# **CRES and Project 8**

CRES: Cyclotron Radiation Emission Spectroscopy.

A new type of spectroscopy proposed by Monreal and Formaggio (PRD 80 (2009) 051301). Nondestructive to electrons trapped magnetically.

Using derived  $f_{cyc}$  as a proxy for energy,  $f_{cyc} = eB / 2\pi\gamma m_e^{2}$ , Project 8 aims to constrain neutrino mass  $m_{\beta}$  to within 40 meV.

BENJAMIN MONREAL AND JOSEPH A. FORMAGGIO

Subset of Project 8 collaborators at the recent Cavity Workshop, held at <u>Great Camp Sagamore</u>, NY. Full list of collaborators: <u>www.project8.org</u>.

# Tritium beta decay and $m_{\beta}$

- ${}^{3}H \to {}^{3}He + \beta^{-} + \bar{\nu}_{e}$ (1/2<sup>+</sup>)  $\to$  (1/2<sup>+</sup>)
- Allowed Fermi decay, Q = 18.6 keV
- $\beta$  spectrum, E<sub>max</sub> = 18.6 keV
- Distortion near  $E_{max}$  is defined by  ${}^{3}H_{2}$ kinematic excitation and by  $m_{\beta}$ . See Bodine, Parno, Robertson PRC 91, 035505 (2015).
- Present state of the art in direct measurement is m<sub>β</sub> ≤ 0.8 eV/c<sup>2</sup> by KATRIN, Aker et al. (KATRIN) Nat. Phys. 18 160-166 (2022).

P. L. Slocum, PTOLEMY Collaboration Meeting, Nov. 6-7, 2023

udu

# CRES data in Project 8

- First demonstrated in 2015 (PRL 114 (2015) 162501).
- 30 keV conversion electrons from a gaseous <sup>83m</sup>Kr source.
- Heterodyne detection, FFT in signal processing leads to raw spectrogram in frequency and time.

## Simulation objectives

- Simulate and study CRES experiment designs.
- Simulate present and future Project 8 demonstrators, validate with data as it becomes available, and understand volume scaling relations.
- Study and anticipate systematics in CRES experiments.
- Support offline physics analysis.
  - Configurable data sets
  - Parameter studies
  - Validation work
  - End to end analyses
- Aim for compatibility with existing tools, in simulation/analysis and in coordinated infrastructure upgrades.

# Simulation resources in Project 8

- Commercial and other publicly available simulation packages
  - Can efficiently address targeted technical questions in Project 8.
  - Several packages are in routine use: HFSS, Comsol, Scikit-RF, CST.
  - ATD simulation work: Sparta, Molflow+, Comsol, CST, Kassiopeia.
- Custom simulation software, integrated with Project 8 tools
  - Necessary to address questions unique to the experiment.
  - Developed and/or integrated within Project 8.
    - Locust\* RF signal calculations driven with theoretical models
    - Kassiopeia\*\* field and trajectory calculations, integrated with Locust
- Theoretical models
  - Critical for our understanding.
  - Can be developed independently, or integrated with other calculations.

\*Project 8, 2019 New J. Phys. 21 113051, \*\*Furse et al., 2017 New J. Phys. 19 053012

#### Locust\* simulation software

- Developed in C++ within Project 8.
- Integrated with Project 8 DAQ libraries.

- Functionality models an RF receiver and digitizer.
- Interfaces are modular and flexible to allow for arbitrary input signals.

### Kassiopeia\* simulation software

• Developed by the KATRIN collaboration.

- Highly advanced calculations of electron trajectories and energy losses in EM fields.
- Adaptable EM field solutions with configurable source geometries.
- Modular and flexible; C++ based code.

\*Furse et al., 2017 New J. Phys. 19 053012

## Kassiopeia example

- 325 MHz trap for T2 endpoint experiment.
- Resonant cavity is shown with diameter 1.12 m.
- 5 electron trajectories are calculated inside the cavity.

