

16th Pisa Meeting on Advanced Detectors

ALLEGRO FCC-ee detector concept & R&D on noble-liquid calorimetry

Juska Pekkanen juska@cern.ch CERN

May 29, 2024

ALLEGRO detector concept

- Proposed general-purpose detector for FCC-ee
- Recently coined as ALLEGRO
 - A Lepton-Lepton collider Experiment with Granular Read-Out
- High-granularity noble-liquid ECAL a central and most studied feature
 - · LAr or LKr as active medium, Pb or W absorbers
 - Multi-layer PCB as readout electrode
- Vtx detector, drift chamber and ECAL inside 2 T solenoid magnet, sharing cryostat
- HCAL and muon system outside solenoid
- Optimized for full FCC-ee physics program
 - Focus on PFlow & particle ID performance

16th Pisa Meeting on Advanced Detectors Juska Pekkanen, juska@cern.ch May 29, 2024 2/24

Noble-liquid calorimetry

- Sampling calorimetry relying on ionization of active material (liquefied noble gas)
- Based on alternating layers of absorbers, noble liquid and readout electrodes
 - Voltage applied over noble-liquid gap
 - Incident particle ionizes noble liquid
 - e⁻ (and ions) drift to electrodes and induce current signal
- Successful in many HEP experiments
 - 🔹 MarkII, DØ ≡ , H1, NA48/62, ATLAS 🞑
- Advantages: excellent energy resolution, linearity, stability and uniformity, good timing properties
- Challenges: complex mechanical structure inside cryostat, signal feed-through, granularity

16th Pisa Meeting on Advanced Detectors Juska Pekkanen, juska@cern.ch May 29, 2024 3/24

High-granularity noble-liquid calorimeter

- Printed circuit board (PCB) technology allows "arbitrarily" high granularity
 - Signal traces inside the electrode
 - Target: at least 10x ATLAS granularity
- CERN prototype PCB 58 cm \times 44 cm \rightarrow
 - 50° inclination, gives 40 cm (22 χ_0) thick ECAL
 - Split to 16 θ-towers & 12 depth layers; 240 cells
 - Narrow strips in front for π^0 detection
 - 7-layer PCB, complex internal structure
 - Readout from inner and outer edge
- New PCB with outer edge readout & other updates to be produced shortly
 active pp (mble liquid) abueter readout detrote

Readout electrode structure & shielding

- Signal traversing under other cells induces cross-talk (x-talk) that worsens resolution
- Can be mitigated by sandwiching signal traces between grounded shields
- Trade-off between x-talk and electronics noise
 - Shields reduce x-talk but increase capacitance to ground and hence noise
- In PCB v0 baseline is 2x width shields above and below each signal trace

Other configurations implemented for studies

16th Pisa Meeting on Advanced Detectors Juska Pekkanen, juska@cern.ch May 29, 2024 6/24

PCB measurement setup

- Electrical properties measured with a table-top setup
- Copper sheet as grouding and "absorbers" above and below the electrode
- Function generator used for injecting shark-fin signal
 - 300 ns wide 1 V peak at 5 ms intervals
 - Mimics the real signal of drifting charges
- Main and x-talk signal read with oscilloscope and analyzed offline
- Extra care needed for good quality measurements
 - Short cables, thorough grounding, impedance matching

16th Pisa Meeting on Advanced Detectors Juska Pekkanen, juska@cern.ch May 29, 2024 7/24

PCB measurements

- Compare main signal magnitude to x-talk signal
- X-talk measured as "peak-to-peak" ratio
- X-talk ratio of <1% is needed and achieved with shaping</p>

PCB measurements

Tower 4 (baseline), inject to cell 7, readout from cell 6 Injected Signal with 20ns shaping signal Cross-talk signal, raw 0.3 Cross-talk signal with 20ns shaping x10 7 0.2 /oltage (V) 6 0.1 2 3 4 5 0.0 20ns shaping Peak-to-peak cross-talk: 0.002/0.316 = 0.60% -0.1 50 Ó 100 150 200 250 300 350 400 Output signals Time (ns)

- Signals shaped with ATLAS-style CR-RC² shaper
 - Here modeled by an analytical function
 - In reality implemented with electronics
- After shaping x-talk signal too small to see $\rightarrow \times 10$

Cross-talk and shaping time

- Longer shaping time gives lower x-talk
 - At LHC long shaping times not good due to pileup, but fine in *e*+*e*-
- X-talk down to 0.1% and less with long shaping time
 - Also noise goes down with longer shaping time
- Low x-talk seen also in other shielding configurations

Readout electrode simulation studies

- Electrode properties also studied with simulations
 - Using Ansys Electronics Desktop
- A cut-out of the PCB taken and prepared to equivalent configuration as in the lab
 - Same conductor & dielectric materials, grounding, absorbers, input & output ports
- Model analyzed and converted to equivalent circuit, results analyzed

PCB simulation studies

- Main signal and x-talk signal shapes in good agreement with measurements
 - Accounting for the finite turn-on of the analog signal
- X-talk in the same ballpark with 20 ns shaping
 - · Exact replication of laboratory setup hard to achieve
 - With 200 ns shaping time x-talk values agree well
- Agreement sufficient for starting to try new ideas with simulations
 - Different shielding scenarios (e.g. lateral shields)
 - 6-layer PCB with one-sided or alternating shields

16th Pisa Meeting on Advanced Detectors Juska Pekkanen, juska@cern.ch May 29, 2024 12/24

Barrel ECAL - mechanical design

- ATLAS LAr ECAL used as reference
 - Larger radius, new electrode geometry
- Finite element analysis used for structural element design (strength, size)
- Clever solutions needed for making the structure possible to build!

