NAIA/AMS-02 Italy Meeting: **Status of Light Ions Analysis** **Li, Be, B, C, N & O**

Alejandro Reina Conde, INFN Sezione di Bologna
Alberto Oliva, INFN Sezione di Bologna

Thursday 30th of November, 2023

Some Information

- **NAIA v1.0.2 ntuples**
 - First 11.5 years of AMS-02 pass8 data, from Bartels 2426 to Bartels 2581.
 - MonteCarlo pass8 B1236 for Lithium to Oxygen.
 - RTI v8.
- **What is new?**
 - Top-of-Instrument (TOI) correction done correctly.
 - Estimation of all systematics error, both for Average and Bartels.

Differential Flux Estimation

Reminder

$$\Phi_i = \frac{1}{N_i T_i A_i \Delta R_i}$$

The isotropic differential flux in the i-th rigidity bin ($R_i; R_i + \Delta R_i$)

Number of events after contamination correction

Bin width

Unfolding factor, bin-to-bin migration correction

Exposure time

Effective acceptance

Φ_i

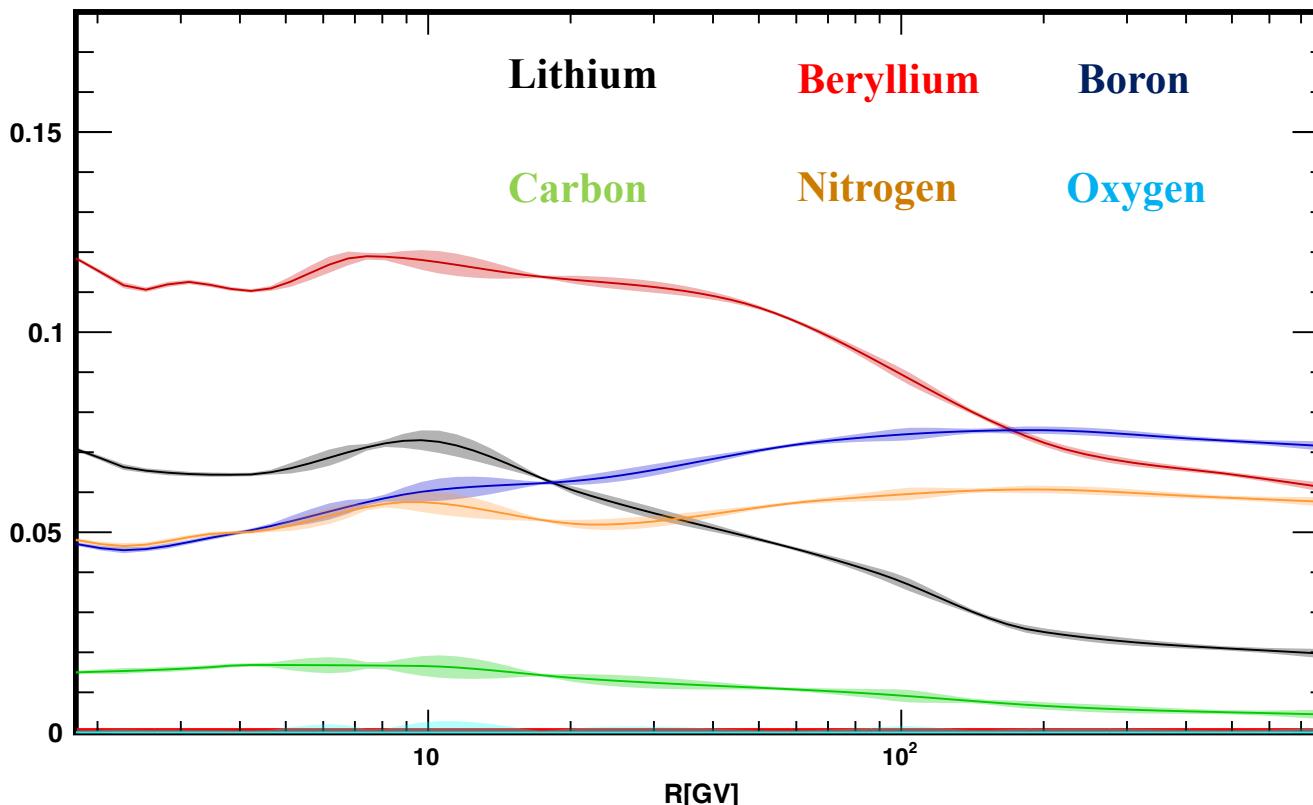

N_i

T_i

A_i

ΔR_i

Top-Of-Instrument (TOI) correction (before partial XS)

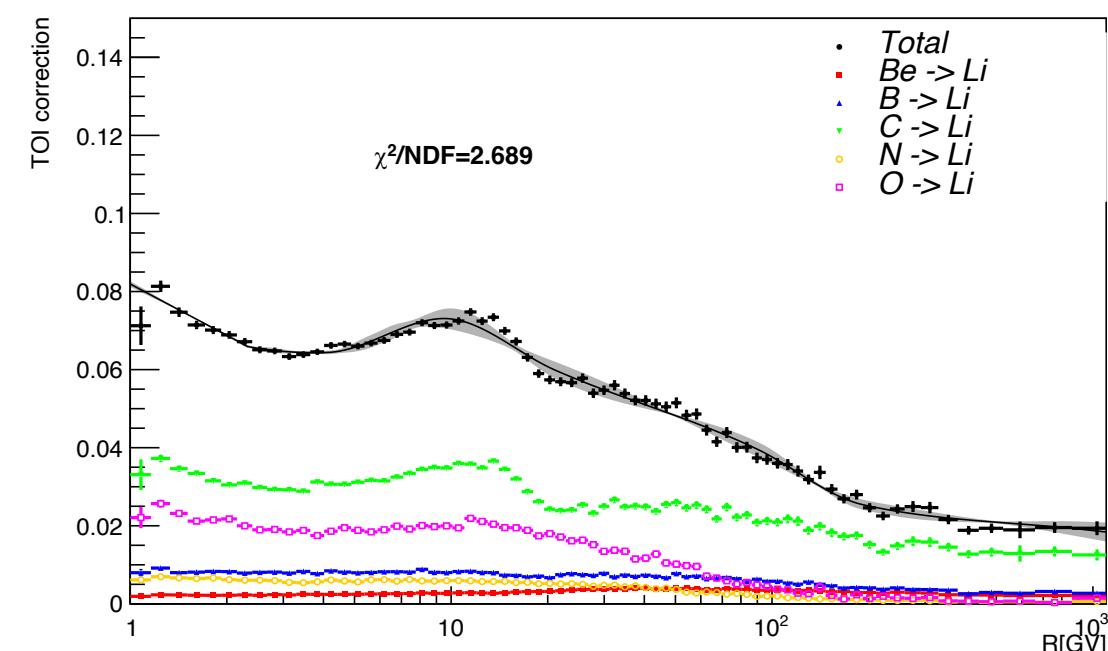

Fluxes of heavier species (AMS-02 or GALPROP)

“folded” acceptance of particles selected as Z_i that with charge-change interaction to Z_i happening before L1.

$$C_i = \frac{\sum_{j>i} \Phi_j A_{j\rightarrow i}}{N_i / \Delta T}$$

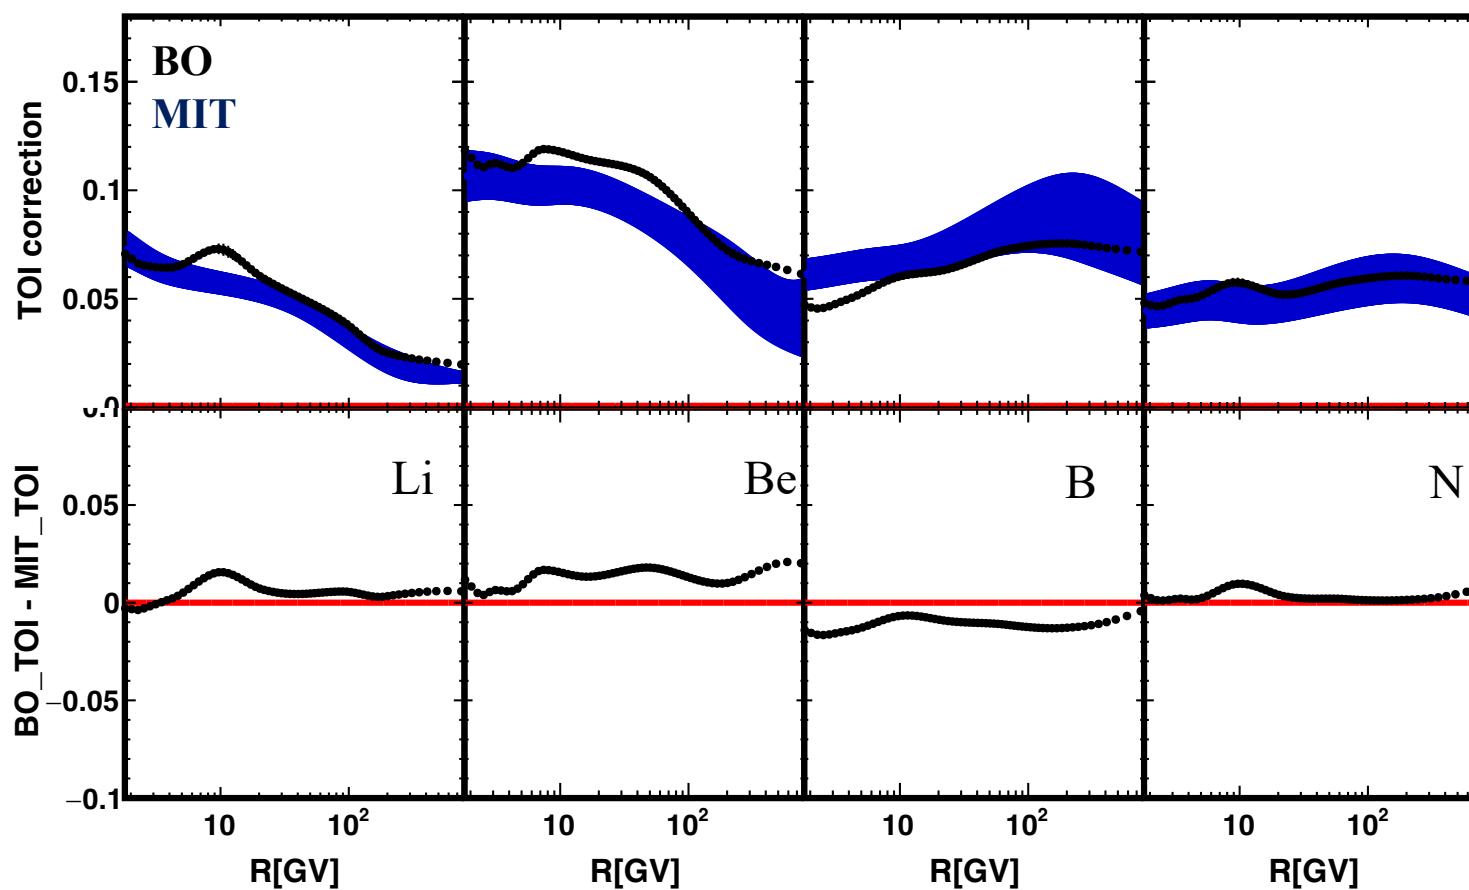

Measured rate of specie Z_i .

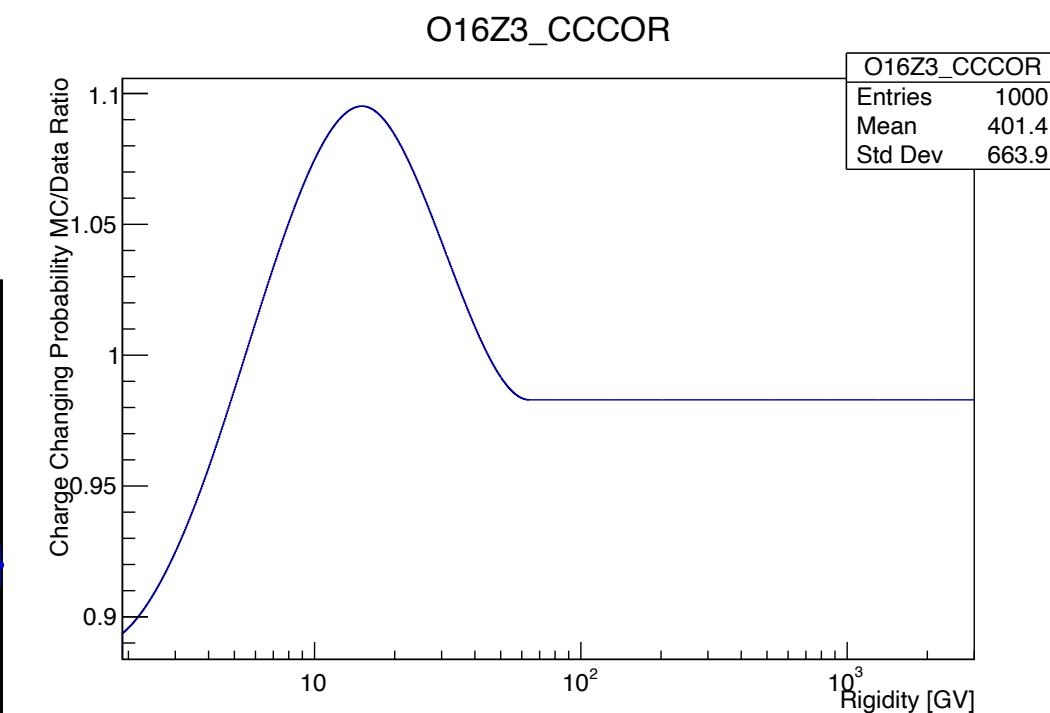

We need to take into account Partial-XS when doing TOI.

Before it was a normalization factor

```
// yao, 01/12/2020
if      ( (Zfrom==10)&&(Zto== 9) ) { a = 1+0.103; ea = 0; }
else if ( (Zfrom==12)&&(Zto== 9) ) { a = 1-0.065; ea = 0; }
else if ( (Zfrom==14)&&(Zto== 9) ) { a = 1-0.059; ea = 0; }
else if ( (Zfrom==12)&&(Zto==11) ) { a = 1+0.076; ea = 0; }
else if ( (Zfrom==14)&&(Zto==11) ) { a = 1+0.009; ea = 0; }
else if ( (Zfrom==14)&&(Zto==13) ) { a = 1+0.060; ea = 0; }
```

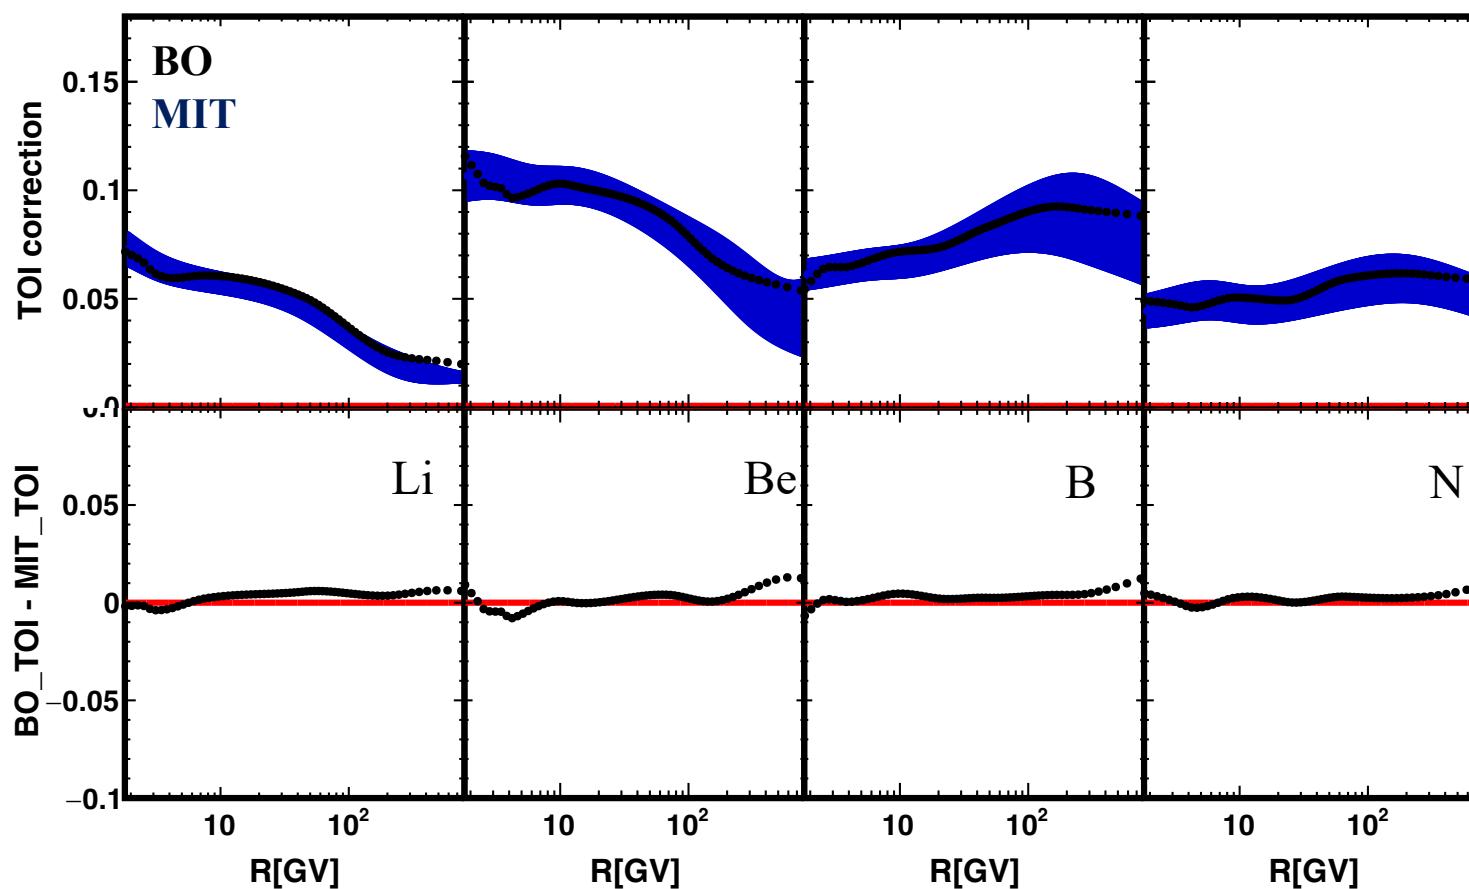

This partial-XS are now dependent on Rigidity, as an example O16 Montecarlo into Lithium

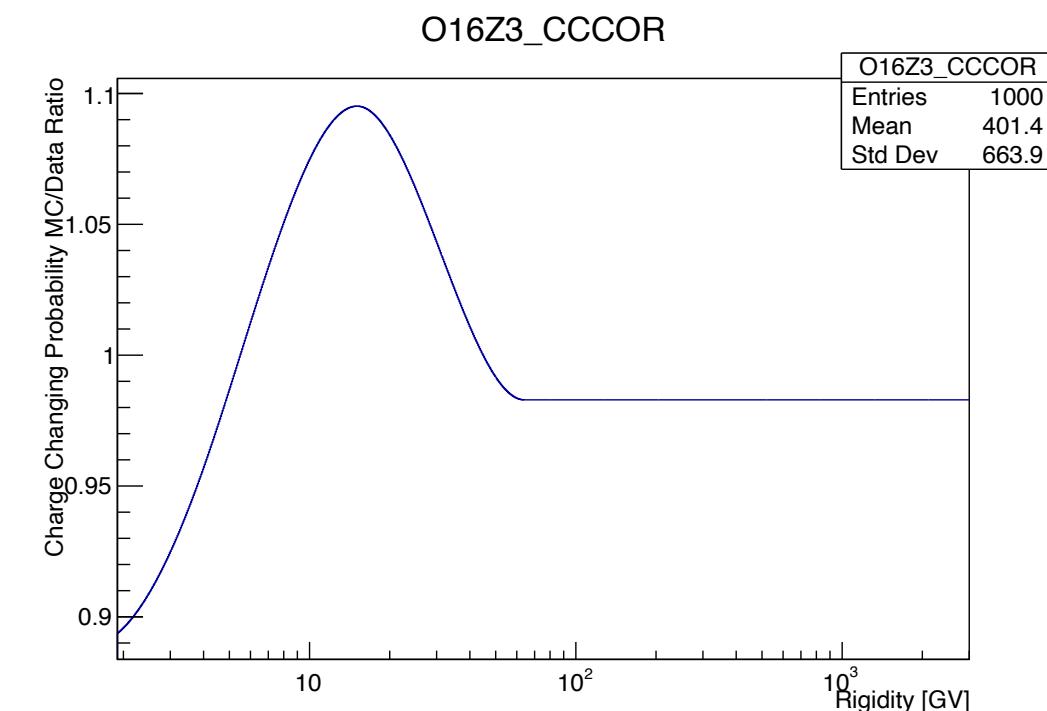

We need to take into account Partial-XS when doing TOI.

