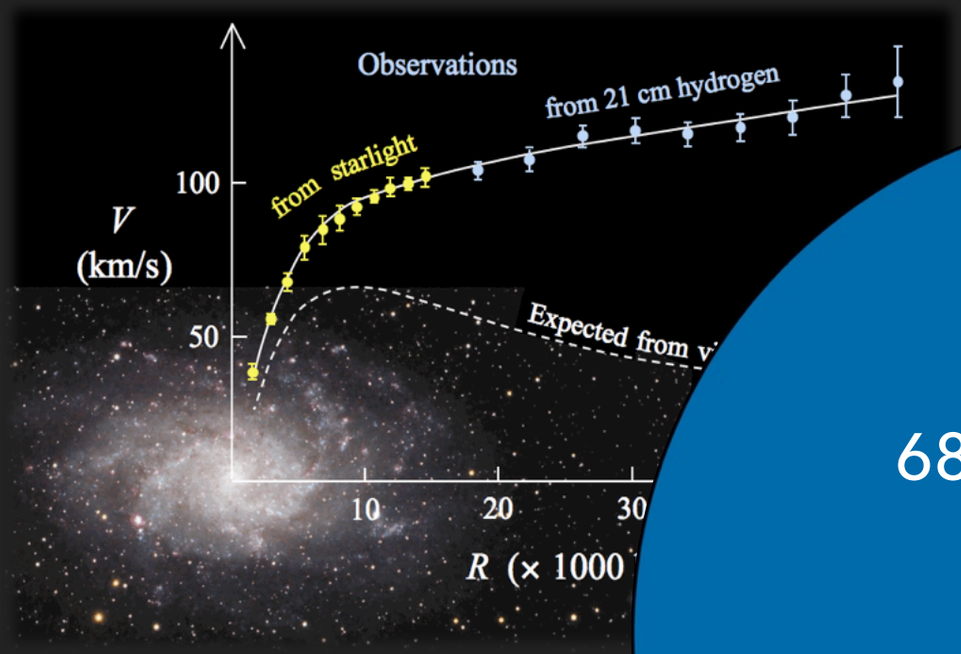
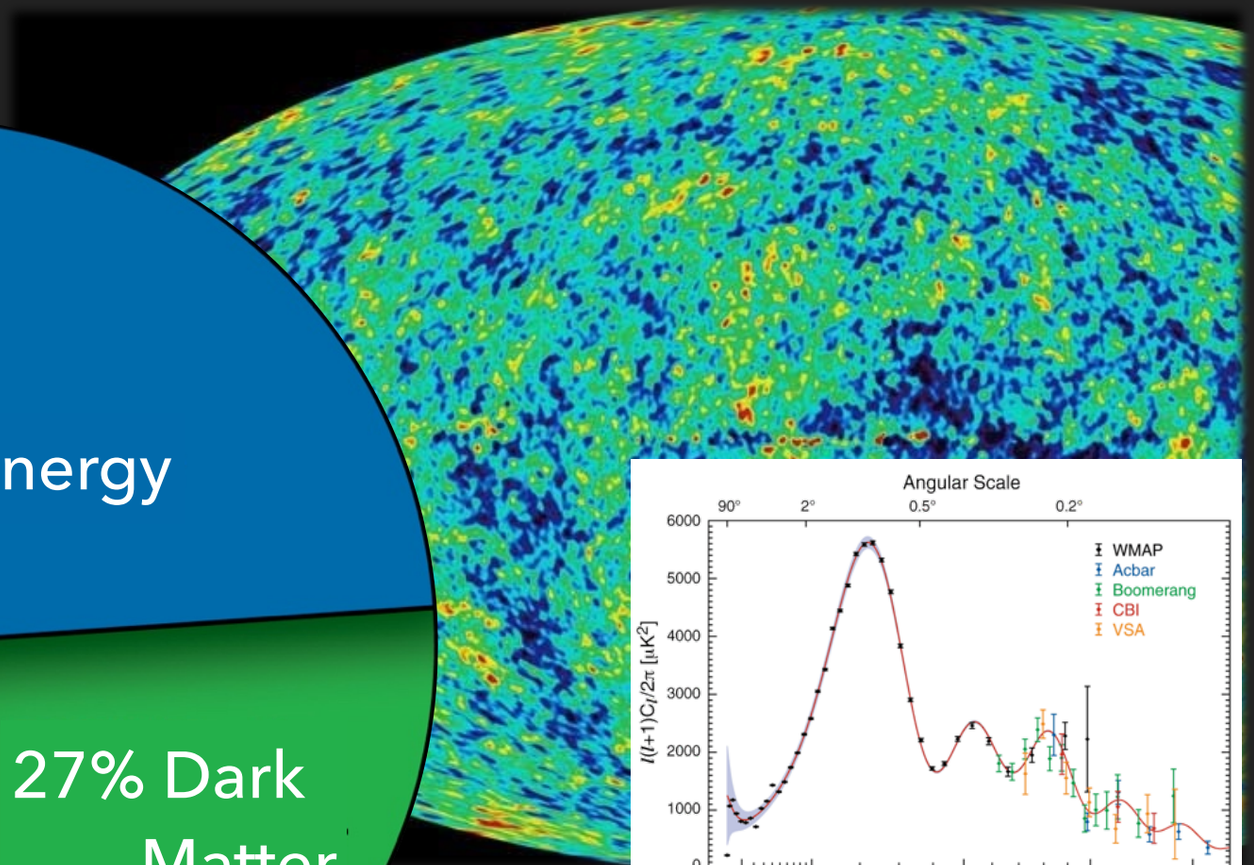
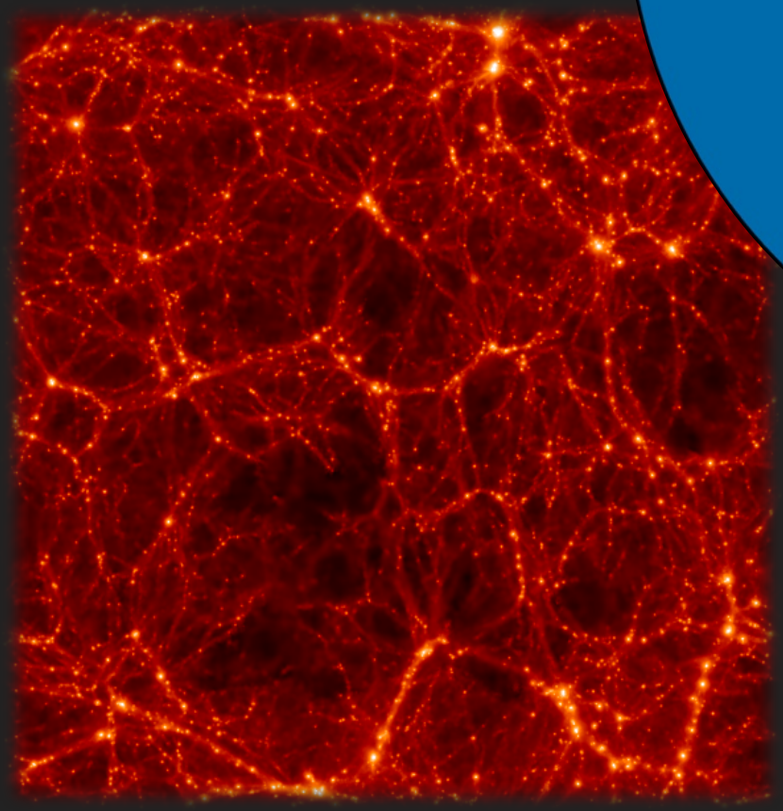
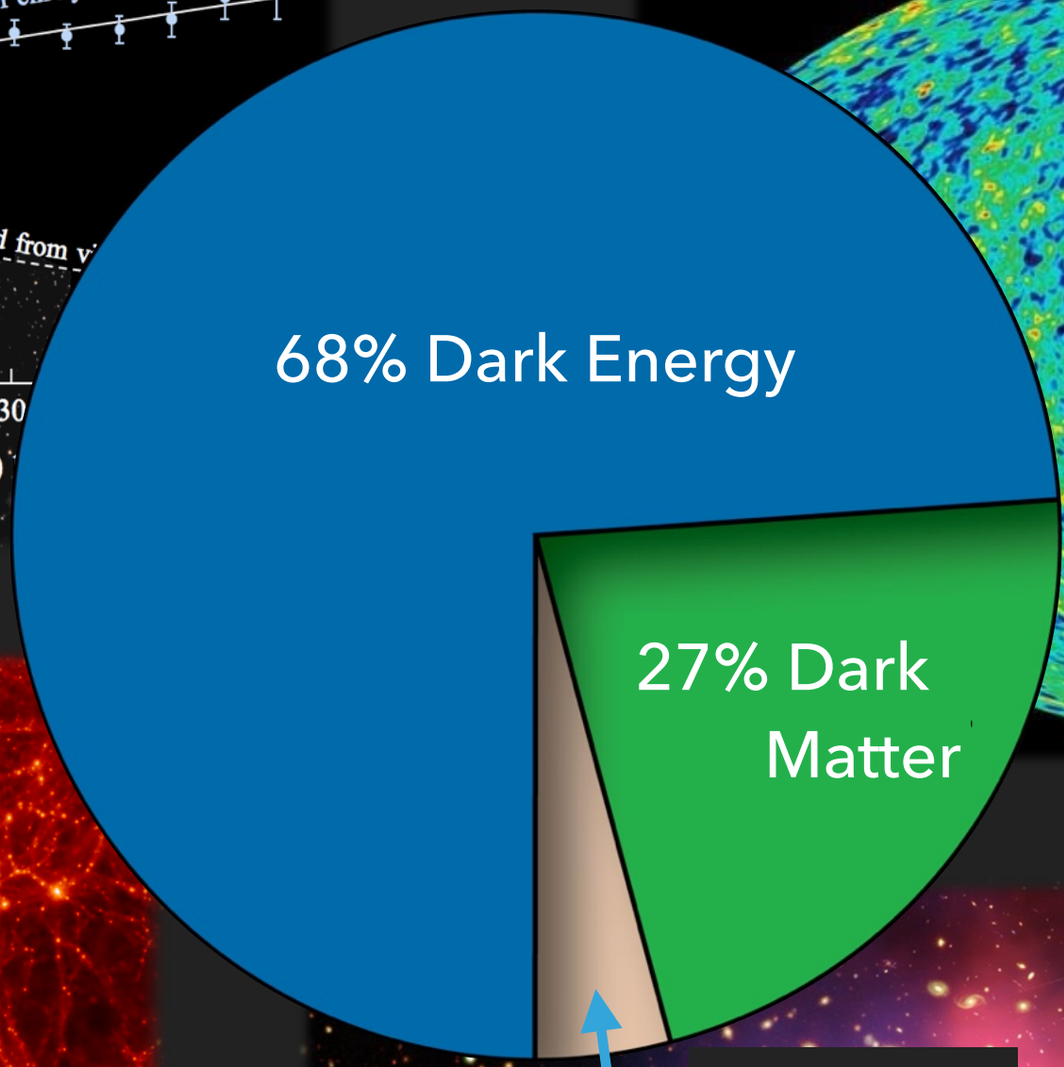
EVIDENCES FOR DARK MATTER

