

# Graphene as a substrate for tritium: hydrogenation and transmission

Alice Apponi

Dipartimento di Scienze, Università degli Studi di  
Roma Tre and INFN Sezione di Roma Tre

28.02.2024 - NuMass 2024, University of Genova

# Tritiated C-nanostructures as PTOLEMY target

PTOLEMY experiment:

- ❖ Tritium in a solid-state target
- ❖ Tritium difficult to handle but same chemical properties of hydrogen
- ❖ Characterisation of hydrogenated graphene nanostructures
- ❖ Measure the transmission through graphene of electrons

This talk!

Nanoporous graphene

Carbon nanotubes

Stacked graphene

# We can measure electron transmission $< 1$ keV

Electron Transmission measurement:

- ❖ Electron gun in our lab
- ❖ Electrons up to 900 eV
- ❖ Planning to extend energy up to 18 keV

A lot of physics to learn and of possible applications:

- ❖ Only a few experiments **below 1 keV**
- ❖ Discussion still **open**
- ❖ Integration of graphene in **MPGD** (transparency to electrons and impermeability to atoms)

# Graphene hydrogenation: experimental footprints

Hydrogen bonding to graphene:

- ❖ C bonds changes from  $sp^2$  to  $sp^3$
- ❖ Band gap opening
- ❖ Most stable CH morphologies  
1-side and 2-side

Nanoporous graphene hydrogenation seems to realize in 2-side mono- and bi- layer structures

Betti, M.G. *et al.*, *Nano Letters* (2022),  
<https://doi.org/10.1021/acs.nanolett.2c00162>