Before it was a normalization factor

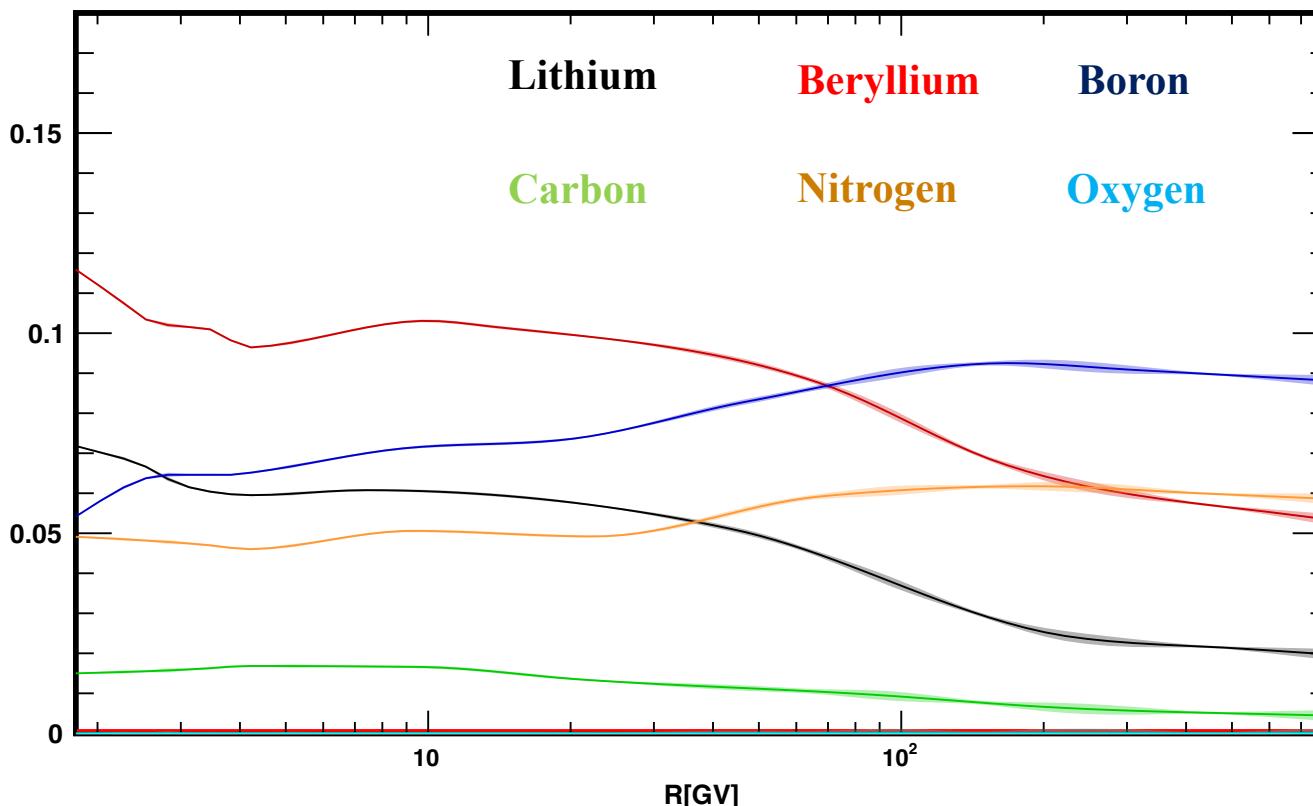

```
// yao, 01/12/2020
if      ( (Zfrom==10)&&(Zto== 9) ) { a = 1+0.103; ea = 0; }
else if ( (Zfrom==12)&&(Zto== 9) ) { a = 1-0.065; ea = 0; }
else if ( (Zfrom==14)&&(Zto== 9) ) { a = 1-0.059; ea = 0; }
else if ( (Zfrom==12)&&(Zto==11) ) { a = 1+0.076; ea = 0; }
else if ( (Zfrom==14)&&(Zto==11) ) { a = 1+0.009; ea = 0; }
else if ( (Zfrom==14)&&(Zto==13) ) { a = 1+0.060; ea = 0; }
```

This partial-XS are now dependent on Rigidity, as an example O16 Montecarlo into Lithium

Top-Of-Instrument (TOI) correction (after partial XS)

The estimation has been done using Lithium, Beryllium, Boron, Carbon, Nitrogen and Oxygen MonteCarlo.

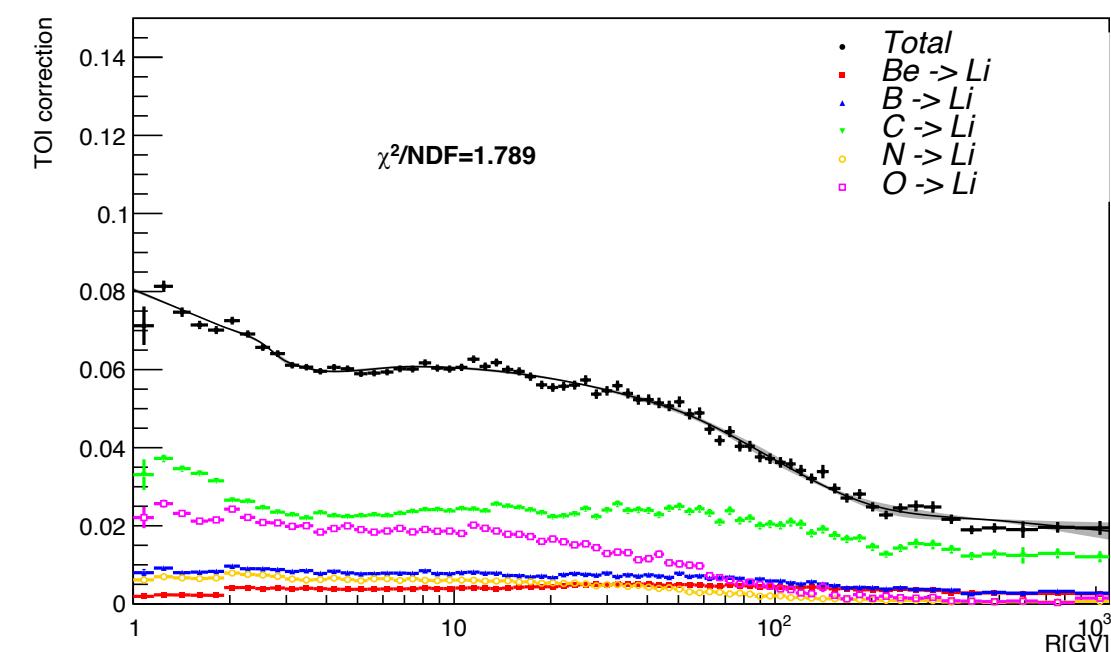

The differences between TOI w/o partial XS is added as a systematic error.

Fluxes of heavier species (AMS-02 or GALPROP)

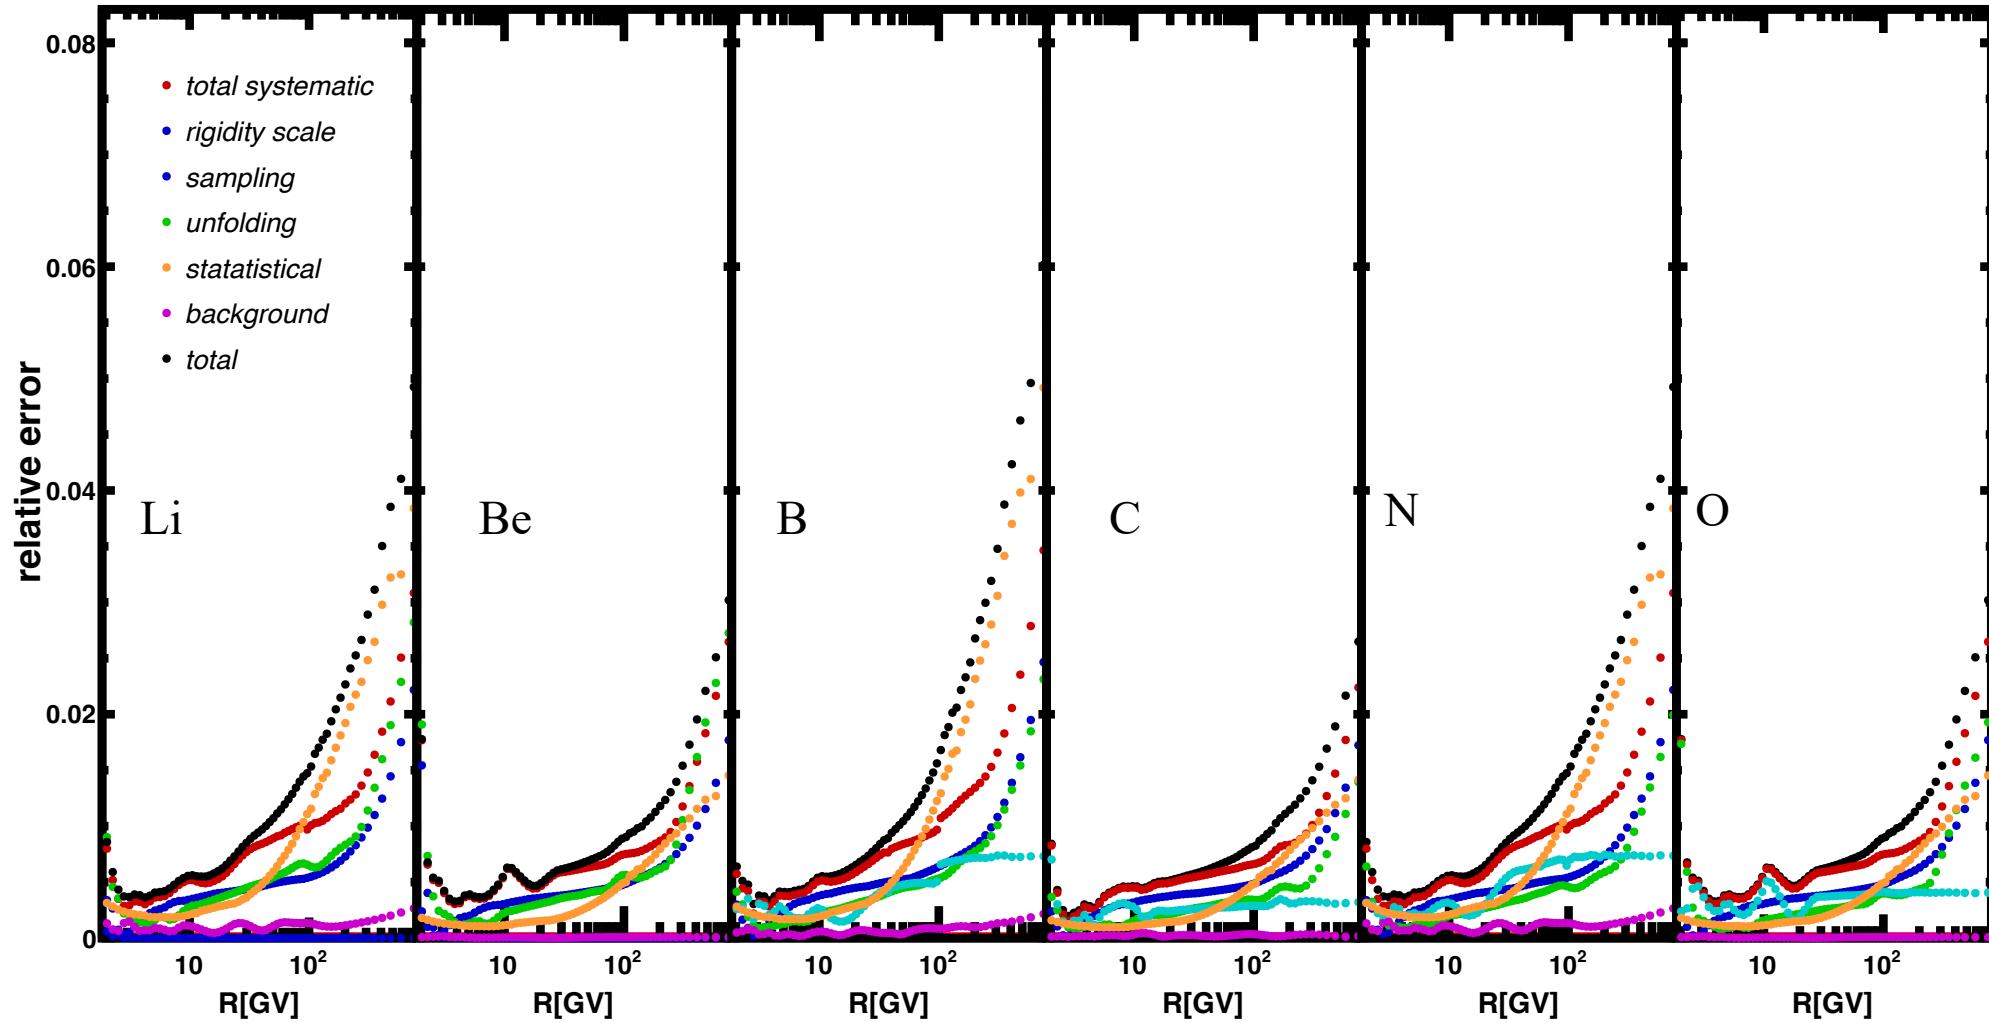

“folded” acceptance of particles selected as Z_i that with charge-change interaction to Z_i happening before L1.

$$C_i = \frac{\sum_{j>i} \Phi_j A_{j\rightarrow i}}{N_i / \Delta T}$$

Measured rate of specie Z_i .