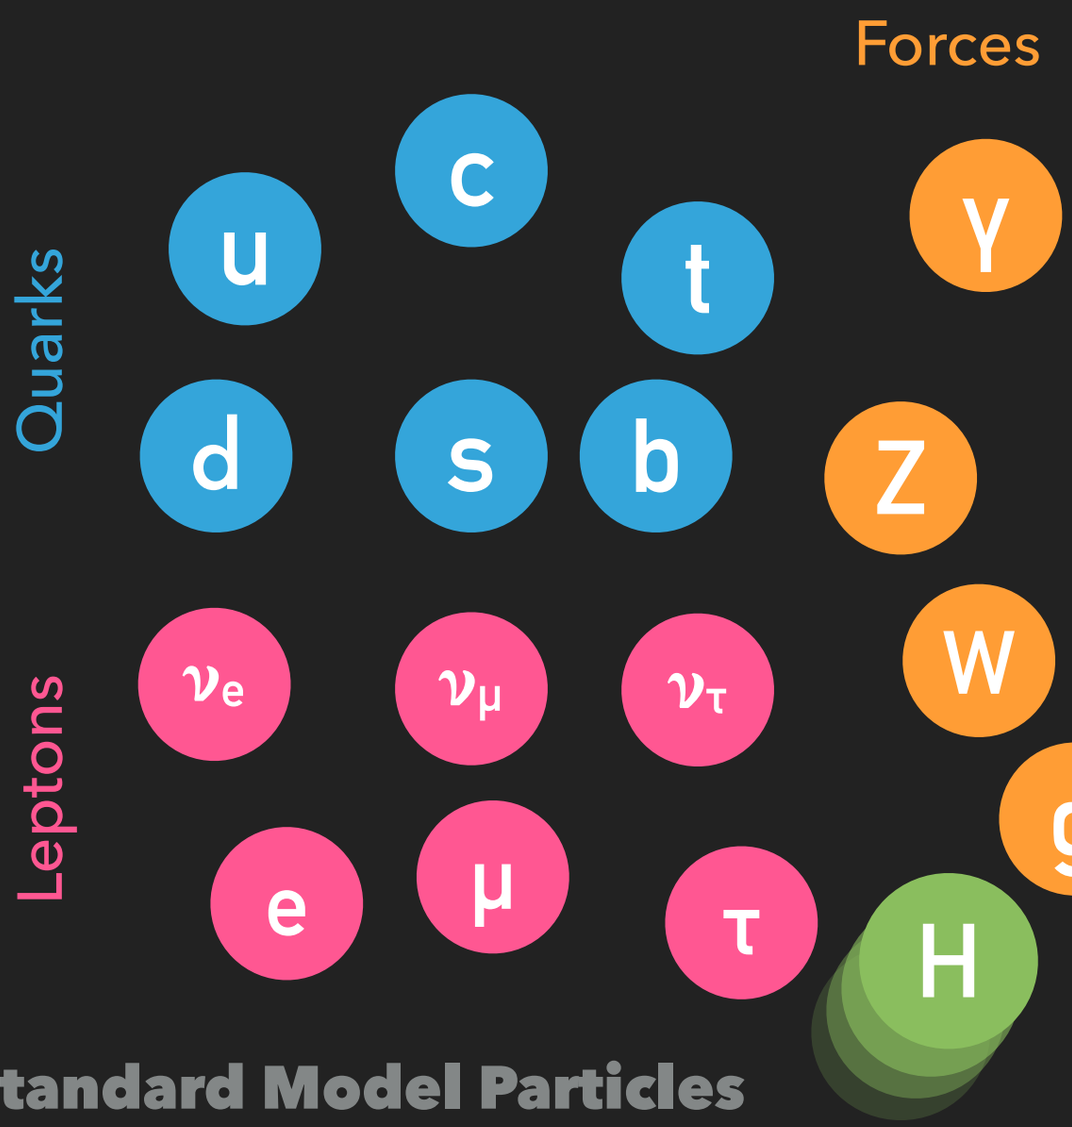








DARK MATTER PROPERTIES

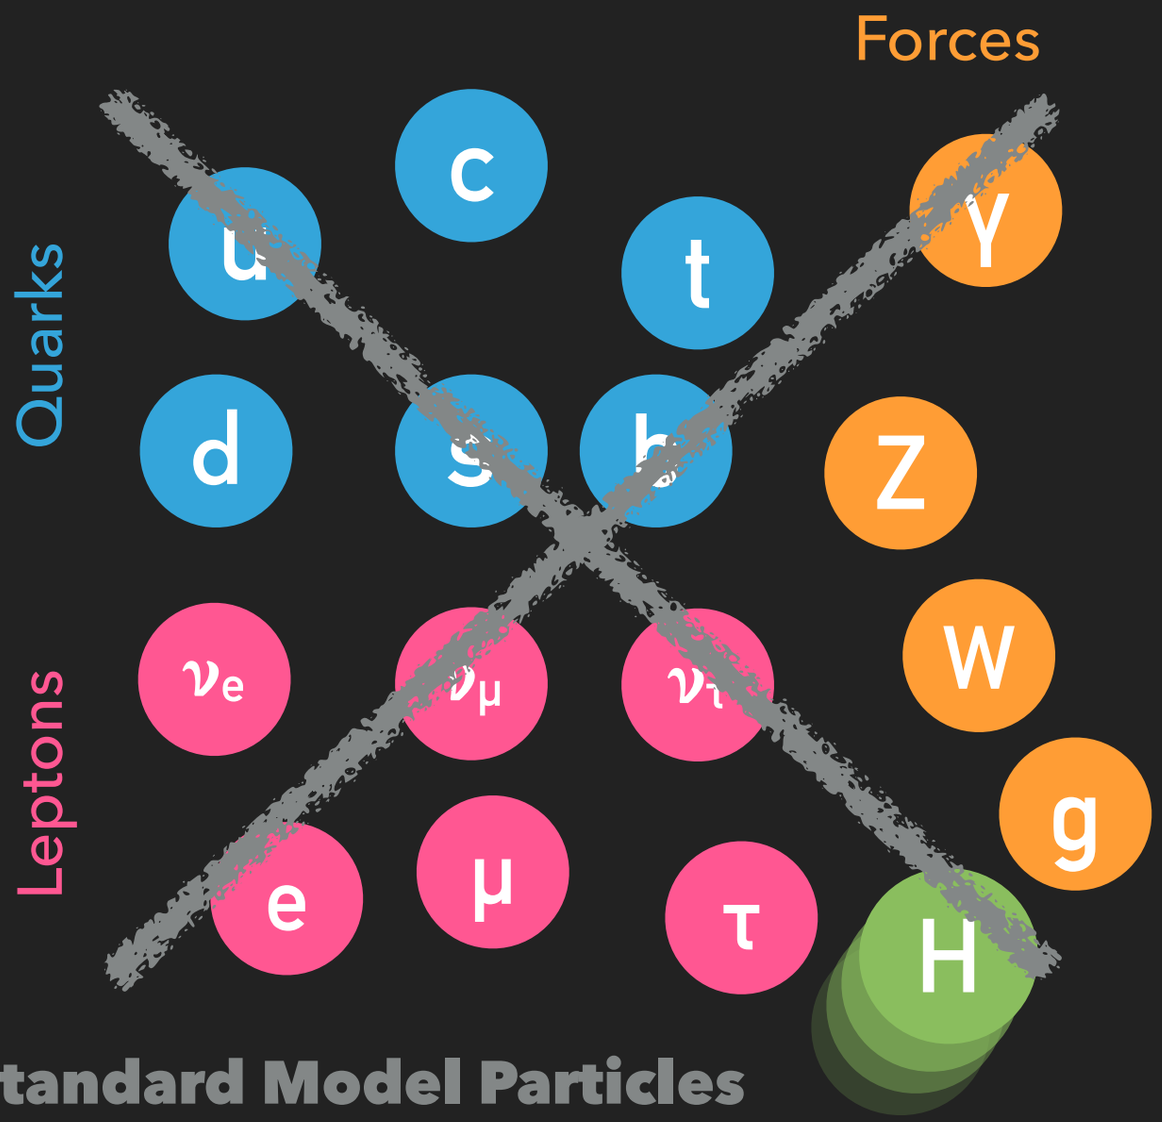


- Gravitationally interacting
- Stable particle
- Not Hot (Heavy)
- Not Baryon (Big Bang nucleosynthesis)

New Physics Beyond Standard Model!!

One of the candidates is WIMPs.

DARK MATTER PROPERTIES



- Gravitationally interacting
- Stable particle
- Not Hot (Heavy)
- Not Baryon (Big Bang nucleosynthesis)

New Physics Beyond Standard Model!!

One of the candidates is WIMPs.

FEATURES OF NOBLE LIQUID DETECTORS

- **Dense** and **easy to purify** (good scalability, advantage over gaseous and solid target)
- High **scintillation** & **ionization** (low energy threshold, not low enough to search < 1 GeV/c^2 DM)
- **Transparent** to own scintillation
- **No mechanical stress** on target materials (one origin of low-energy backgrounds)
- **Purification in situ** after commissioning

For TPC

- High electron **mobility** and **low diffusion**
- Amplification (electroluminescence gain) for **ionization signal**
- **Discrimination** electron/nuclear recoils **(ER/NR)** via **ionization/scintillation ratio**

Liquid **Xenon**

- Denser & Radio pure
- Lower energy threshold
- Sensitive to low mass WIMP

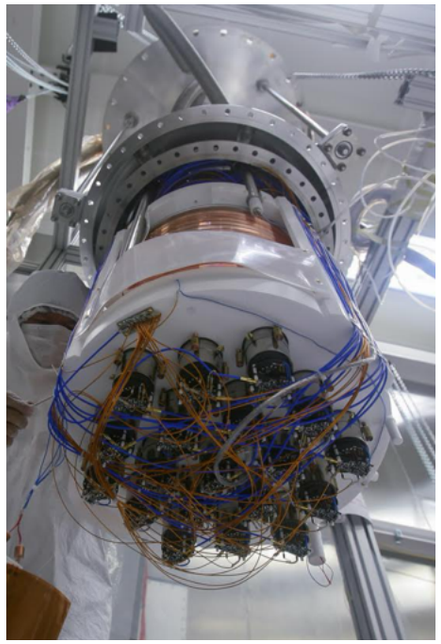
Liquid **Argon**

- lower temperature (Rn removal is easier)
- **Stronger ER discrimination** via pulse shape
- Intrinsic ER BG from ^{39}Ar
- Need wavelength shifter
- Higher sensitivity at low mass WIMP

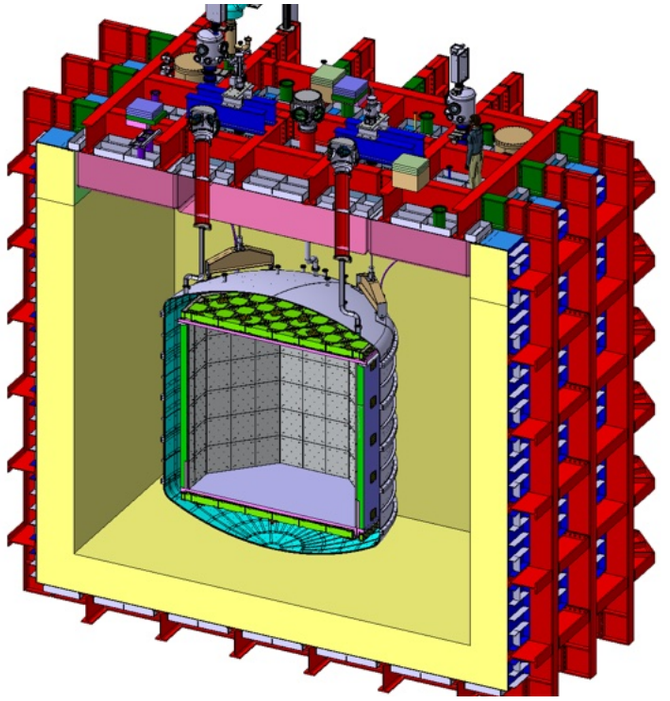
DARKSIDE PROGRAM

- **Direct detection** search for **WIMP** dark matter
- Based on a **two-phase argon** time projection chamber (**TPC**)
- Design philosophy based on having very low background levels that can be further reduced through **active suppression**, for **background-free** operation from both neutrons and β/γ's

DarkSide-10



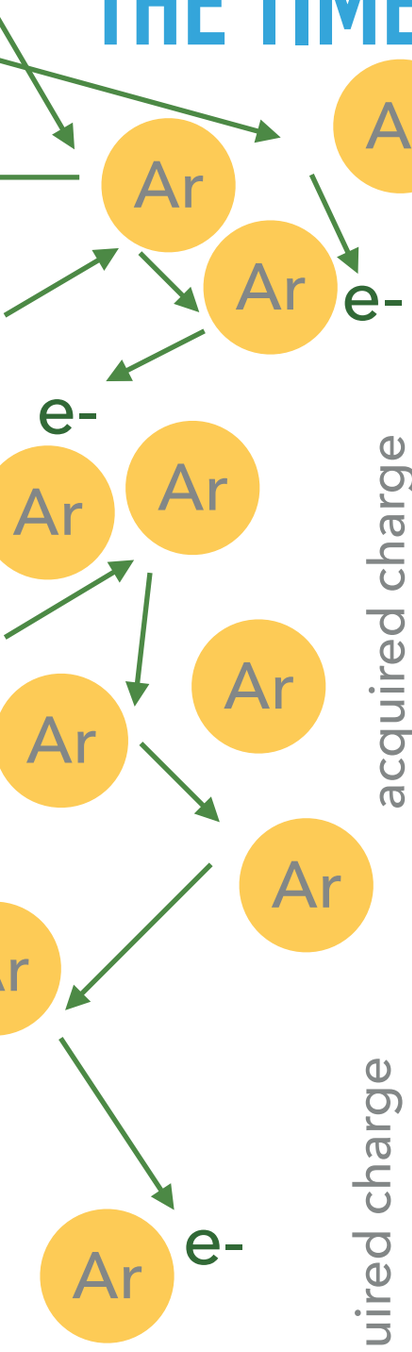
DarkSide-50

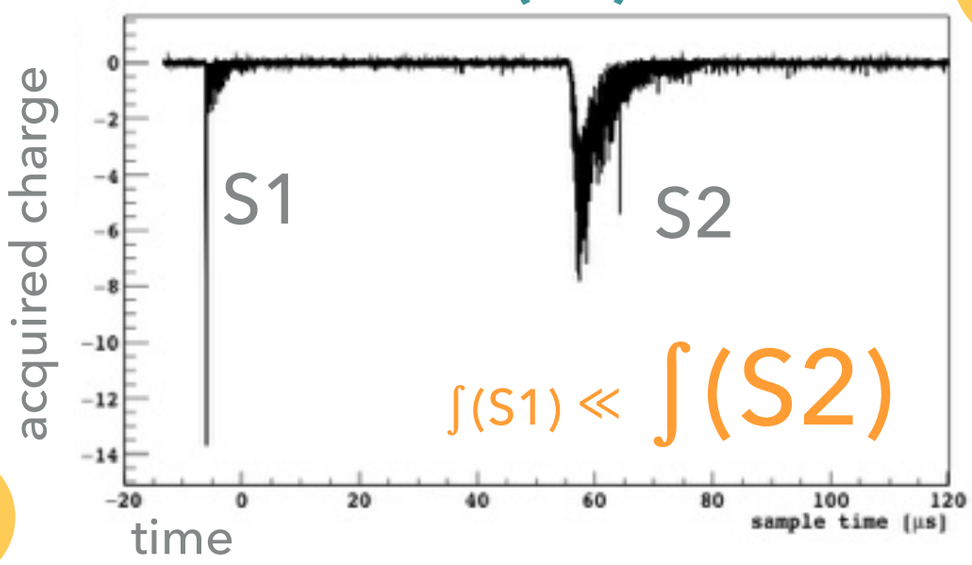


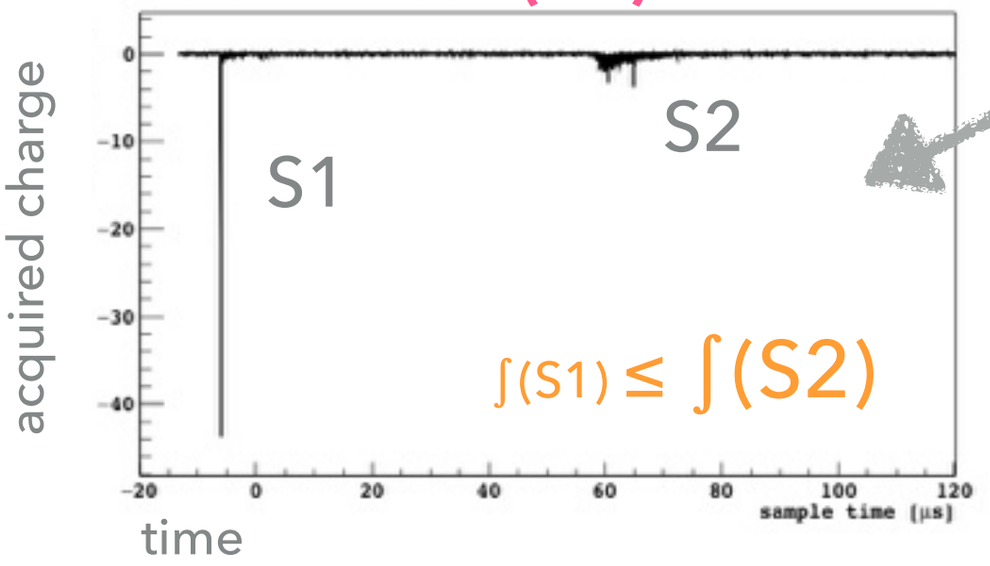
DarkSide-20k

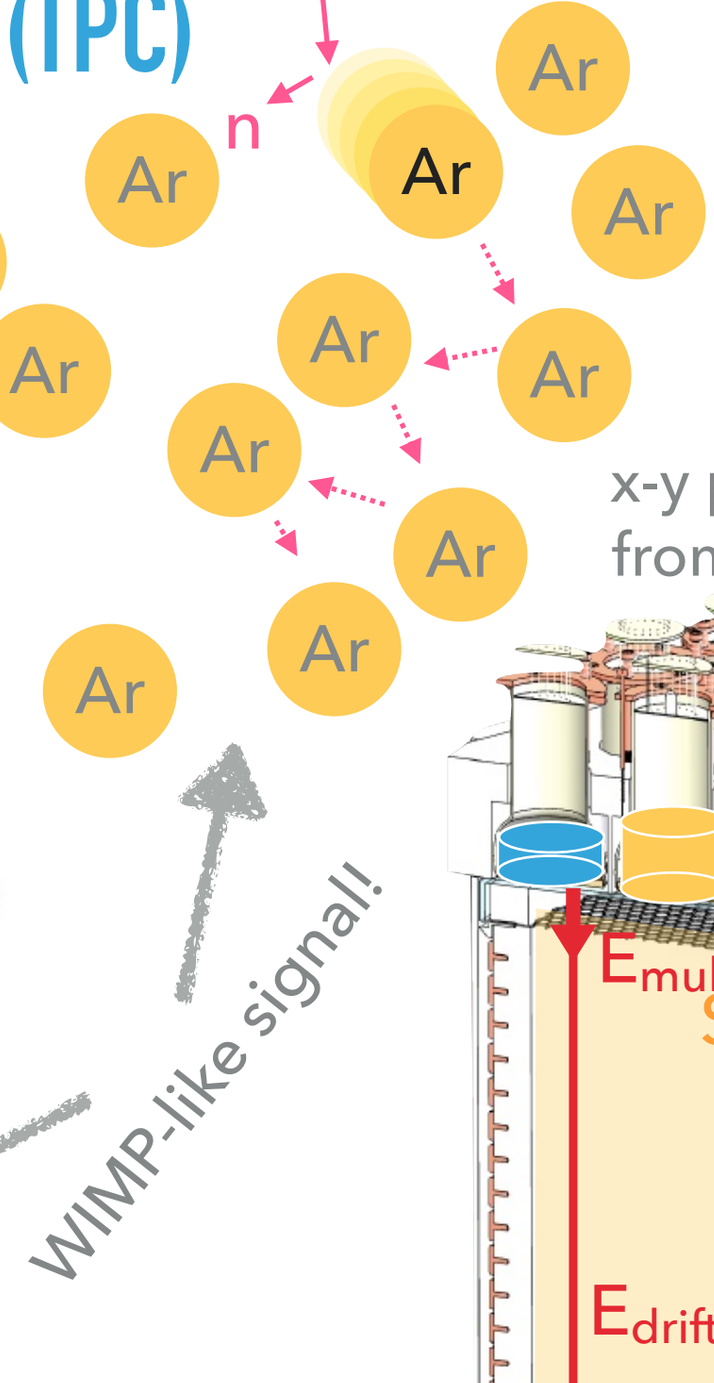
and **DarkSide-LowMass**
for low-mass dark matter searches

