{\lambda m^2}{32\pi^2} \left[\ln\left(\frac{\Lambda^2}{\mu^2}\right) - 1 \right] - \frac{\lambda m^2}{16\pi^2\overline{\epsilon}} \\ \delta\lambda_{int} &= \frac{3\lambda^2}{32\pi^2} \left[\ln\left(\frac{\Lambda^2}{\mu^2}\right) - 1 \right] - \frac{3\lambda^2}{16\pi^2\overline{\epsilon}} \end{split}$$

DR has a Physical Meaning but No Special Physical Properties. It implements the Wilsonian iterative elimination of modes for including the quantum fluctuations in the Effective Theory, and **secretly** realizes the fine-tuning

Summary on DR

DR setting, "Bubble (2)", obtained by introducing an intermediate step, $(1) \rightarrow$ (2), in the process of obtaining the Renormalized Potential, "Bubble (3)". DR provides a shortcut: "Bubble (3)" is reached starting from "Bubble (2)". The fine-tuning step "Bubble (1)" \rightarrow "Bubble (2)" is skipped (secretly realized)

Lesson: DR is a way to implement the Wilson's strategy in the perturbative regime, where the *fine-tuning* (in the Wilsonian language: tuning toward the critical regime, critical surface) is secretly performed.

Naturalness and Dimensional Regularization

What should we then say on those attempts to solve the Naturalness/Hierarchy problem with DR?

- Classically Scale Invariant BSM. The theory does not possess mass or length scales ⇒ only dimension four operators
- Dimensional Regularization used ⇒ Scale Invariance only softly broken ⇒ apparently no fine-tuning needed ... seems good ...

▲□▶ ▲□▶ ▲□▶ ▲□▶ ヨ□ のへで

- ... But ... we have just shown ... DR secretly realizes the fine-tuning
- \Rightarrow No way to solve the Naturalness/Hierarchy problem with DR

"Wilson" versus "Perturbatively-Renormalized" RG Equations

Scalar Theory :
$$\mathcal{L}_{\Lambda} = \frac{1}{2} \left(\partial_{\mu} \phi_{\Lambda} \right)^2 + \frac{1}{2} m_{\Lambda}^2 \phi_{\Lambda}^2 + \frac{\lambda_{\Lambda}}{4!} \phi_{\Lambda}^4$$

Wilson-Polchinski RG Equations

 $\mu \frac{d\Omega}{d\mu} = -\frac{m^2 \mu^2}{16\pi^2} + \frac{m^4}{32\pi^2} \quad ; \quad \mu \frac{dm^2}{d\mu} = -\frac{\lambda \mu^2}{16\pi^2} + \frac{\lambda m^2}{16\pi^2} \quad ; \quad \mu \frac{d\lambda}{d\mu} = \frac{3\lambda^2}{16\pi^2}$ $\mu \in [0, \Lambda] \quad \text{is the running scale.} \quad \Lambda \text{ is the UV boundary (physical cut-off)}$

Define:

$$\begin{split} m_{\rm cr}^2(\mu) &\equiv \frac{\lambda(\mu)}{16\pi^2} \,\mu \,\delta\mu \quad \text{and} \quad \widetilde{m}^2(\mu - \delta\mu) \equiv m^2(\mu - \delta\mu) - m_{\rm cr}^2(\mu) \\ \Omega_{\rm cr}(\mu) &\equiv \frac{\widetilde{m}^2(\mu)}{16\pi^2} \,\mu \,\delta\mu \quad \text{and} \quad \widetilde{\Omega}(\mu - \delta\mu) \equiv \Omega(\mu - \delta\mu) - \Omega_{\rm cr}(\mu) \end{split}$$

Perturbatively-Renormalized RG Equations $~~(\delta\mu
ightarrow 0)$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ヨ□ のへで

$$\mu \frac{d\widetilde{\Omega}}{d\mu} = \frac{\widetilde{m}^4}{32\pi^2} = \beta_{\Omega} \quad ; \quad \mu \frac{d\widetilde{m}^2}{d\mu} = \frac{\lambda \widetilde{m}^2}{16\pi^2} = \widetilde{m}^2 \gamma_m \quad ; \quad \mu \frac{d\lambda}{d\mu} = \frac{3\lambda^2}{16\pi^2} = \beta_{\lambda}$$