Furse et al., 2017 New J. Phys. 19 053012 P. L. Slocum, PTOLEMY Collaboration Meeting, Nov. 6-7, 2023

# High Frequency Simulation Software (HFSS)

• Highly advanced, industry-standard finite element method solver for EM structures.

# Integrating software packages (carefully)

- Challenge: We have multiple highly refined calculations (e.g. theory, Kassiopeia, and HFSS), each developed separately, and each representing years of scientific and technical development by world-leading experts.
- To combine these advanced calculations nondestructively, we need to consider the interfaces between them.
- Locust is well-suited for this purpose flexibility allows for careful software integration with minimal loss of information.

### Locust-Kassiopeia interface

- Modularity in both Locust and Kassiopeia supports tight integration of Locust-Kassiopeia in the time domain.
- Cross-package communication happens after each trajectory step in Kassiopeia.

# Kassiopeia-Locust-HFSS combined

- Time-dependent Locust-Kassiopeia EM fields\* drive the HFSS hardware model and receiver.
- Accurate complex voltage signals are extracted for reconstruction.
- Reconstructed signals provide both cross checks and design diagnostics.

\*N. Buzinsky, Ph.D. dissertation, MIT.

#### Locust and analytic calculations

- Analytic EM models\* can also drive the software receiver in Locust.
- Or, discrete steps in analytic models can also be implemented as components in larger workflows. Example: The single-mode <u>cavity response model</u> by H. Robertson and A. Marsteller:
  - Kassiopeia e- current acts as an impulse that drives a Green's function in Locust.
  - The Green's function is derived from a damped harmonic oscillator.
  - The Locust-Kassiopeia interface is preserved.

 $A(t) = \sum_{r} f(nT, z, v_z) G(t, nT),$   $= \sum_{r} A_0 \sin \left( \omega_c (nT + \left| \frac{z}{v_p} \right|) + \varphi \right) \cos \left( \frac{\pi}{L} z \right) J_1 \left( X'_{01} \frac{r}{r_C} \right)$ Complex discrete Green's function in Locust P. L. Slocum, PTOLEMY Collaboration Meeting, Nov. 6-7, 2023 Kass e- current & coupling ( $A(t) = \sum_{r} f(nT, z, v_z) G(t, nT),$   $= \sum_{r} A_0 \sin \left( \omega_c (nT + \left| \frac{z}{v_p} \right|) + \varphi \right) \cos \left( \frac{\pi}{L} z \right) J_1 \left( X'_{01} \frac{r}{r_C} \right)$   $= \sum_{r} A_0 \sin \left( \omega_c (nT + \left| \frac{z}{v_p} \right|) + \varphi \right) \cos \left( \frac{\pi}{L} z \right) J_1 \left( X'_{01} \frac{r}{r_C} \right)$   $= \sum_{r} A_0 \sin \left( \omega_c (nT + \left| \frac{z}{v_p} \right|) + \varphi \right) \cos \left( \frac{\pi}{L} z \right) J_1 \left( X'_{01} \frac{r}{r_C} \right)$   $= \sum_{r} A_0 \sin \left( \omega_c (nT + \left| \frac{z}{v_p} \right|) + \varphi \right) \cos \left( \frac{\pi}{L} z \right) J_1 \left( X'_{01} \frac{r}{r_C} \right)$   $= \sum_{r} A_0 \sin \left( \omega_c (nT + \left| \frac{z}{v_p} \right|) + \varphi \right) \cos \left( \frac{\pi}{L} z \right) J_1 \left( X'_{01} \frac{r}{r_C} \right)$   $= \sum_{r} A_0 \sin \left( \omega_c (nT + \left| \frac{z}{v_p} \right|) + \varphi \right) \cos \left( \frac{\pi}{L} z \right) J_1 \left( X'_{01} \frac{r}{r_C} \right)$   $= \sum_{r} A_0 \sin \left( \omega_c (nT + \left| \frac{z}{v_p} \right|) + \varphi \right) \cos \left( \frac{\pi}{L} z \right) J_1 \left( X'_{01} \frac{r}{r_C} \right)$   $= \sum_{r} A_0 \sin \left( \omega_c (nT + \left| \frac{z}{v_p} \right|) + \varphi \right) \cos \left( \frac{\pi}{L} z \right) J_1 \left( X'_{01} \frac{r}{r_C} \right)$   $= \sum_{r} A_0 \sin \left( \omega_c (nT + \left| \frac{z}{v_p} \right|) + \varphi \right) \cos \left( \frac{\pi}{L} z \right) J_1 \left( X'_{01} \frac{r}{r_C} \right)$  $= \sum_{r} A_0 \sin \left( \omega_c (nT + \left| \frac{z}{v_p} \right|) + \varphi \right) \cos \left( \frac{\pi}{L} z \right) J_1 \left( \frac{x}{v_0} \right) + \sum_{r} A_0 \sin \left( \frac{\pi}{L} \frac{r}{v_0} \right) + \sum_{r} A_0 \sin \left$ 