THE TIME-PROJECTION CHAMBER (TPC)

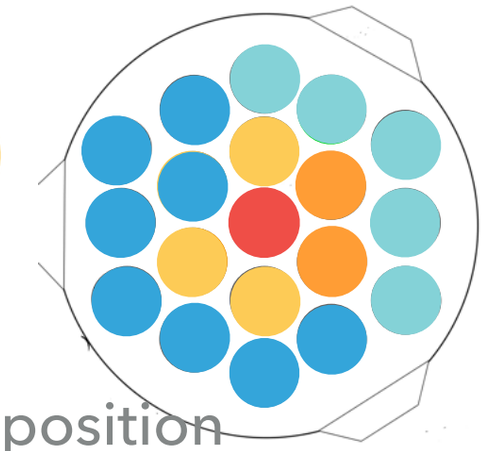




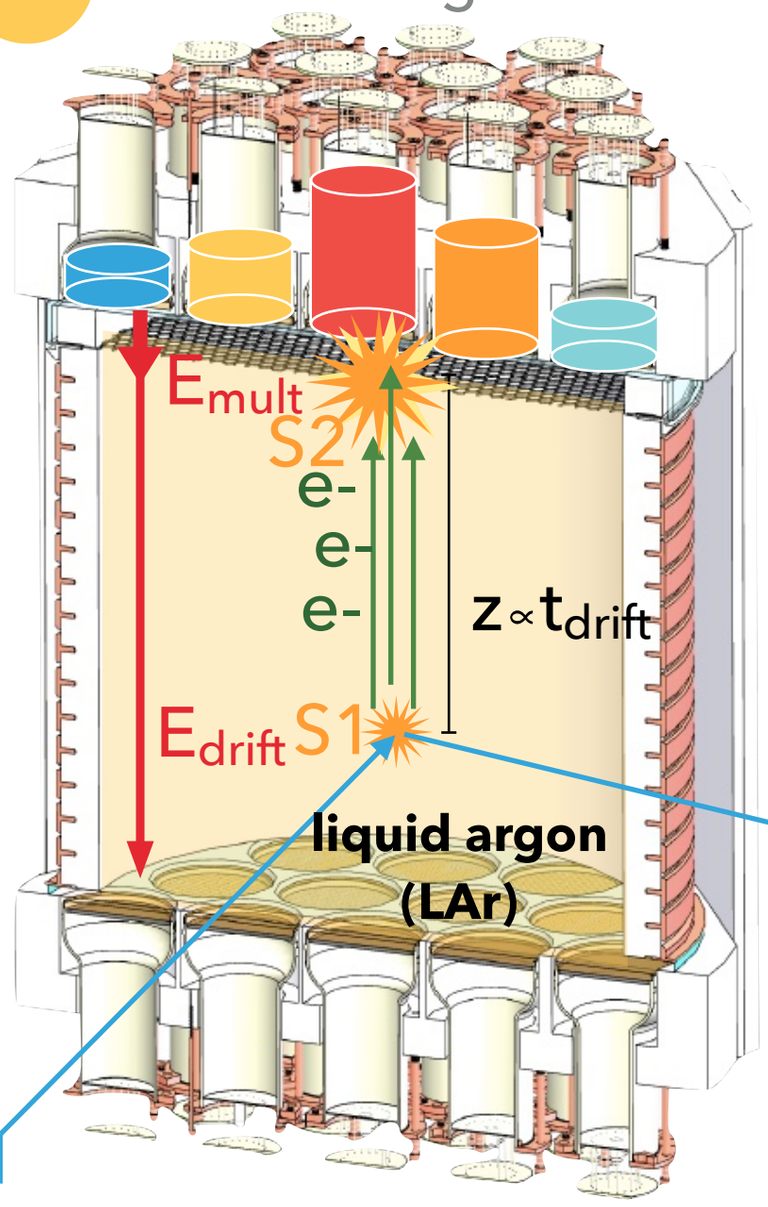




WIMP-like signal!



x-y position
from S2 light fraction



S2/S1 ratio and **Pulse Shape Discrimination (PSD)**
WIMPs will generate nuclear recoils (NRs)

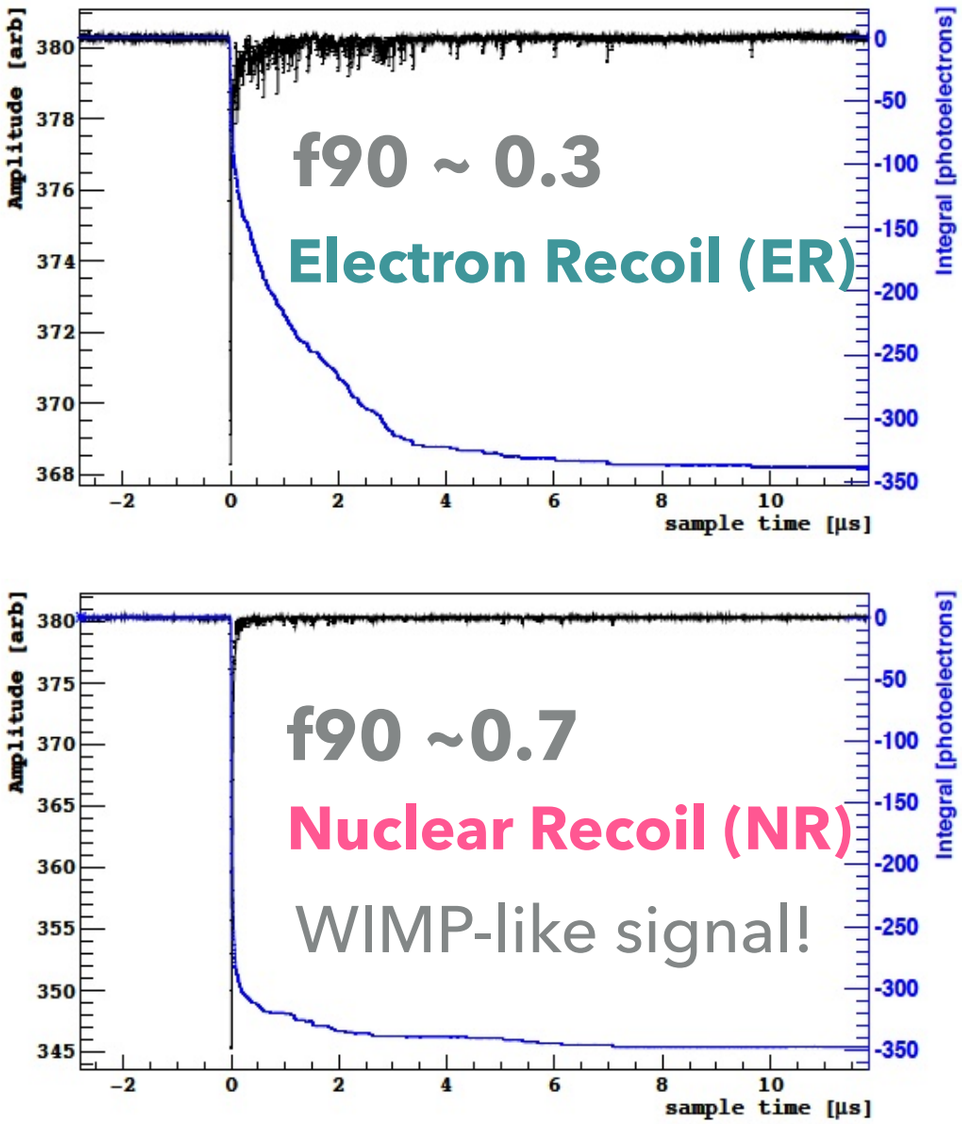
PULSE SHAPE DISCRIMINATION

β & γ Rejection

- Electron and nuclear recoils produce different excitation densities in the argon, leading to different **ratios of singlet and triplet excitation states**

τ singlet ~ 7 ns

τ triplet ~ 1500 ns



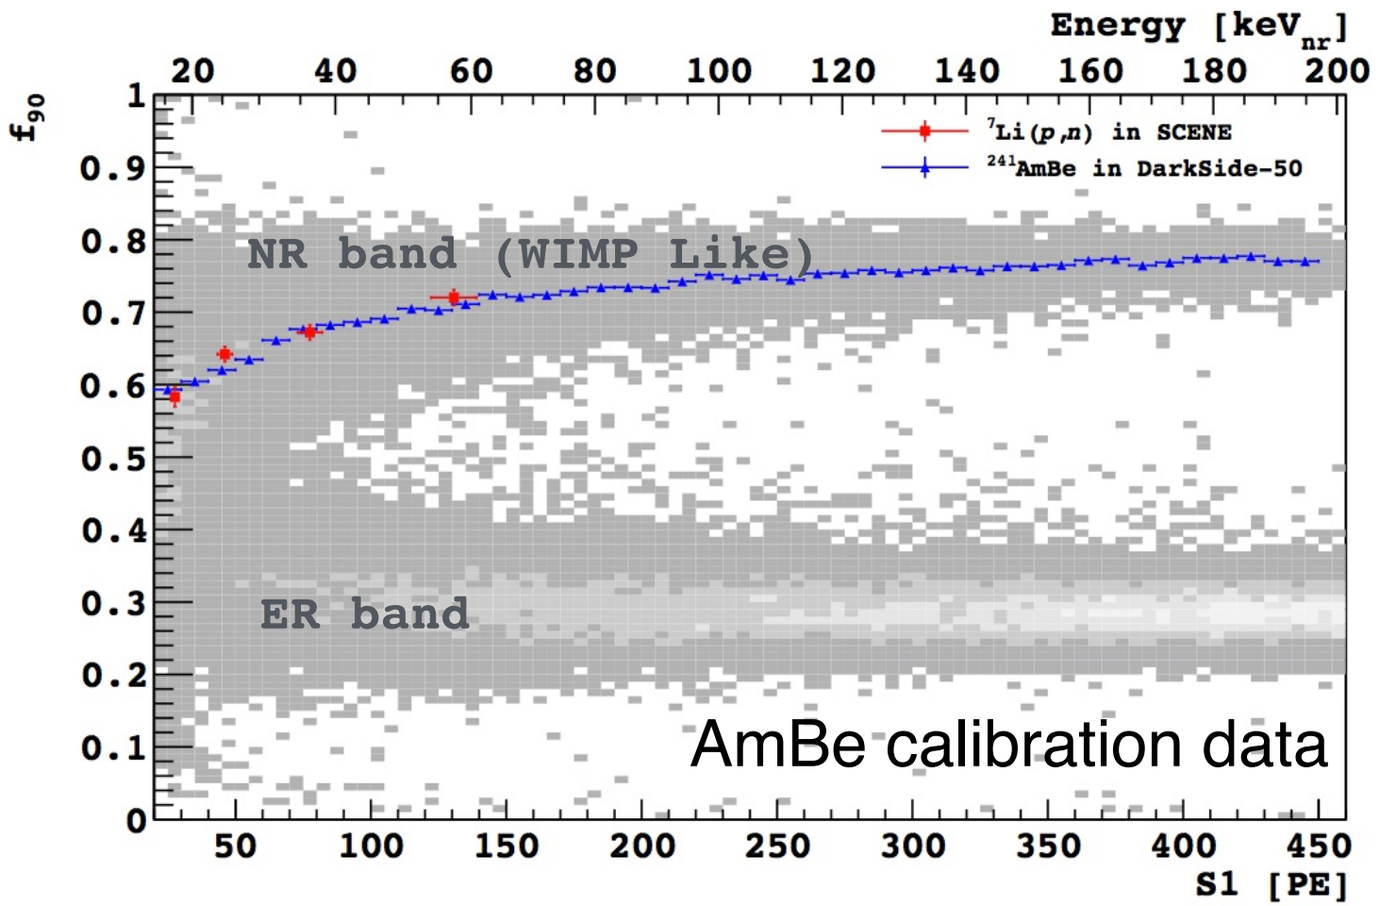
PSD parameter

A. Hitachi et al. Phys. Rev. B 27 (1983) 5279

M. G. Boulay and A. Hime, Astropart. Phys. 25 (2006) 179

F90: Ratio of detected light in the first 90 ns*, compared to the total signal

~ Fraction of singlet states



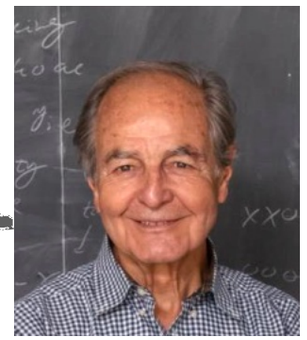
More for PSD: DEAP-3600, Eur. Phys. J. C 81, 823 (2021)

* the 90 ns is optimized value for DS50 and detector dependent parameter.