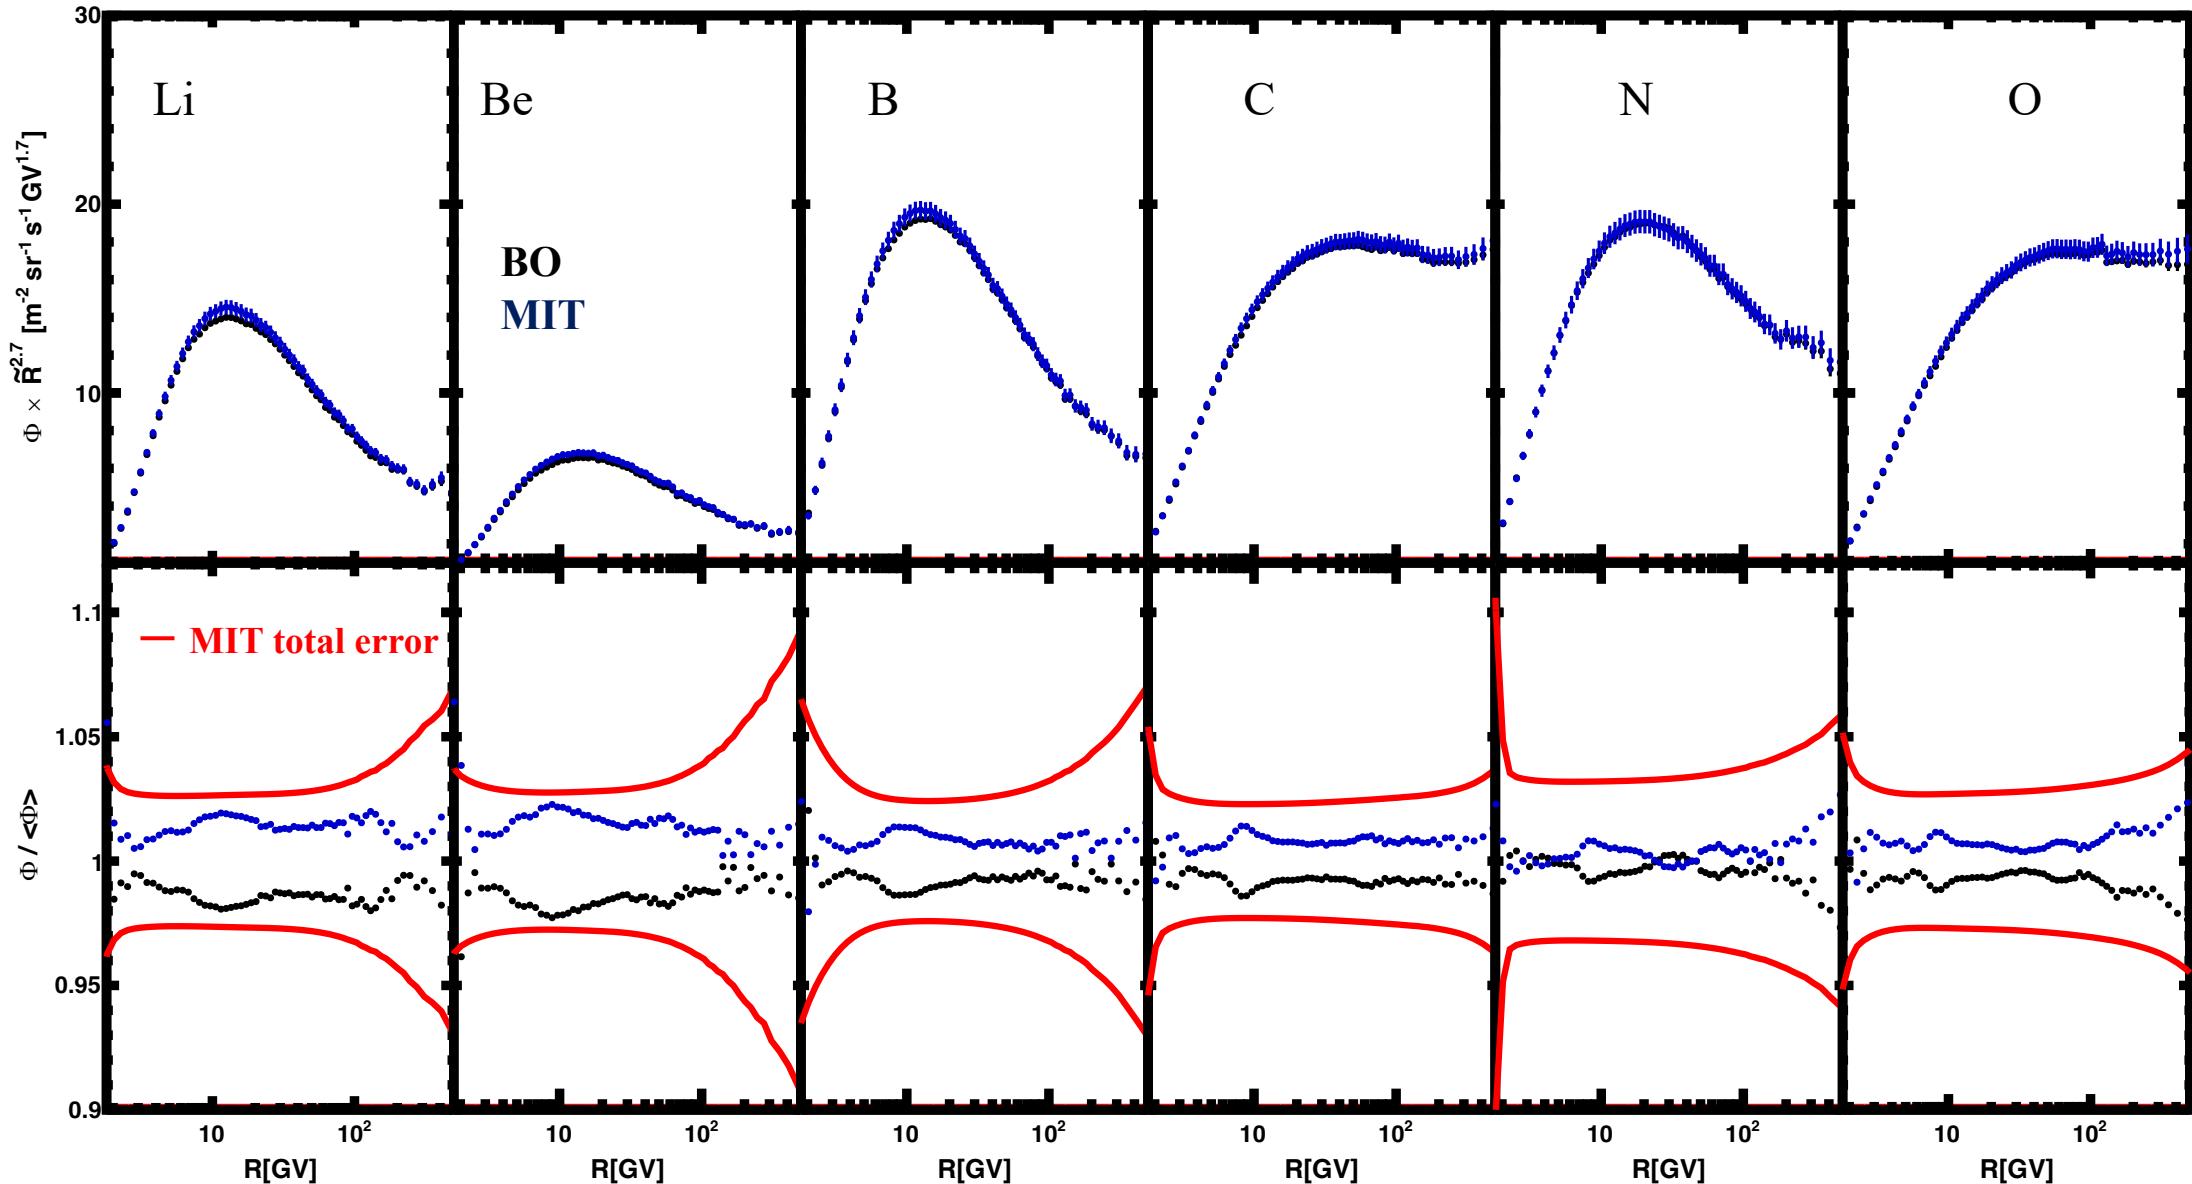

Error breakdown

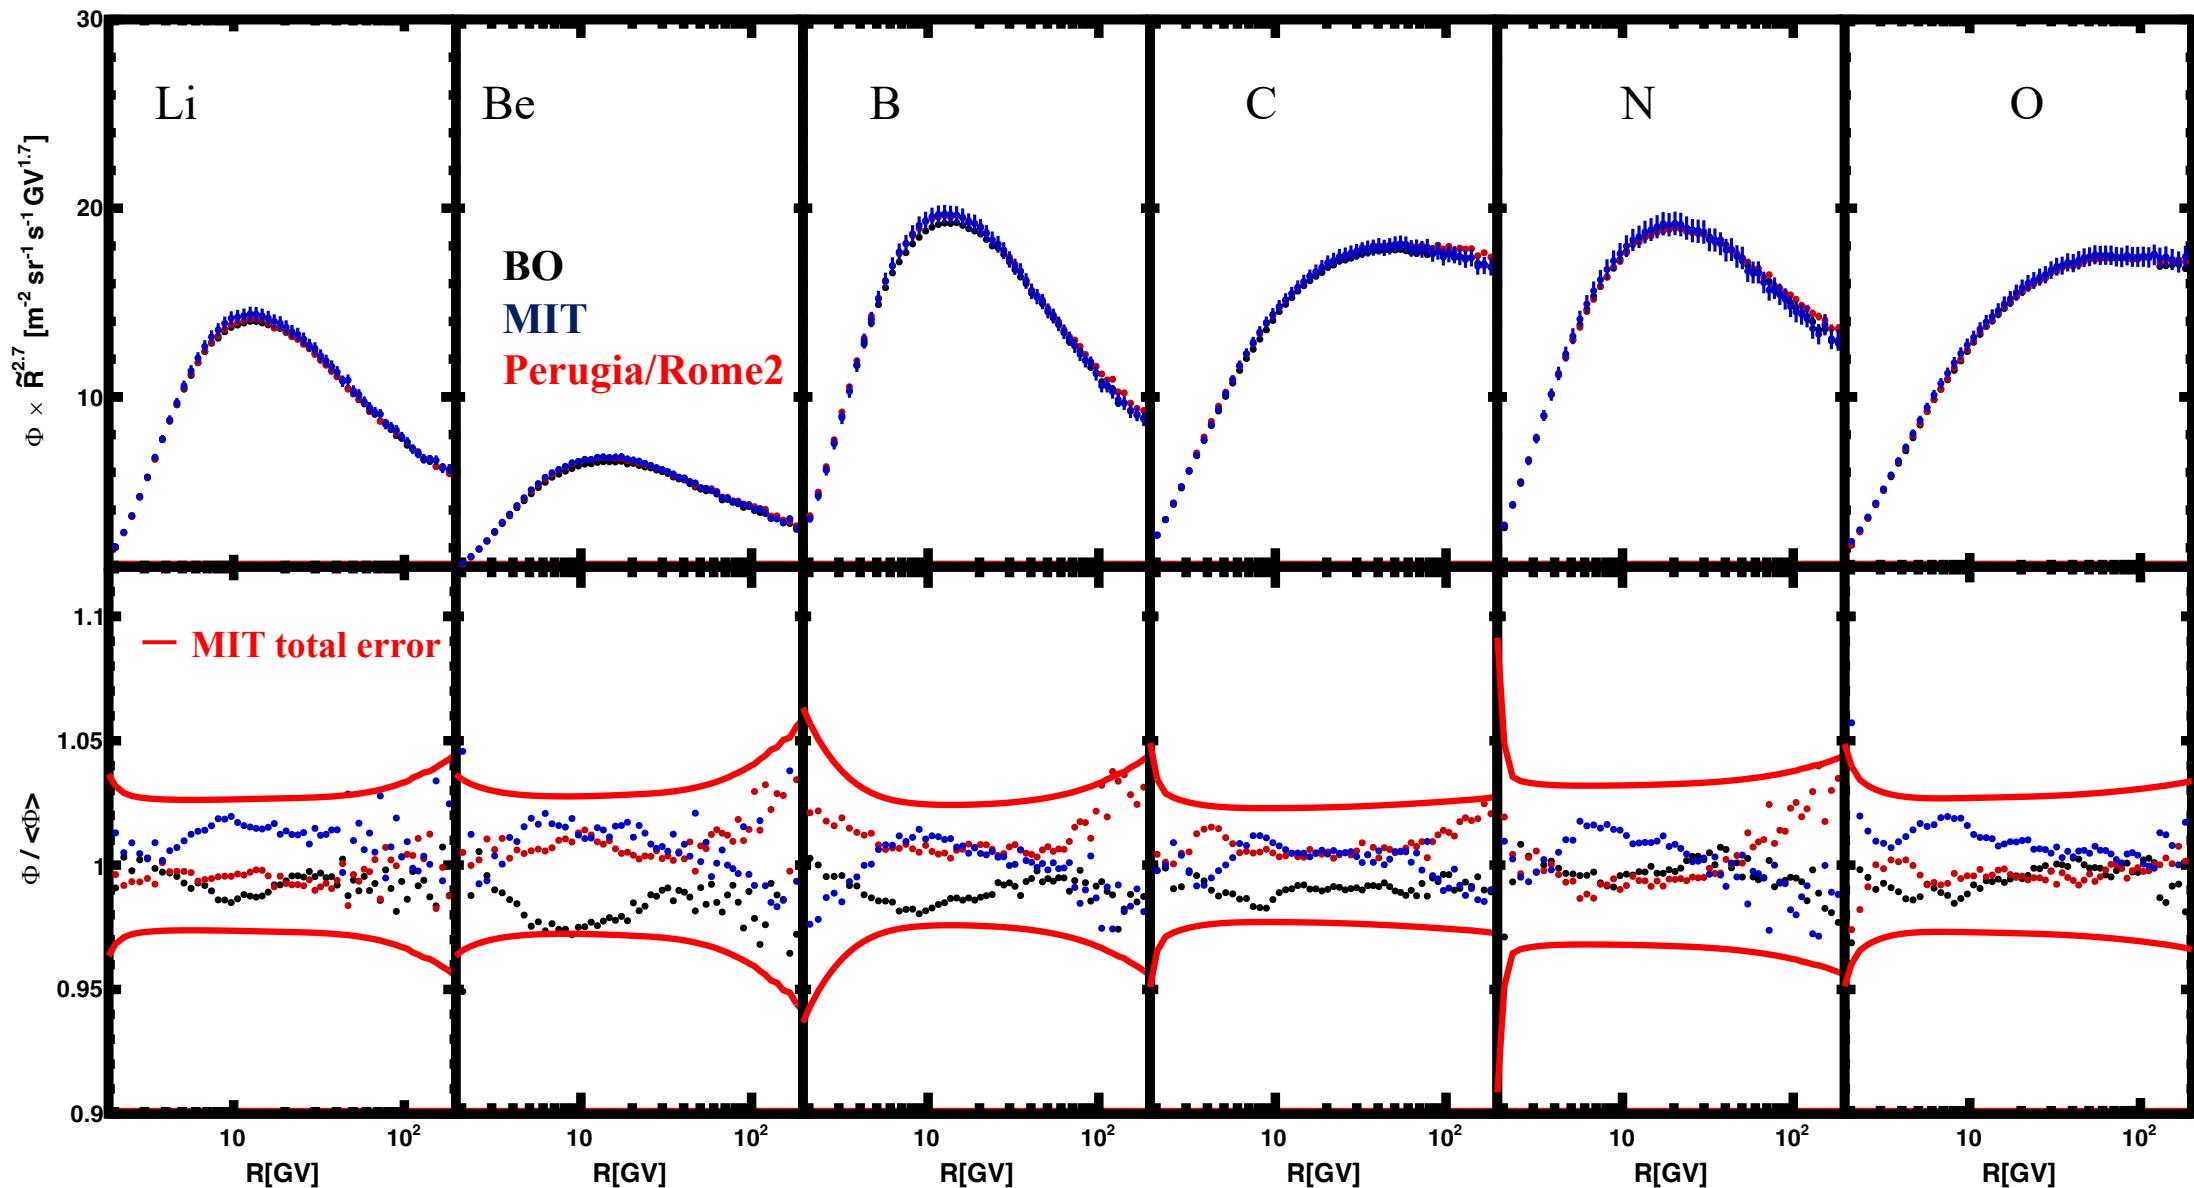

Two systematic error sources are not considered here:

- Cross section (XS) error, which is around 2-3% extra "flat" in rigidity.
- Partial cross sections TOI correction error, estimated before.

Average vs MIT

Average vs MIT vs PG/Rome2

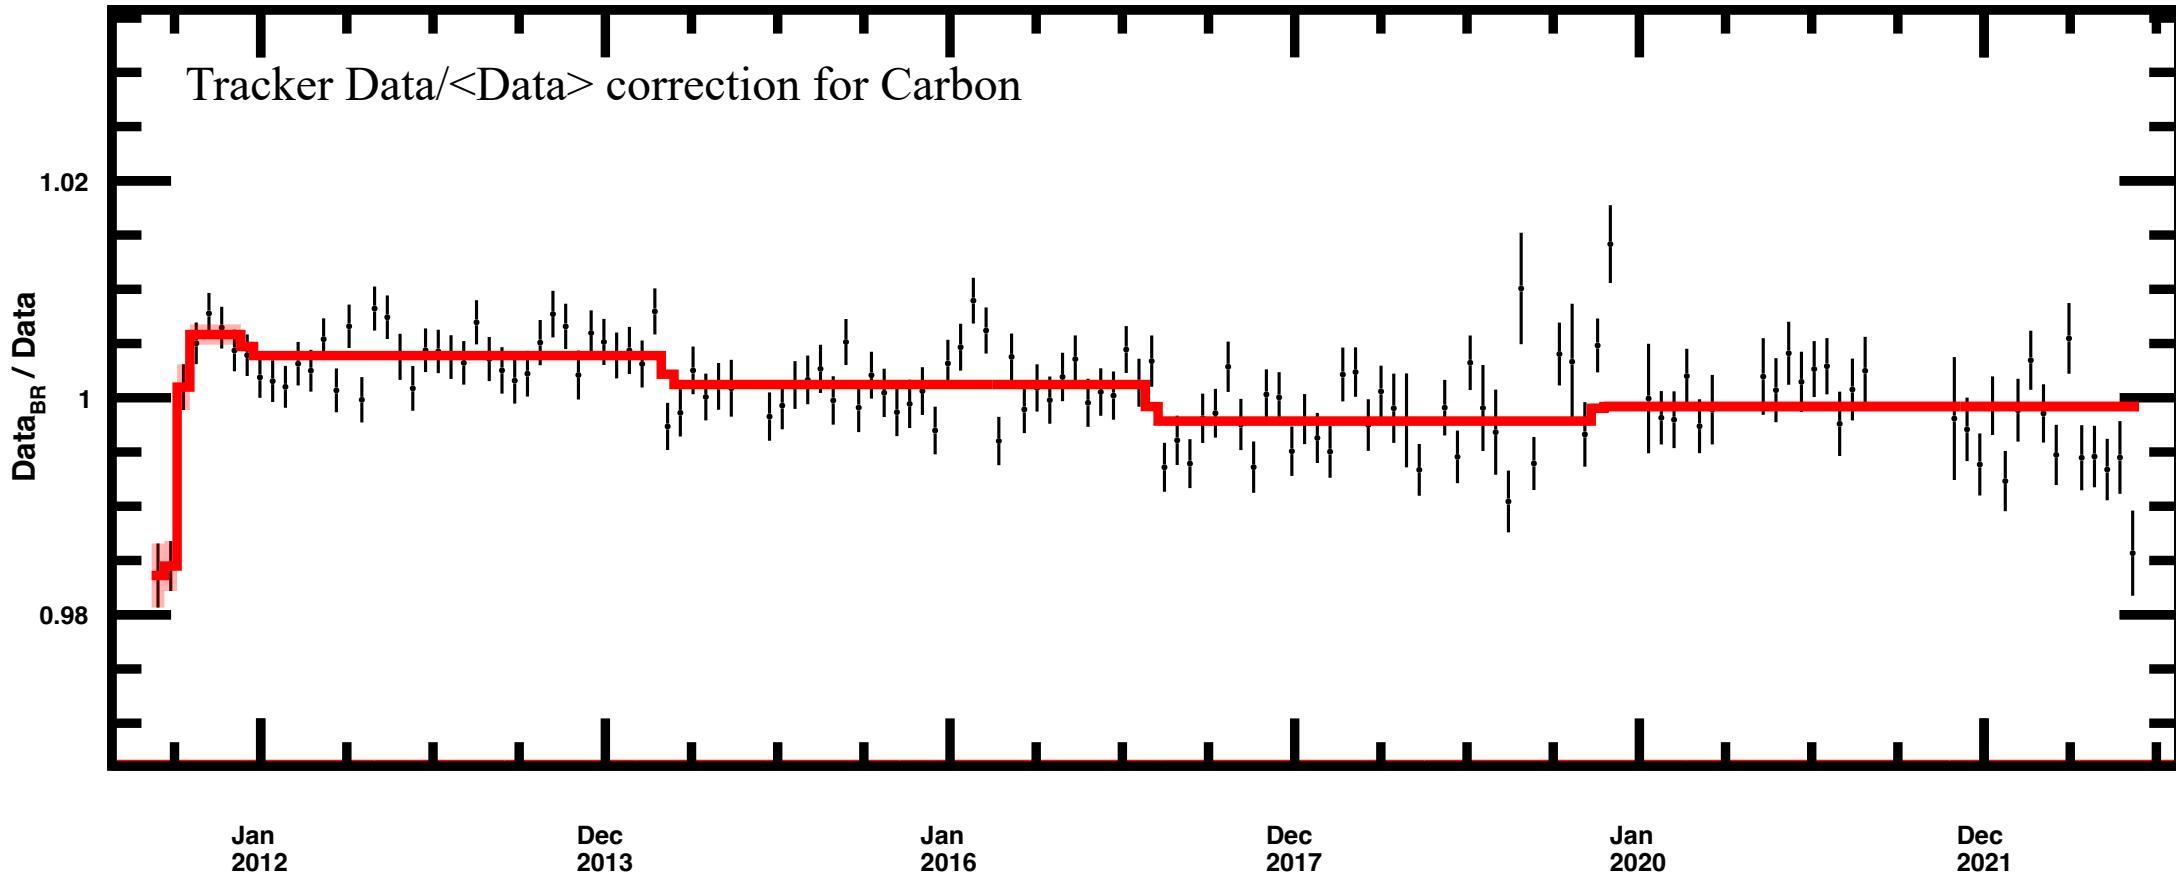

Data/<Data> Corrections

Reminder

- Correct the average acceptance by all the Data/Data corrections.

