Introduction

The LEGEND experiment:

- Goal: Measure $0\nu\beta\beta$ decay in ⁷⁶Ge
- LEGEND-1000: Sensitivity on half-lives of up to 10^{28} y

To reach this sensitivity, background reduction is very important

Motivation for position reconstruction: The position of an event inside a Ge-detector

Germanium detectors and pulse shape simulation

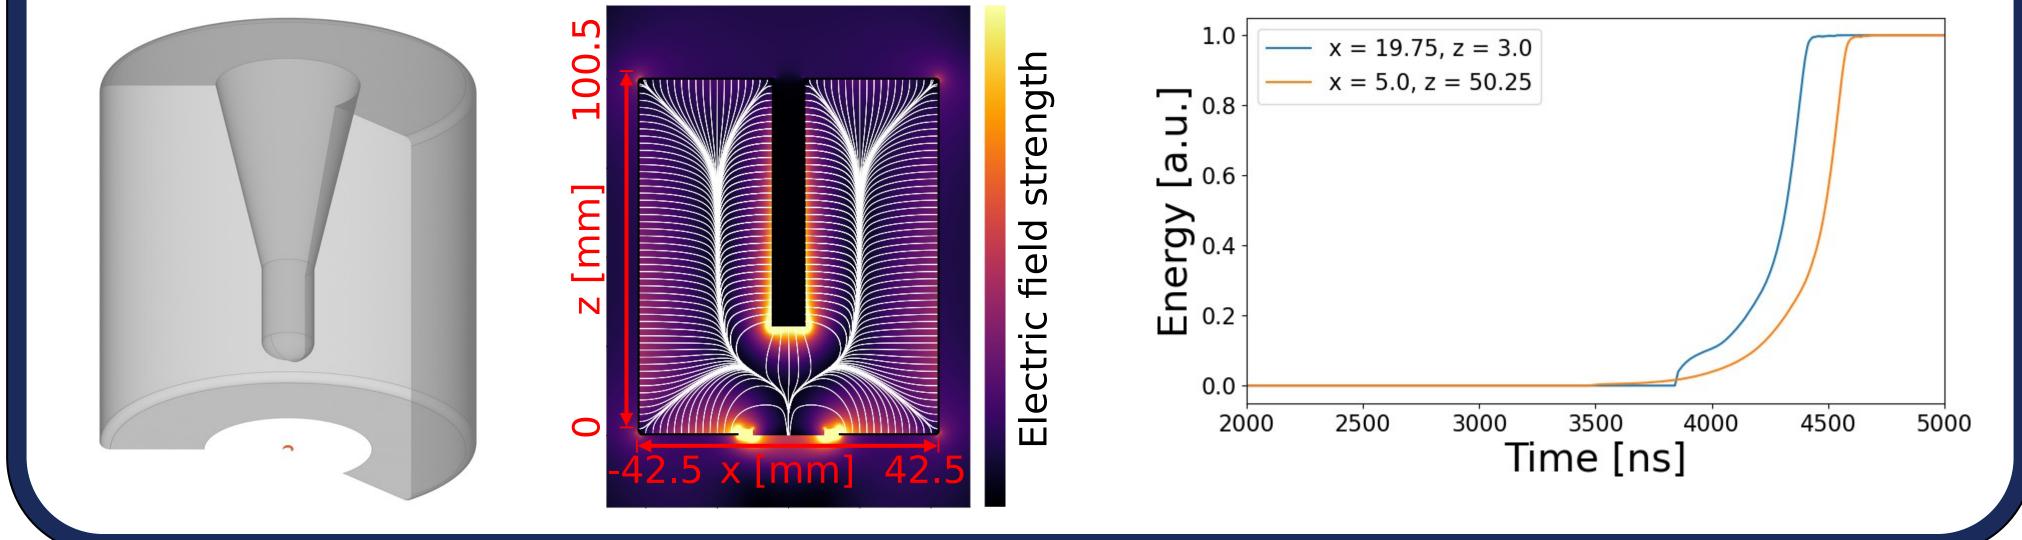

LEGEND-1000 mainly uses inverted coaxial point contact (ICPC) detectors (left) • Can be produced with comparatively high masses (\sim 3 kg), pulse shape discrimination works well

