## Test-beam measurements of instrumented sensor planes for a higly compact and granular electromagnetic calorimeter

Wednesday, 29 May 2024 08:30 (20 minutes)

The LUXE experiment is designed to explore the strong-field QED regime in interactions of high-energy electrons from the European XFEL with an intense laser field. One of the crucial aims of this experiment is to measure the production of electron-positron pairs as a function of the laser field strength, where non-perturbative effects are expected to kick in above the Schwinger limit. For the measurements of positron energy and multiplicity spectra, a tracker and an electromagnetic calorimeter are foreseen. Since the expected number of positrons varies over five orders of magnitude, and has to be measured over a widely spread low-energy background, the calorimeter must be compact and finely segmented. The concept of a sandwich calorimeter made of tungsten absorber plates interspersed with thin sensor planes is developed. The sensor planes comprise a silicon pad sensor, flexible Kapton printed circuit planes for bias voltage supply and signal transport to the sensor edge, all embedded in a carbon fibre support. The thickness of a sensor plane is less than 1 mm. A dedicated readout is developed comprising front-end ASICs in 130 nm technology and FPGAs to orchestrate the ASICs and perform data pre-processing. As an alternative, GaAs are considered with integrated readout strips on the sensor. Prototypes of both sensor planes are studied in an electron beam of 5 GeV. Results will be presented on the homogeneity of the response, edge effects and cross talk between channels.

## Collaboration

LUXE

## **Role of Submitter**

The presenter will be selected later by the Collaboration

Primary author: PIETRUCH, Dawid (AGH University of Krakow)
Presenter: PIETRUCH, Dawid (AGH University of Krakow)
Session Classification: Calorimetry - Oral session

Track Classification: T4 - Calorimetry
