

# Searching for long faint astronomical high energy transients: a data driven approach

Riccardo Crupi, Giuseppe Dilillo, Kester Ward,  
Elisabetta Bissaldi, Fabrizio Fiore, Andrea Vacchi

October 2024 - Gravi-Gamma-Nu

## SPOKE 3

### ASTROPHYSICS & COSMOS OBSERVATIONS

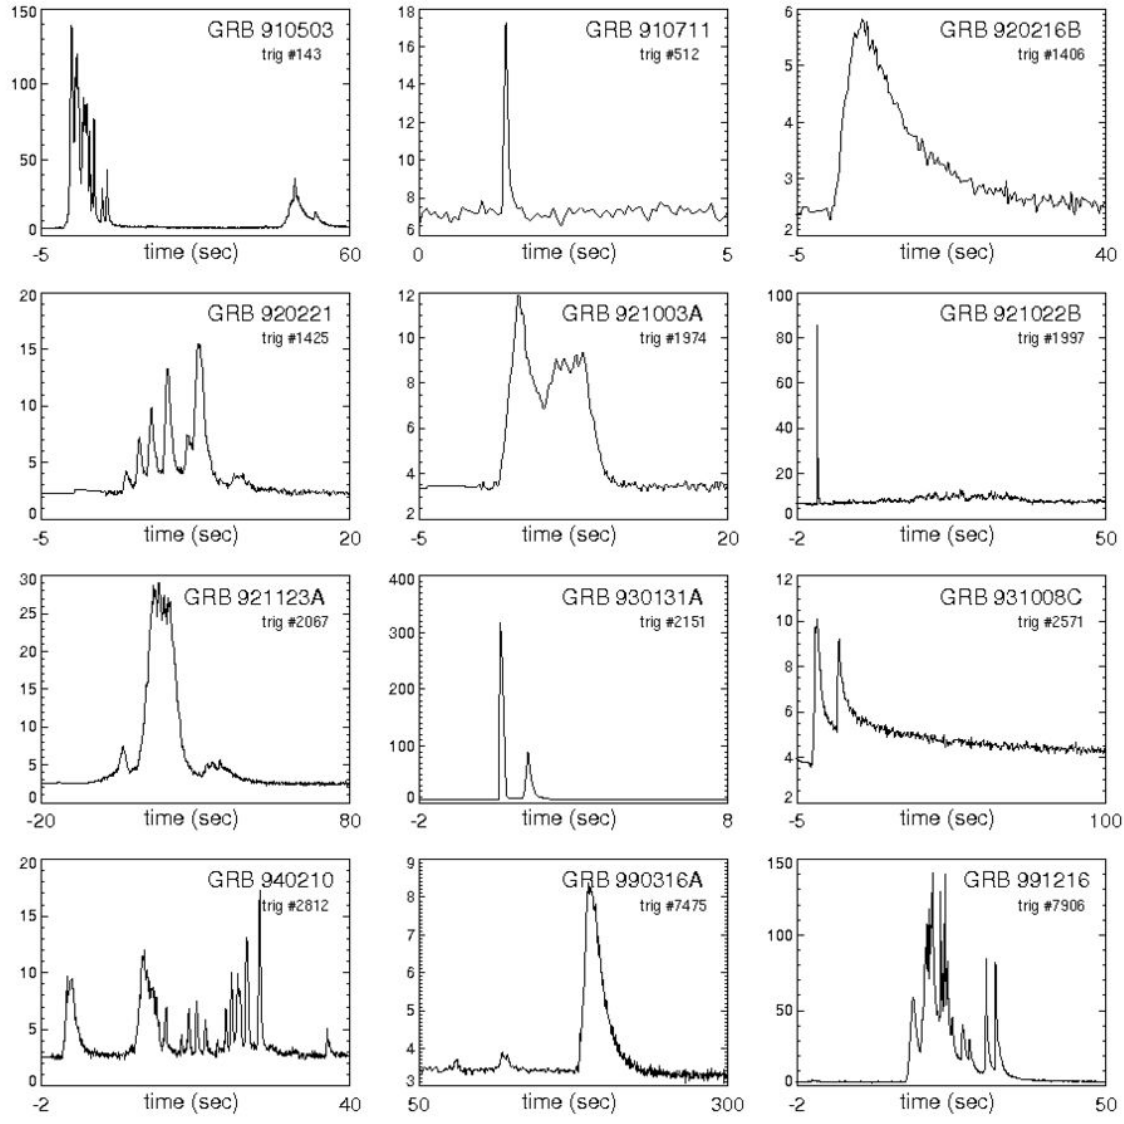

Time series use cases:

