Aims:

Feasibility study, design and construction

- Luminosity Monitors
- Polarimeter measurements

Luminosity Monitors preliminary requirements:

Average luminosity (every 10ms)
Average luminosity for every bunch-crossing
(every ~minute)

Measurements with
time response of 2-4 ns

Polarimeter preliminary requirements:

Polarization near interaction point

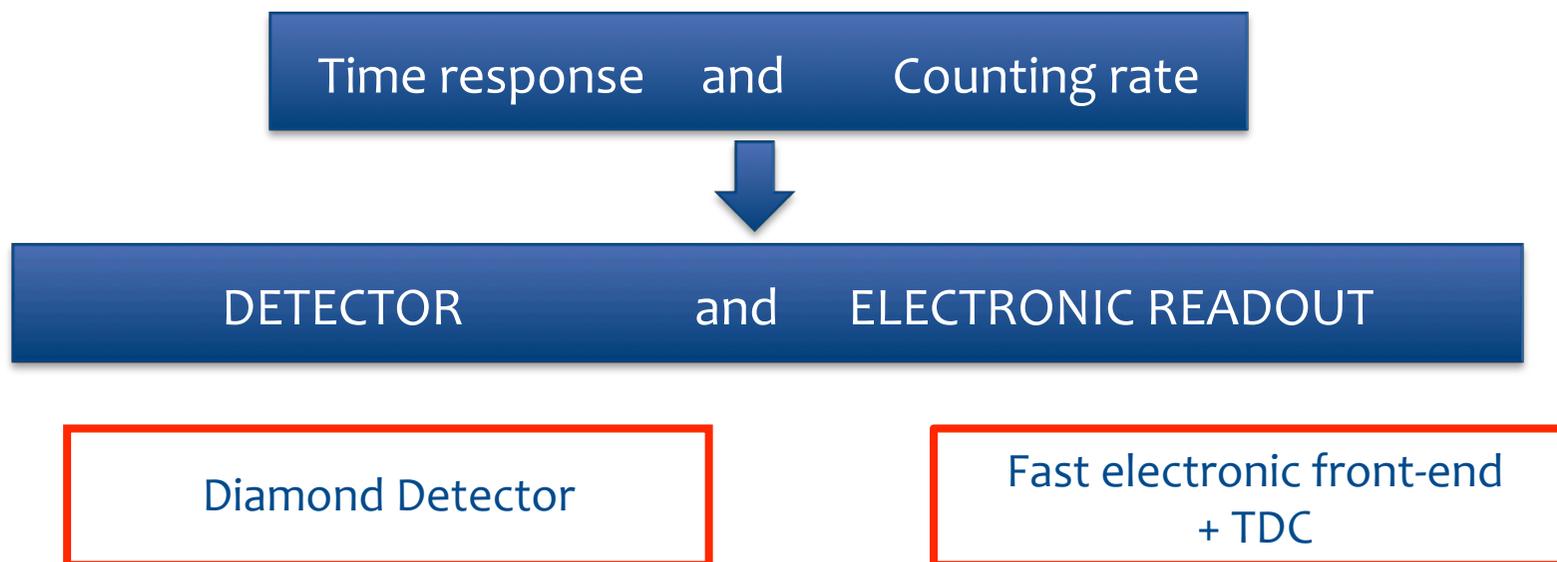

“Compton” polarimeter

Luminosity Monitor

Goal: Measurements with time response of 2-4 ns

Several detectors with same electronic readout will be studied and compared

Detector

Diamond Detector

Motivations:

- Rad-hard
- No leakage current for high dose rate
- Low photons sensitivity
- No cooling system
- Very fast response (<100ps)

Start!!!

High Purity Single Crystal Detector
Size 4.5x4.5x0.5mm
by Diamond Detector Ltd

Others Diamond Detectors

Electronic front-end

Fast Amplifier or Fast charge sensitive amplifier

Start!!!

Diamond Broadband Amplifier
CIVIDEC 2GHz
by Diamond Detector Ltd

Investigation of existing VLSI
front-end chips

Polarimeter

Goal: feasibility study of “Compton” polarimeter

Collaboration with:

- SLAC researchers
- LNF researchers
- Roma 2 INFN group

Simulation with GEANT4 and other tools

Thanks

Fast front-end

Diamond Broadband Amplifier CIVIDEC 2GHz

Parameters:

Type:	Ultra-fast current amplifier
Analog bandwidth:	1 MHz - 2 GHz
Gain:	20 dB
Radiation hardness:	1 MGy
Input coupling:	AC coupled with 1.5 nF
Input impedance:	50 Ω
Input protection:	IEC61000-4-2 (± 8 kV, 2 A for 1 μ s)
Input polarity:	Bipolar
Output polarity:	Inverting
Max. output voltage:	1 V
Output impedance:	50 Ω
RMS noise:	460 μ V

Impulse response:

Rise time:	210 ps
Pulse width:	280 ps
Fall time:	150 ps