$$A_i^{\text{BR}} = A_i^{11\text{y}} \prod_j \frac{\epsilon_i^{\text{Data,BR}}}{\epsilon_i^{\text{Data,11y}}} \Big|_j$$

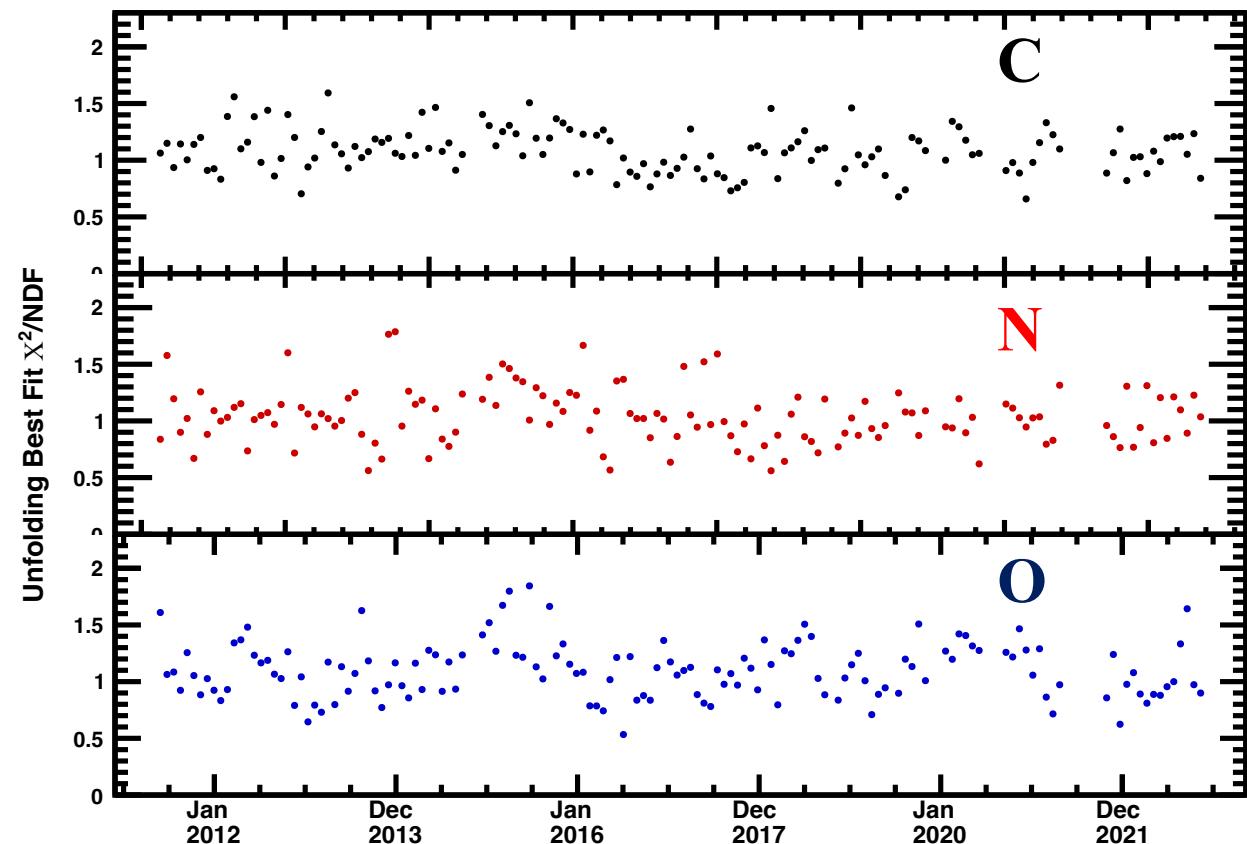

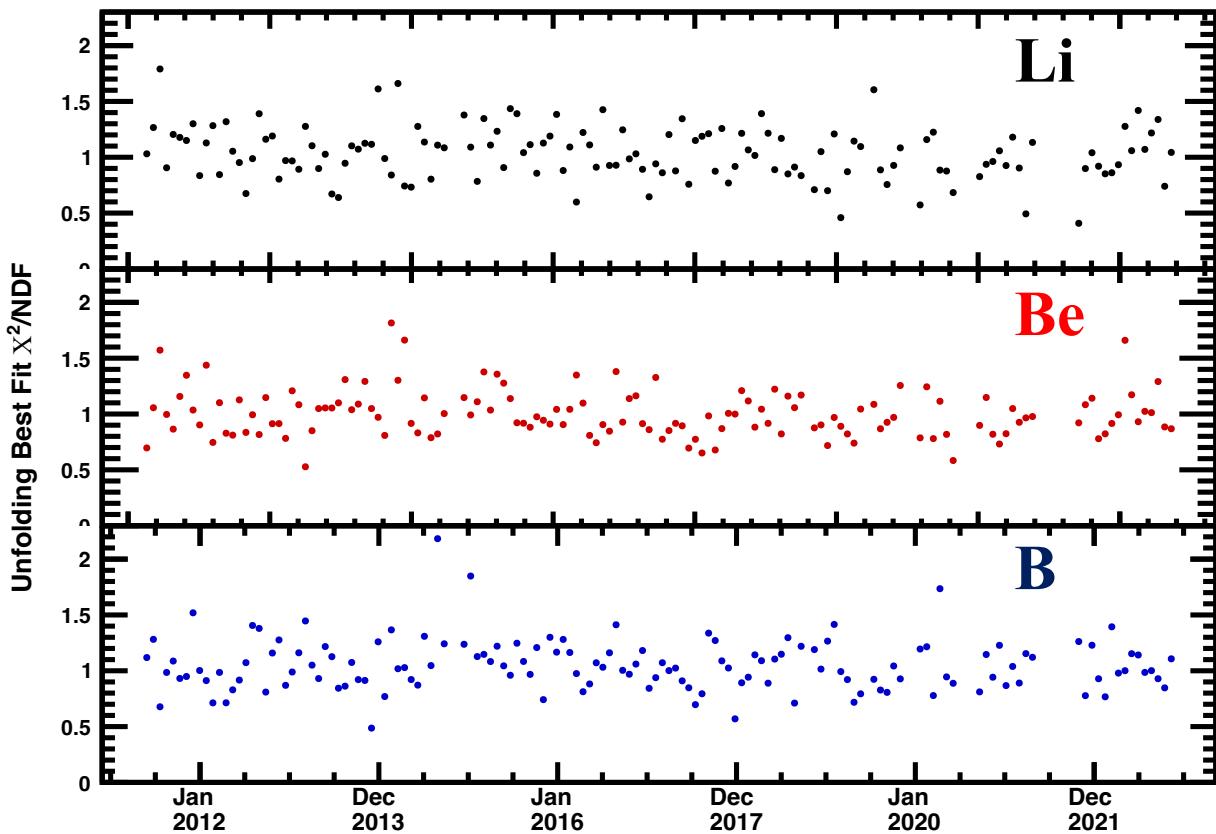

Forward Unfolding vs Time

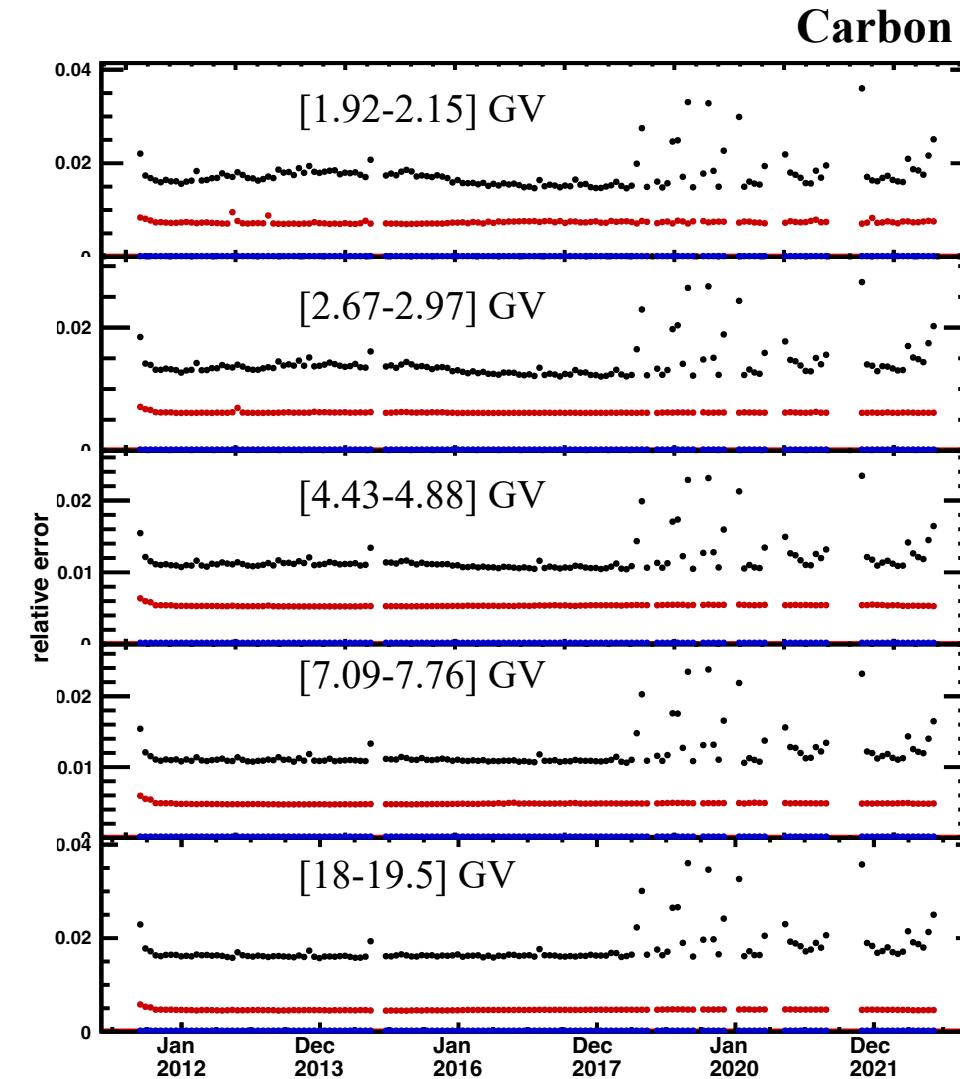

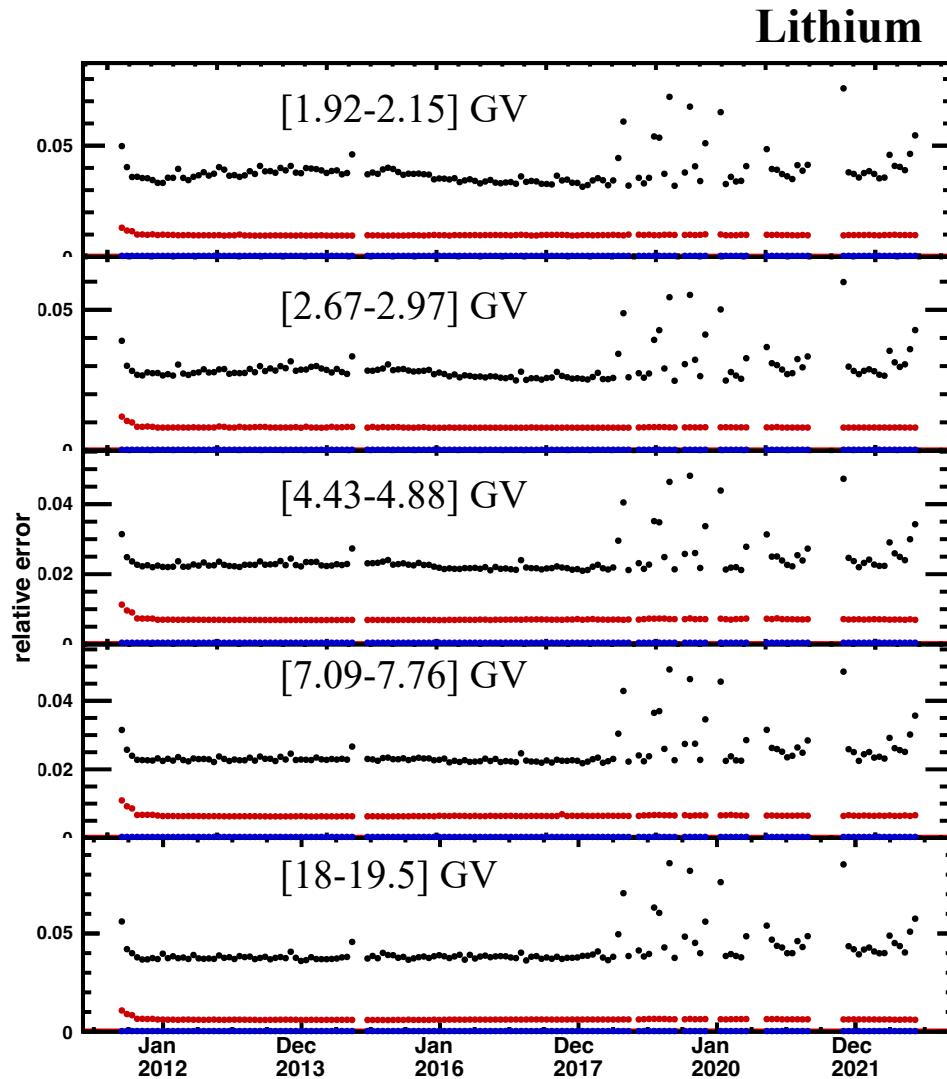

The flux model for each Bartels is given by the best-fit flux model obtained from the average flux forward unfolding method multiplied by a parametrization of the $\Phi^{\text{BR}}/\Phi^{\text{AVG}}$ ratio by a spline allowed to fluctuate only at low rigidities.

Reminder

This effectively allows to study the solar modulation effects on the unfolding.

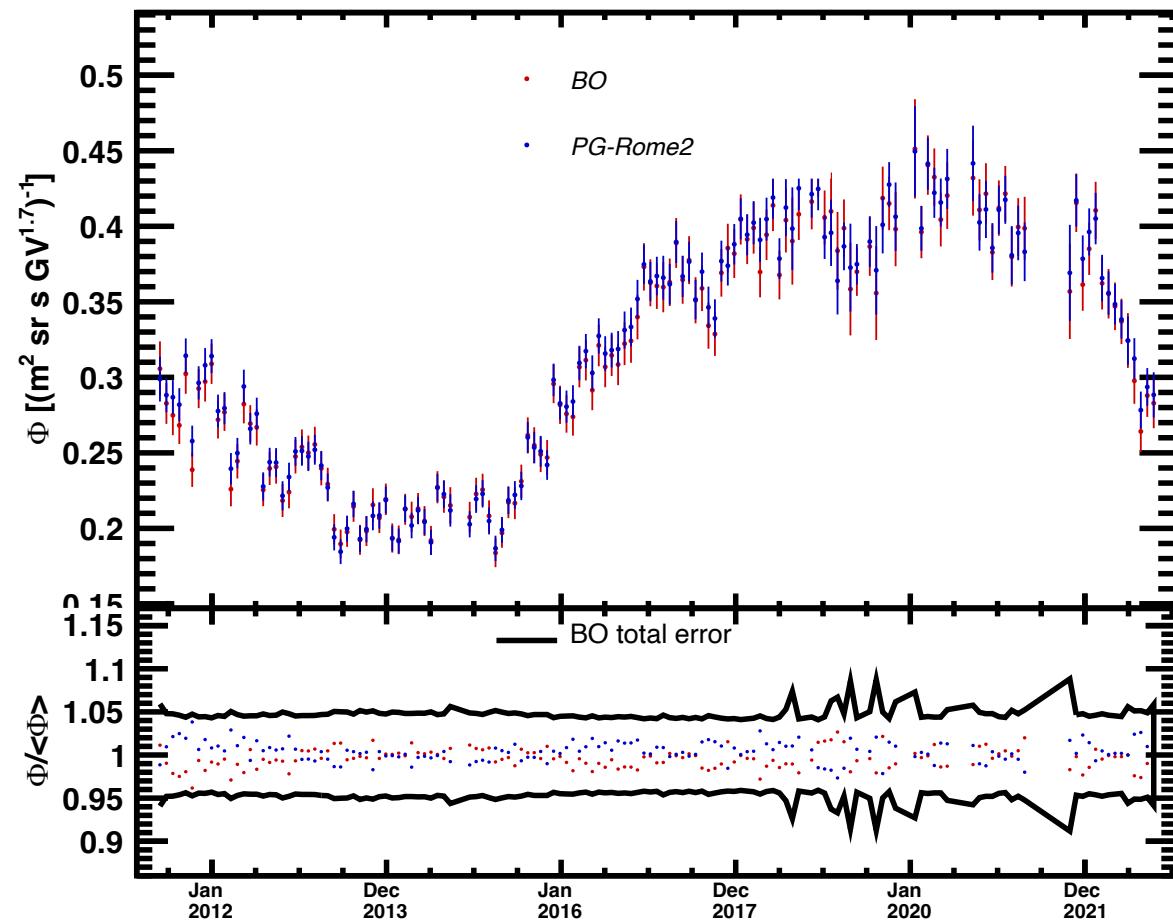

- Statistical Error (it is time dependent too)
- Systematics Time dependent error (data/data + unfolding sampling + matrix resolution + rigidity scale)
- Systematics Time independent error (raw acceptance + data/MC + background)
XS and partial XS TOI errors were not added to the systematics time independent.