### Resonant cavity simulation for testing

- 325 MHz single-mode TE011 cavity simulation workflow. 2D set of 18574.01 eV e- simulations in pitch angle θ and starting radial position.
- Abstract readout configuration test is shown with distortion-free probe.
- Power in azimuthal E-field scales as  $J'_{0}(k_{01}r)$  as expected.
- Higher resolution scans in e.g. energy, θ are ongoing.

### Locust-HFSS in realistic cavity designs

- More realistic readout configurations can be simulated in HFSS, SciKit-RF.
- Complex wave impedance can be exported and defined in Locust.
- Expected outcome: A more realistic simulated cavity response.
- Existing LTI framework in Locust would support this test.

## Multiple simulation paths

- Modular approach allows cross checks.
- Systematic effects can be isolated and studied.
- Multiple paths can be explored.
  - Sets of modules
  - Theory + DAQ

# Simulation interfaces

- Targeted development happens at the interfaces between packages.
- This preserves the fidelity of advanced calculations contained within each package.
- Alternate approaches

   (e.g. without integrating software packages) can also be useful,
   depending on goals.

# Example workflow

- 25.9 GHz cyclotron frequency
- Using Locust-Kassiopeia, calculate RF signals expected from magnetically trapped electron in waveguide. Process with Katydid analysis software.

Discuss/validate; e.g. these results are consistent with predictions in PRC 99 (2019) no.5, 055501.

**Power Spectrum** 

# Simulated cavity signals

- Output format in a time series, compatible with our analysis tools.
- Cavity transient time is predicted\* to be 2Q/ω<sub>c</sub> and characterizes the "ring-up" of the signal.
- Example: For a 1 GHz cavity with Q=1000, 2Q/ω<sub>c</sub> ~ 0.3 μs.
- In post-processing, a typical time bin spans ~ 4 µs, which confines the signal ring-up to the first signal pixel.

## 1 GHz cavity workflow

#### 325 MHz cavity workflow

#### 325 MHz cavity workflow

# 325 MHz cavity energy reconstruction

- Each pixel represents one simulation with SNR>10.
- Maximum likelihood estimator applied to simulation output. 89.0100
- With optimistic assumptions, good energy • resolution is seen. Work is ongoing.

 $1\sigma$  (68.3%)

 $2\sigma$  (95.4%)

# Summary

- Project 8 relies on a suite of simulation tools. Our compact technical questions can often be answered with commercial software. Other unique questions have motivated software approaches that have been developed internally.
- Demonstrator experiments in Project 8 have been built into simulation workflows.
- Development and integration work is ongoing:
  - Collaboration with KATRIN on Kassiopeia development.
  - Integration of plasma effects\* into our simulation framework.
- Software repositories are publicly available at <u>github.com/project8/locust\_mc</u> and <u>github.com/KATRIN-Experiment/Kassiopeia</u>.