UNDERGROUND Ar

β & γ Rejection

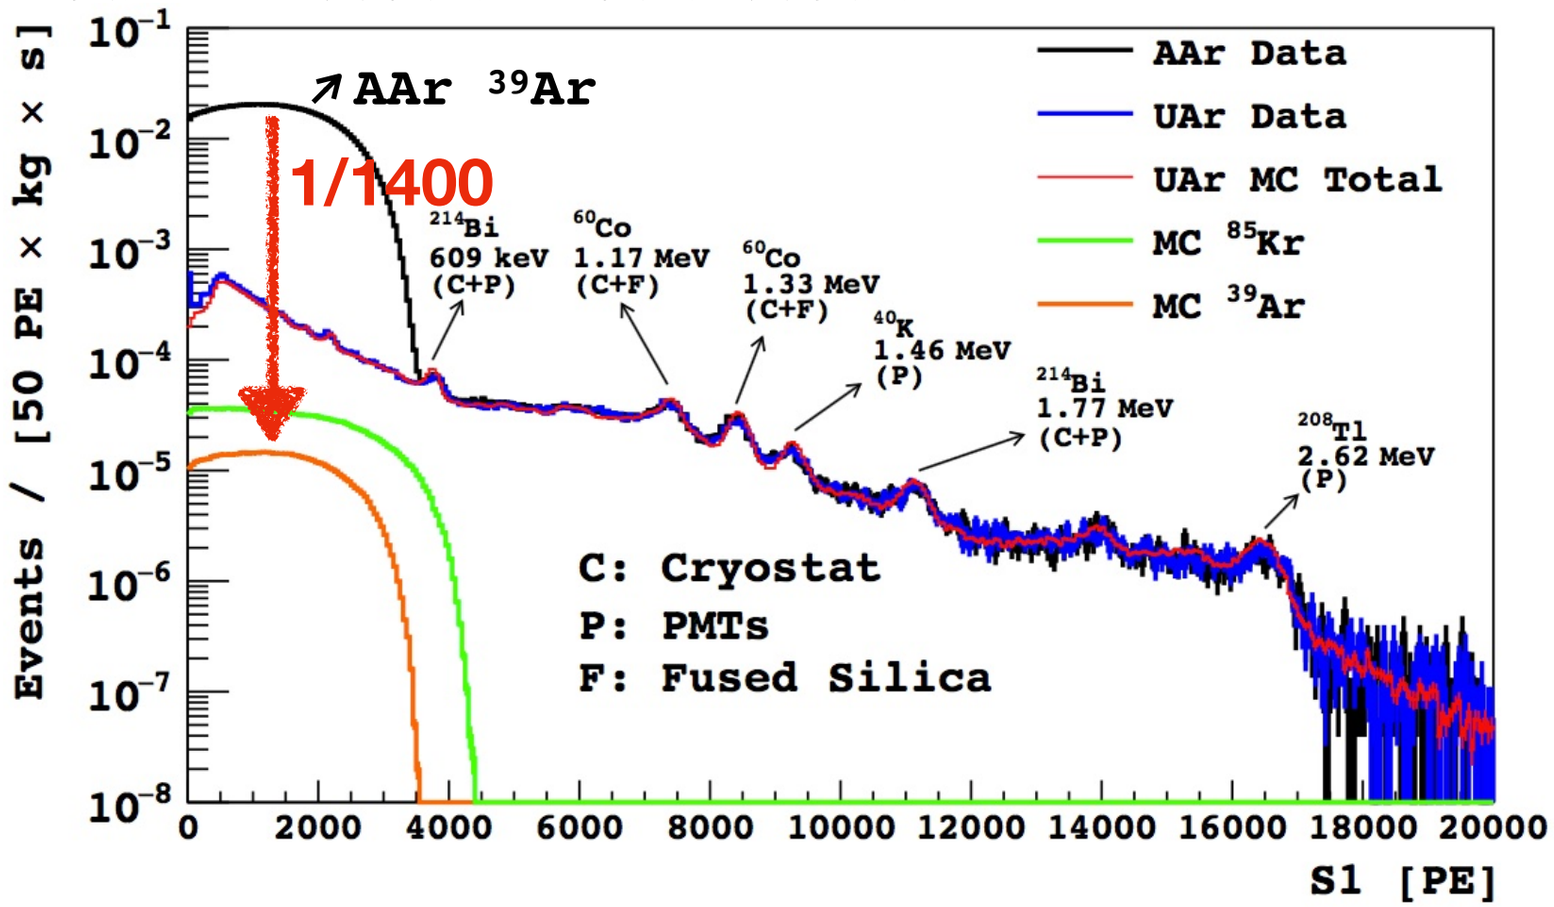
- Intrinsic ^{39}Ar radioactivity in **atmospheric argon** is the primary background for argon-based detectors
- ^{39}Ar activity sets the dark matter detection threshold at low energies (where pulse shape discrimination is less effective)
- ^{39}Ar is a **cosmogenic isotope**, and the activity in argon from **underground sources** can be significantly lower compared to **atmospheric argon**



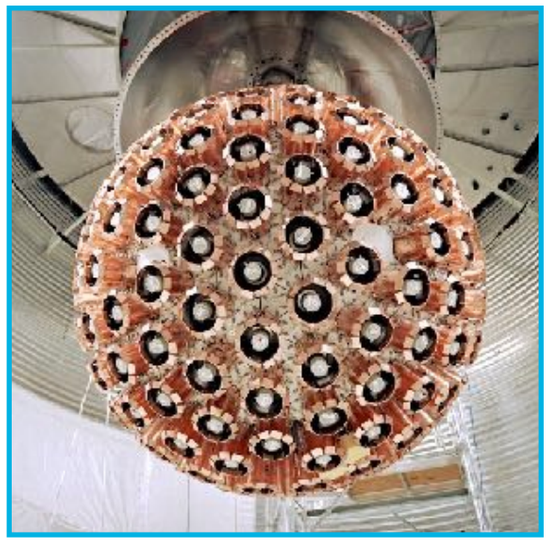
Frank Calaprice

- We deployed 157kg of underground argon in 2015.

^{39}Ar reduction factor of ~1400!



GLOBAL ARGON DARK MATTER COLLABORATION

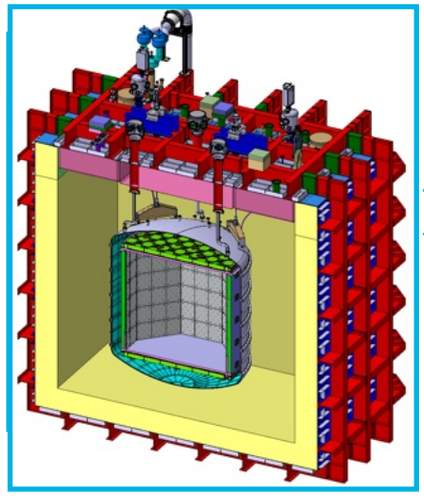


DEAP-3600

More than 400 scientists from past and present argon-based experiments in a single international argon collaboration: **GADMC**

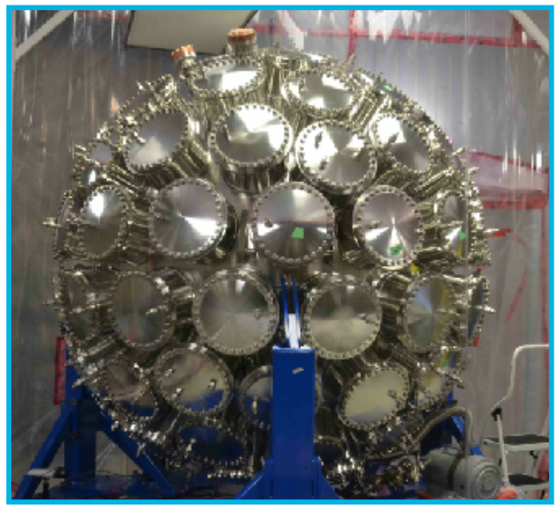
A sequential, two-steps program:

- DarkSide-20k (200 tonne yr fiducial)

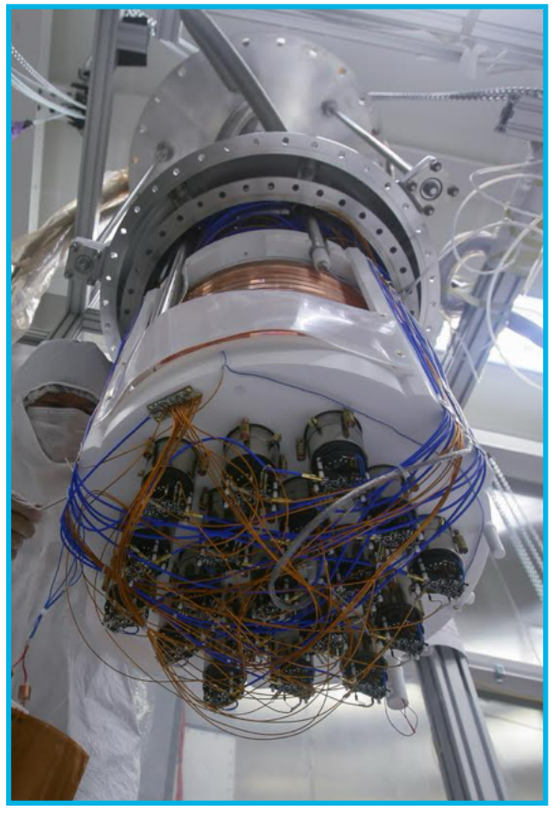


- Argo (3,000 tonne yr fiducial)

At SNOLAB
~203X

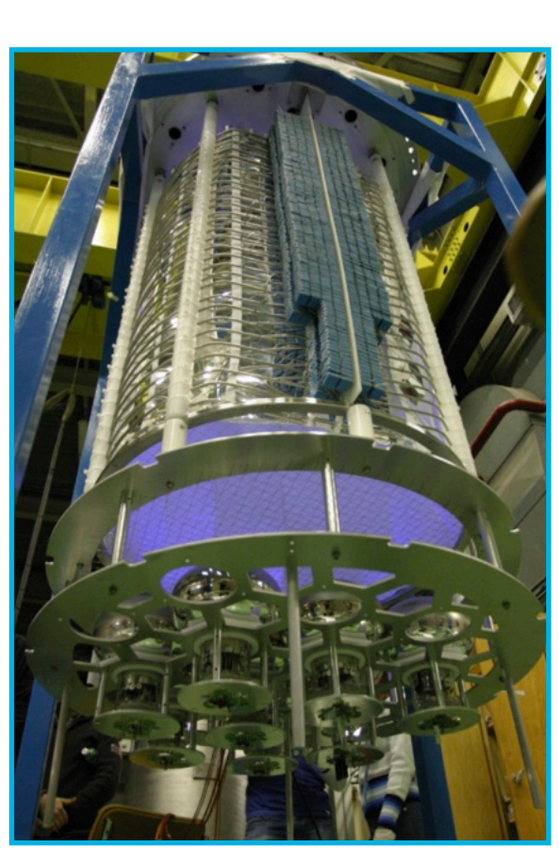


MiniCLEAN

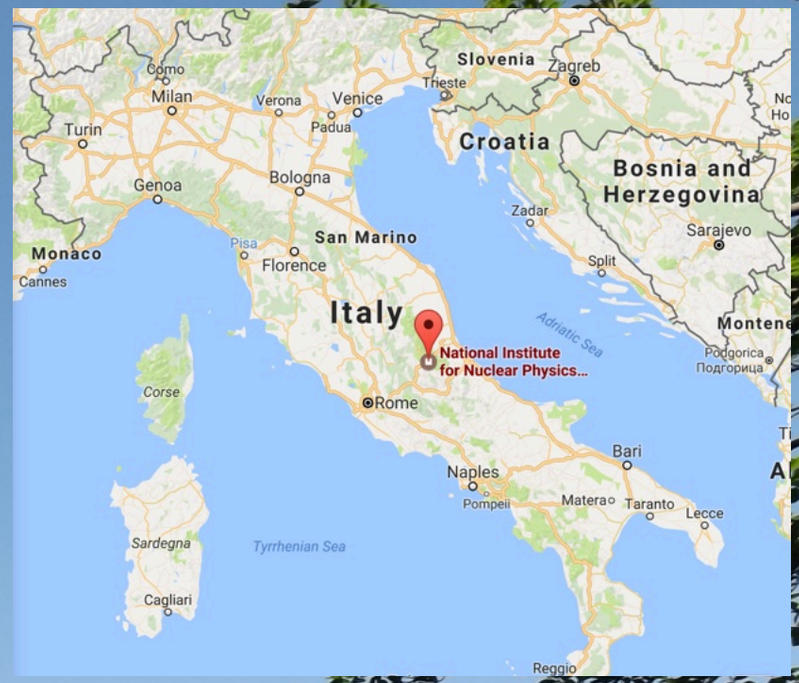


DarkSide-50

The goal: explore heavy dark matter to the neutrino floor and beyond with extremely low instrumental background