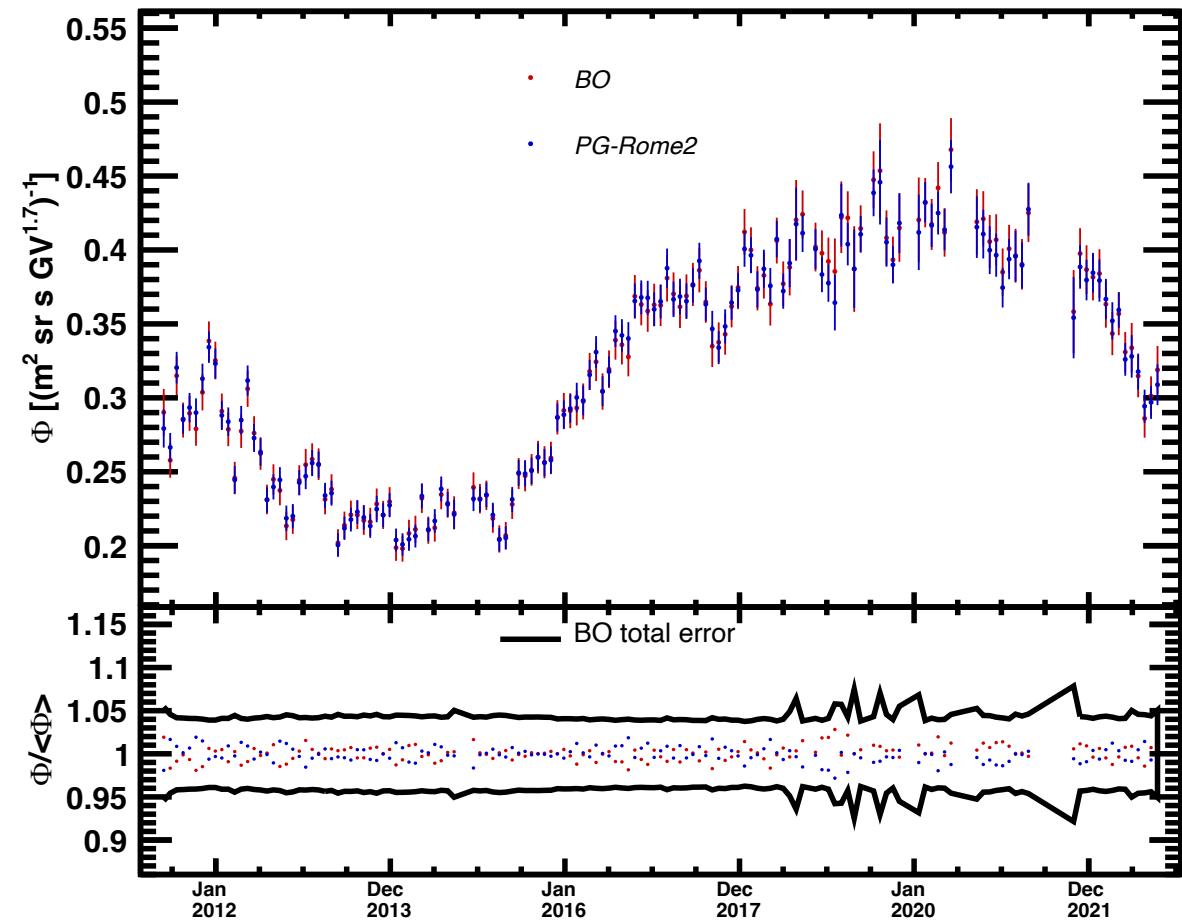

Bartels Comparison: Lithium

[1.92 - 2.15] GV

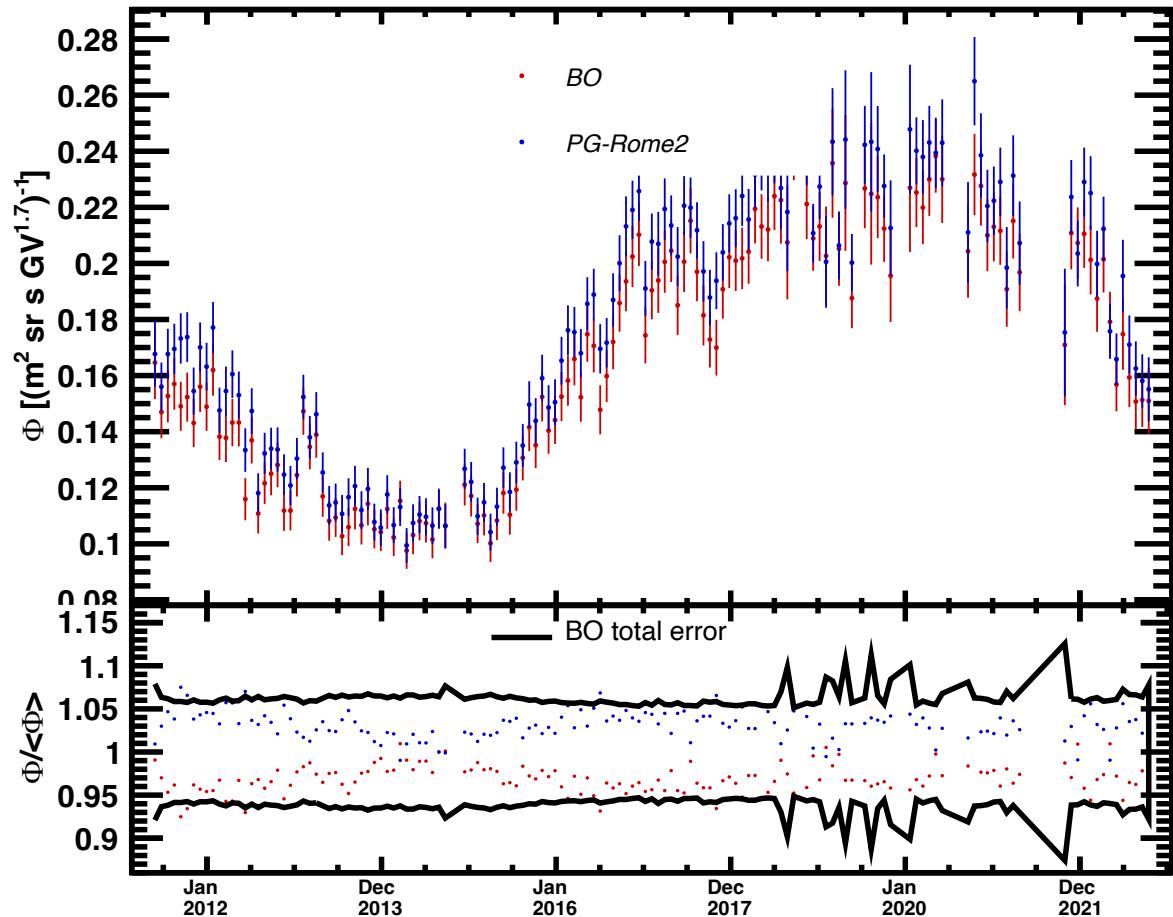

[2.15 - 2.40] GV

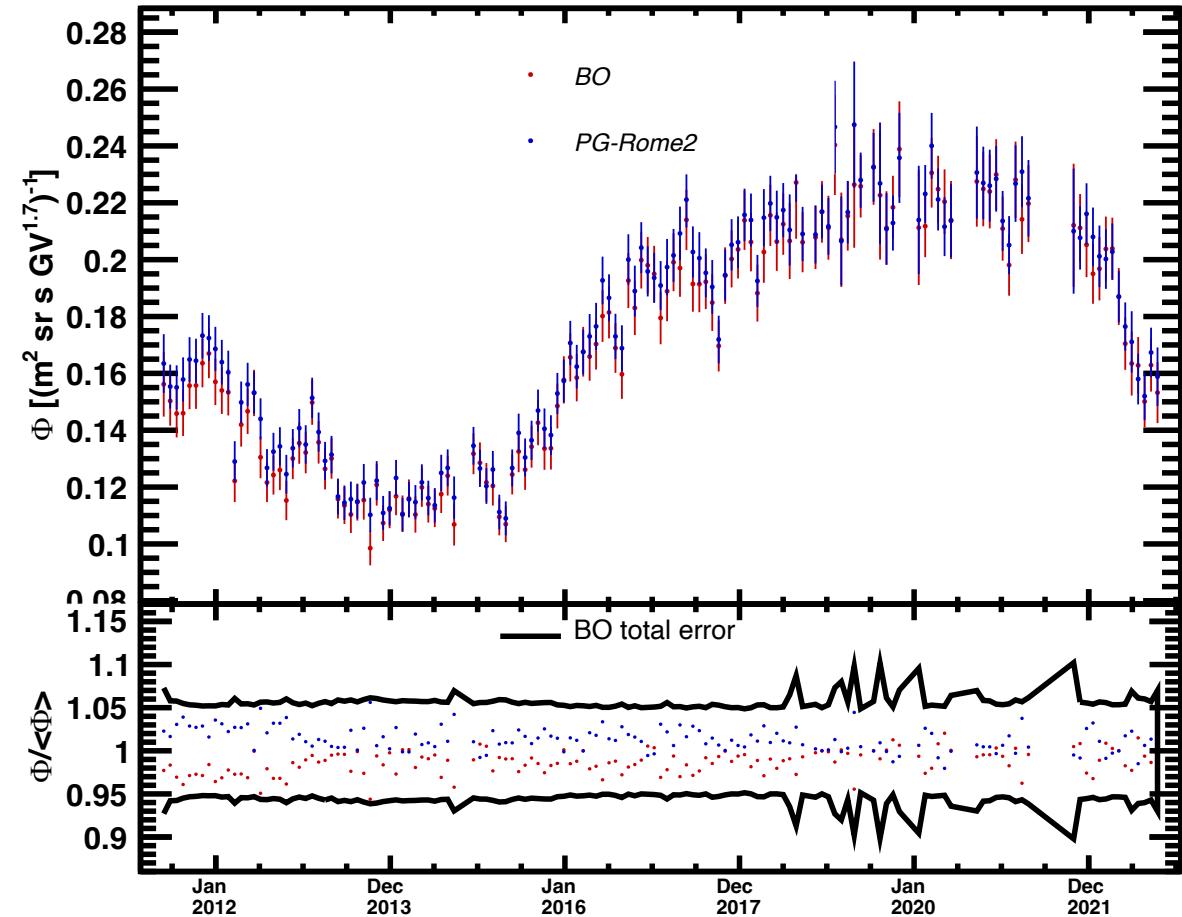

Bartels Comparison: Beryllium

[1.92 - 2.15] GV

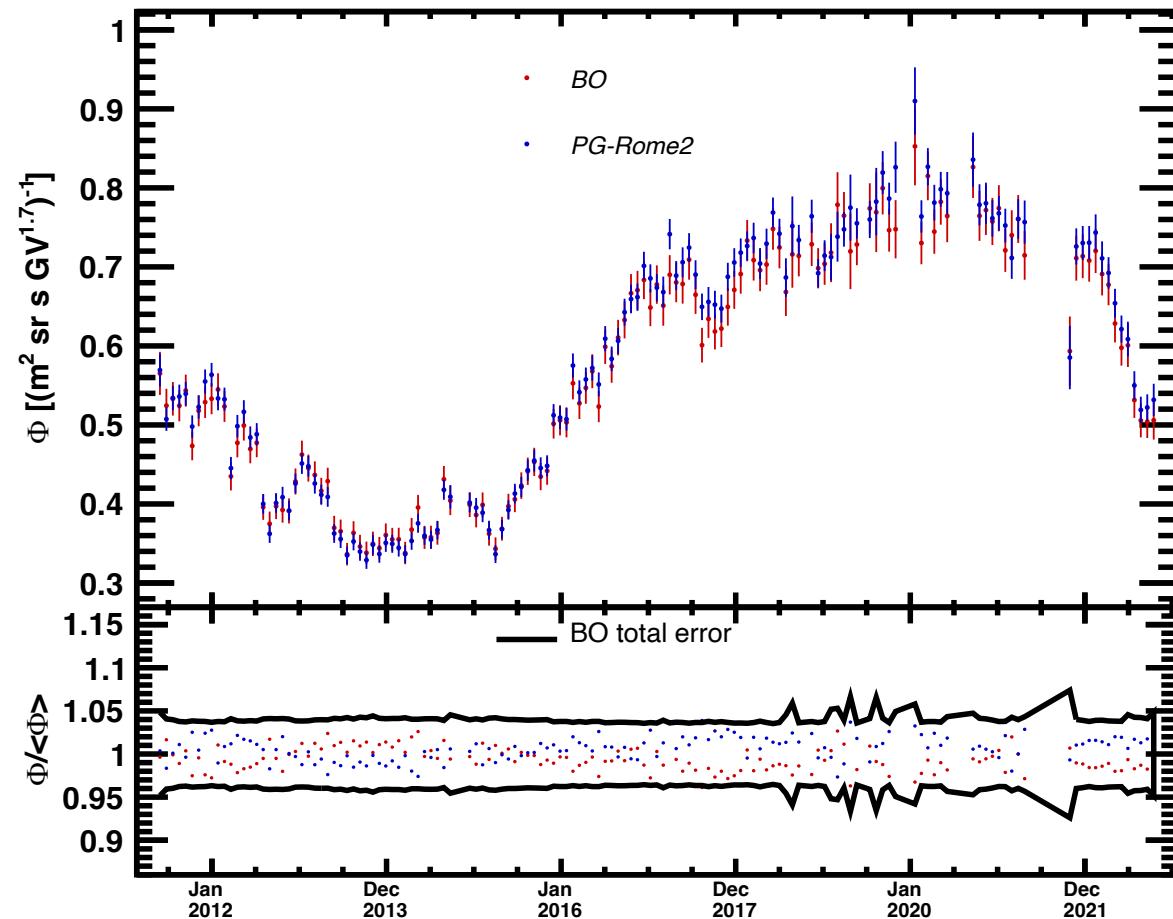

[2.15 - 2.40] GV

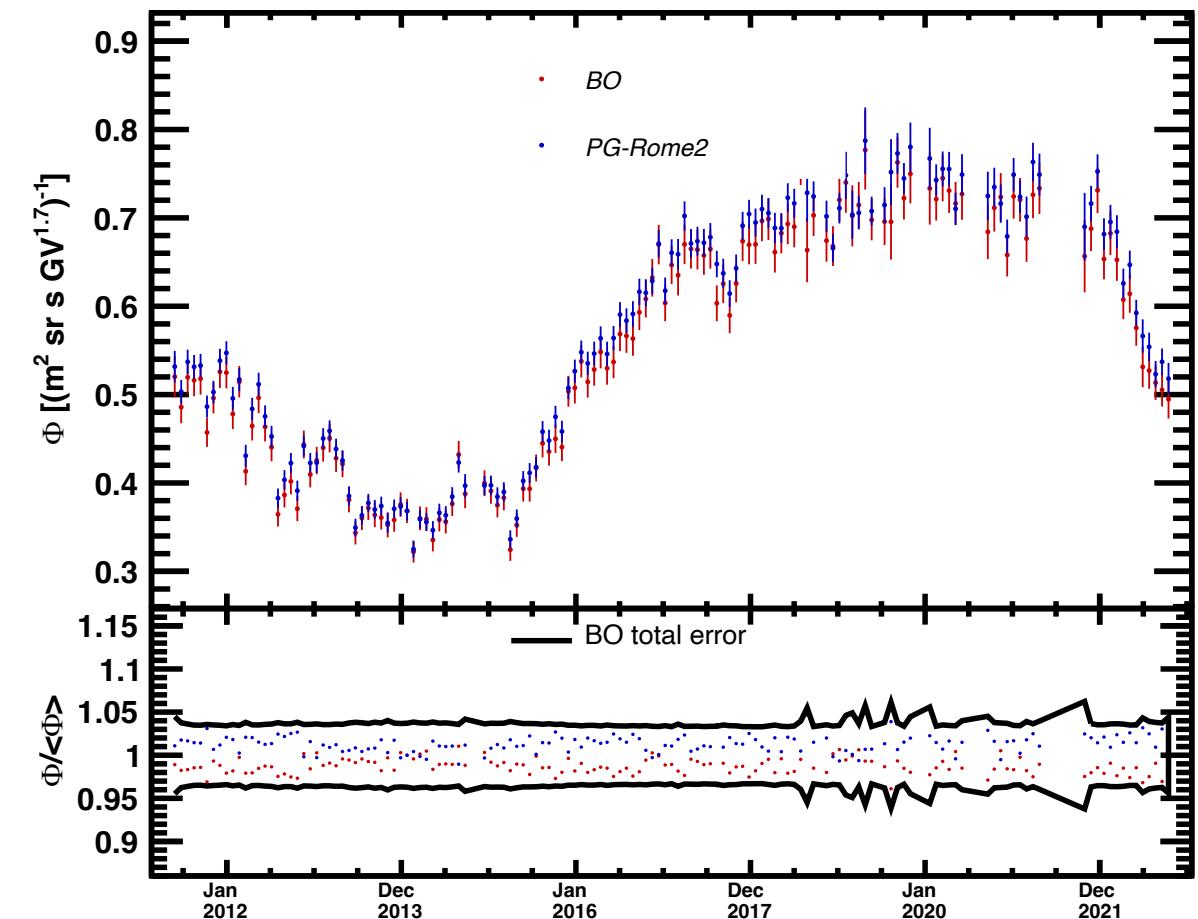

Bartels Comparison: Boron

[1.92 - 2.15] GV

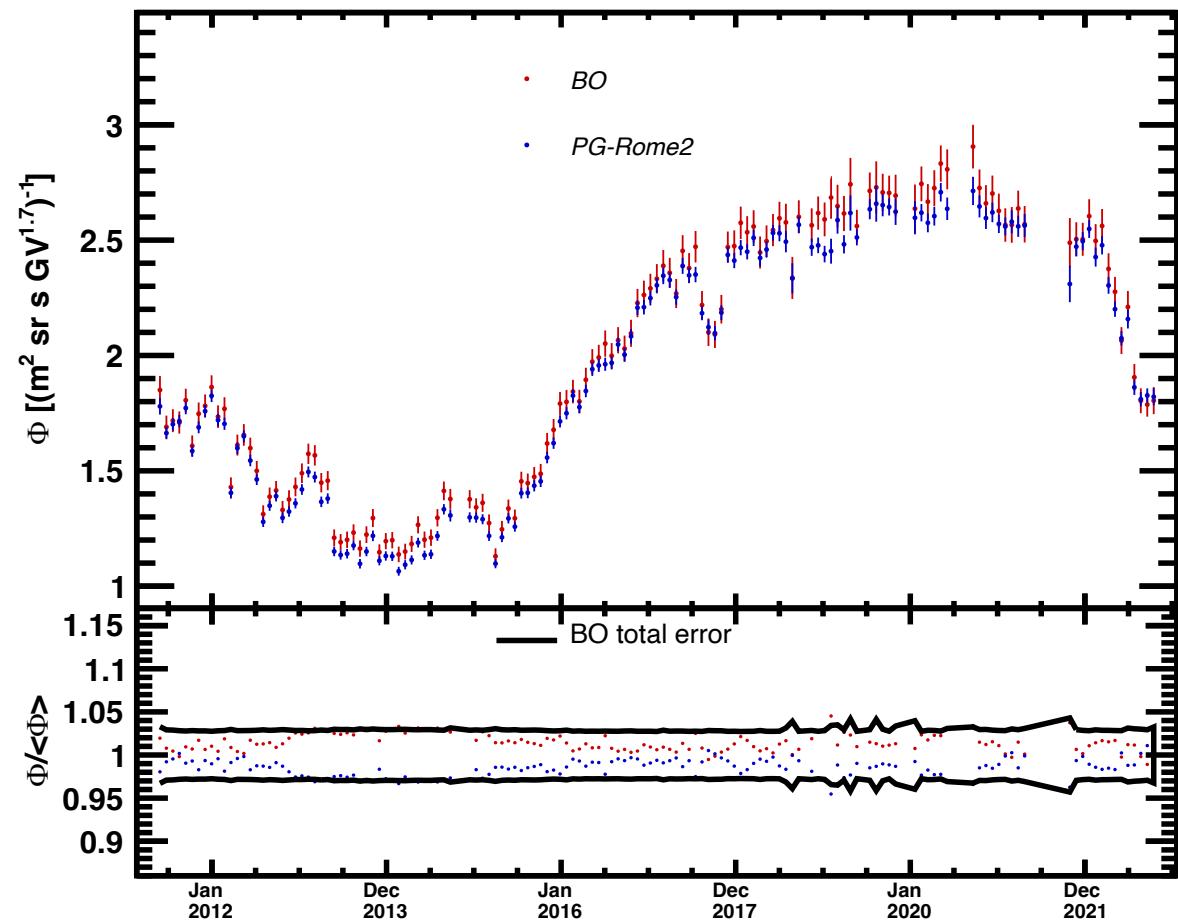