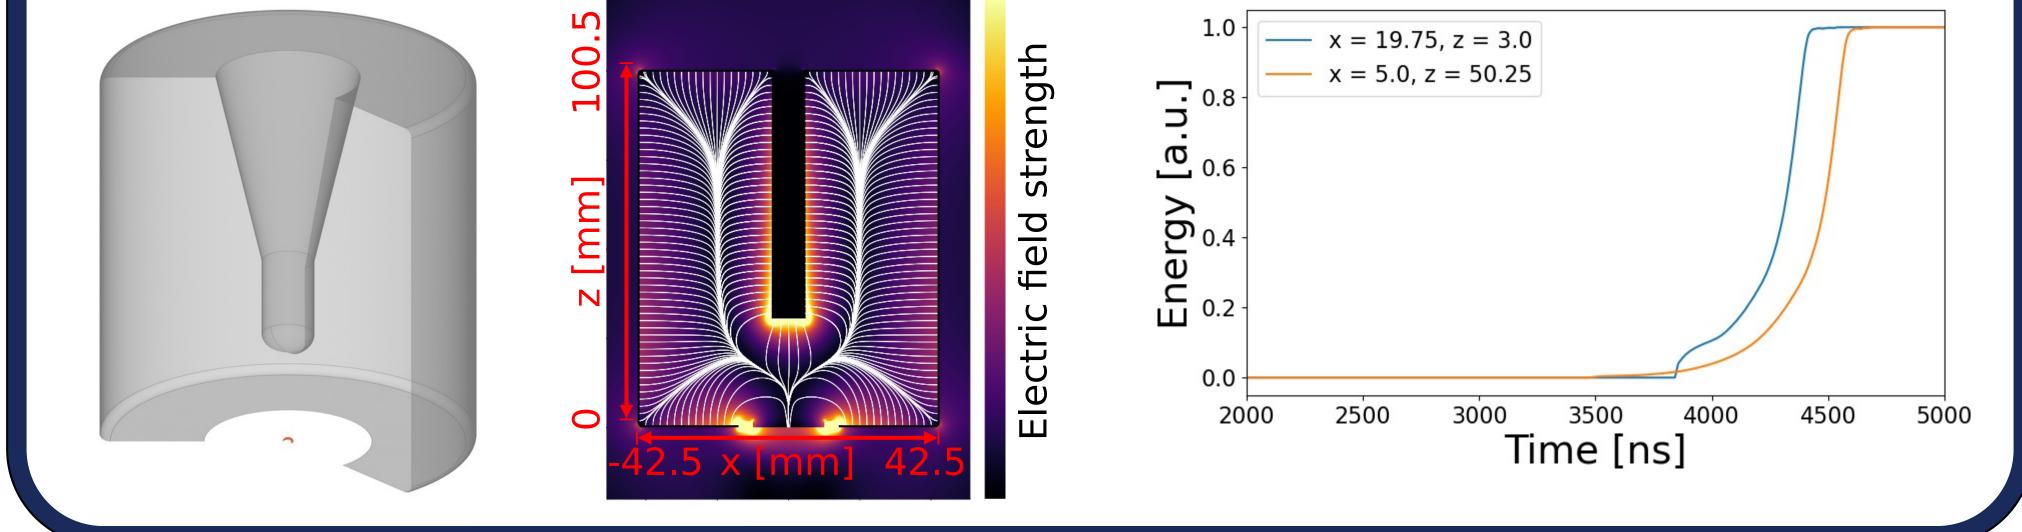

Pulse shape simulation:

Simulate detector geometry and electric field

Energy deposition creates charge cloud

Charge cloud measured at point contact as waveform, which depends on event position

can indicate signal or background origin: • Surface events and events near the contact • Spot local detector impurities Position reconstruction has purpose beyond background reduction:

• Exploring possibilities of pulse shape simulation and machine learning

Long-Short-Term-Memory (LSTM):

- Iterates an LSTM unit over each waveform sample
- Hidden state h(t) stores short-term memory, **LSTM Unit:** cell state c(t) stores long-term memory

Attention mechanism:

Results: Training the LSTM on simulated pulses Optimization of the neural network: Extended training with optimized parameters • Precision of a neural network depends on various • 240000 events, 100 epochs \rightarrow Higher stability fixed parameters **Average errors:** • Bayesian optimization: Choose parameters of the Absolute Relative to error [mm] detector size [%] x = 7.98, z = 38.57 next training based on previous trainings \rightarrow [mm] **D** 0.8 Efficient optimization 7.44 ± 0.02 17.5 ± 0.1 dx **ص** _{0.6} • Optimization with 120000 simulated events and Ν 7.05 ± 0.02 **O** 0.4 7.01 ± 0.02 50 iterations over the dataset (epochs) dz Ð **0.2** Performance over trials dr 11.00 ± 0.02 19.68 ± 0.05 111 ---- best performance 22500 20000 20 40 x [mm] <u>**0**</u> 6×10^{-2} **Error heatmaps:** sulting by original position: by reconstructed position 4×10^{-2} **Results:** 14 — 20 2 ¹⁴ [mm] ¹⁰ In ⁸ B 80 **Ö** 3×10⁻² 80 • Average Error [mm]: $\textbf{15.95} \pm \textbf{0.05}$ 25 [um 60 10 35 15 30 ¹⁵ ס Trial index • z-reconstruction good for near-point-contact events N ⁴⁰ Learning rate over trials Ν • z-reconstruction difficult for

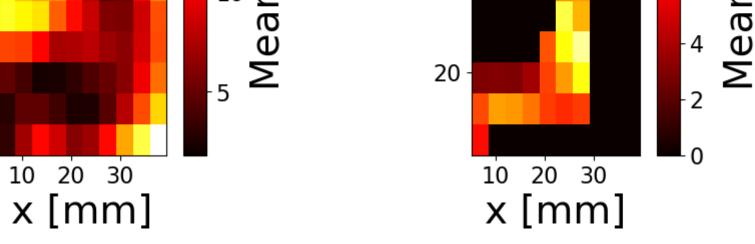

20 -

Position reconstruction of realistic waveforms

• Adding features of the data acquisition (electronic noise, preamplifier) to mimic real data waveforms

• x-reconstruction only possible close to contact • (Wanted) property of ICPC detectors

• z-reconstruction works better (7% average error)

events far from contact

• Such events have waveforms N 40 with a long rising edge

• The start of the rising edge is "hidden" by noise

• Reconstruction limit of approximately **70 mm**