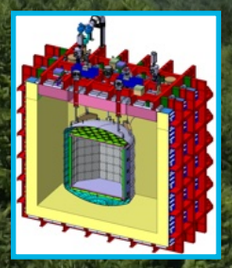


ArDM



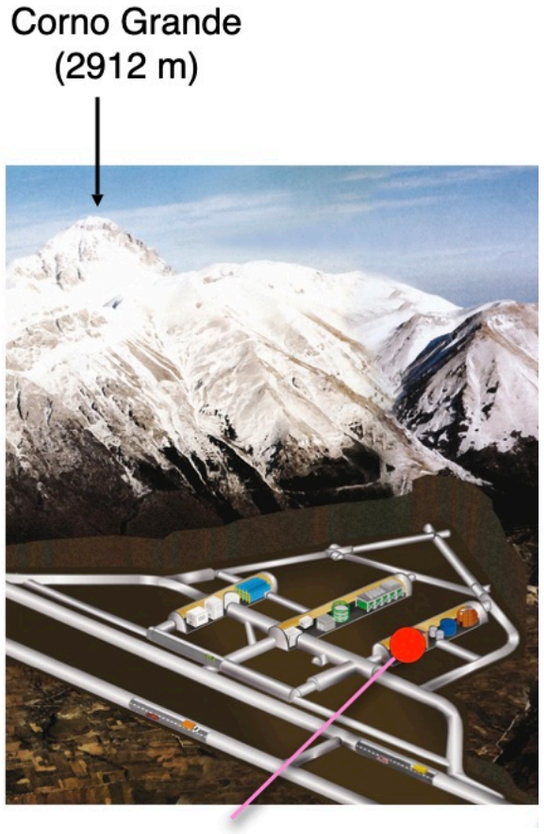
Gran Sasso

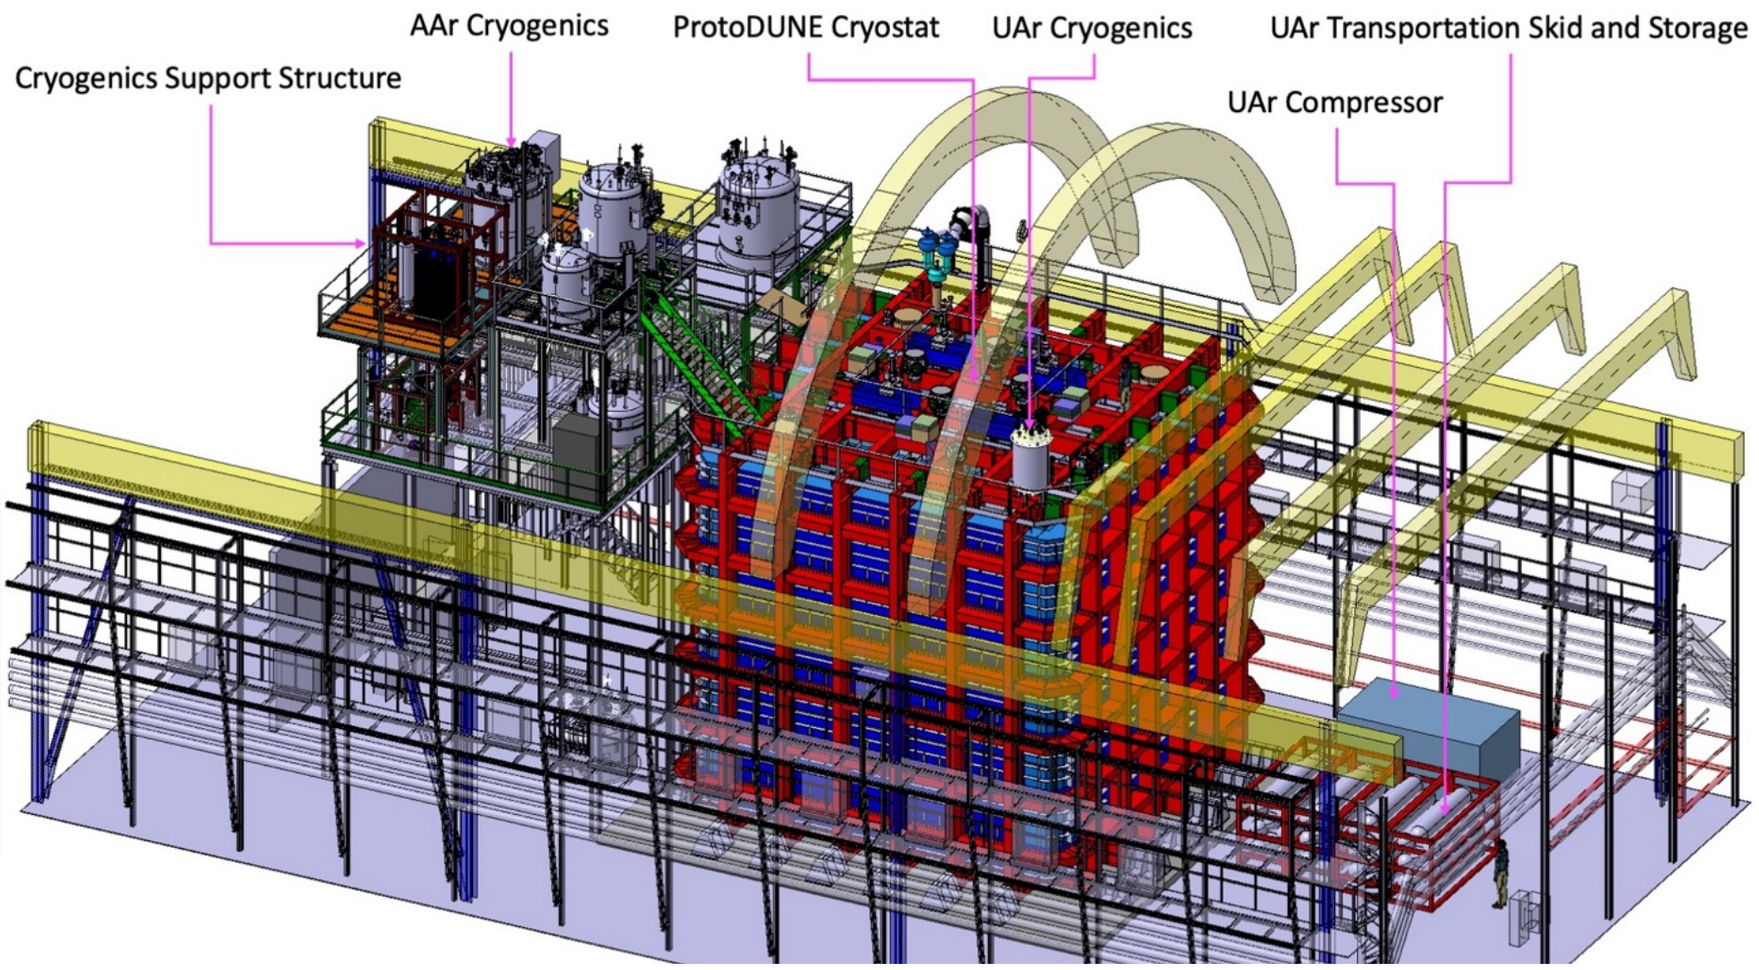
3800 m w. e.



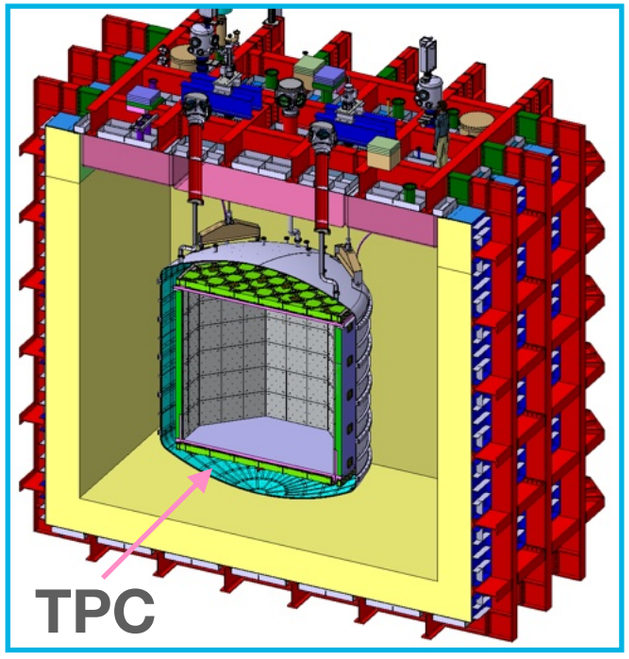
Deep underground location at LNGS, Italy.

DARKSIDE-20K DETECTOR

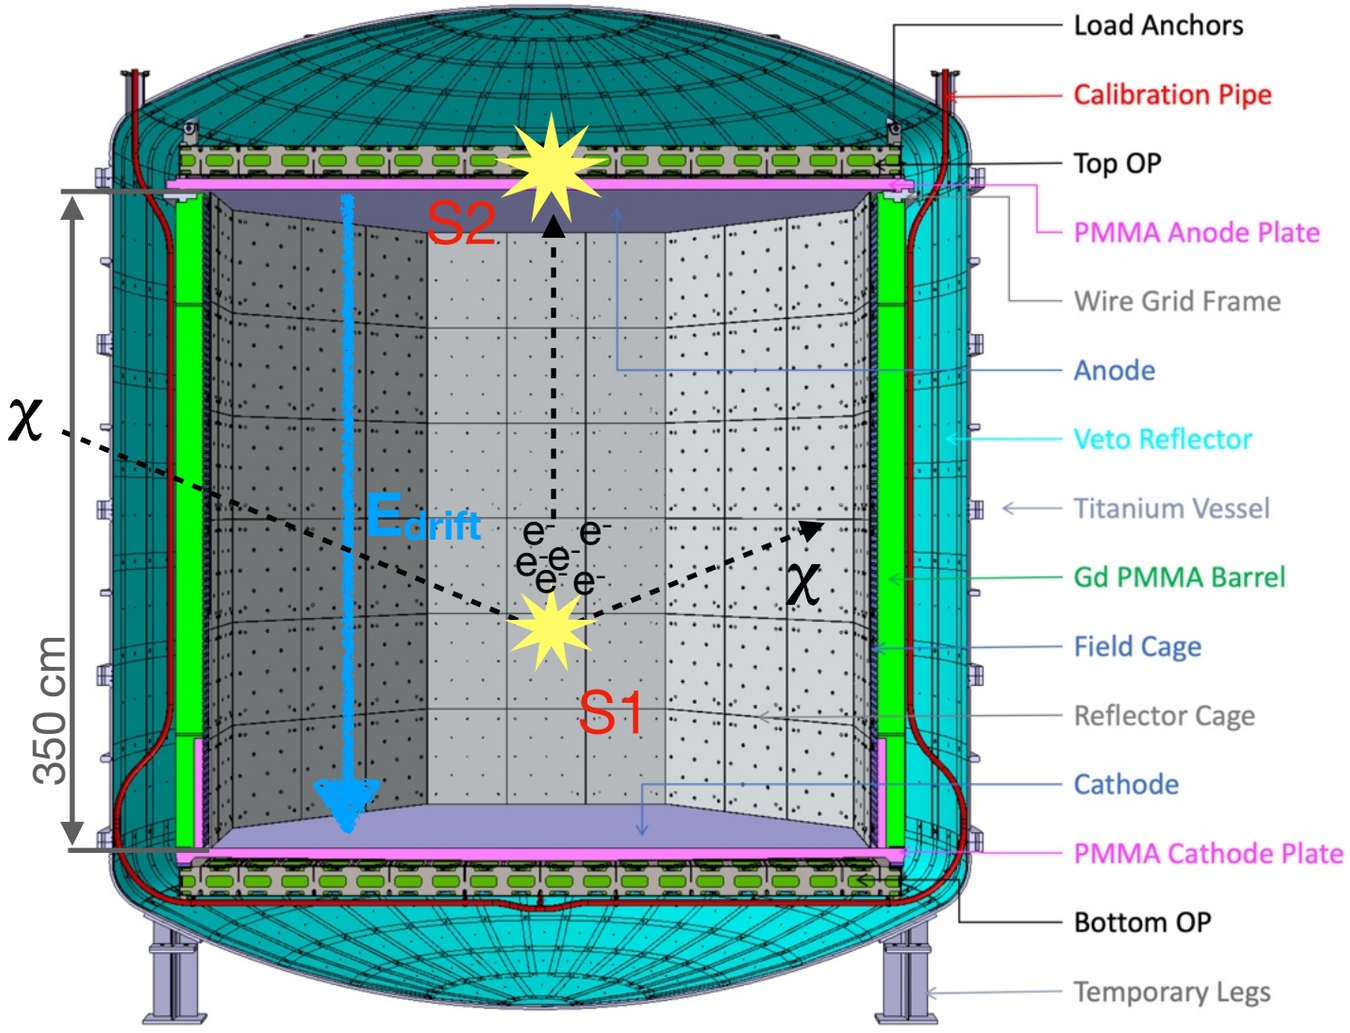


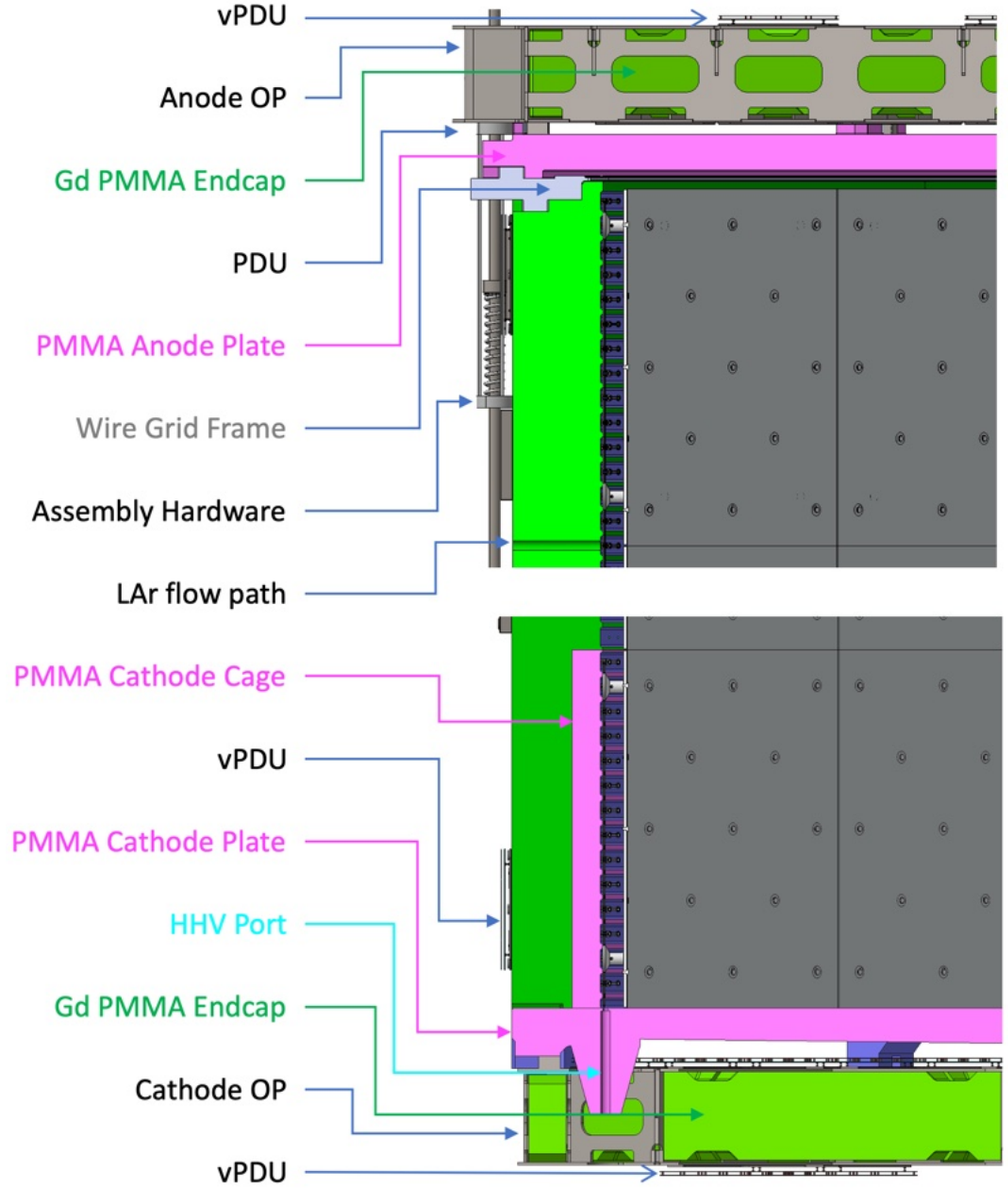


- DarkSide-20k will be installed underground at the Gran Sasso National laboratories, in Italy.
- The detector has a nested structure:
  - Titanium Vessel contain liquid underground argon (100 t)
    - Gadolinium loaded acrylic TPC filled with 50 t of UAr
    - Neutron veto buffer between TPC and Ti vessel
  - Membrane cryostat like the ProtoDune one



TIME PROJECTION CHAMBER





- Gd-doped acrylic, PMMA (polymethylmethacrylate), vessel to capture neutrons
- Octagonal shape
- Cathode and anode coated with new transparent conductor (Clevios) and wavelength shifter
- Grooves with Clevios for field cage (No copper rings)
- Wire grid for extraction and electroluminescence fields
- Sides covered with multilayer polymeric reflector evaporated with wavelength shifter (TPB)
- SiPMs planes external to anode and cathode

UNDERGROUND ARGON

- **Urania** (Extraction):
  - Expansion of the argon extraction plant in Cortez, CO, to reach capacity of **330 kg/day** of Underground Argon

- **Aria** (Isotope separation):
  - Very tall column in the Seruci mine in Sardinia, Italy, for high-volume chemical and isotopic purification of Underground Argon. **A factor 10 reduction of ^{39}Ar** per pass is expected with ~10 kg/day.

- **DArT** (assay):
  - A single phase low-background detector to measure the ^{39}Ar depletion factor of different underground argon batches.