[2.15 - 2.40] GV

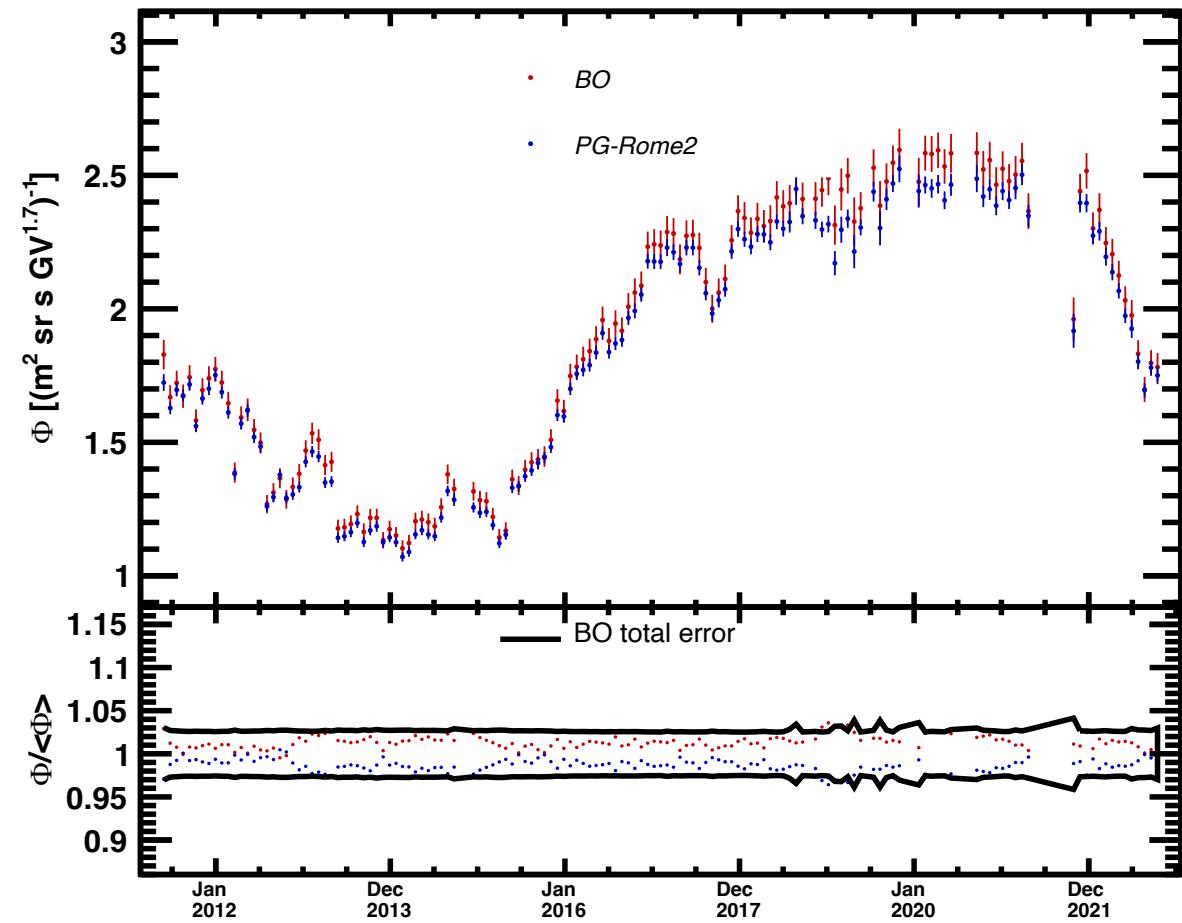

Bartels Comparison: Carbon

[1.92 - 2.15] GV

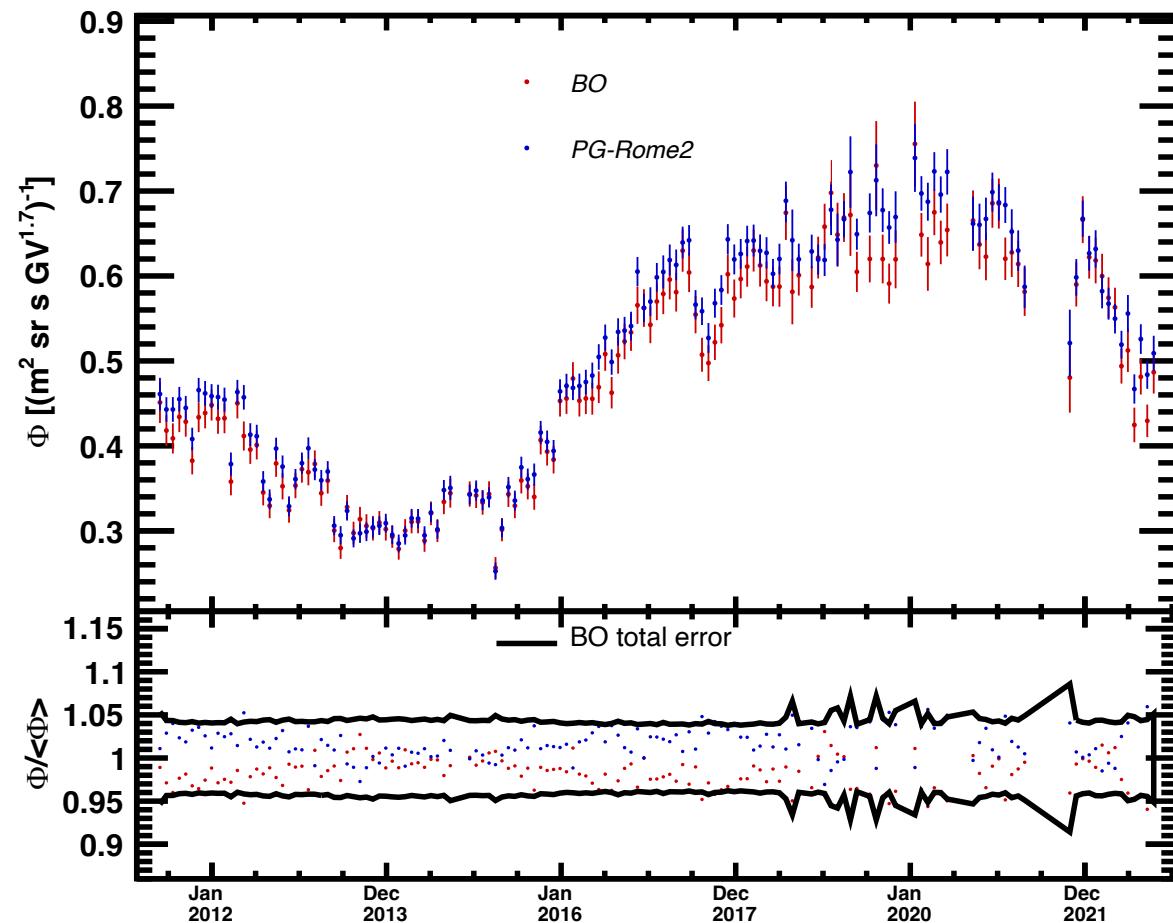

[2.15 - 2.40] GV

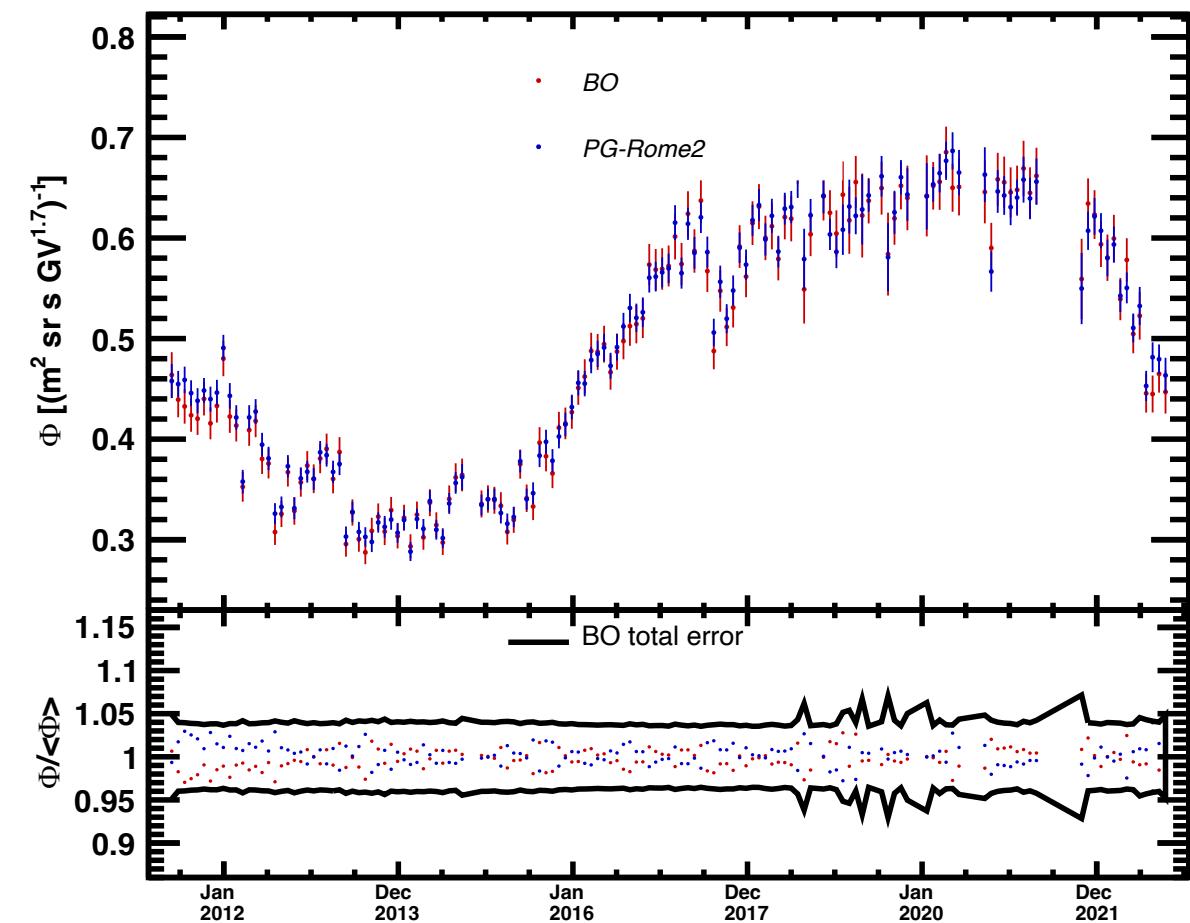

Bartels Comparison: Nitrogen

[1.92 - 2.15] GV

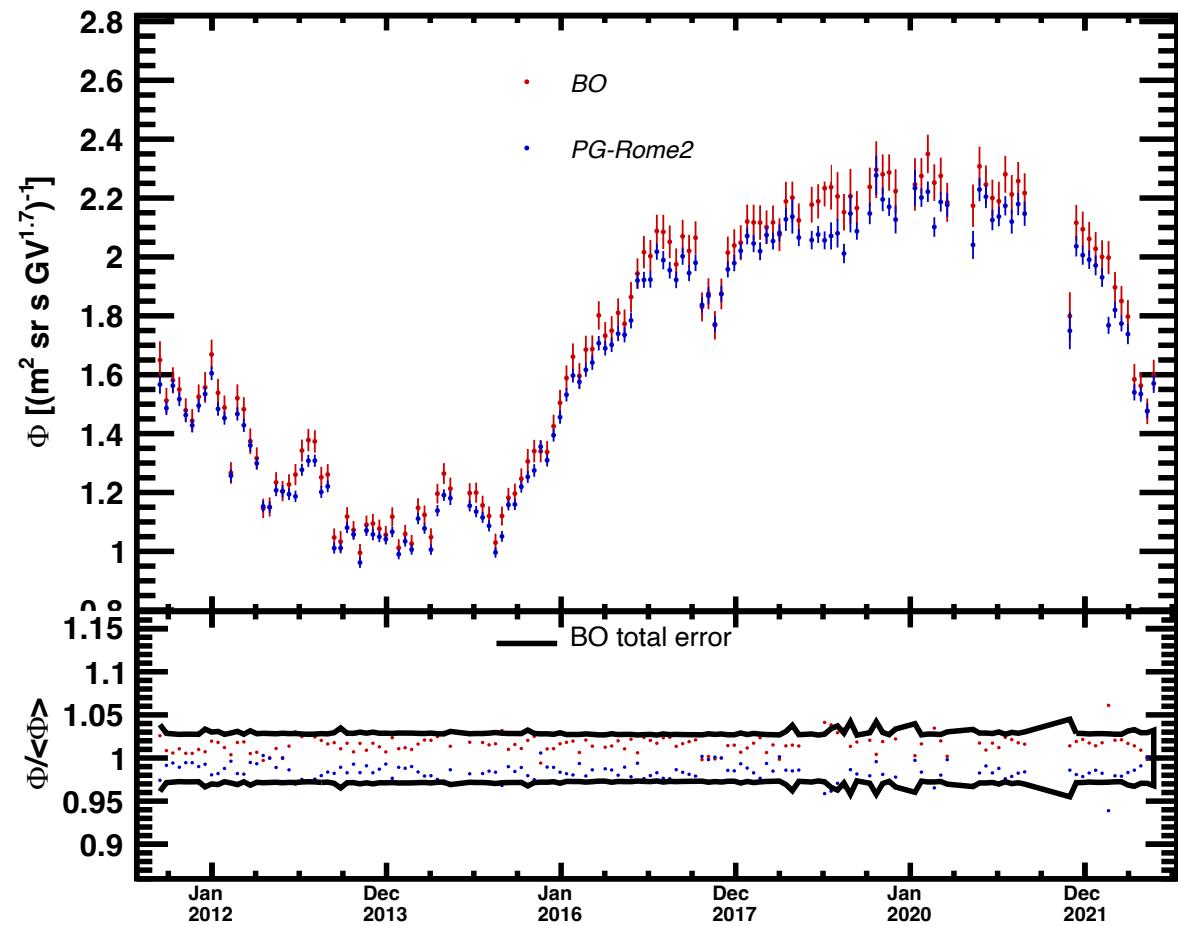

[2.15 - 2.40] GV

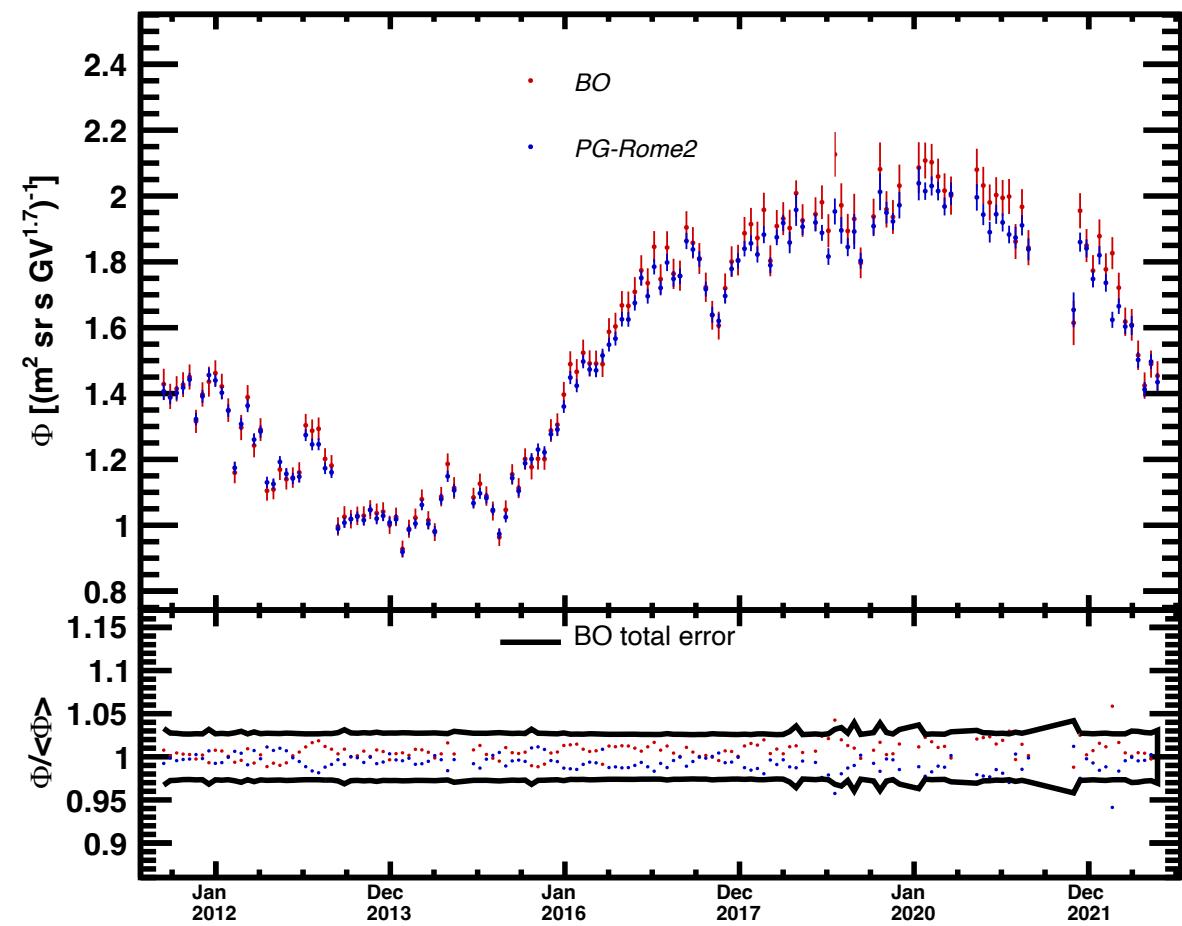

Bartels Comparison: Oxygen