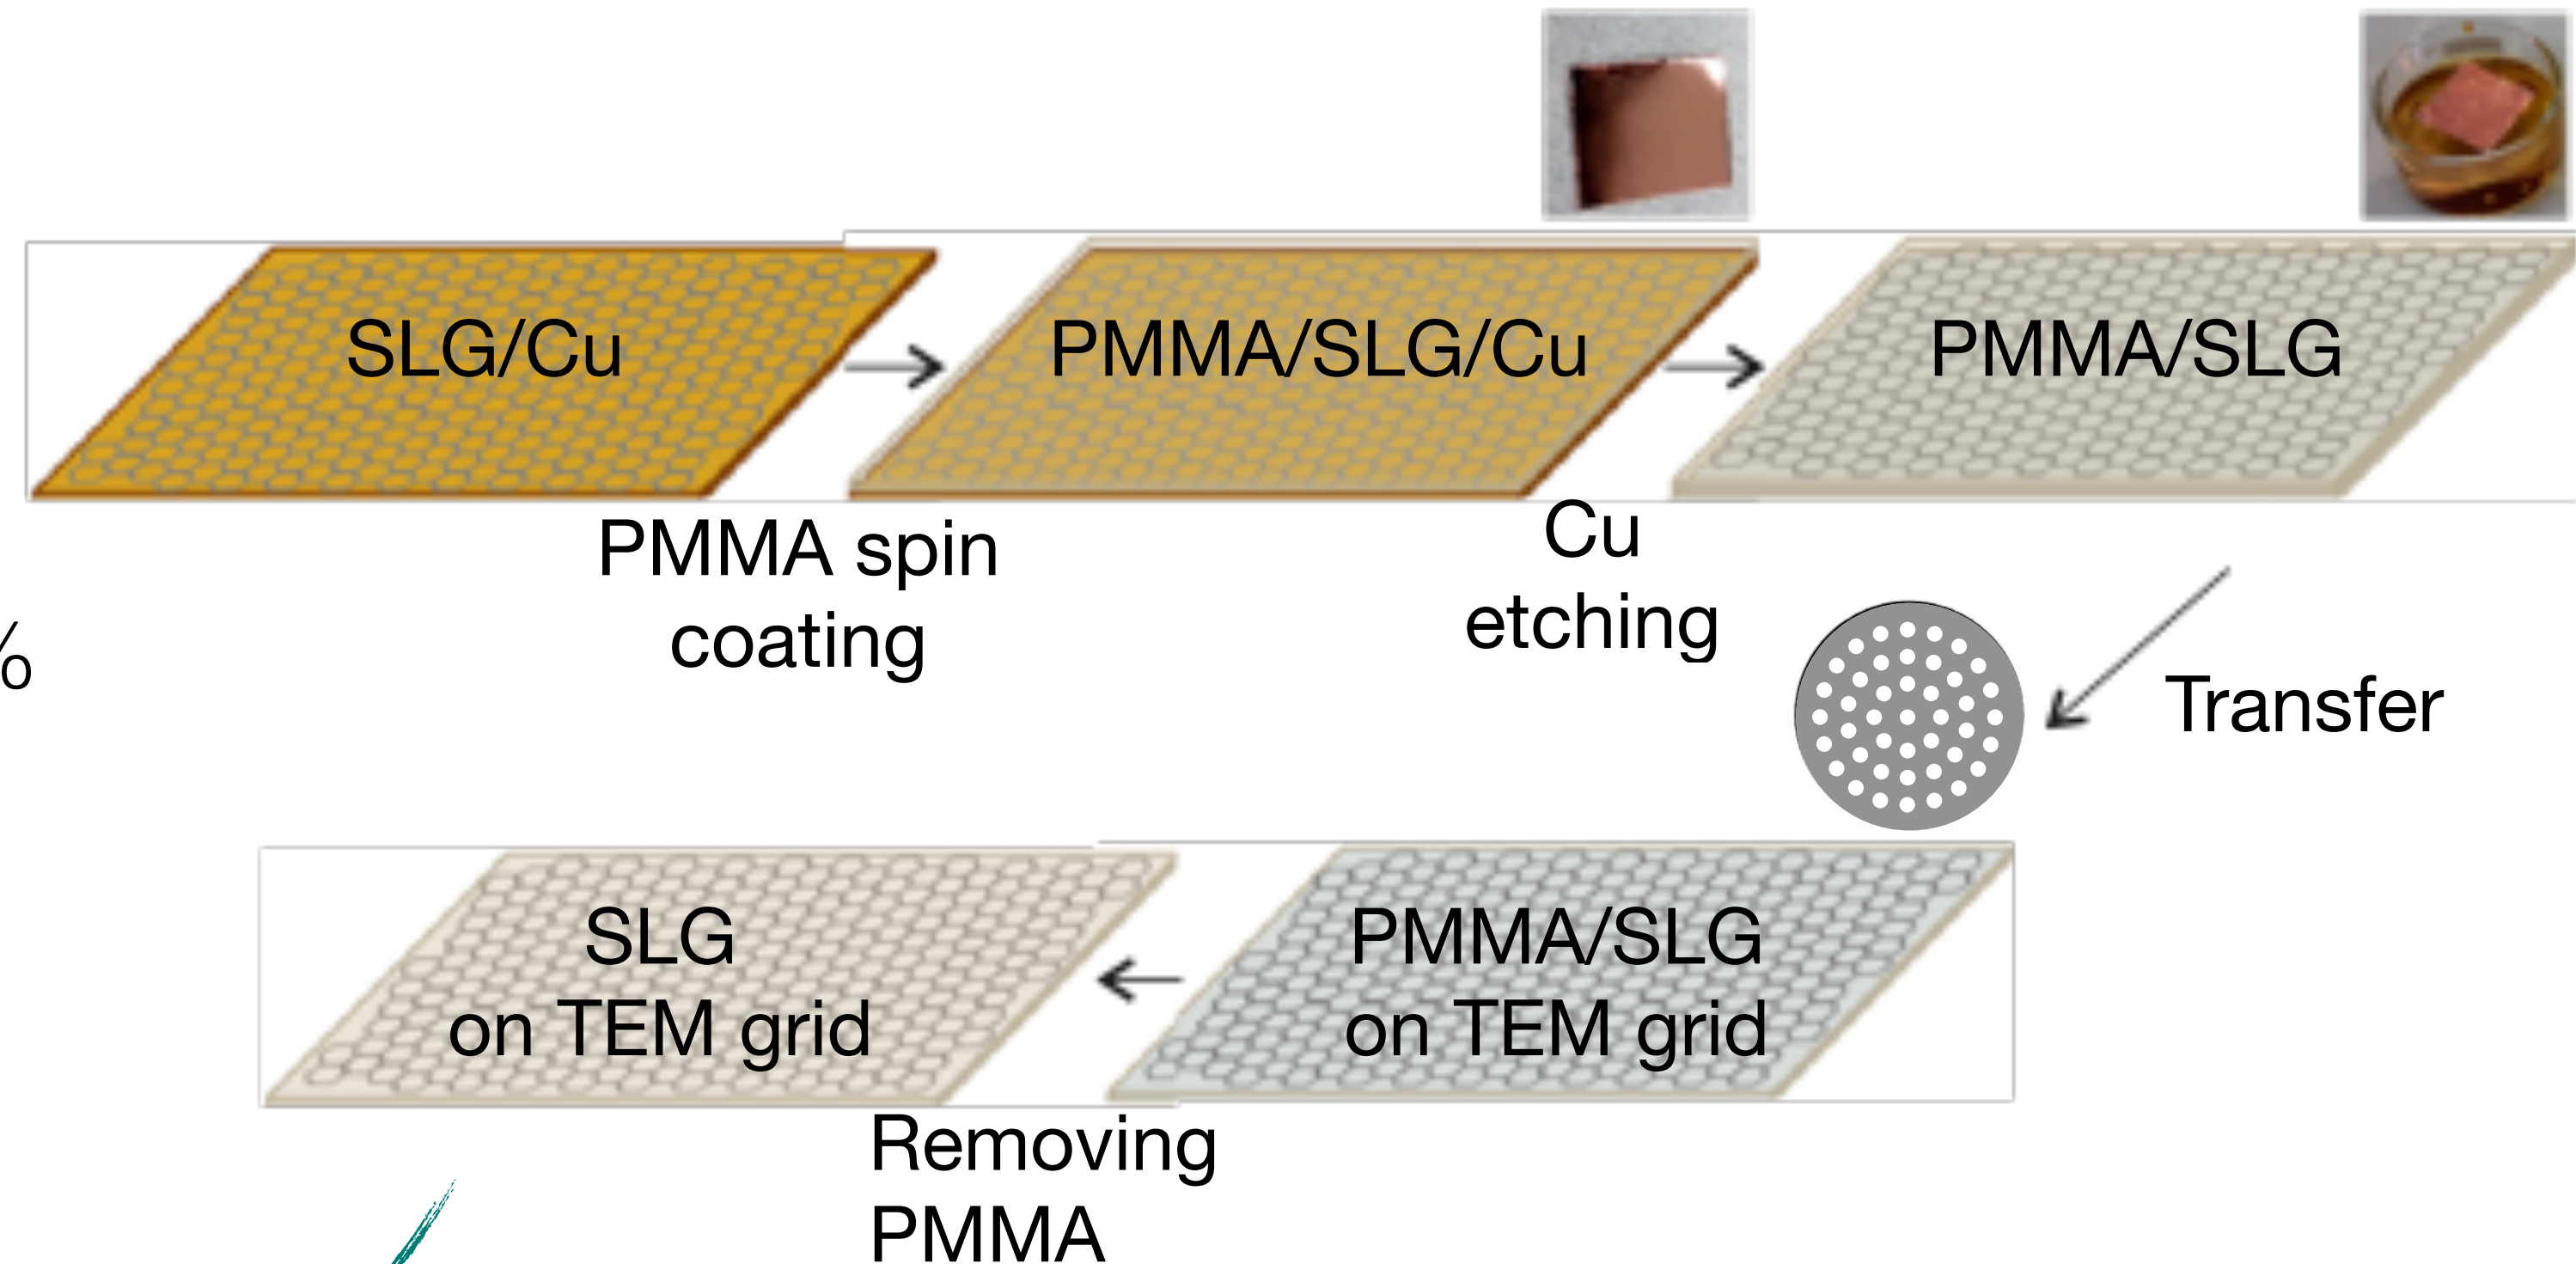

Hydrogenation of **suspended graphene** as a starting point to better understand

# Graphene growth and transfer on metallic grid

Monolayer graphene on nickel grid:

- ❖ G2000HAN - Ted Pella Inc.
- ❖ Hole width  $8\ \mu\text{m}$
- ❖ Nominal geometrical transmission 41%