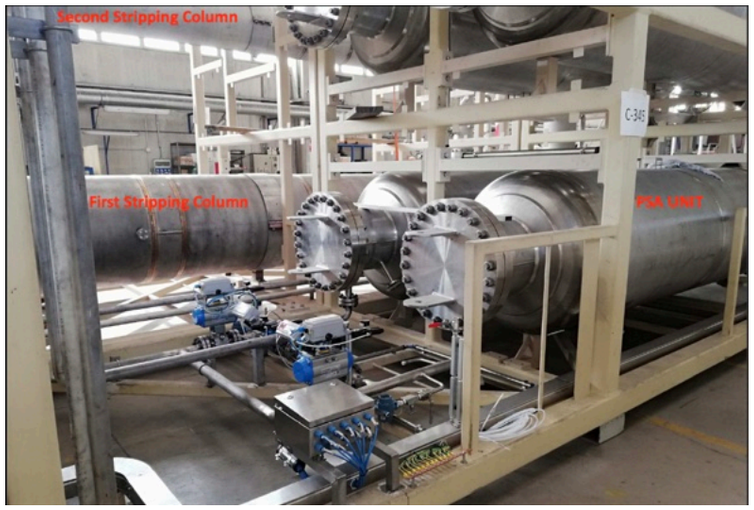
URANIA UPDATE



Production of components

Leak test

Shipping & Storage

Urania Site Construction

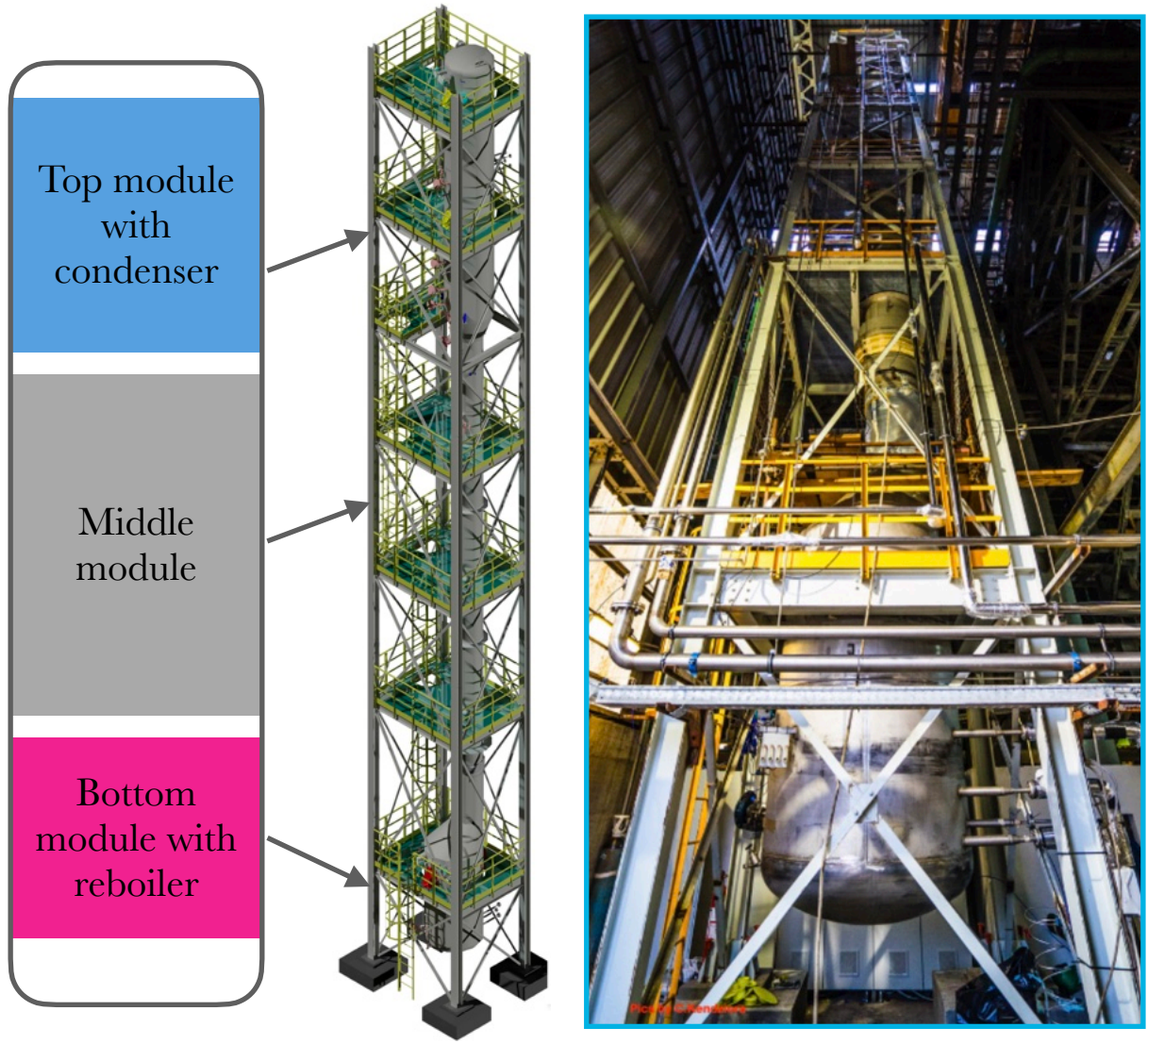
ARIA UPDATE

- The demonstrator column (26 m) that consists of three modules was **successfully tested** in 2019 with LN_2 and with argon in 2021.

Eur. Phys. J. C 81, 359 (2021)

Eur. Phys. J. C 83, 453 (2023)

- **The results are in agreement with the expectations** and validate the concept and design of the plant.
- Successful **test installation** of the first module (of 28 central ones) in the shaft at Seruci mine.
- Refurbishing of shaft and support structure is on going.

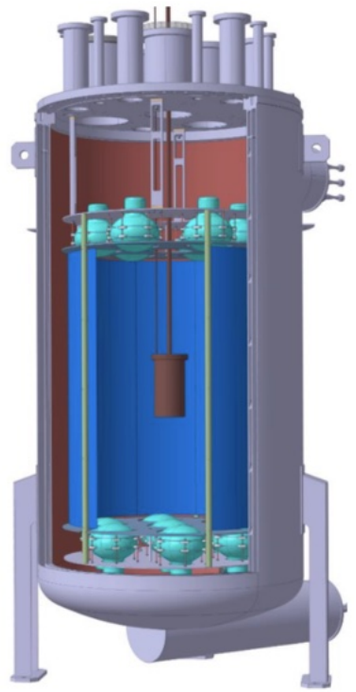


Prototype ARIA column ~26 m

Test installation of the module

ARGON RADIO-PURITY MEASUREMENT

- **DArT:** a single phase low-background detector to measure the ^{39}Ar depletion factor of different underground argon batches (URANIA+ARIA).
- Cylinder made of 99.99% OFHC Cu, 1.42 kg of LUAr. PMMA support structure with TPB coating. Two 1 cm^2 SiPMs.
- To be installed inside the ArDM apparatus (Canfranc Laboratory, Spain) filled with LAr (850 kg AAr) used as active veto.
- Sensitivity to the depletion factor of 1000 with 10% precision in one week run.



DArT in ArDM

DArT SiPM

DArT was installed at LSC in April 2021 and the following installation in ArDM was in 2023.

More details of DArT: JINST 15 P02024 (2020)

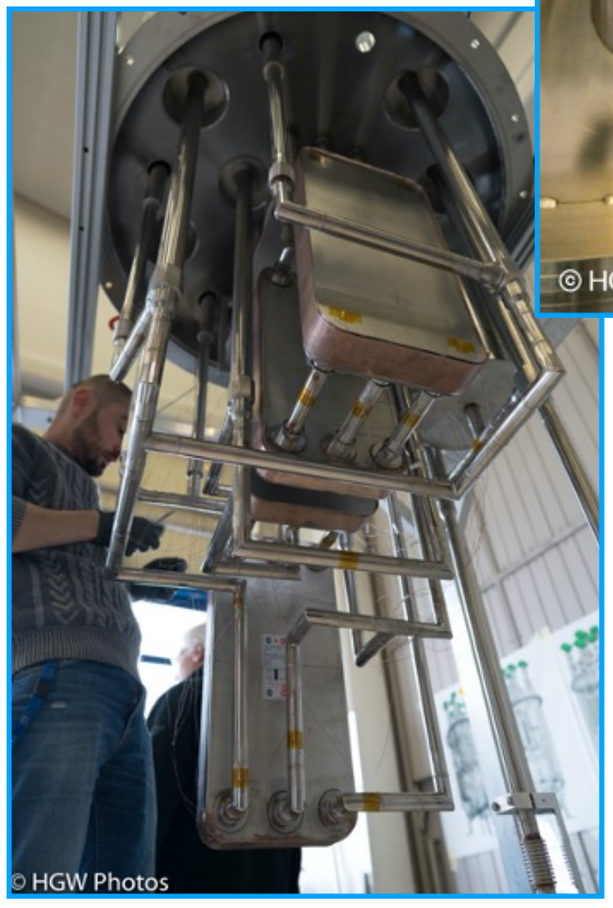
Measurement of UAr from DarkSide-50 is up coming…

CRYOGENIC SYSTEM FOR TPC

- Integrated test of the UAr cryogenics is ongoing at CERN.
- Up to 10 kW (latent heat + heat exchanging) adjustable condenser box.
- 1000 SLM circulation speed with two homemade pumps in parallel.
- The first test was taken in July 2021.
- More tests are planned later this year.

DarkSide unique condenser design

Fully instrumented condenser system



In-house fabrication of the gas handling system

TPC Cryogenic system (test installation) at CERN

MOCKUP @LNGS

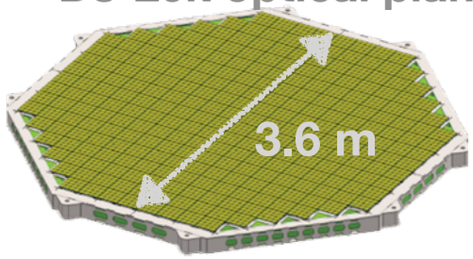
- Mockup to check TPC mechanical assembly and characterization of the cryogenic system.
- Currently, cryogenic system characterization, such as maximum flow rate, stability, and emergency behavior, is on going.
- Mockup TPC will be installed in Summer 2024!

Credit: P. Salomone

PHOTO SENSOR

- Custom cryogenic SiPMs developed in collaboration with Fondazione Bruno Kessler (FBK), in Italy.
- Key features
  - Photon detection efficiency (PDE) ~45%
  - Low dark-count rate < 0.01 Hz/mm² at 77K (7 Volts overVoltage)
  - Timing resolution ~ 10 ns
- The 21m² for the TPC (2112 channels) + 512 channel for Veto detector. Mass production of the raw wafer in LFoundry company and assembly in a dedicated facility at LNGS (NOA).

Ds-20k optical plane



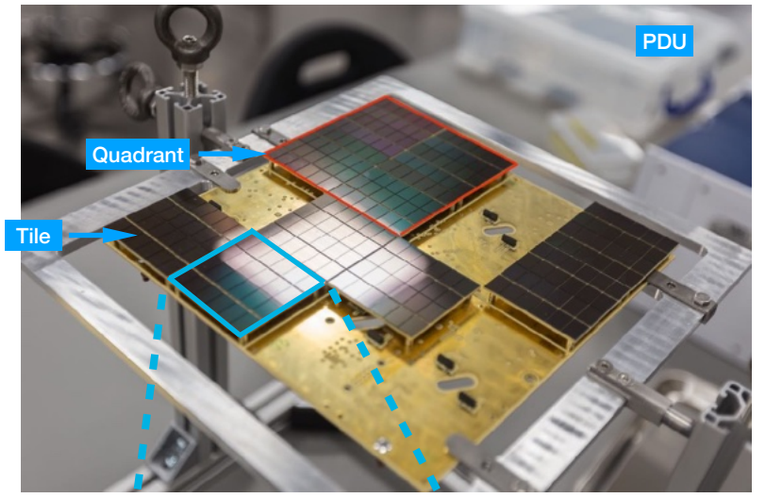


Photo Detector Unit (PDU) = matrix of 16 PDMs
20 x 20 cm²

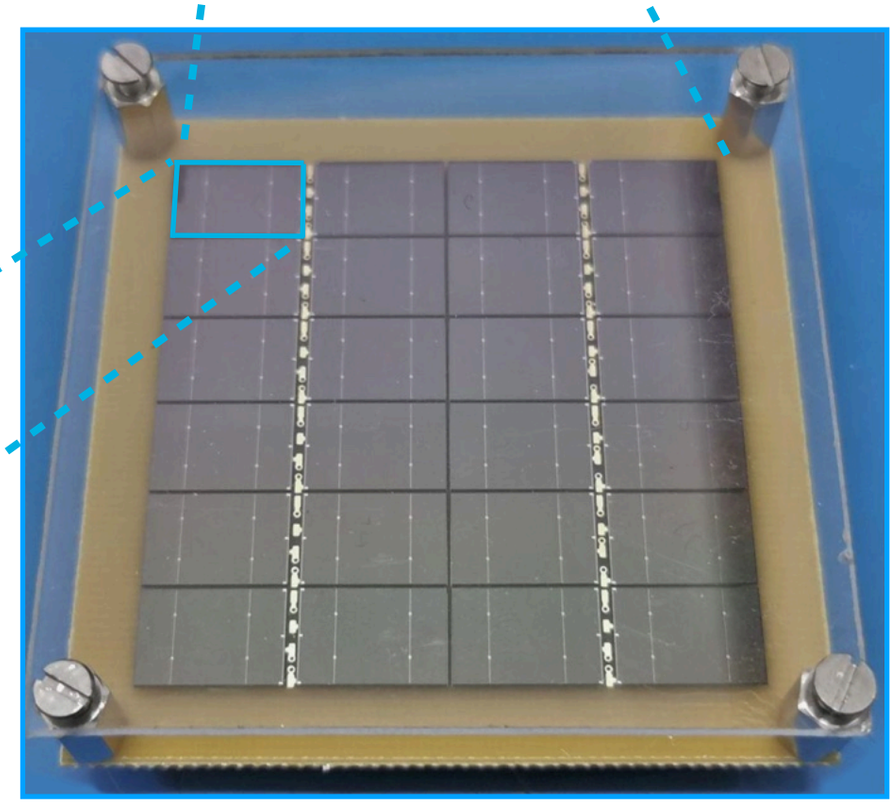

Photo Detector Module (PDM)
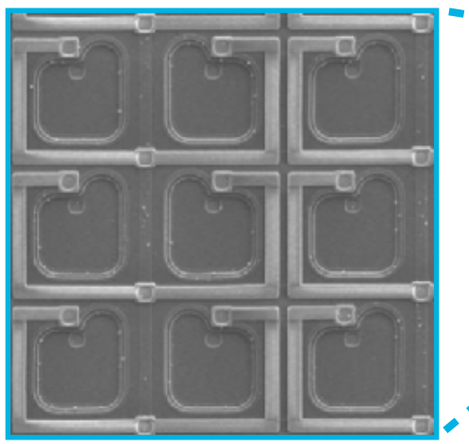
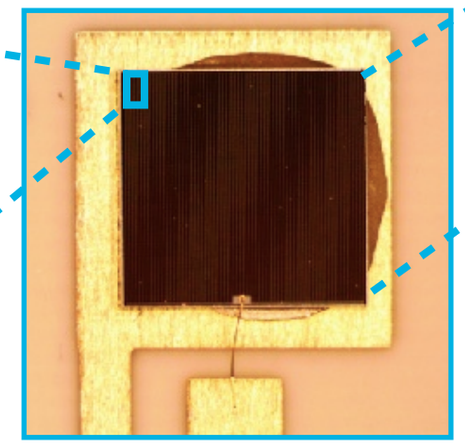
= matrix of 24 SiPMs, 5 x 5 cm²
4 PDUs are summed and read as a single channel
(largest single SiPM unit ever!)