[2.15 - 2.40] GV

[2.40 - 2.67] GV

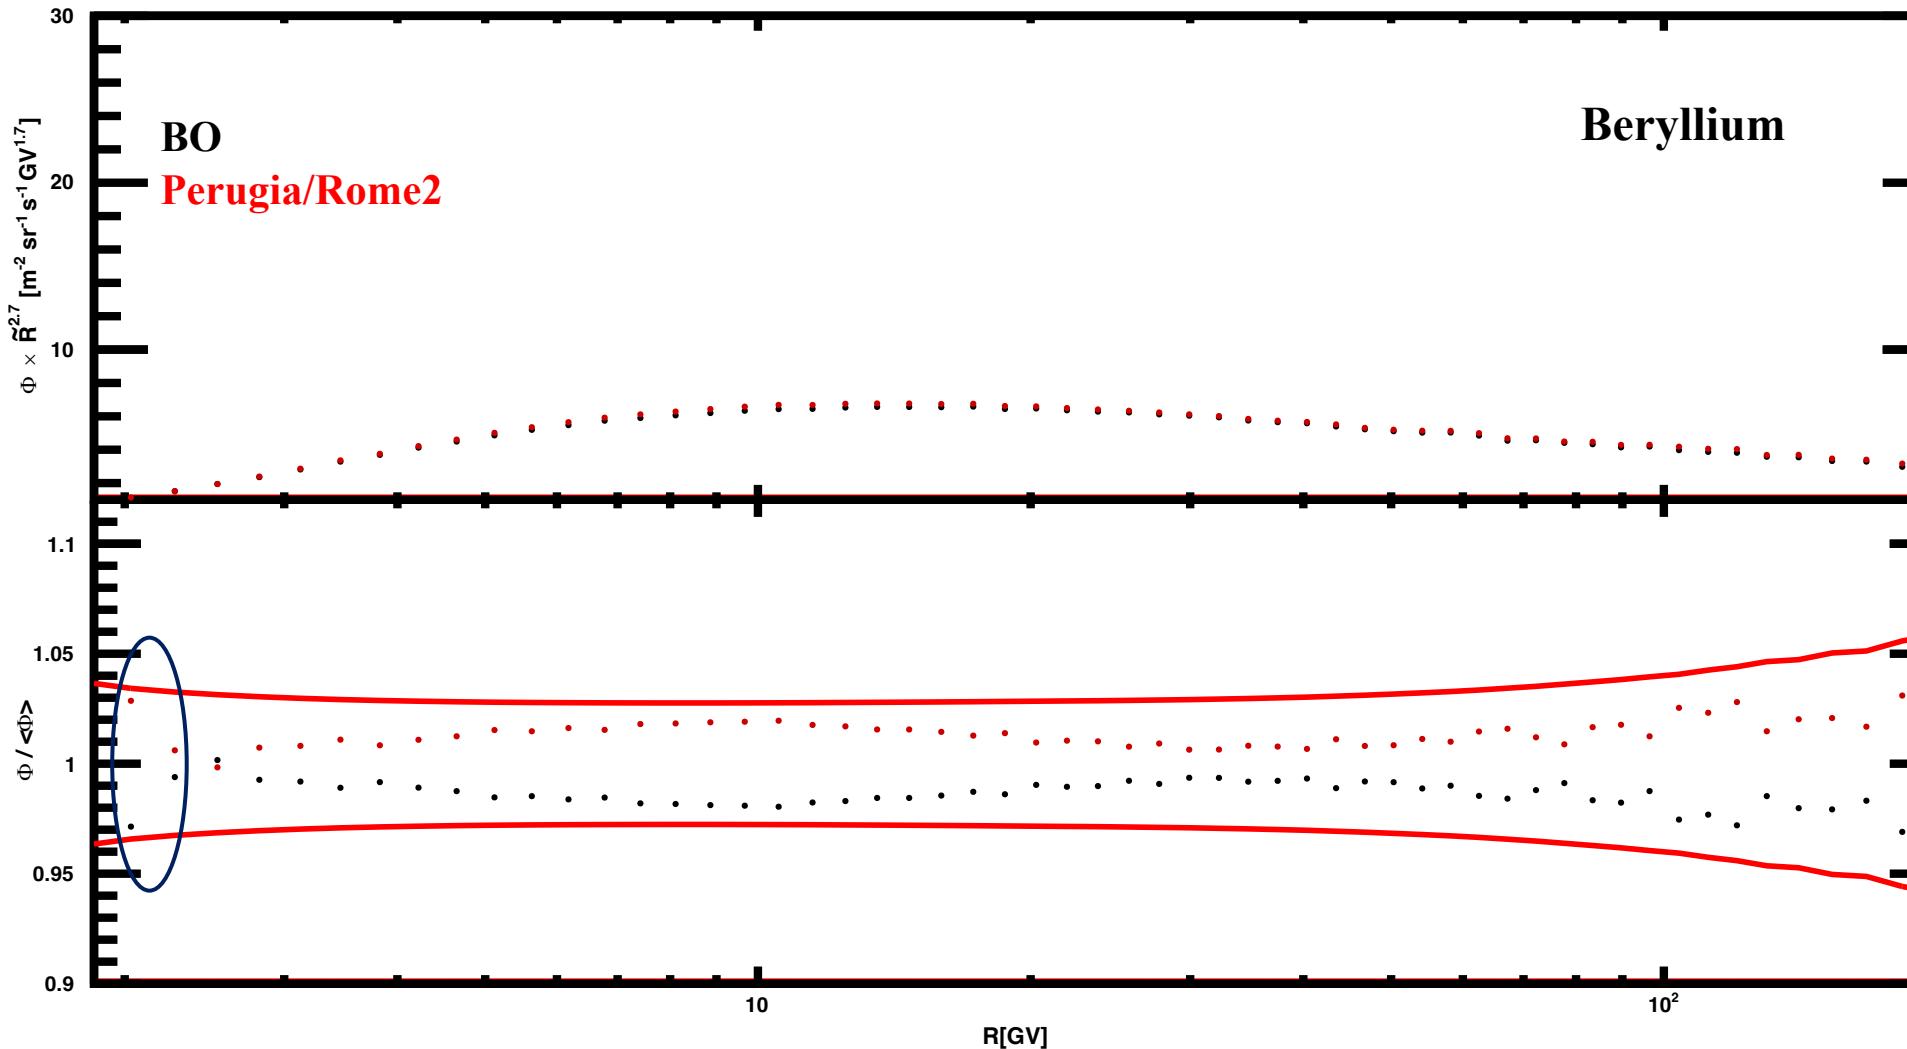

Bartels differences between groups

- Difference is coming from Average → Normalize
- Difference is coming from Bartels → Data/Data or/and Unfolding

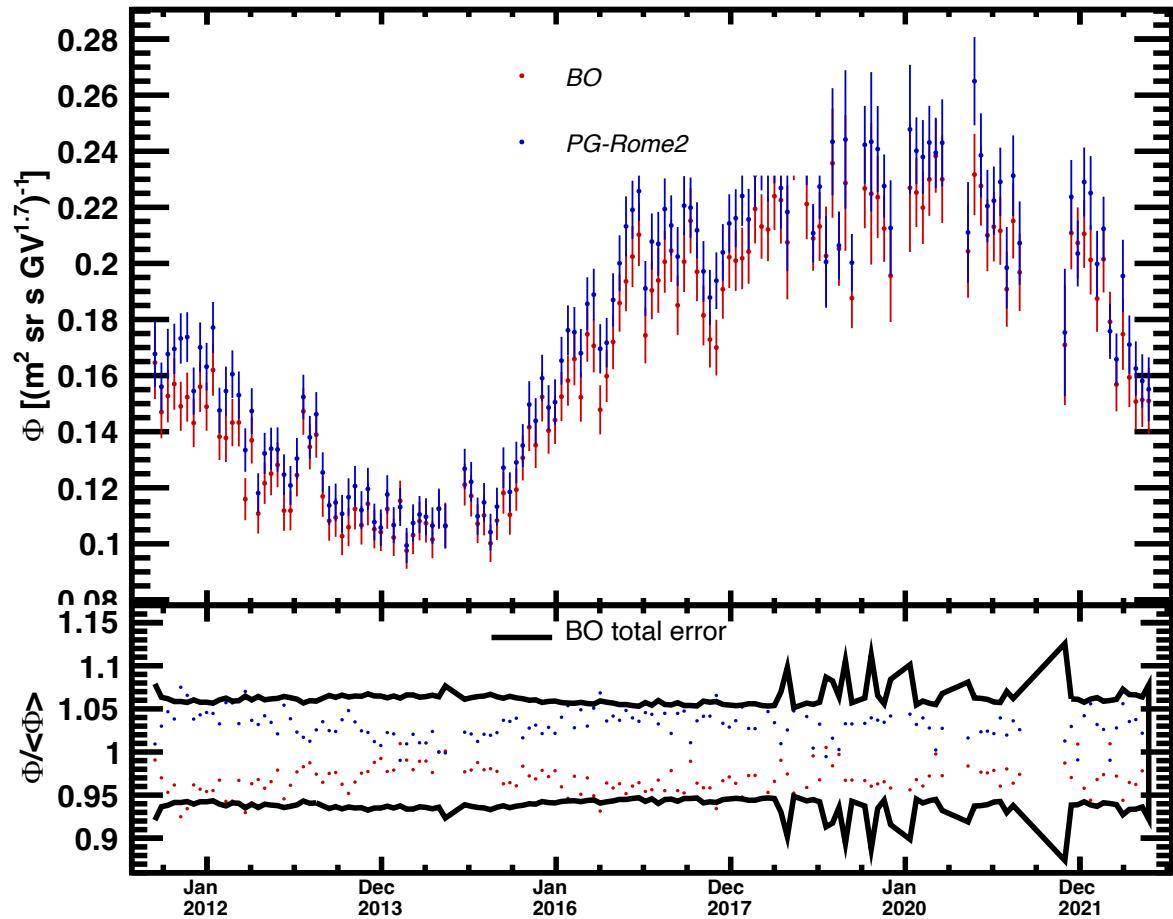

Bartels differences between groups

- Difference is coming from Average → Normalize
- Difference is coming from Bartels → Data/Data or/and Unfolding

