

# Characterization of hybrid photodetector prototype based on microchannel plates and the Timepix4 ASIC

Monday, 27 May 2024 18:40 (20 minutes)

A novel single-photon detector based on a vacuum tube with transmission photocathode, microchannel plates and the Timepix4 CMOS ASIC used as read-out anode is presented. Timepix4, developed by the Medipix4 Collaboration, consists of a 512x448 pixel matrix with 55 microns pitch. Each pixel is equipped with amplifier and discriminator, and a TDC allows for precise measurement of the hit time-of-arrival and time-over-threshold. The ASIC features a data-driven architecture producing up to 160 Gb/s that are handled by FPGA-based external electronics with flexible design, used as well as control board. This device is expected to allow detection of up to 1 billion photons per second over an area of 7 cm<sup>2</sup>, with simultaneous measurement of position and timing for each photon with resolutions of 5-10 microns and 50-100 ps respectively.

Initial characterisation of the Timepix4 ASIC using a 100-micron thick n-on-p Si sensor illuminated by an infrared pulsed picosecond laser have demonstrated a timing resolution of 110 ps per single pixel hit, after precise frequency mapping and calibration over the whole matrix. A timing resolution better than 50 ps was measured illuminating a cluster of multiple pixels exploiting oversampling.

The first hybrid photodetector prototypes have been recently produced. A first characterisation of their performance will be presented.

---

The DRD4 international Collaboration has been formed at the beginning of 2024 following the ECFA Detector R&D Roadmap. The scope of the Collaboration, which is anchored at CERN, is to bundle and boost R&D activities in photodetector technology and particle identification techniques for building future high-energy physics (HEP) experiments and facilities. DRD4 also covers scintillating fibre tracking as well as transition radiation detectors based on solid state X-ray detectors. A brief overview of the scientific scope and organisation of DRD4 will be presented, with a particular focus on the strategic role of the Collaboration for the future of HEP.

## Collaboration

## Role of Submitter

I am the presenter

**Primary authors:** SAPUTI, Alessandro (Istituto Nazionale di Fisica Nucleare); COTTA RAMUSINO, Angelo (Istituto Nazionale di Fisica Nucleare); FRANZOSO, Edoardo (Università di Ferrara / INFN); ROMOLINI, Gabriele (Istituto Nazionale di Fisica Nucleare); ALOZY, Jerome (CERN); GUARISE, Marco (INFN - Ferrara); FIORINI, Massimiliano (Università di Ferrara / INFN); CAMPBELL, Michael (CERN); BIESUZ, Nicolò Vladi (INFN - Ferrara); BALLABRIGA, Rafael; BOLZONELLA, Riccardo (INFN - Ferrara); CAVALLINI, Viola (INFN e Università di Ferrara); LLOPART, Xavier (CERN)

**Presenter:** FIORINI, Massimiliano (Università di Ferrara / INFN)

**Session Classification:** Photo Detectors and Particle ID - Oral session

**Track Classification:** T2 - Photo Detectors and Particle ID