Single SPADs

~25-30 μm²



Single SiPM

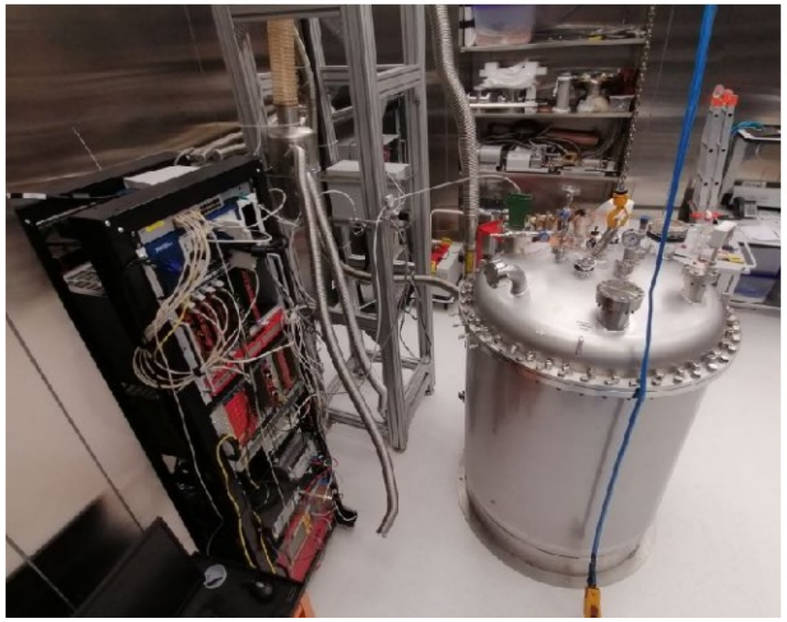
~1 cm²

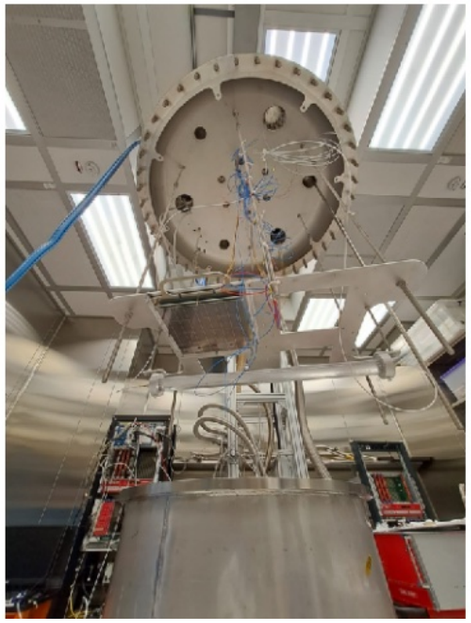
NUOVA OFFICINA ASSERGI (NOA)

- INFN Facility managed by LNGS – clean room class ISO 6
- Two main rooms:
  - CR3: 3.0 m x 350 m^2 -> photodetector production area, equipped with highly sophisticated packaging machines for the assembly of photosensors in a dust-controlled environment
  - CR2: 5.8 m x 68 m^2 -> large volume detector assembly
- To be equipped with dedicated Rn-abatement system (currently, Rn level in CR3: 6-10 Bq/m^3)
- Operative since Nov. 2022, completed in 2023
- Currently populated with machines needed by DarkSide for SiPM packaging, test and integration
- 2023, so far: start-up of activities, characterization of silicon wafers procured for the in-house production of the PhotoDetector Units (PDU).

PDU TEST FACILITY IN NAPOLI

- ~800 L double wall **cryostat** with domed flange
- ~100 ps pulsed **laser for calibration**
- > 300 readout channels with 5 CAEN VX2740 ADC Boards
- Custom support structure with room for 16 PDUs inside the cryostat
- Custom illumination system with PMMA rods as diffusers
- High end local servers for DAQ and Acquisition with O(1 PB) storage
- Fully automated cold box, remotely controllable with fast FILL and DRAIN
- Two external 3000L each reservoirs
- Ready to test PDUs!





VETO DETECTOR

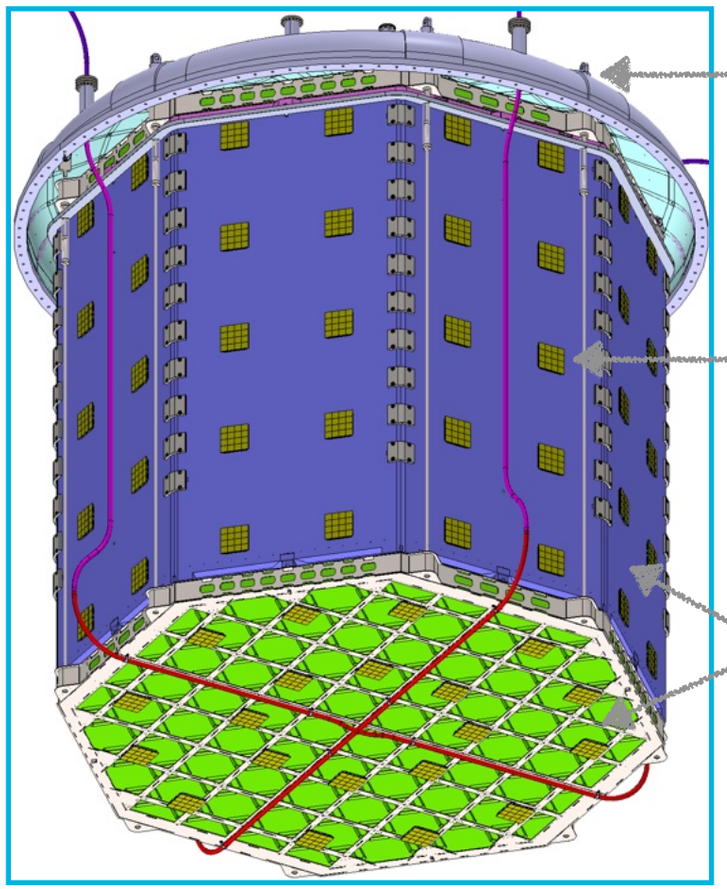
Neutrons elastically scattering from argon nuclei are indistinguishable from WIMPs signals. PSD is useless against neutron events.

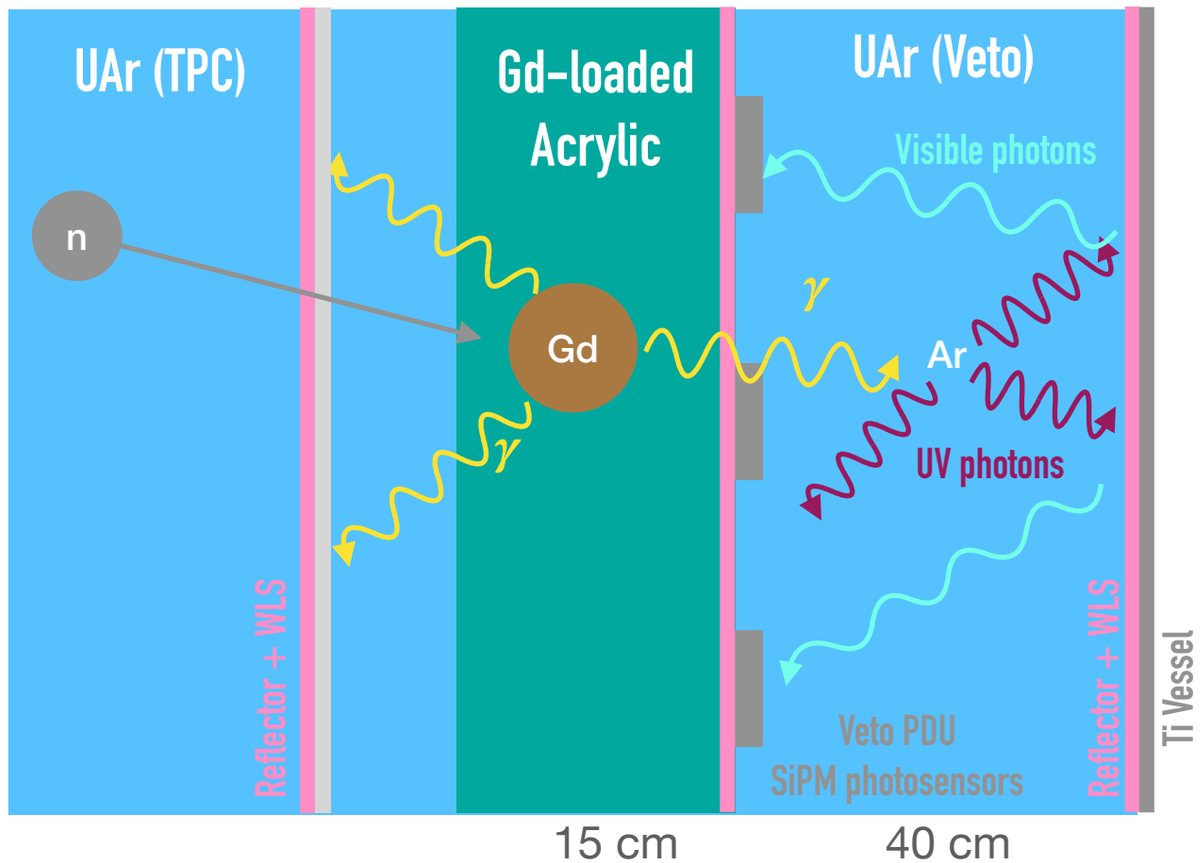
Veto Structure

- 8 vertical panels of acrylic loaded with gadolinium (Gd-PMMA), form lateral walls of the TPC. Acrylic thickness: 15 cm.
- The UAr volume between the Ti vessel and Gd-PMMA serves as a veto volume with ~40 cm thickness.
- Reflector with WLS on all the surfaces

Veto Working Principle

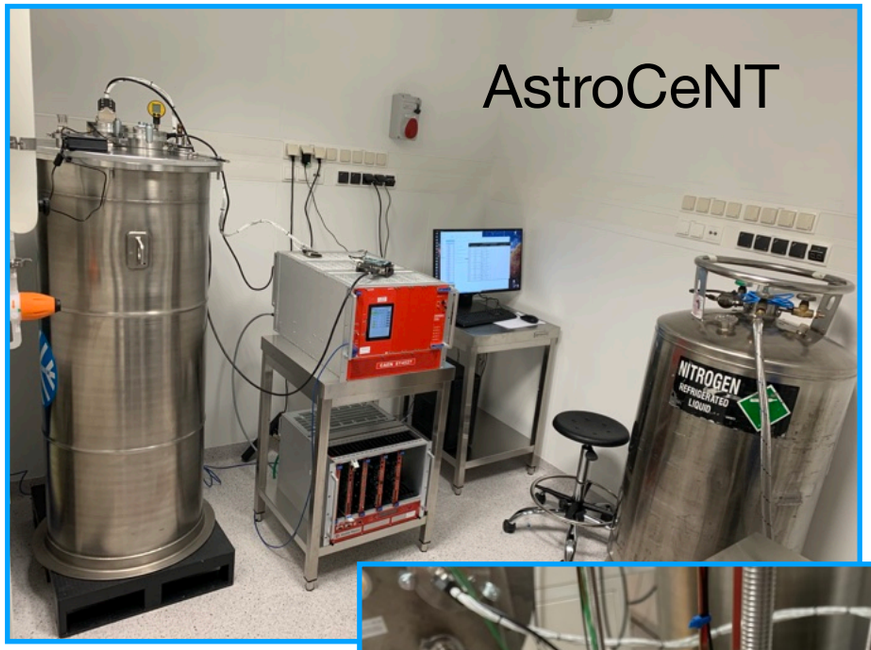
1. Neutrons are moderated in the acrylic shell and then captured by gadolinium.
2. Gd emits multiple γ-rays with energy up to 8 MeV.
3. γ-rays interact in the liquid argon buffers.
4. LAr scintillation light is shifted and detected by ~1920 SiPM-based photosensors.

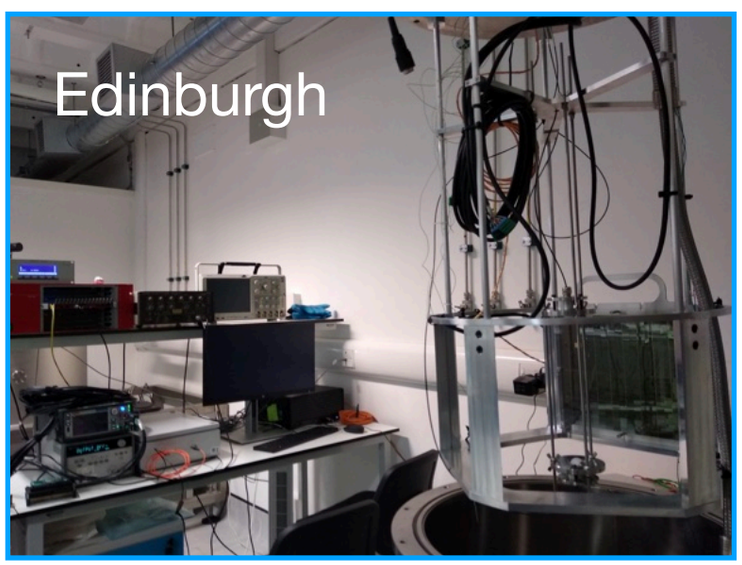


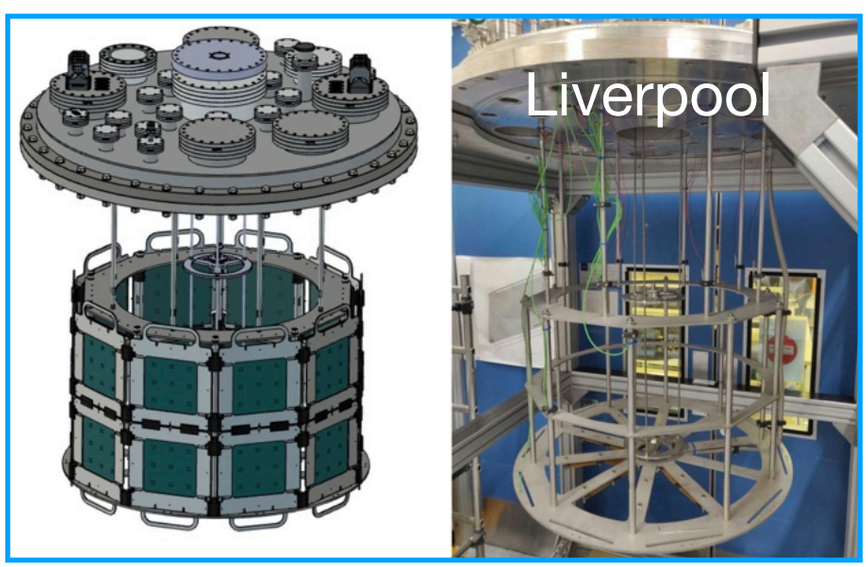


VETO PDU TESTING

- ASIC amplifier designed by INFN Torino.
- Production of vPDU is in Birmingham, STFC interconnect, Manchester, and Liverpool
- Three testing facilities: AstroCeNT, Edinburgh, and Liverpool.
- All facilities are ready for production and testing.