The Perturbatively-Renormalized RG Equations contain the fine-tuning Physically: Tuning towards the Critical Surface

Well-known Standard Model perturbative RG equations (*)

$$\mu \frac{d}{d\mu} \lambda_i = \beta_{\lambda_i}$$
 $\mu \frac{d}{d\mu} m_H^2 = m_H^2 \gamma_m$
 $\lambda_i \ (i = 1, ..., 5)$ are the SM couplings

◆□▶ ◆□▶ ◆□▶ ◆□▶ ●□□ のQ@

(*) similarly for SM extensions

$$\mu \frac{d}{d\mu} m_H^2 = m_H^2 \gamma_m$$

Attempt 1 : Quantum Gravity "miracle"

 $m_{H}^{2}(\Lambda)\ll\Lambda^{2}$ With the SM perturbative γ_{m} $(\gamma_{m}\ll1)$ \Rightarrow

Apparently no Hierarchy Problem : $m_H^2(\Lambda) \sim m_H^2(\mu_F)$

...But ... remember ... in the above RG Equation m_H^2 is the tuned mass \Rightarrow Fine-tuning encoded in the RG Equation above

$$\mu \frac{d}{d\mu} m_H^2 = m_H^2 \gamma_m$$

Assumes Quantum Gravity might give a non-perturbative $\gamma_{\rm m}\sim 2~\Rightarrow$

Hierarchy can be tolerated : $m_H^2(\Lambda) \gg m_H^2(\mu_F)$

... But ... remember ... m_H^2 is the **tuned mass** \Rightarrow

Fine-tuning encoded in the above RG Equation

$$\mu \frac{d}{d\mu} m_H^2 = m_H^2 \gamma_m$$

Attempt 3 : $m_H^2(\mu)$ from $\lambda(\mu)$ and $v(\mu)$...

Apparently no large corrections : $m_H^2(\mu_F) \sim 125 \, \text{GeV}$

... However ... same problem as before ... Tuning encoded in the RG equation for the vev $v(\mu)$ (equivalent to the above RG equation for $m_H^2(\mu)$)

Attempt 4 : "Finite formulation" of QFT using RG equations à la Callan-Symanzik for the Green's functions ...

Apparently no quadratic corrections for the mass m^2 of scalar particles

However ... Tuning encoded in taking derivatives with respect to m^2 of the Green's functions, until they become finite

Callan has shown that this is just a way of implement the subtraction of Λ^2 and log Λ terms C. G. Callan, Jr., Conf. Proc. C 7507281, 41-77 (1975)

Backup slides

$$k\frac{dm_k^2}{dk} = -\frac{\lambda_k}{16\pi^2}k^2 + \frac{\lambda_k}{16\pi^2}m_k^2$$
$$k\frac{d\lambda_k}{dk} = \frac{3\lambda_k^2}{16\pi^2}$$

Can be solved analytically with no further approximations. Second Equation:

$$\lambda(\mu) = rac{\lambda_{\Lambda}}{1 - rac{3}{16\pi^2}\lambda_{\Lambda}\log\left(rac{\mu}{\Lambda}
ight)}$$

Inserting in the First Equation \Rightarrow **Non-perturbative** RG equation for $m^2(\mu)$ $(E_{\frac{2}{3}}(x)$ is the generalized exponential integral function $E_p(x)$ with $p = \frac{2}{3}$)

Nice features of this Non-perturbative evolution equation for $m^2(\mu)$ (replace $\lambda_{\Lambda} \rightarrow \lambda$)

1) Expanding for $\lambda \ll 1$ and $\mu^2 \ll \Lambda^2 \Rightarrow$ well-known perturbative result

$$m_{\mu}^2 = m_{\Lambda}^2 + rac{\lambda}{32\pi^2} \left(\Lambda^2 - m_{\Lambda}^2 \log rac{\Lambda^2}{\mu^2}
ight)$$

2) Also: very interesting **non-perturbative** approximation, obtained by replacing λ_k with λ in the rhs of the RG equation for $m^2(\mu)$

$$m_{\mu}^{2} = \left(\frac{\mu}{\Lambda}\right)^{\frac{\lambda}{16\pi^{2}}} \left(m_{\Lambda}^{2} + \frac{\lambda\Lambda^{2}}{32\pi^{2} - \lambda}\right) - \frac{\lambda\mu^{2}}{32\pi^{2} - \lambda}$$