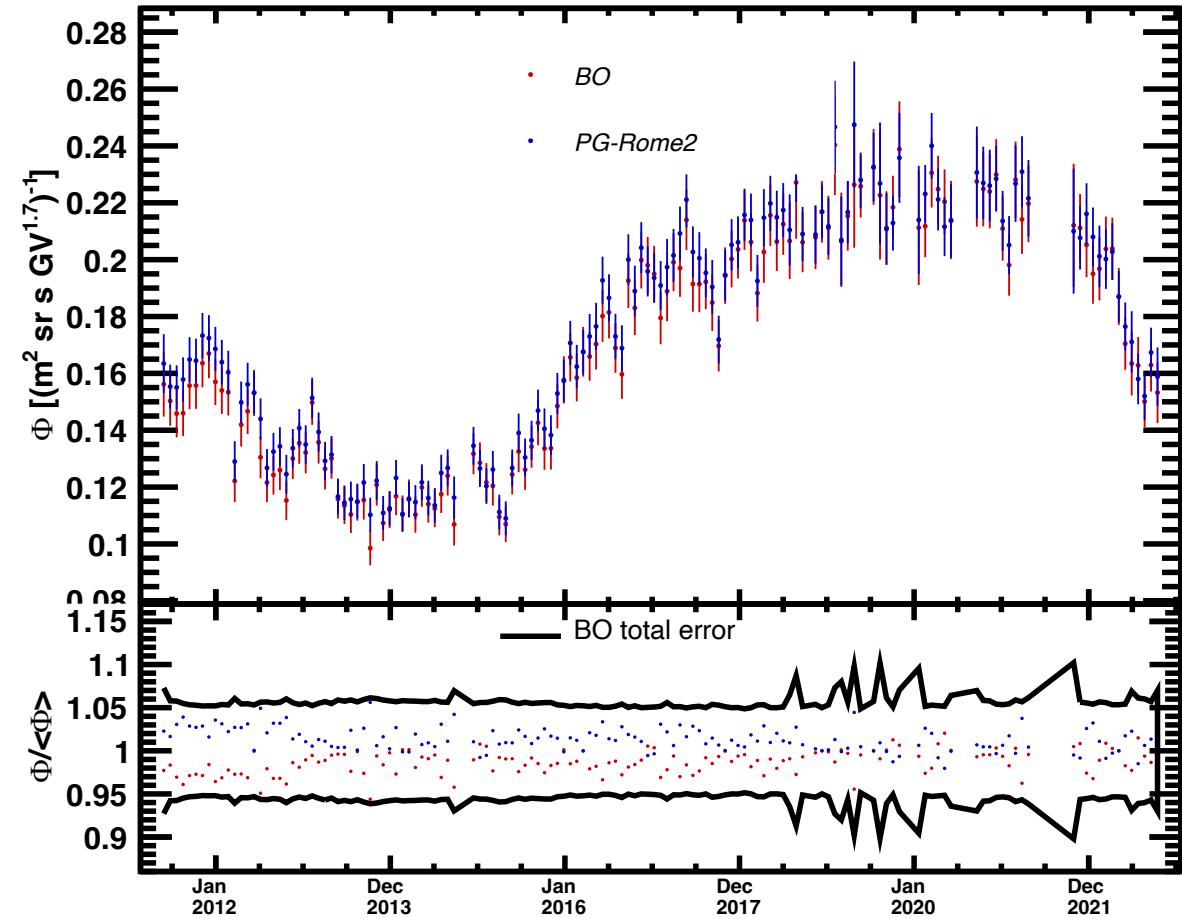

Bartels Comparison: Beryllium

[1.92 - 2.15] GV

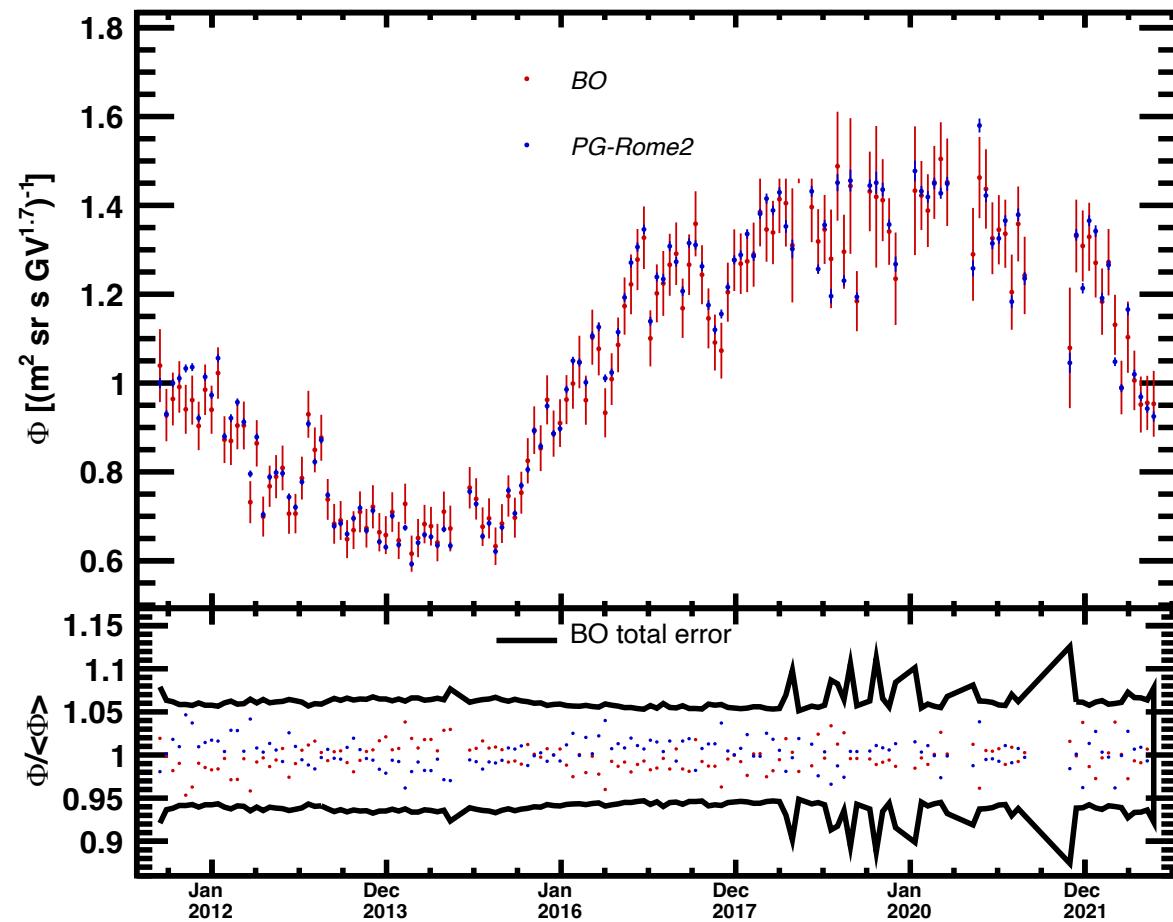

[2.15 - 2.40] GV

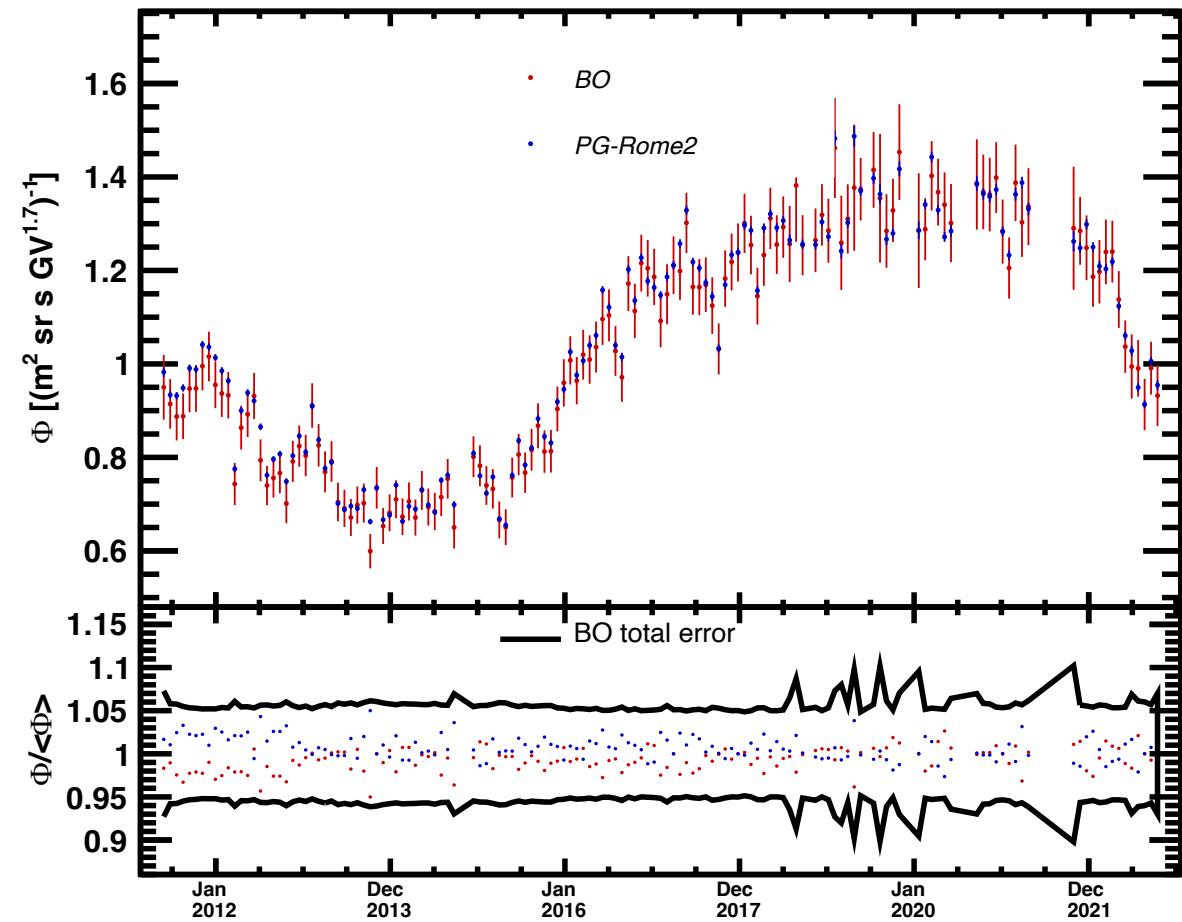

Bartels Comparison: Beryllium Normalized to Average

[1.92 - 2.15] GV

[2.15 - 2.40] GV

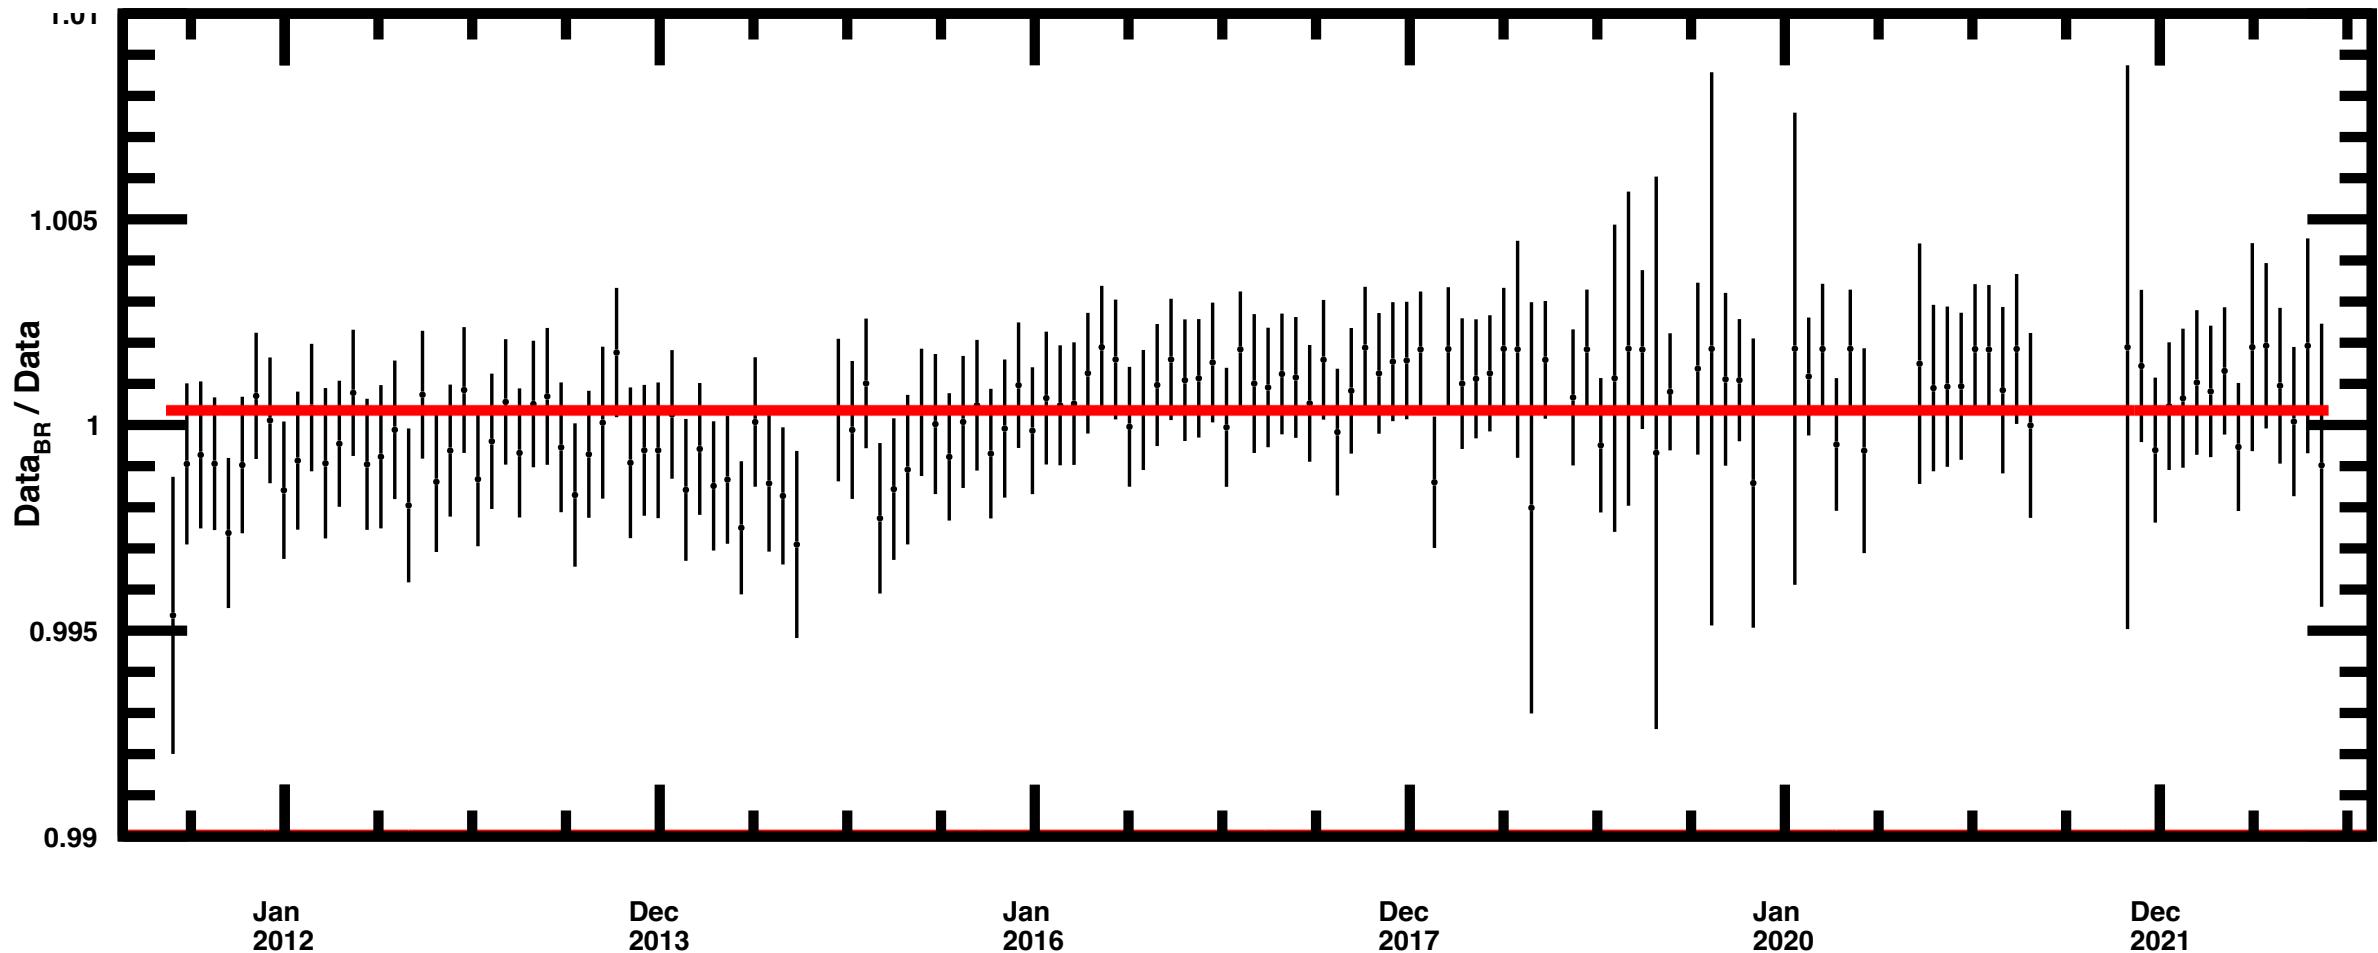

Conclusions

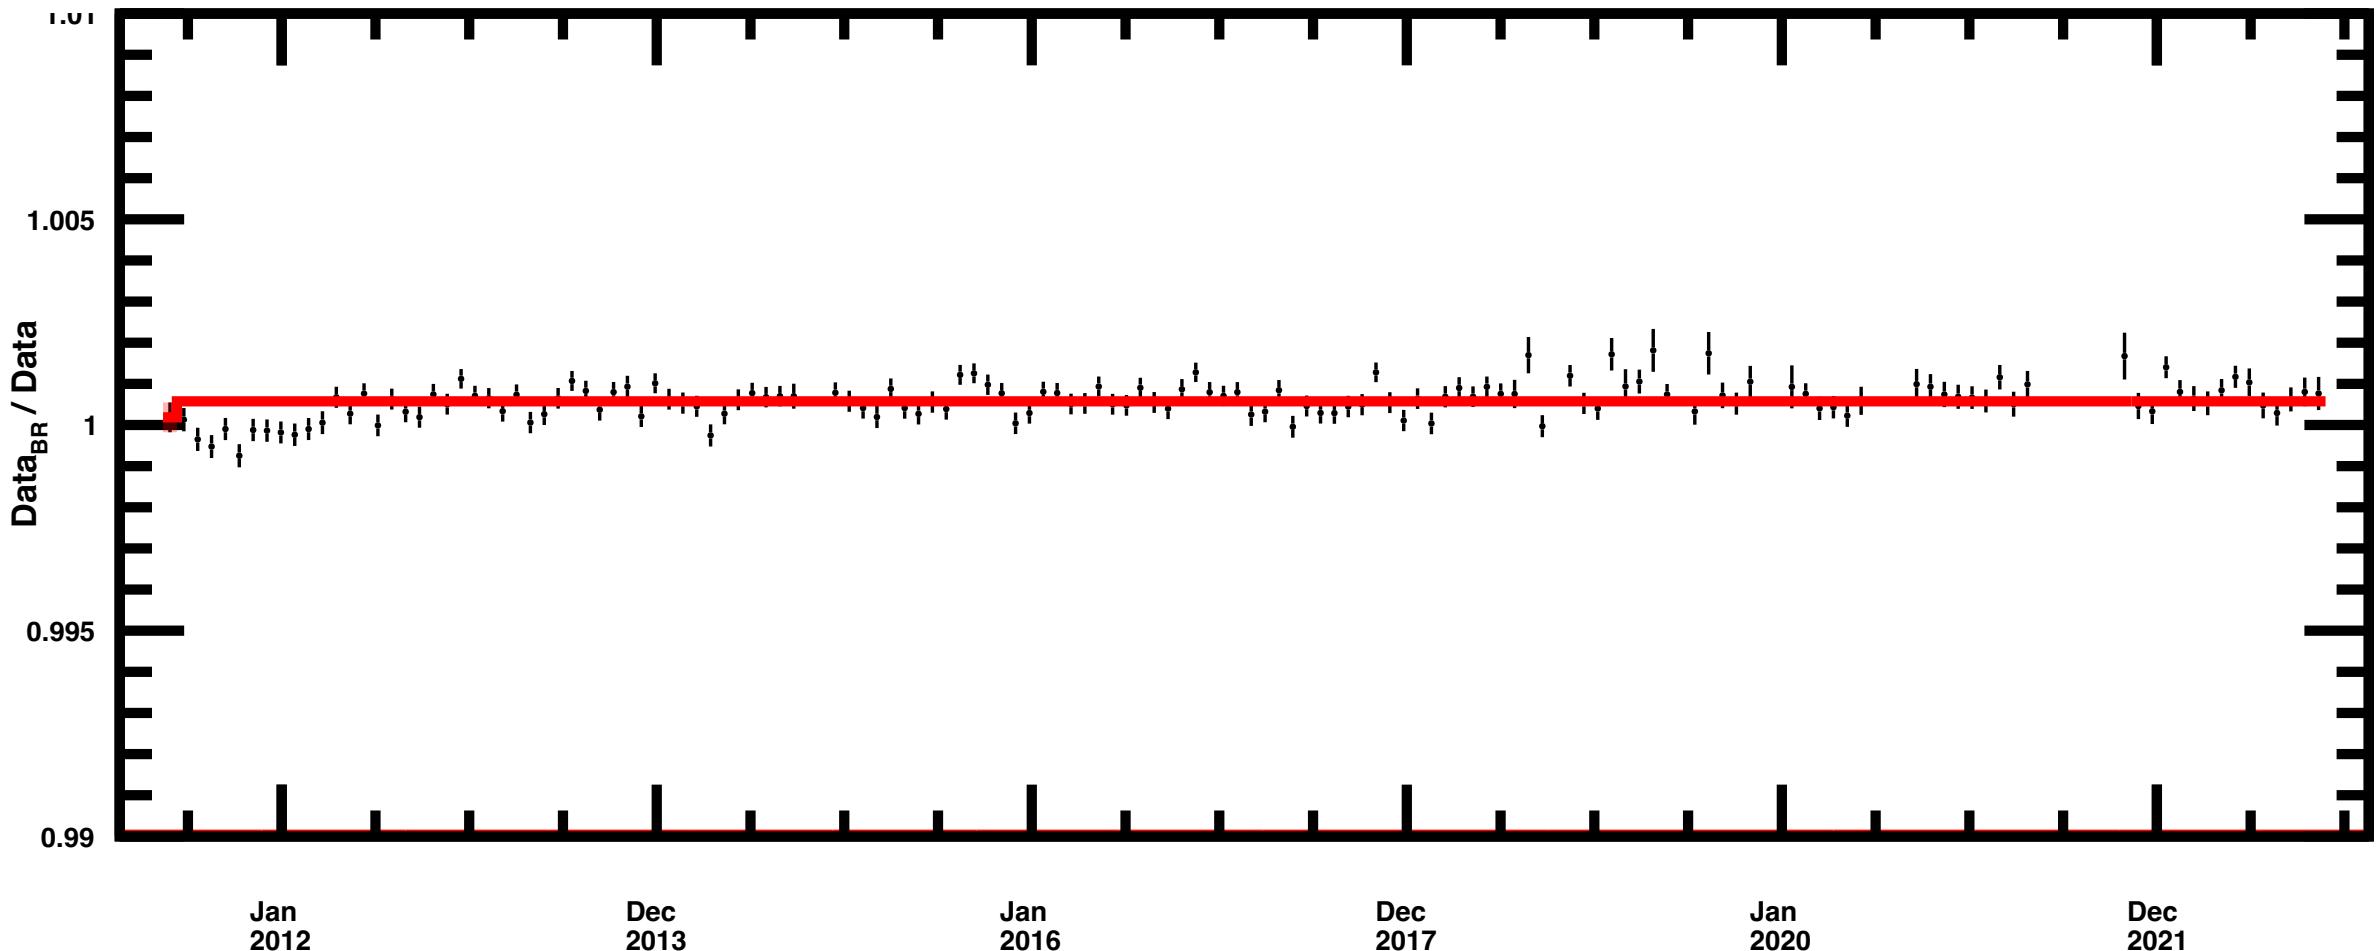

- The Bartels fluxes for Lithium to Oxygen for the first 11.5 years of AMS data taking, from Bartels 2426 to Bartels 2581, have been present.
- The agreement between the two groups is good enough for a publication. Anyway, a few more checks will be done:
 - Compare Unfolding vs Time
 - Compare Data/Data corrections
- All the systematics, time dependent and time independent, have been estimated.
- The Photon-Trigger period (6 months) is being studied to include it.
- The goal is to have everything prepare for the General Meeting in January, and present something solid to publish.