ATLAS liquid argon calorimeter general layout

EM calorimeter size comparison

16th Pisa Meeting on Advanced Detectors Juska Pekkanen, juska@cern.ch May 29, 2024 13/24

Absorbers & test-beam prototype

- First absorber prototypes produced with 1.8 mm of lead with 50 μm steel layers
- Immersed to liquid nitrogen, small depressions seen after cold test
 - Origin being investigated, thicker 100 μm steel layer being studied
- Design of test beam prototype frozen by 9/2025
 - 64 electrodes and absorbers
 - Big enough for containing a typical shower
 - To be placed in a cryostat for beam tests

16th Pisa Meeting on Advanced Detectors Juska Pekkanen, juska@cern.ch May 29, 2024 14/24

Endcap EM calorimeter

- Noble-liquid based sampling calorimeter
- ECAL endcap designed to feature:
 - Thin absorbers (high granularity)
 - Readout from outside faces only (no dead material), uniformity in ϕ

\Rightarrow Turbine-like geometry as one option

- ~240 absorbers and electrodes each
- Geometry ported to FCC-SW for FCC-ee simulations

CIRCULAR

COLLIDER

16th Pisa Meeting on Advanced Detectors Juska Pekkanen, juska@cern.ch May 29, 2024 15/24

Detector simulation & clustering

- Optimal granularity & materials being studied with simulations
 - Find optimal granularity for π^0/γ separation
 - LAr or LKr as liquid, Pb or W as absorbers
- Full-Sim of ALLEGRO being built to FCC-SW
 - ECAL+HCAL topo-clustering implemented
 - Next: add tracking and Particle Flow

EM resolution with a sampling term of 7-8% in simulation

16th Pisa Meeting on Advanced Detectors Juska Pekkanen, juska@cern.ch May 29, 2024 16/24

Conclusions & outlook

- ALLEGRO is a general-purpose FCC-ee detector concept
- Multi-layer PCB's as readout electrodes allow high granularity
- New prototype PCB being designed at CERN
- Test-beam prototype to be built by 2027-28
 - To be studied with test beams inside a cryostat
- ECFA DRD6 Calorimetry collaboration founded in April
 - Noble-liquid calorimetry in work package 2
- Team is growing fast, already 20 institutions joined!
 - Ideal time to join ALLEGRO!

Noise as a Function of C_d and Impedance R₀

Adding a transmission line (here 5m, t_d = 30 ns) leads to deterioration of noise Higher impedance (50 $\Omega \rightarrow 100 \Omega$) reduces effect of transmission line.

April 7, 2022

M. Aleksa (CERN)

14

Optimizing the Noise Level

- Assume transmission line of 5 m (t_d = 30 ns)
- $R_0 = 100 \Omega$ is supposed to be the highest possible impedance for the coax cables leading the signal out (e.g. Axon)
 - difficult to obtain for transmission line inside the PCB
- Current preamp (CR-RC³), see plot:
 - e_n = 0.5 nV/VHz and i_n = 3 pA/VHz
 - Achieving 2.4 MeV noise for $\tau > 80$ ns and $R_0 = 100 \Omega$
 - Achieving **3.0 MeV noise** for $\tau > 100$ ns and $R_0 = 50 \Omega$
- Charge preamp (CR²-RC²) generally show lower parallel noise in:
 - e.g. $e_n = 0.5 \text{ nV/VHz}$ and $i_n = 1 \text{ pA/VHz}$
 - Achieving **1.3 MeV noise** for τ = 200 ns, C_d = 100 pF and **R₀ = 100** Ω
 - Achieving 1.4 MeV noise for τ = 200 ns , C_d = 200 pF and R₀ = 100 Ω
 - Achieving **1.8 MeV noise** for τ = 200 ns , C_d = 100 pF and R₀ = 50 Ω
 - Achieving 1.9 MeV noise for τ = 100 ns , C_d = 100 pF and R_0 = 100 Ω
- Only small dependence on C_d

16th Pisa Meeting on Advanced Detectors Juska Pekkanen, juska@cern.ch May 29, 2024 22/24

Plans for next PCB prototype

- Simulation studies underway for optimizing granularity
- Readout from outer edge only for minimizing dead material
 - X-talk of strip layer a challenge due to smaller signal
 - Singnal traces need to be "funneled" thru support structure
 - readout pins become tiny
- Would only one shield per signal strip be sufficient?
 - 6-layer PCB easier to manufacture and thinner \rightarrow increased sampling ratio
- Need to re-design readout connections
 - Industry standard connector?
 - Soon results from Paris prototype \Rightarrow

16th Pisa Meeting on Advanced Detectors Juska Pekkanen, juska@cern.ch May 29, 2024 23/24

- Another consideration is the variation of the gap with radius
 - means that response is very different at the inner and outer radii (41 cm and 275 cm)
- To mitigate this, the detector can be subdivided into a set of nested cylinders:

Tradeoff between minimizing variation in gap width vs. minimizing transitions/dead areas

In this example, each cylinder has $r_o/r_i \approx 1.9$

16th Pisa Meeting on Advanced Detectors Juska Pekkanen, juska@cern.ch May 29, 2024 24/24