PMMA = Poly-methyl-methacrylate ( $\text{C}_5\text{O}_2\text{H}_8$ )<sub>n</sub>

# Full coverage good quality graphene

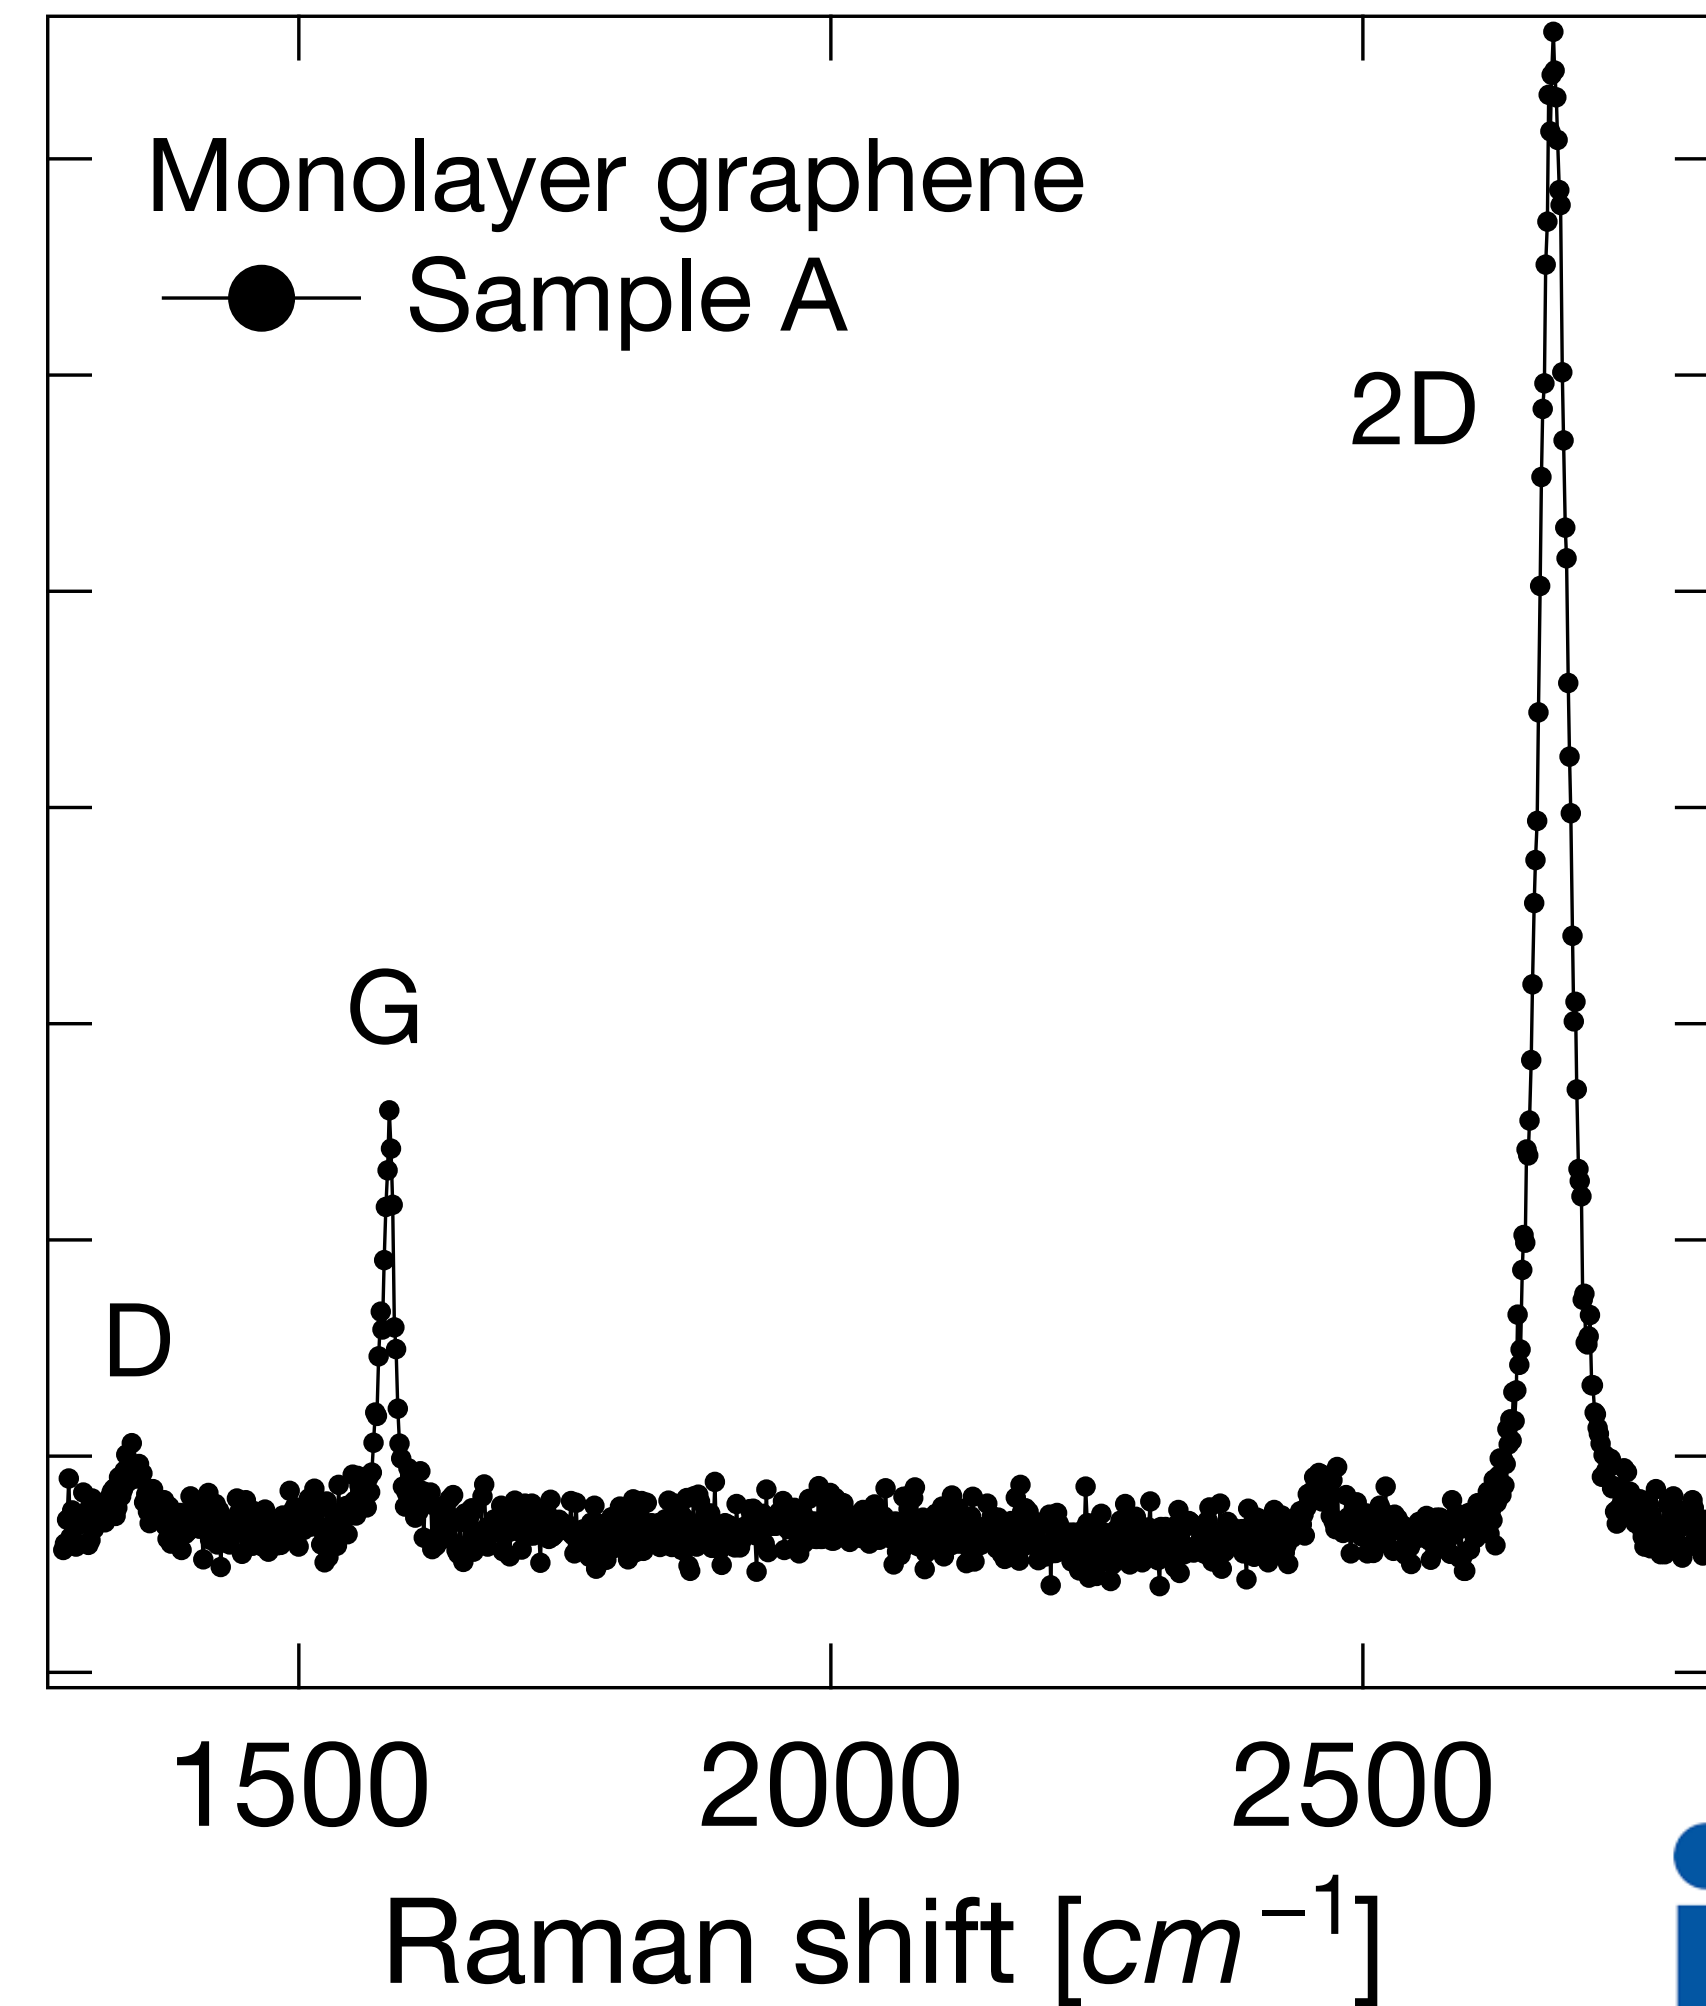

Micro-Raman maps:

- ✿ Full coverage achieved
- ✿ Few spots without graphene X
- ✿ From typical spectrum low D peak, prominent G and 2D peaks

