

# STUDY OF PROTON-NUCLEUS INTERACTIONS IN THE DSTAU/NA65 EXPERIMENT AT THE CERN-SPS

*martedì 18 giugno 2024 19:29 (1 minuto)*

The DsTau (NA65) experiment at CERN was proposed to measure an inclusive differential cross-section of Ds production, and its decay branching ratios in p-A interactions. The DsTau detector is based on the nuclear emulsion technique providing an excellent spatial resolution for detecting short-lived particles like charmed hadrons. The first results of the analysis of the pilot-run data are presented. The accuracy of the proton interaction vertex reconstruction is reported. A high precision in vertex reconstruction allows one to measure the proton interaction length and charged particle multiplicities accurately in a high-track density environment. The measured data have been compared with several Monte Carlo event generators in terms of multiplicity and angular distribution of charged particles. The results presented in this study can be used to validate event generators of p-A interactions.

## Poster prize

No

## Second affiliation

## Collaboration (if any)

DsTau(NA65) Coll.

## Given name

Elena

## Surname

Firu

## First affiliation

CERN

## Institutional email

elena.firu@cern.ch

## Gender

Female

**Autore principale:** FIRU, Elena

**Relatore:** FIRU, Elena

**Classifica Sessioni:** Poster session and reception 1

**Classificazione della track:** Accelerator neutrinos