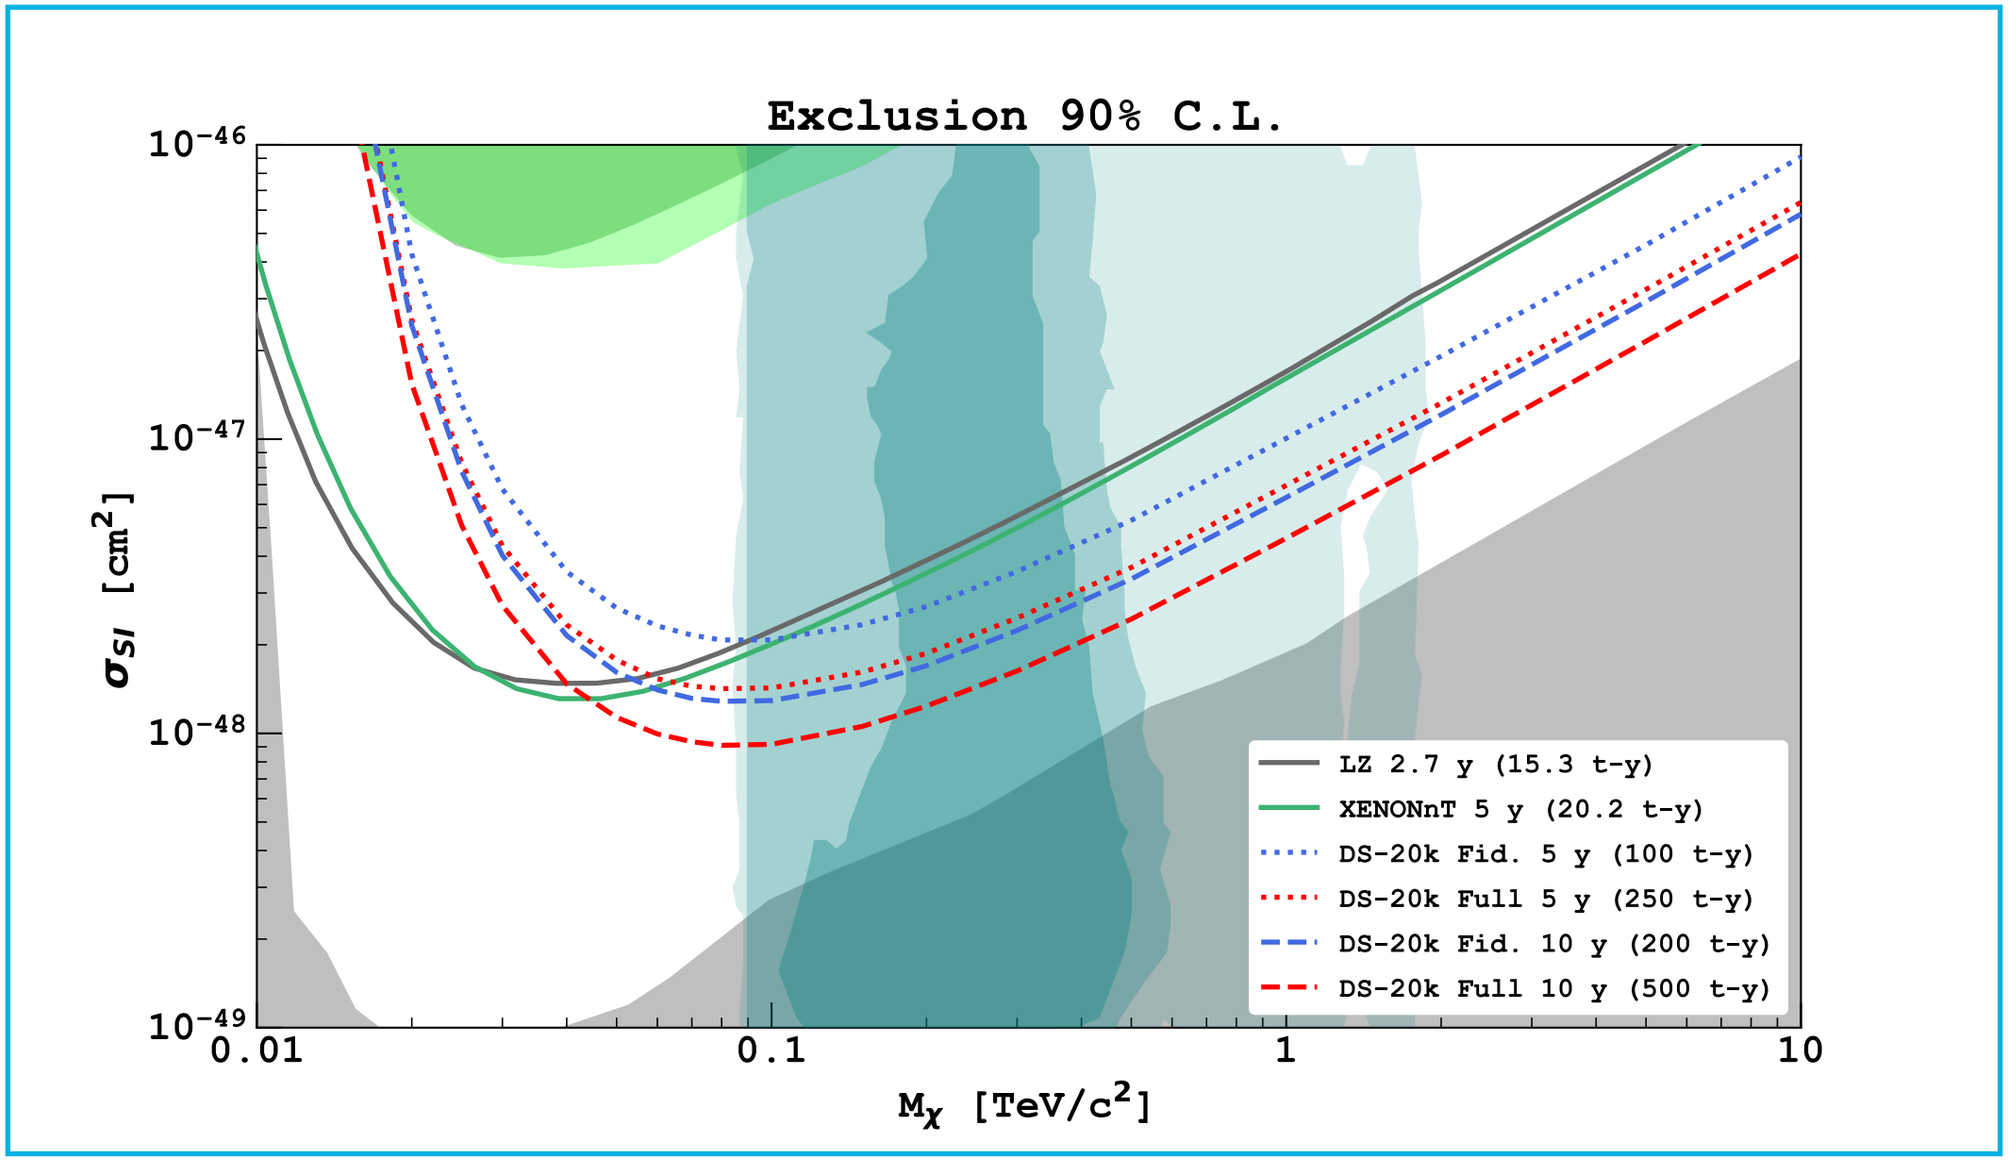






EXPECTED SENSITIVITY

- The sensitivity of DS-20k to spin independent WIMPs for different lengths of runs, with the full exposure and with the fiducial cuts applied, compared to LZ and XENONnT.



- The present projection - based on a 10 yr run, giving a fiducial volume exposure of 200 t yr - is 6.3 x 10^{-48} cm^2 for 1 TeV/c^2 WIMP for the 90% C.L. exclusion.

Turquoise filled contours is from pMSSM11 model (E. Bagnaschi et al., Eur. Phys. J. C 78, 87 (2018).

SUMMARY

- TPC with underground Ar has excellent properties suited to high and low mass WIMP searches.
- Large effort for DarkSide-20k is ongoing in all parts and the construction started in LNGS.
- DarkSide-20k will start data taking in the end of 2026 for 10 years.
- (Not presented) DarkSide-20k serve as a neutrino observatory with sensitivity to supernova neutrinos. JCAP 03, 043 (2021)

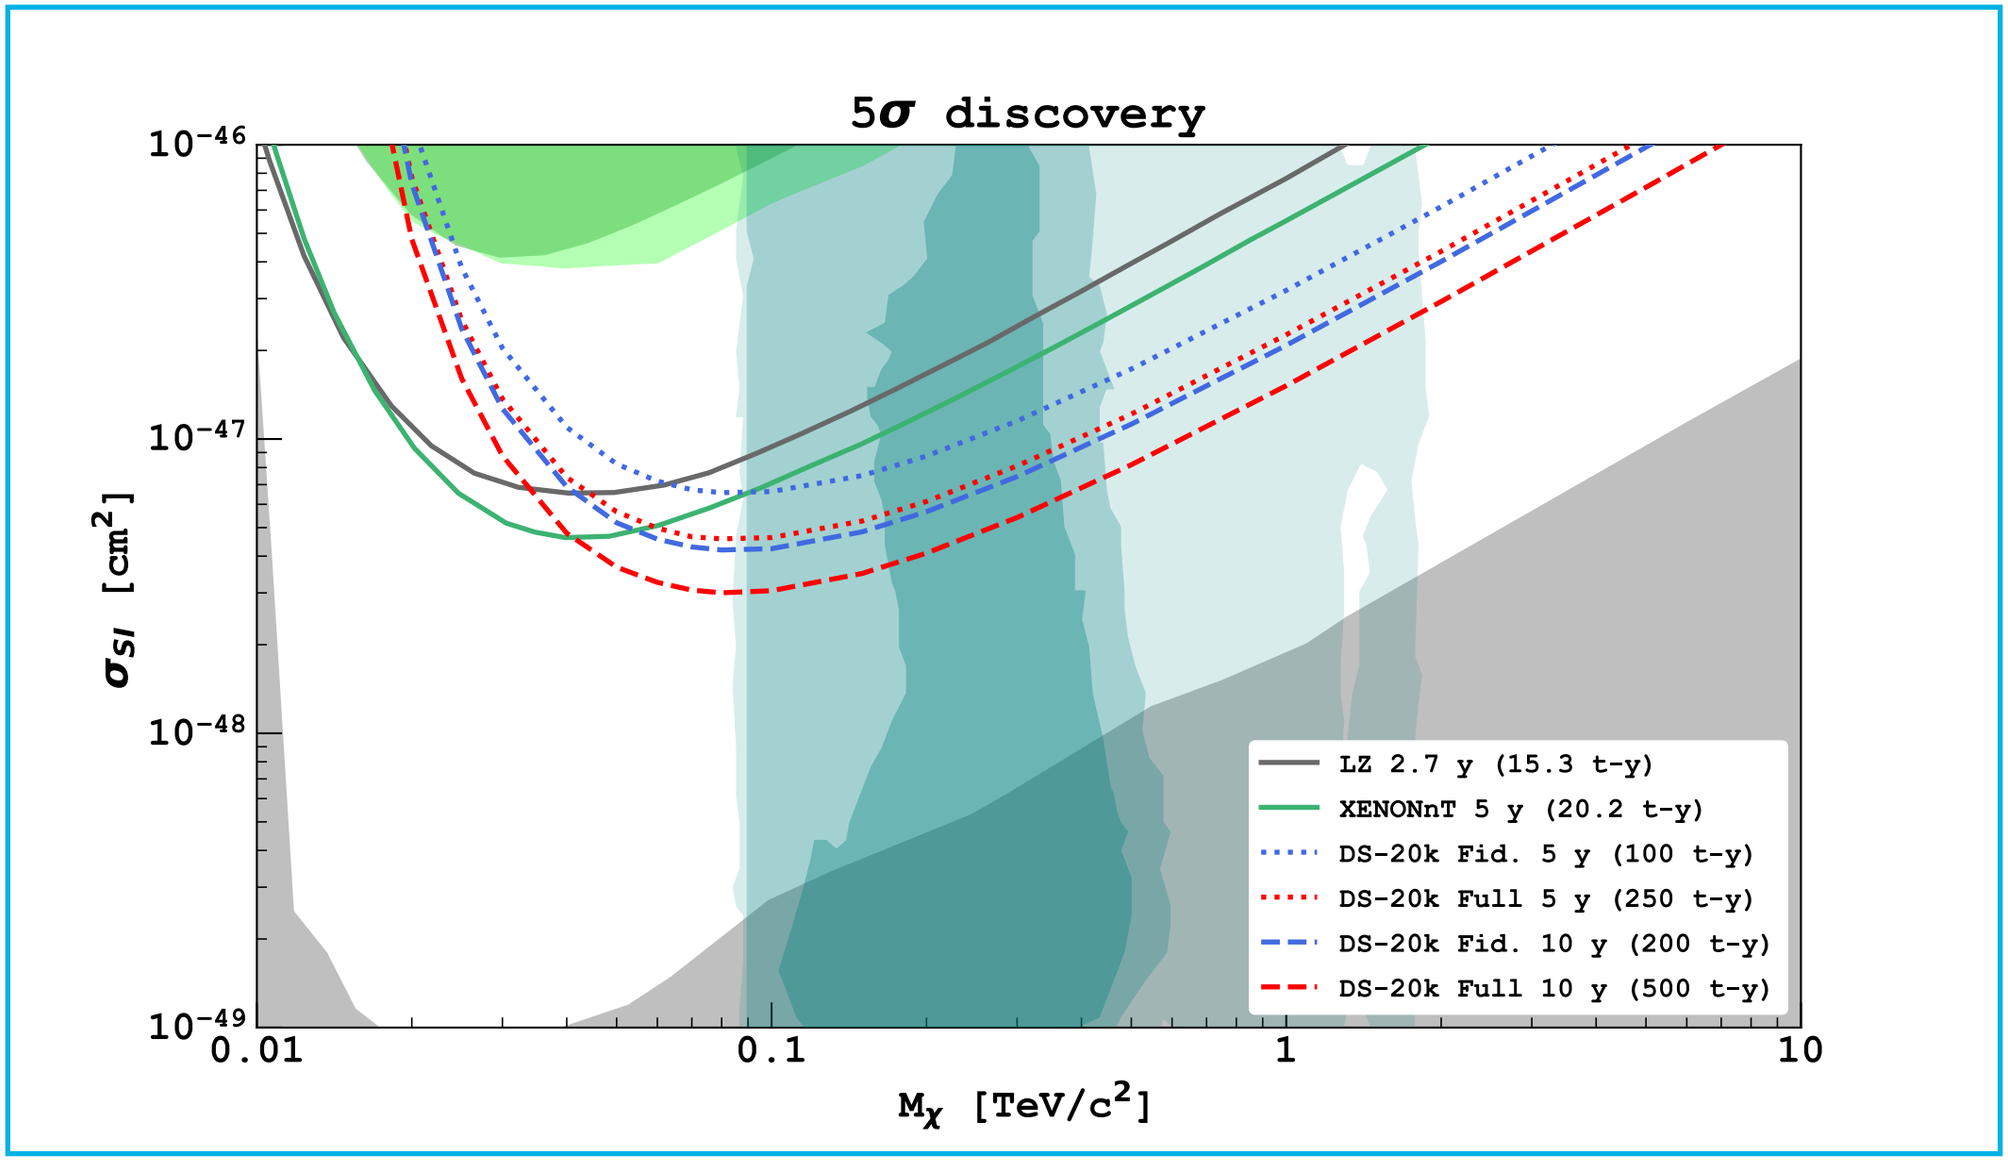
  - 2nd year **PhD student** working on low energy calibration

Thank you!

EXPECTED DISCOVERY POTENTIAL

- The 5σ significance of DS-20k to spin independent WIMPs for different lengths of runs, with the full exposure and with the fiducial cuts applied, compared to LZ and XENONnT..



- The present projection - based on a 10 yr run, giving a fiducial volume exposure of 200 t yr - is 2.1 x 10^{-47} cm^2 for 1 TeV/c^2 WIMP for the 5σ discovery.

Turquoise filled contours is from pMSSM11 model (E. Bagnaschi et al., Eur. Phys. J. C 78, 87 (2018).