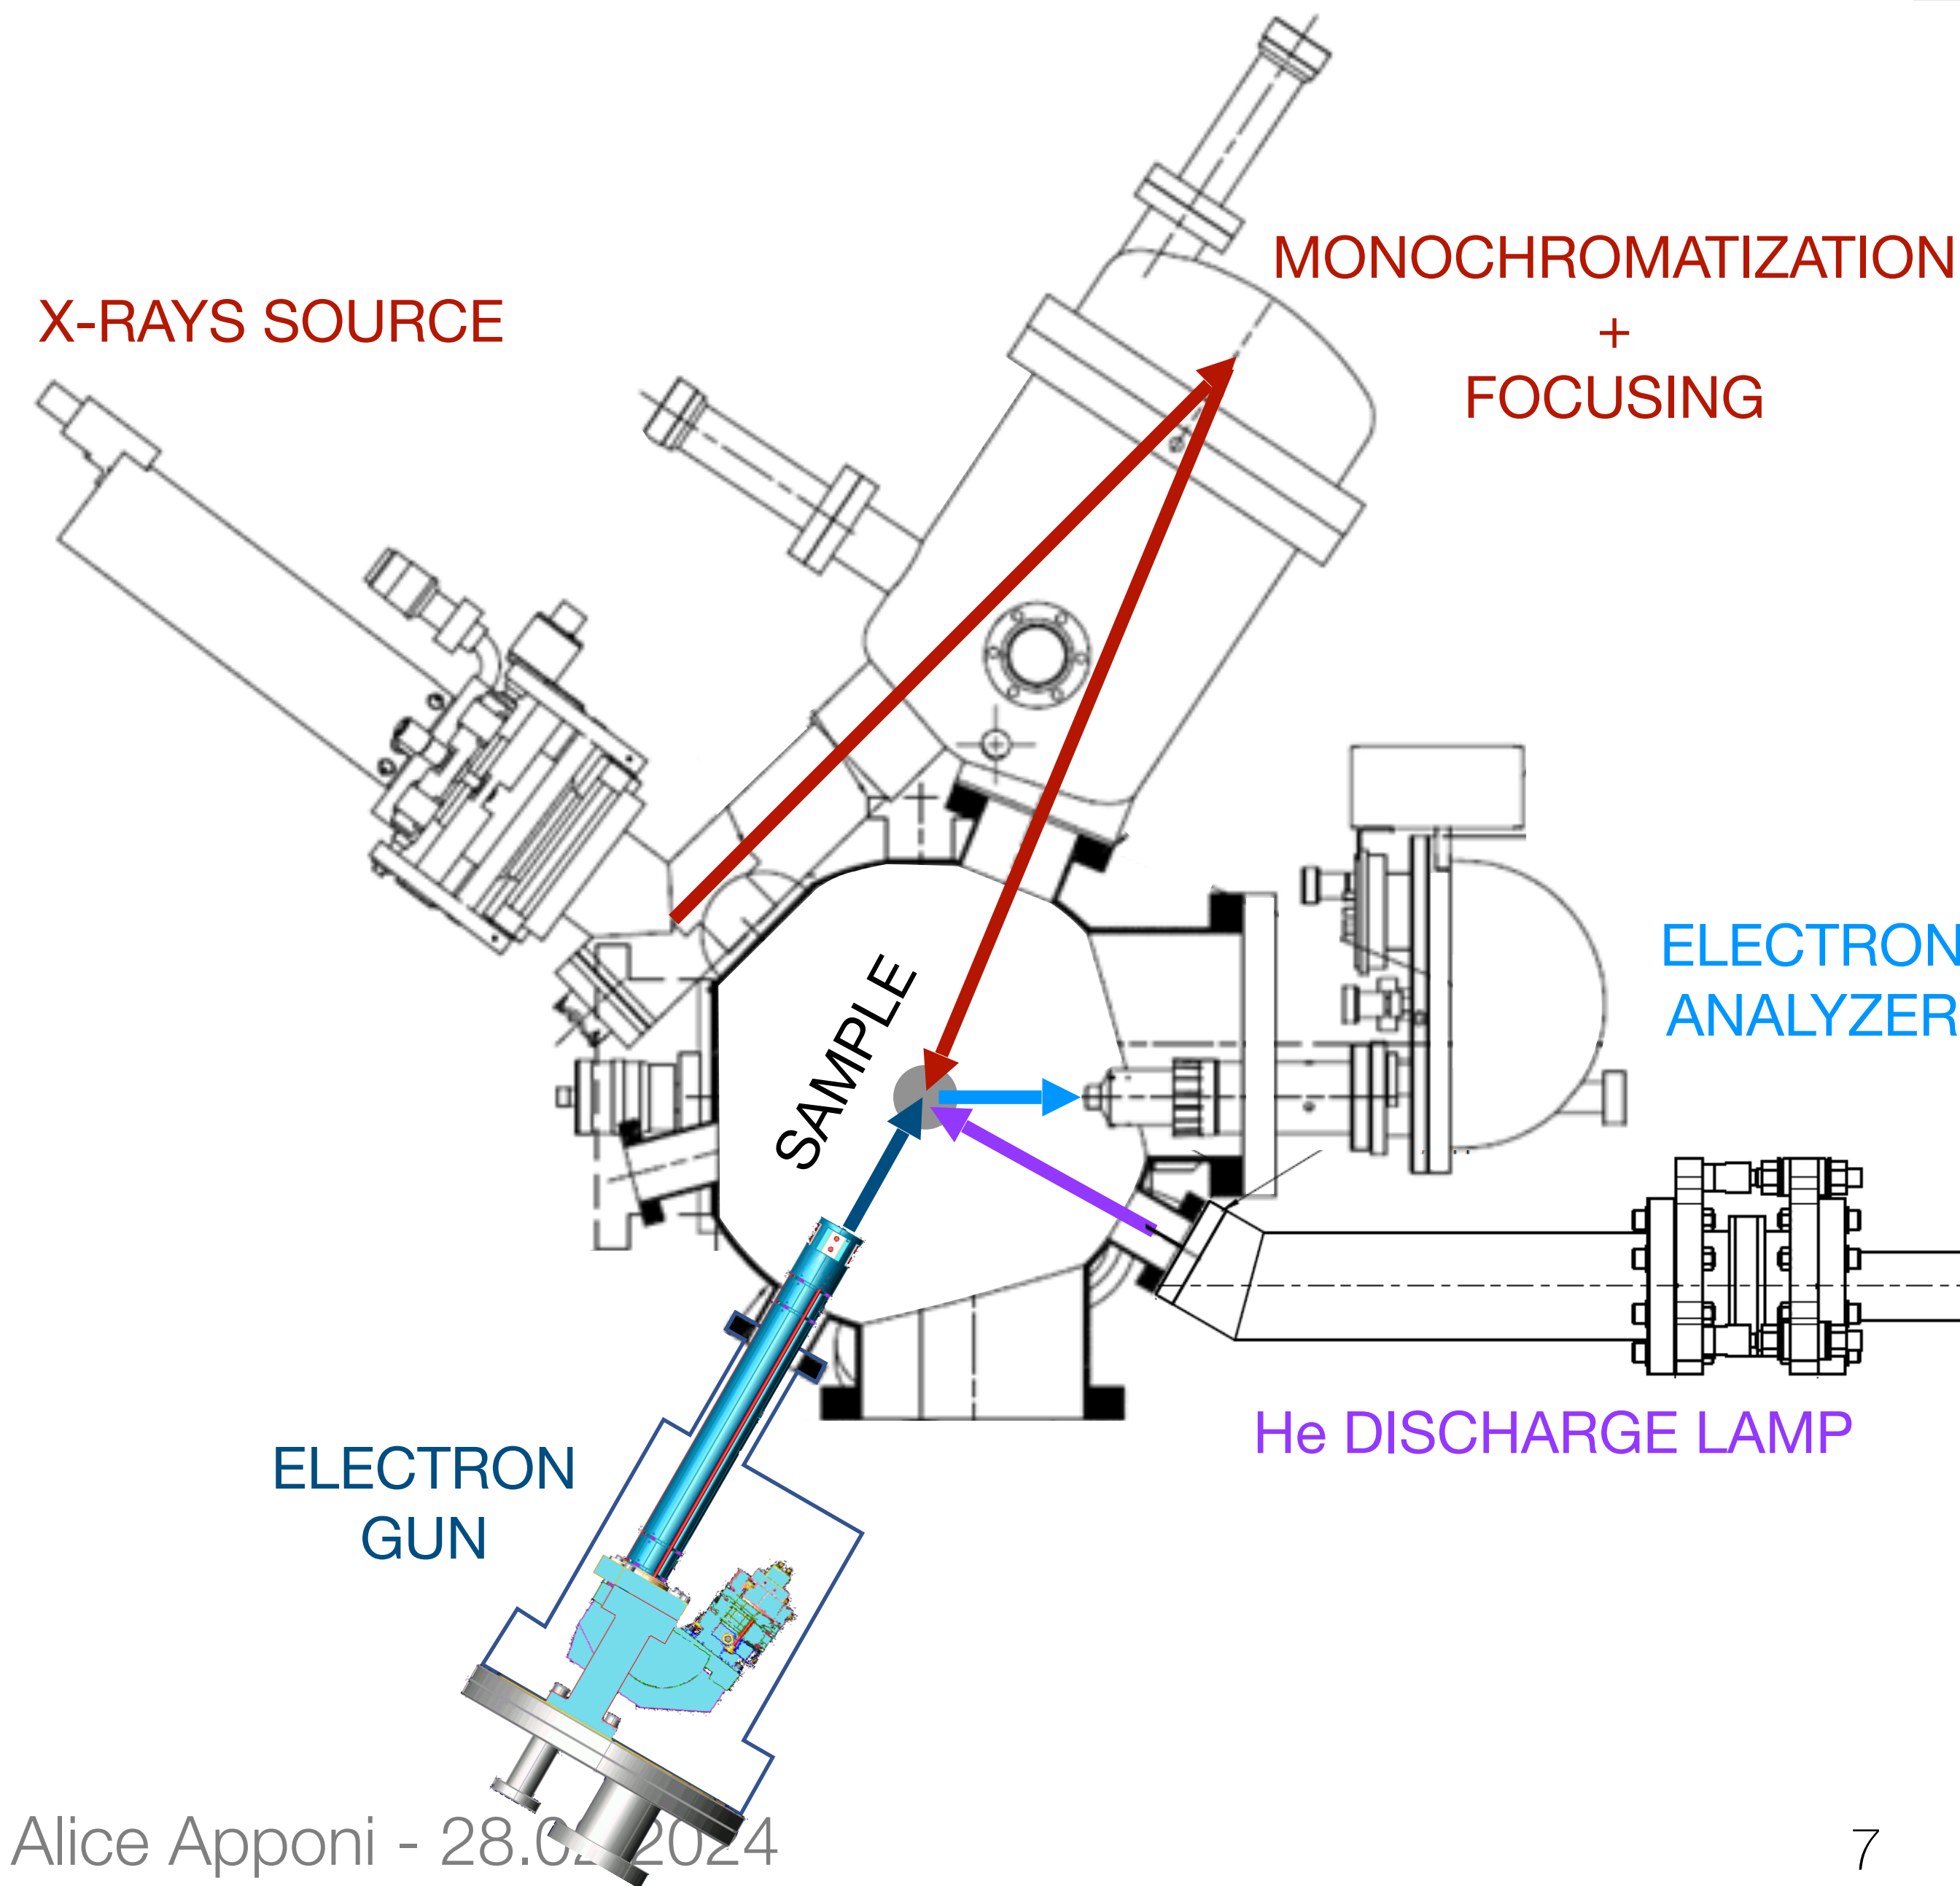

Good quality!