Excellent approximation for $m^2(\mu)$ (see ugly equation previous page) Important result

▲□▶ ▲□▶ ▲□▶ ▲□▶ ヨ□ のへで

Wilsonian - Polchinski RG equations

Flow of the theory parameters:

$$\Lambda \frac{d}{d\Lambda} \Omega_0 = -\frac{m_0^2 \Lambda^2}{16\pi^2} + \frac{m_0^4}{32\pi^2} \qquad \Lambda \frac{d}{d\Lambda} m_0^2 = -\frac{\lambda_0 \Lambda^2}{16\pi^2} + \frac{\lambda_0 m_0^2}{16\pi^2} \qquad \Lambda \frac{d}{d\Lambda} \lambda_0 = \frac{3\lambda_0^2}{16\pi^2}$$

• From the Wegner-Houghton equation for d = 4, inserting the expansion $U_k(\phi) = \Omega_k + \frac{1}{2}m_k^2\phi^2 + \frac{1}{4!}\lambda_k\phi^4 + \frac{1}{6!}\lambda_k^{(6)}\phi^6 + \dots$ we have the flow equations:

$$\begin{aligned} k \frac{\partial \Omega_k}{\partial k} &= -\frac{k^4}{16\pi^2} \log\left(\frac{k^2 + m_k^2}{k^2}\right) \\ k \frac{\partial m_k^2}{\partial k} &= -\frac{k^4}{16\pi^2} \frac{\lambda_k}{k^2 + m_k^2} \\ k \frac{\partial \lambda_k}{\partial k} &= \frac{k^4}{16\pi^2} \frac{3\lambda_k^2}{(k^2 + m_k^2)^2} \end{aligned}$$

• Under the condition $k^2 \gg m_k^2$, i.e. in the UV regime, they reduce to the bare parameters flow equations.

Critical term

Finite difference RG equation for the mass:

$$m_{0}^{2}\left(\Lambda-\delta\Lambda
ight)=m_{0}^{2}\left(\Lambda
ight)+rac{\delta\Lambda}{\Lambda}rac{\lambda_{0}\left(\Lambda
ight)}{16\pi^{2}}\Lambda^{2}-rac{\delta\Lambda}{\Lambda}rac{\lambda_{0}\left(\Lambda
ight)m_{0}^{2}\left(\Lambda
ight)}{16\pi^{2}}+\mathcal{O}\left(rac{\delta\Lambda^{2}}{\Lambda^{2}}
ight)$$

• Subtracted mass parameter at the scale $\Lambda - \delta \Lambda$

$$\widetilde{m}^2(\Lambda - \delta \Lambda) \equiv m_0^2(\Lambda - \delta \Lambda) - m_{
m cr}^2(\Lambda)$$

where the critical mass $m_{\rm cr}^2$, and the boundary at Λ are given by

$$m_{\rm cr}^2(\Lambda) \equiv \frac{\lambda_0(\Lambda)}{16\pi^2} \Lambda \,\delta\Lambda \qquad \widetilde{m}^2(\Lambda) = m_0^2(\Lambda)$$

• In the limit $\delta \Lambda \rightarrow 0$ we recover the perturbative RG equations:

$$\beta_{\Omega} = \mu \frac{d\Omega}{d\mu} = \frac{m^4}{32\pi^2} \qquad \gamma_m = \frac{1}{m^2} \left(\mu \frac{dm^2}{d\mu} \right) = \frac{\lambda}{16\pi^2} \qquad \beta_{\lambda} = \mu \frac{d\lambda}{d\mu} = \frac{3\lambda^2}{16\pi^2}$$

 The renormalized RG equations contain the fine-tuning: physically, this corresponds to a tuning towards the critical surface.

$$\mu \frac{d}{d\mu} m_H^2 = m_H^2 \gamma_m$$

Attempt 5 : hierarchy between M_P and μ_F generated by an instanton configuration contributing to the vev of the Higgs field ...

M. Shaposhnikov and A. Shkerin, Phys. Lett. B 783, 253 (2018)

M. Shaposhnikov and A. Shkerin, JHEP 10, 024 (2018)

Apparently Hierarchy explained

however ... quantum corrections calculated with DR, and flow of the parameters studied with the perturbative RG flows ... same problems as before