1. Data Quality control on banking accounts
2. Fraud Detection
3. Anomalies in Time Series

# Summary

- **Sensitivity demonstration for HERMES**
- New method to estimate the background via a Neural Network
- Use Poisson-FOCuS to trigger events and present some results
- Propose an automatic classification of the events identified

# Spacecraft for X/γ observations

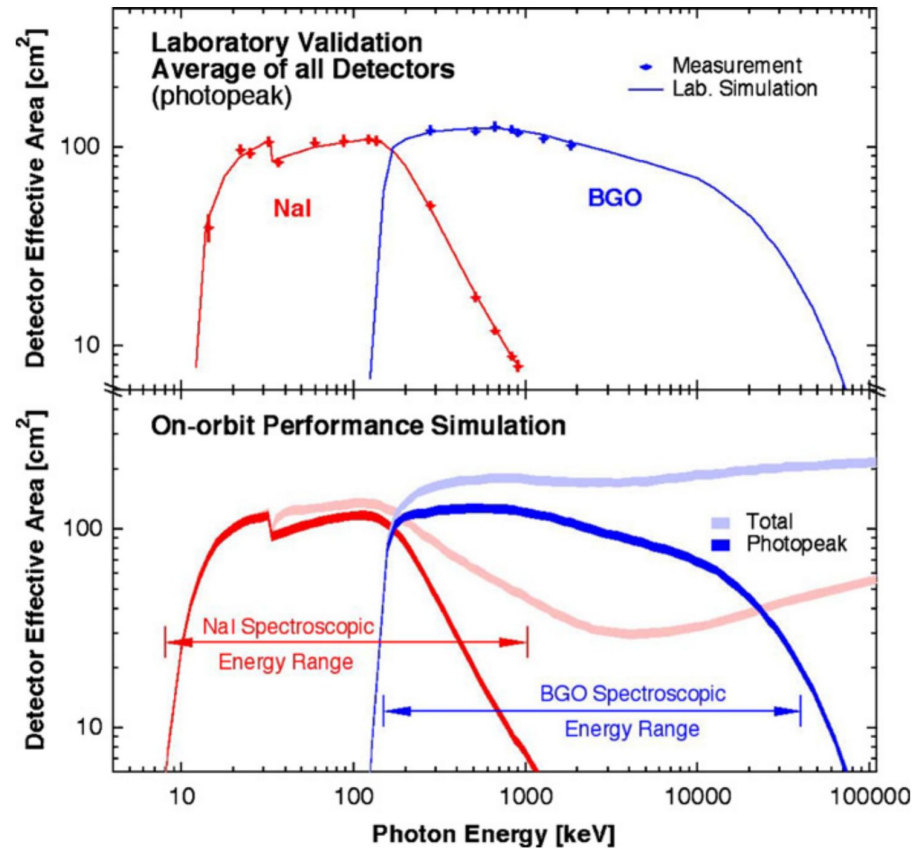

Fermi GBM

HERMES

# Spacecraft for X/γ observations

# Background estimation

# Background estimation

## Background physical model\*:

- Detector Response Matrices (DRMs)
- Earth albedo
- South Atlantic Anomaly (SAA)
- point sources (e.g., the Sun)
- extended sources (e.g., cosmic gamma-ray background)
- McIlwain L-parameter (magnetic intensity)
- Other factors...

\*Bjorn Biltzinger, Felix Kunzweiler, Jochen Greiner, Kilian Toelge, and J Michael Burgess.  
A physical background model for the fermi gamma-ray burst monitor. *Astronomy & Astrophysics*, 640:A8, 2020.