Intensity (arb. units)

# The LASEC experimental chamber

Al  $K\alpha$  X-ray source:

- ✿  $h\nu = 1486.7 \text{ eV}$
- ✿ Monochromatized beam
- ✿ XPS resolution =  $0.46 \text{ eV}$

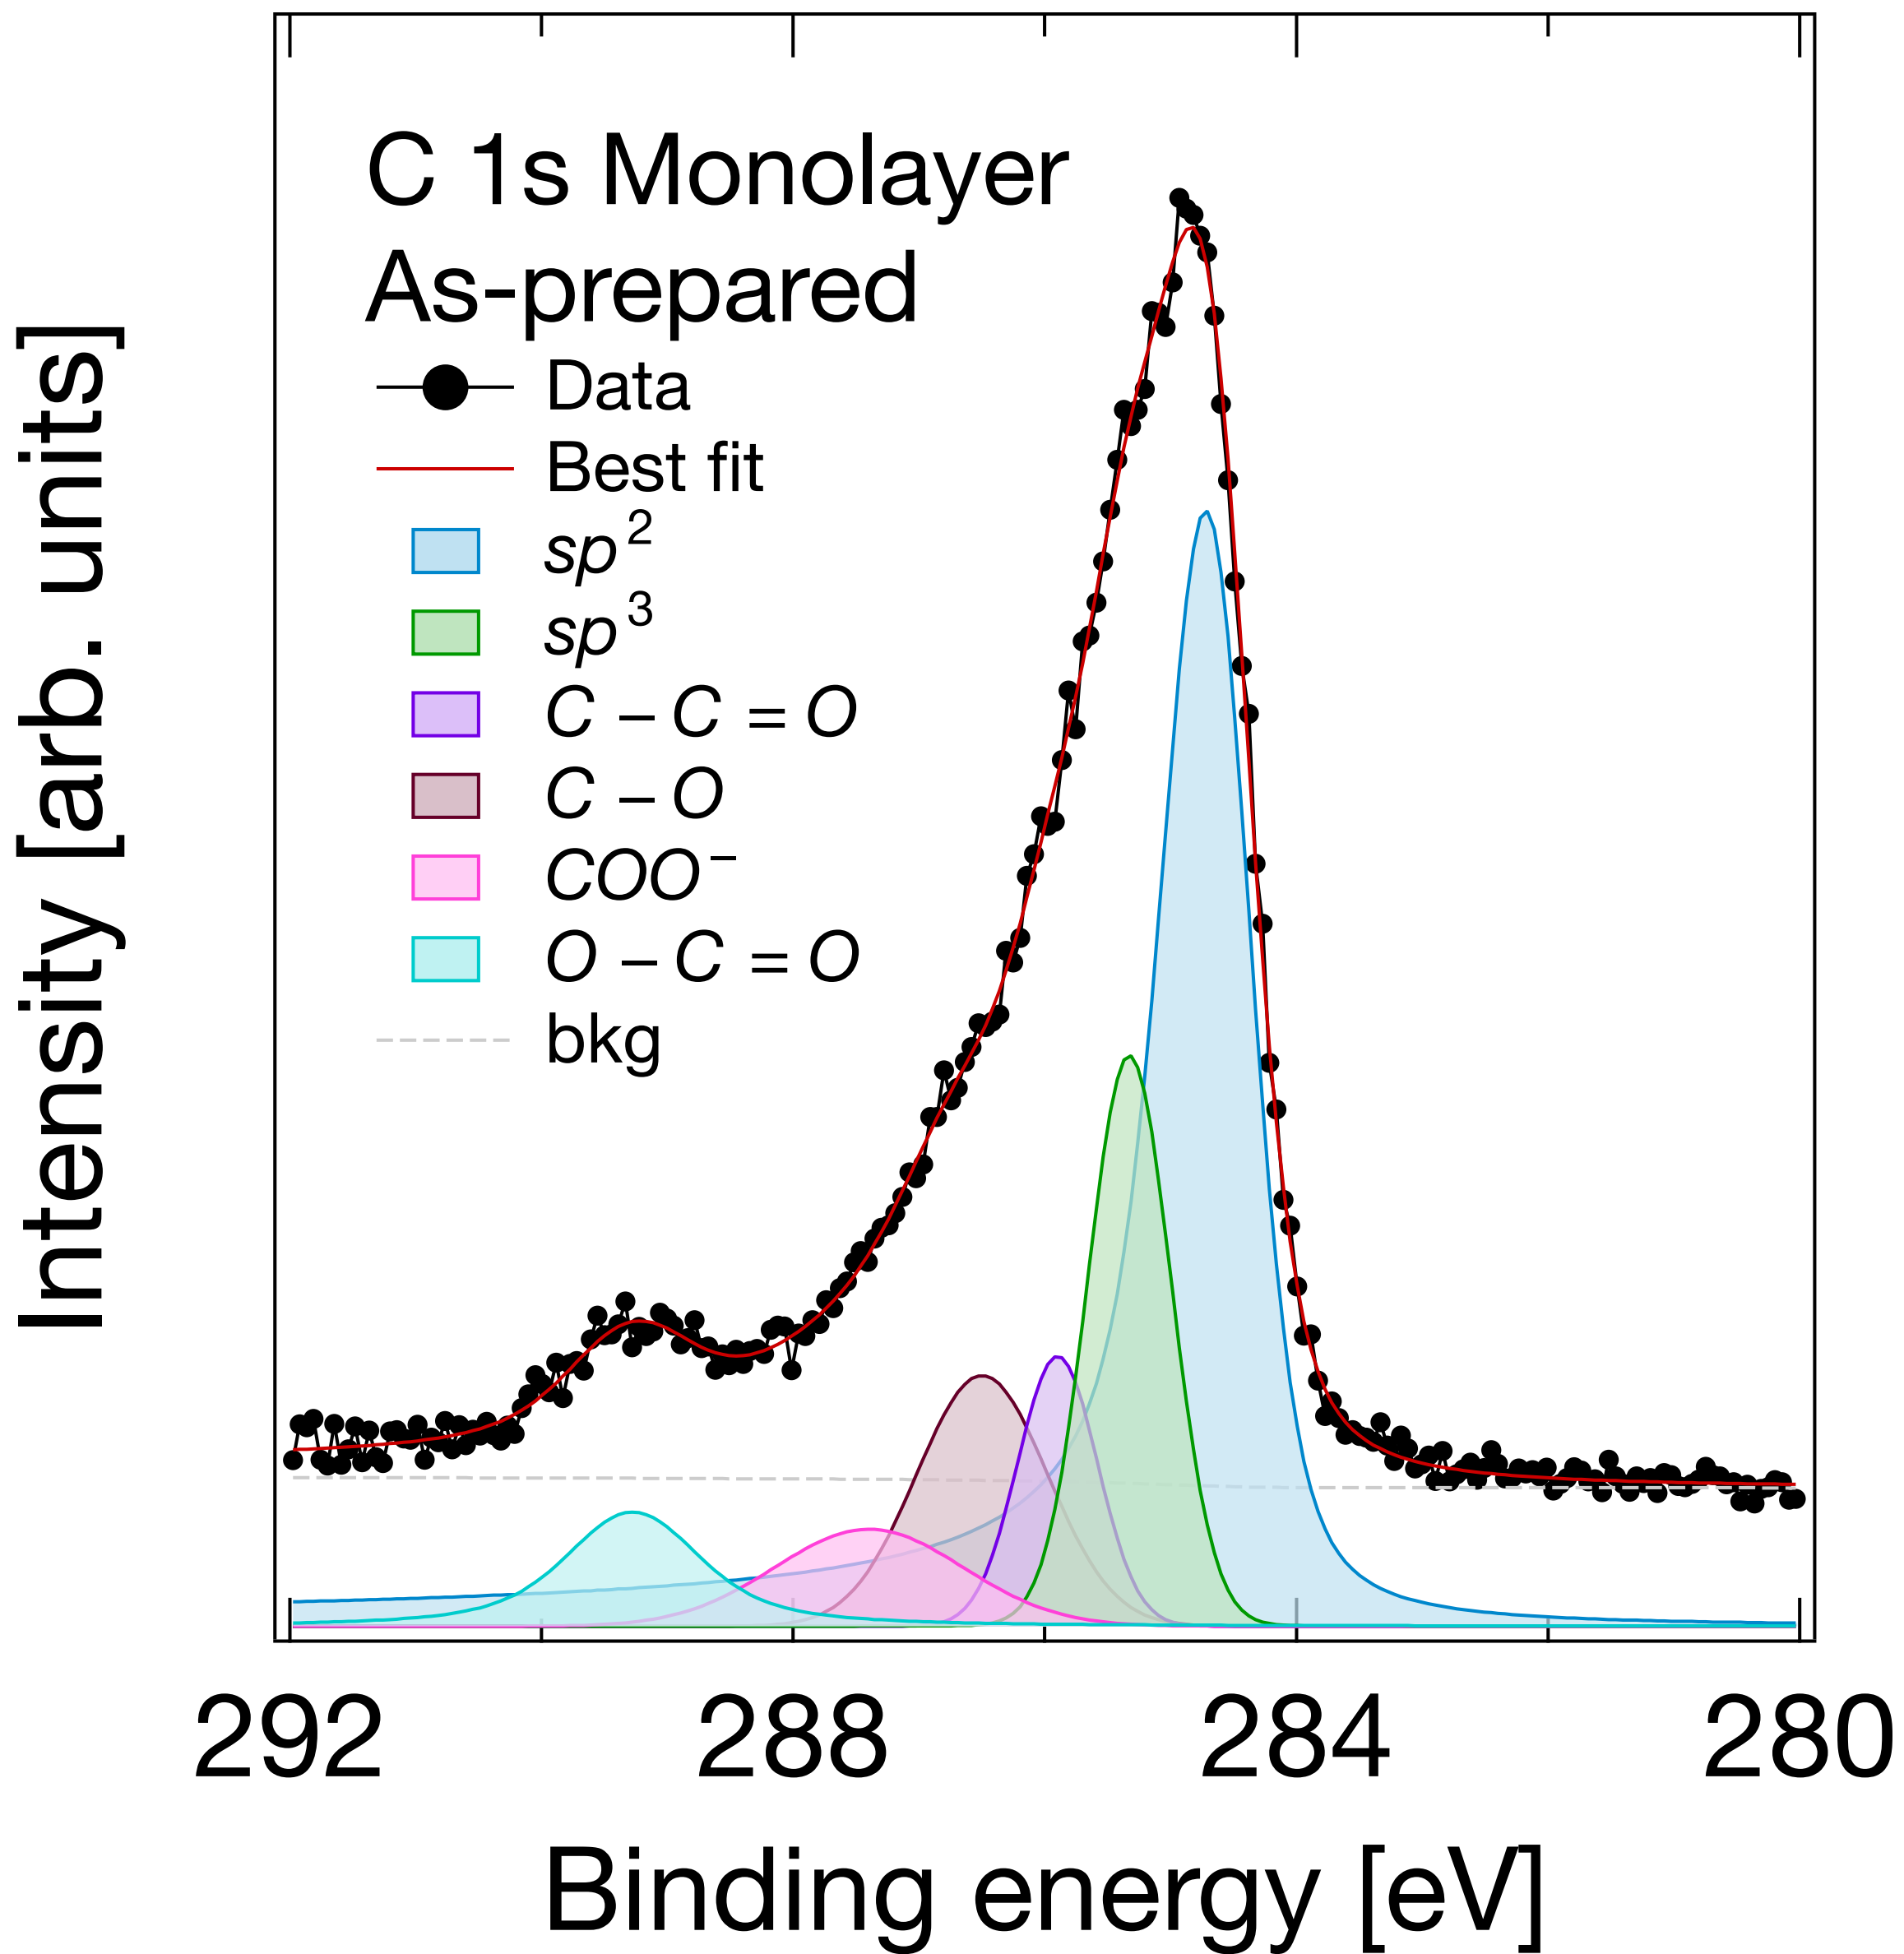

Custom-made monochromatic electron gun:

- ✿ Continuous electron beam
- ✿ Tuneable energy  $30 - 900 \text{ eV}$
- ✿ Resolution =  $45 \text{ meV}$

He discharge lamp:

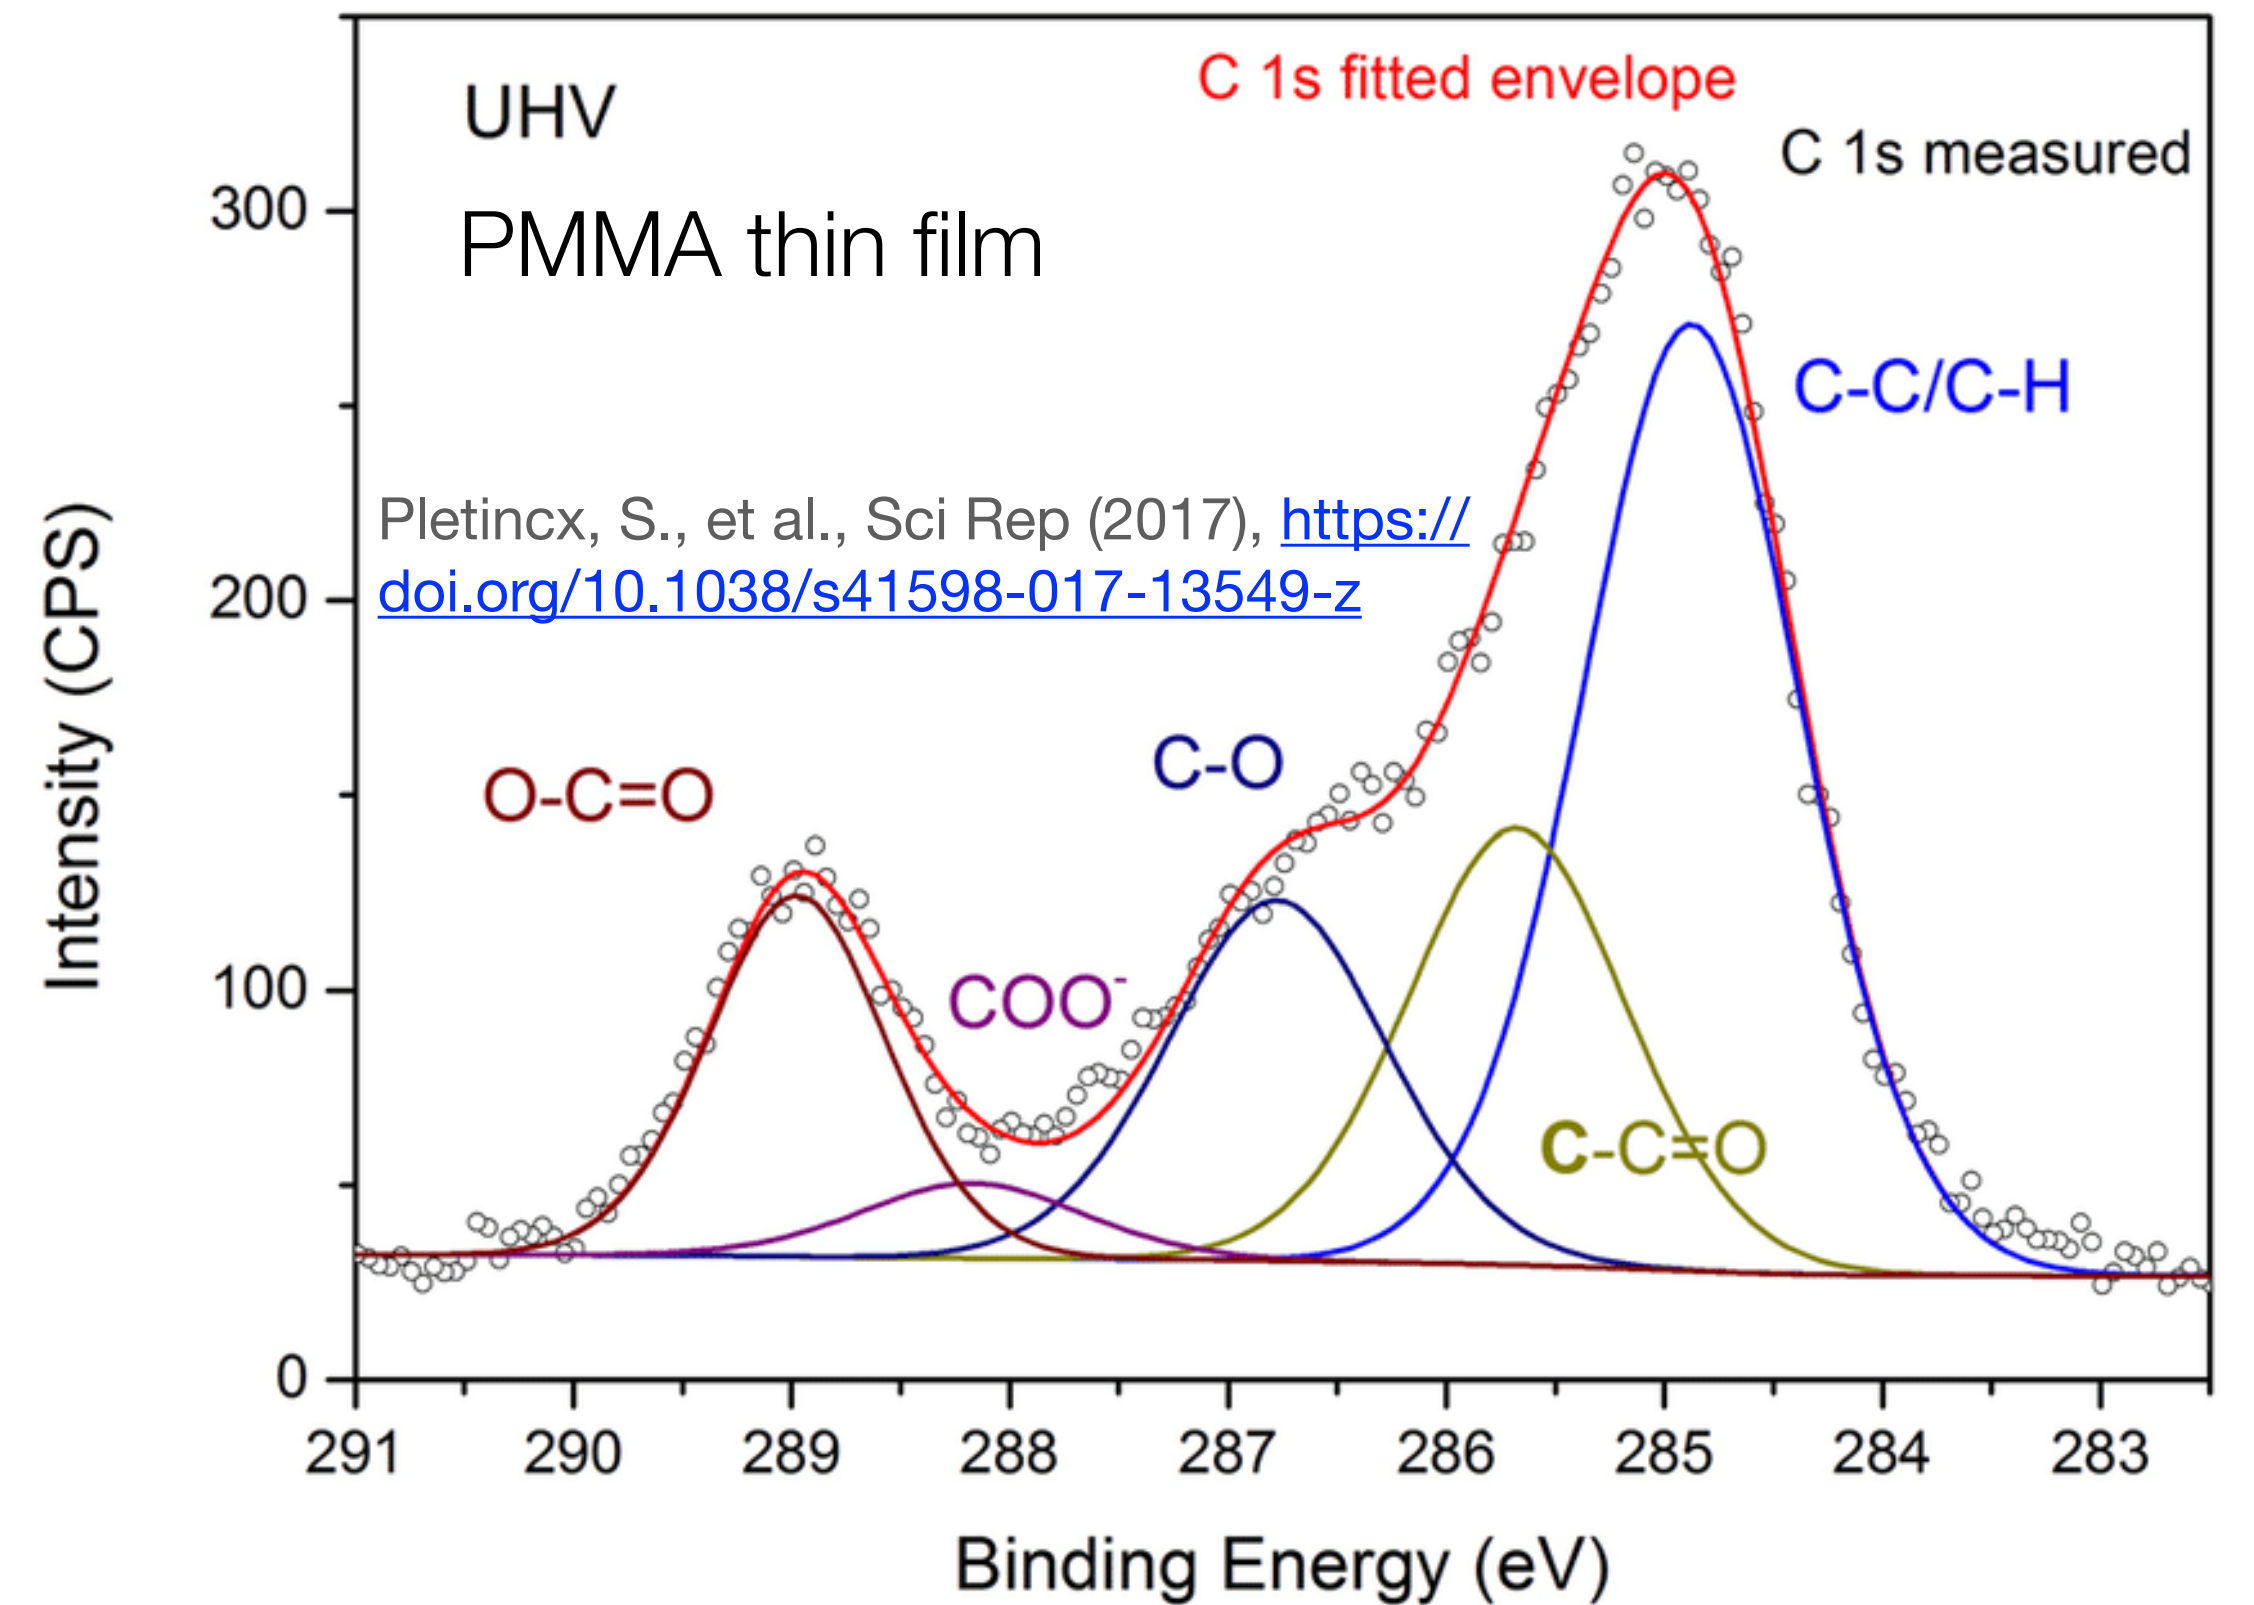

- ✿ Spot diameter  $300 \mu\text{m}$

# XPS reveals high contamination

Monolayer sample measured as prepared:

- ❖ High contamination
- ❖ PMMA residues due to graphene transfer
- ❖ Cleaning treatment is necessary