# ML Background estimation

## Input variables:

- Latitude satellite
- Longitude satellite
- Altitude satellite
- Detectors pointing
- Sun position
- McIlwain L-parameter
- ...

# ML Background estimation

## Input variables:

- Latitude GBM
- Longitude GBM
- Altitude GBM
- Detectors pointing
- Sun position
- McIlwain L-parameter
- ...

## output variables:

- Counts det n0
- Counts det n1
- ...
- Counts det n9
- Counts det na
- Counts det nb

# ML Background estimation

## Input variables:

- Latitude GBM
- Longitude GBM
- Altitude GBM
- Detectors pointing
- Sun position
- McIlwain L-parameter
- ...

## output variables:

- Counts det n0
- Counts det n1
- ...
- Counts det n9
- Counts det na
- Counts det nb

Energy range (KeV): [28, 50], [50, 300], [300, 500]

n4\_r1 2019-05-21 00:00:01.977903

# Predicted vs Detected

Predicted vs True count rates (counts/s) - n8\_r1

det range	MAE train	MAE test
r0	$4.942 \pm 0.331$	$4.953 \pm 0.328$
r1	$6.088 \pm 0.167$	$6.098 \pm 0.163$
r2	$1.790 \pm 0.044$	$1.792 \pm 0.045$
average	4.273	4.281

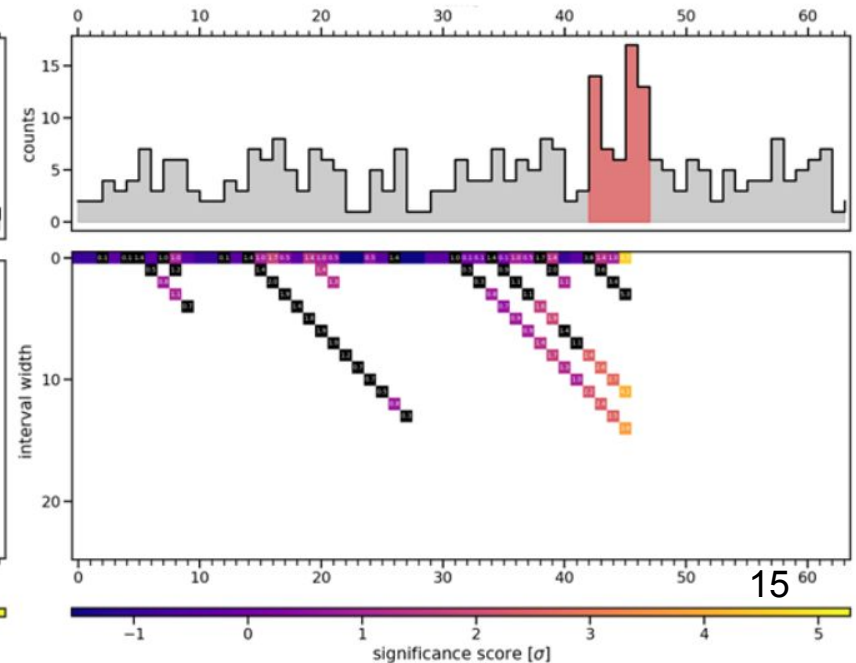

# Trigger algorithm: Poisson-FOCuS

- Conventional algorithms checks for counts excess over pre-defined timescales.
- FOCuS tests for count excess over timescales which are optimal and dynamically assessed.
- Faster and more accurate (less false negatives).

Conventional algorithm trace

FOCuS algorithm trace

## light curves

no effective area correction

The MAXI/GSC nova alert system triggered on a bright uncatalogued X-ray transient source at 13:14:08 UT on 2019 April 04. Assuming that the source flux was constant over the transit, we obtain the source position at **(R.A., Dec) = (220.987 deg, -22.632 deg) = (14 43 56, -22 37 55) (J2000)** with a statistical 90% C.L. elliptical error region with long and short radii of 0.13 deg and 0.11 deg, respectively.