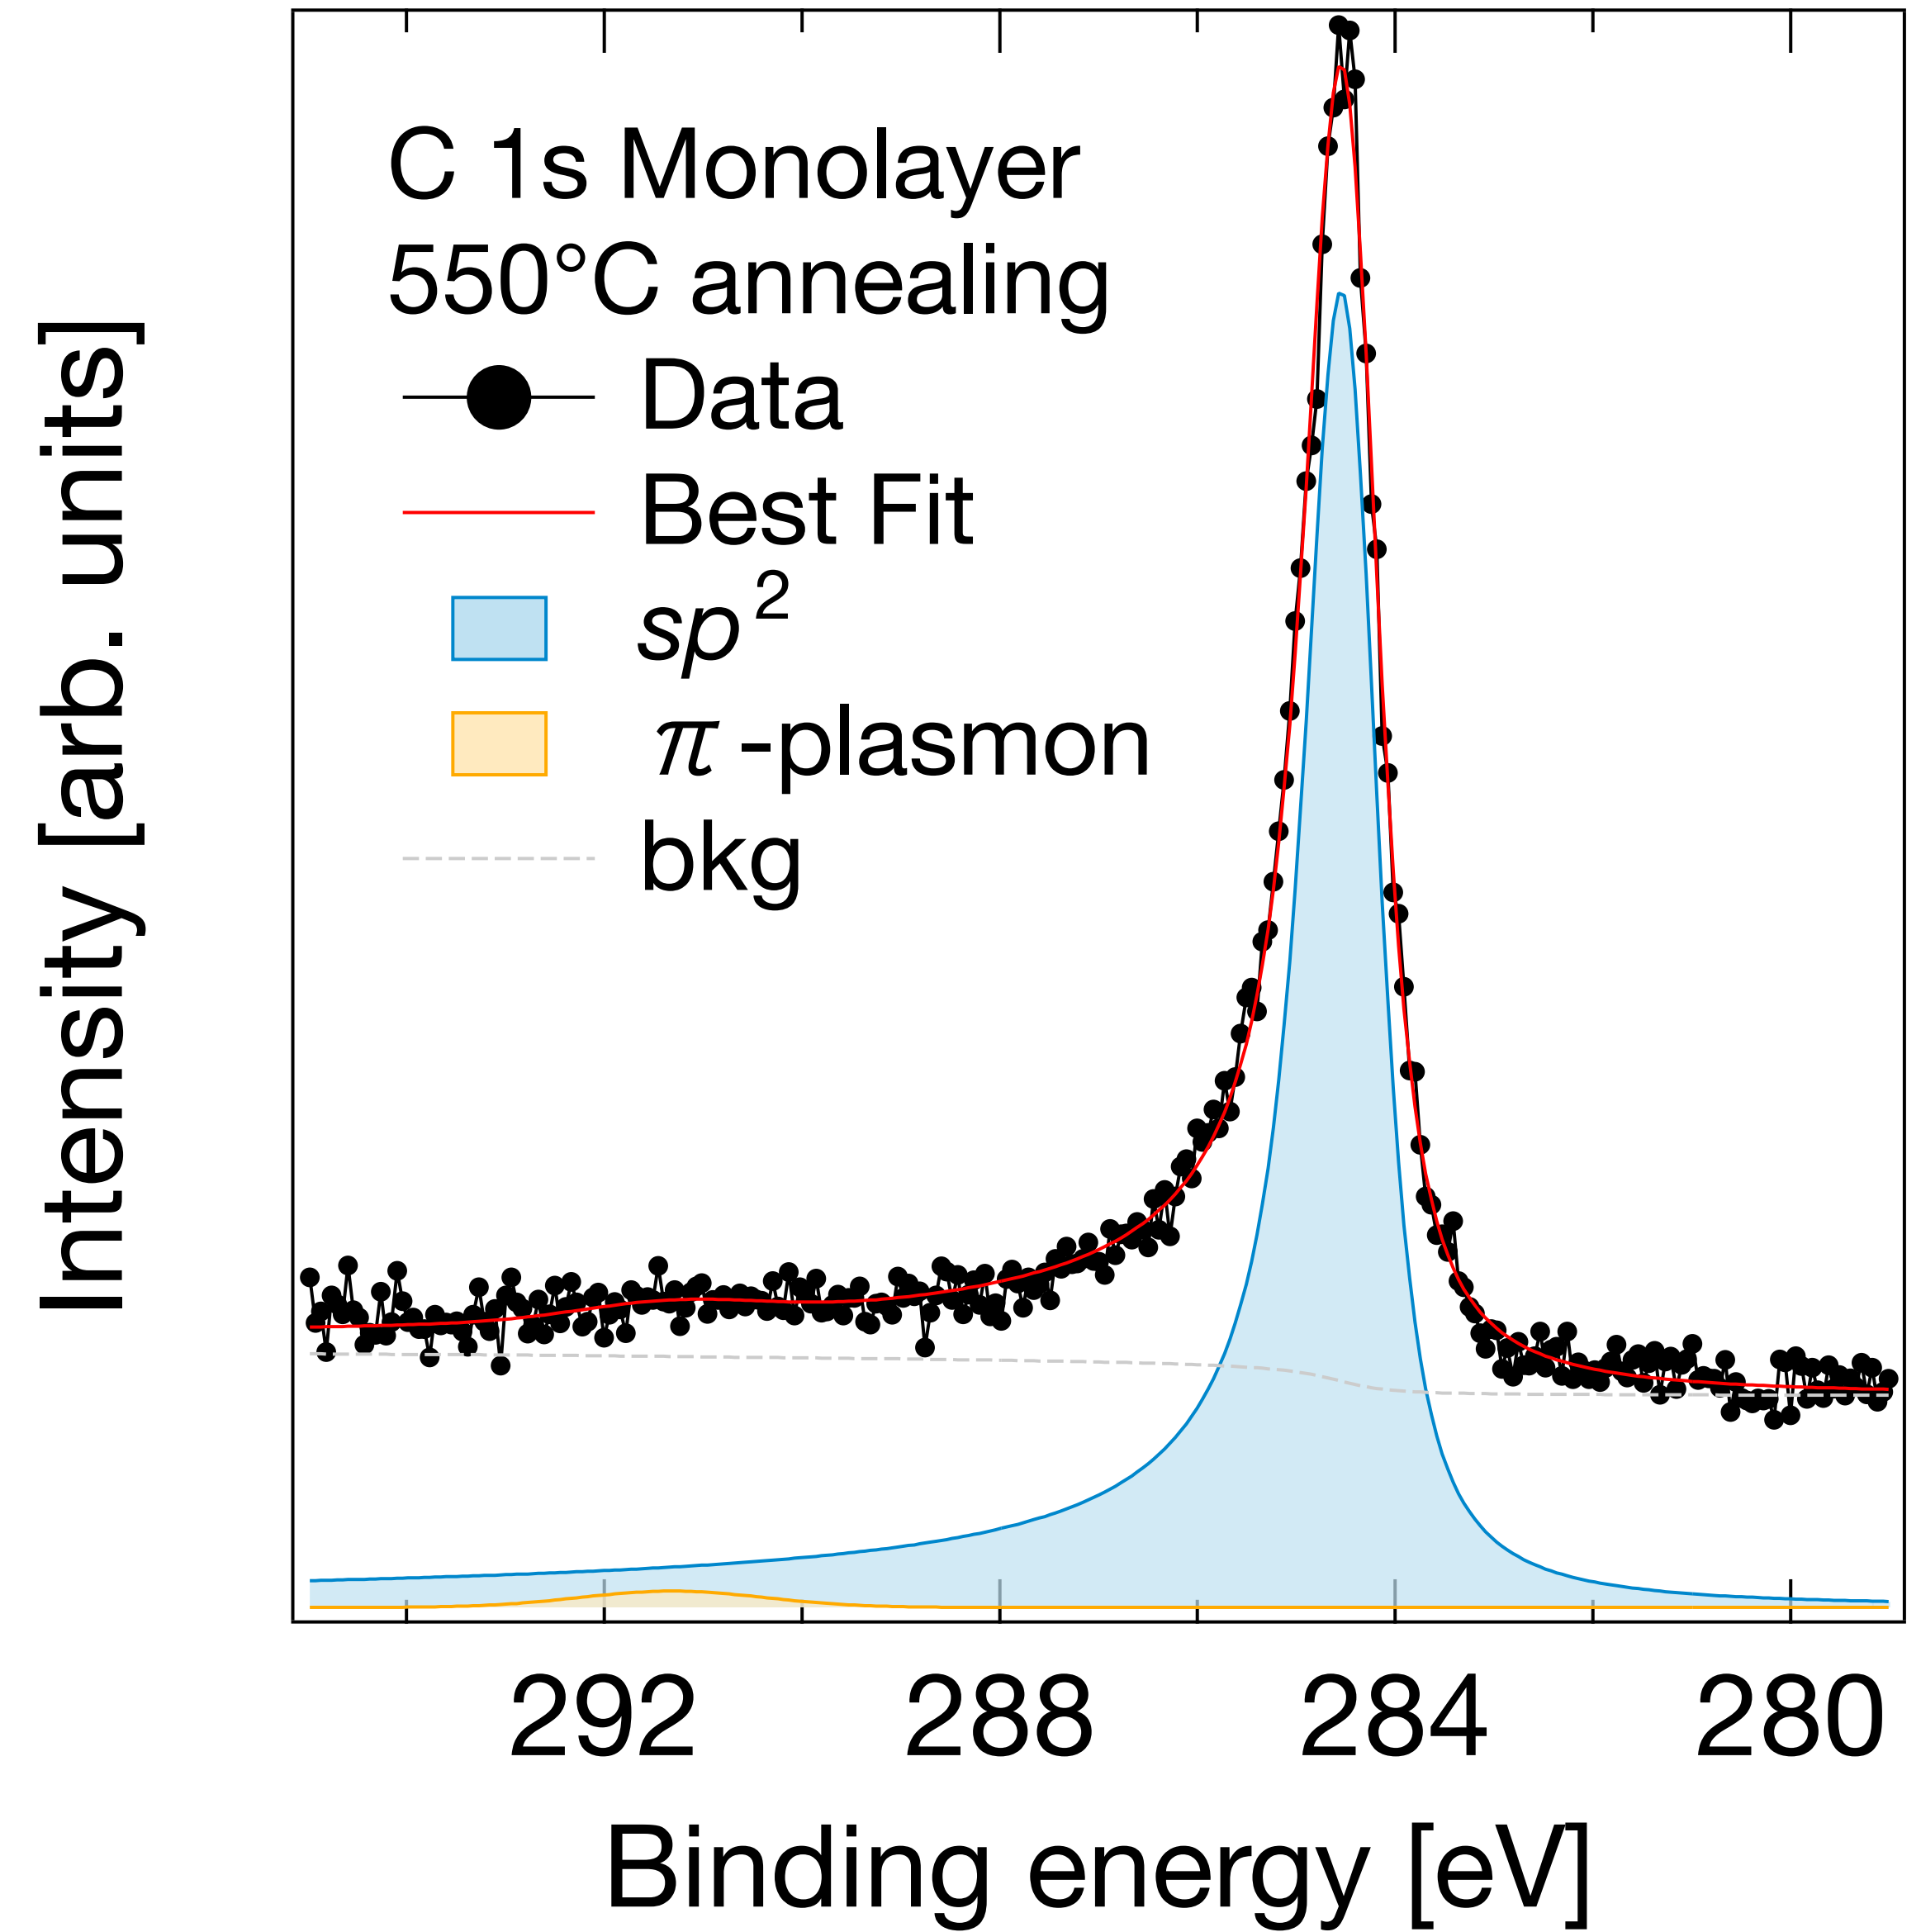

# High temperature annealing: good quality graphene

550°C annealing  
in vacuum

C 1s spectrum reveals a good quality graphene:  
✦ Purely  $sp^2$  line-shape

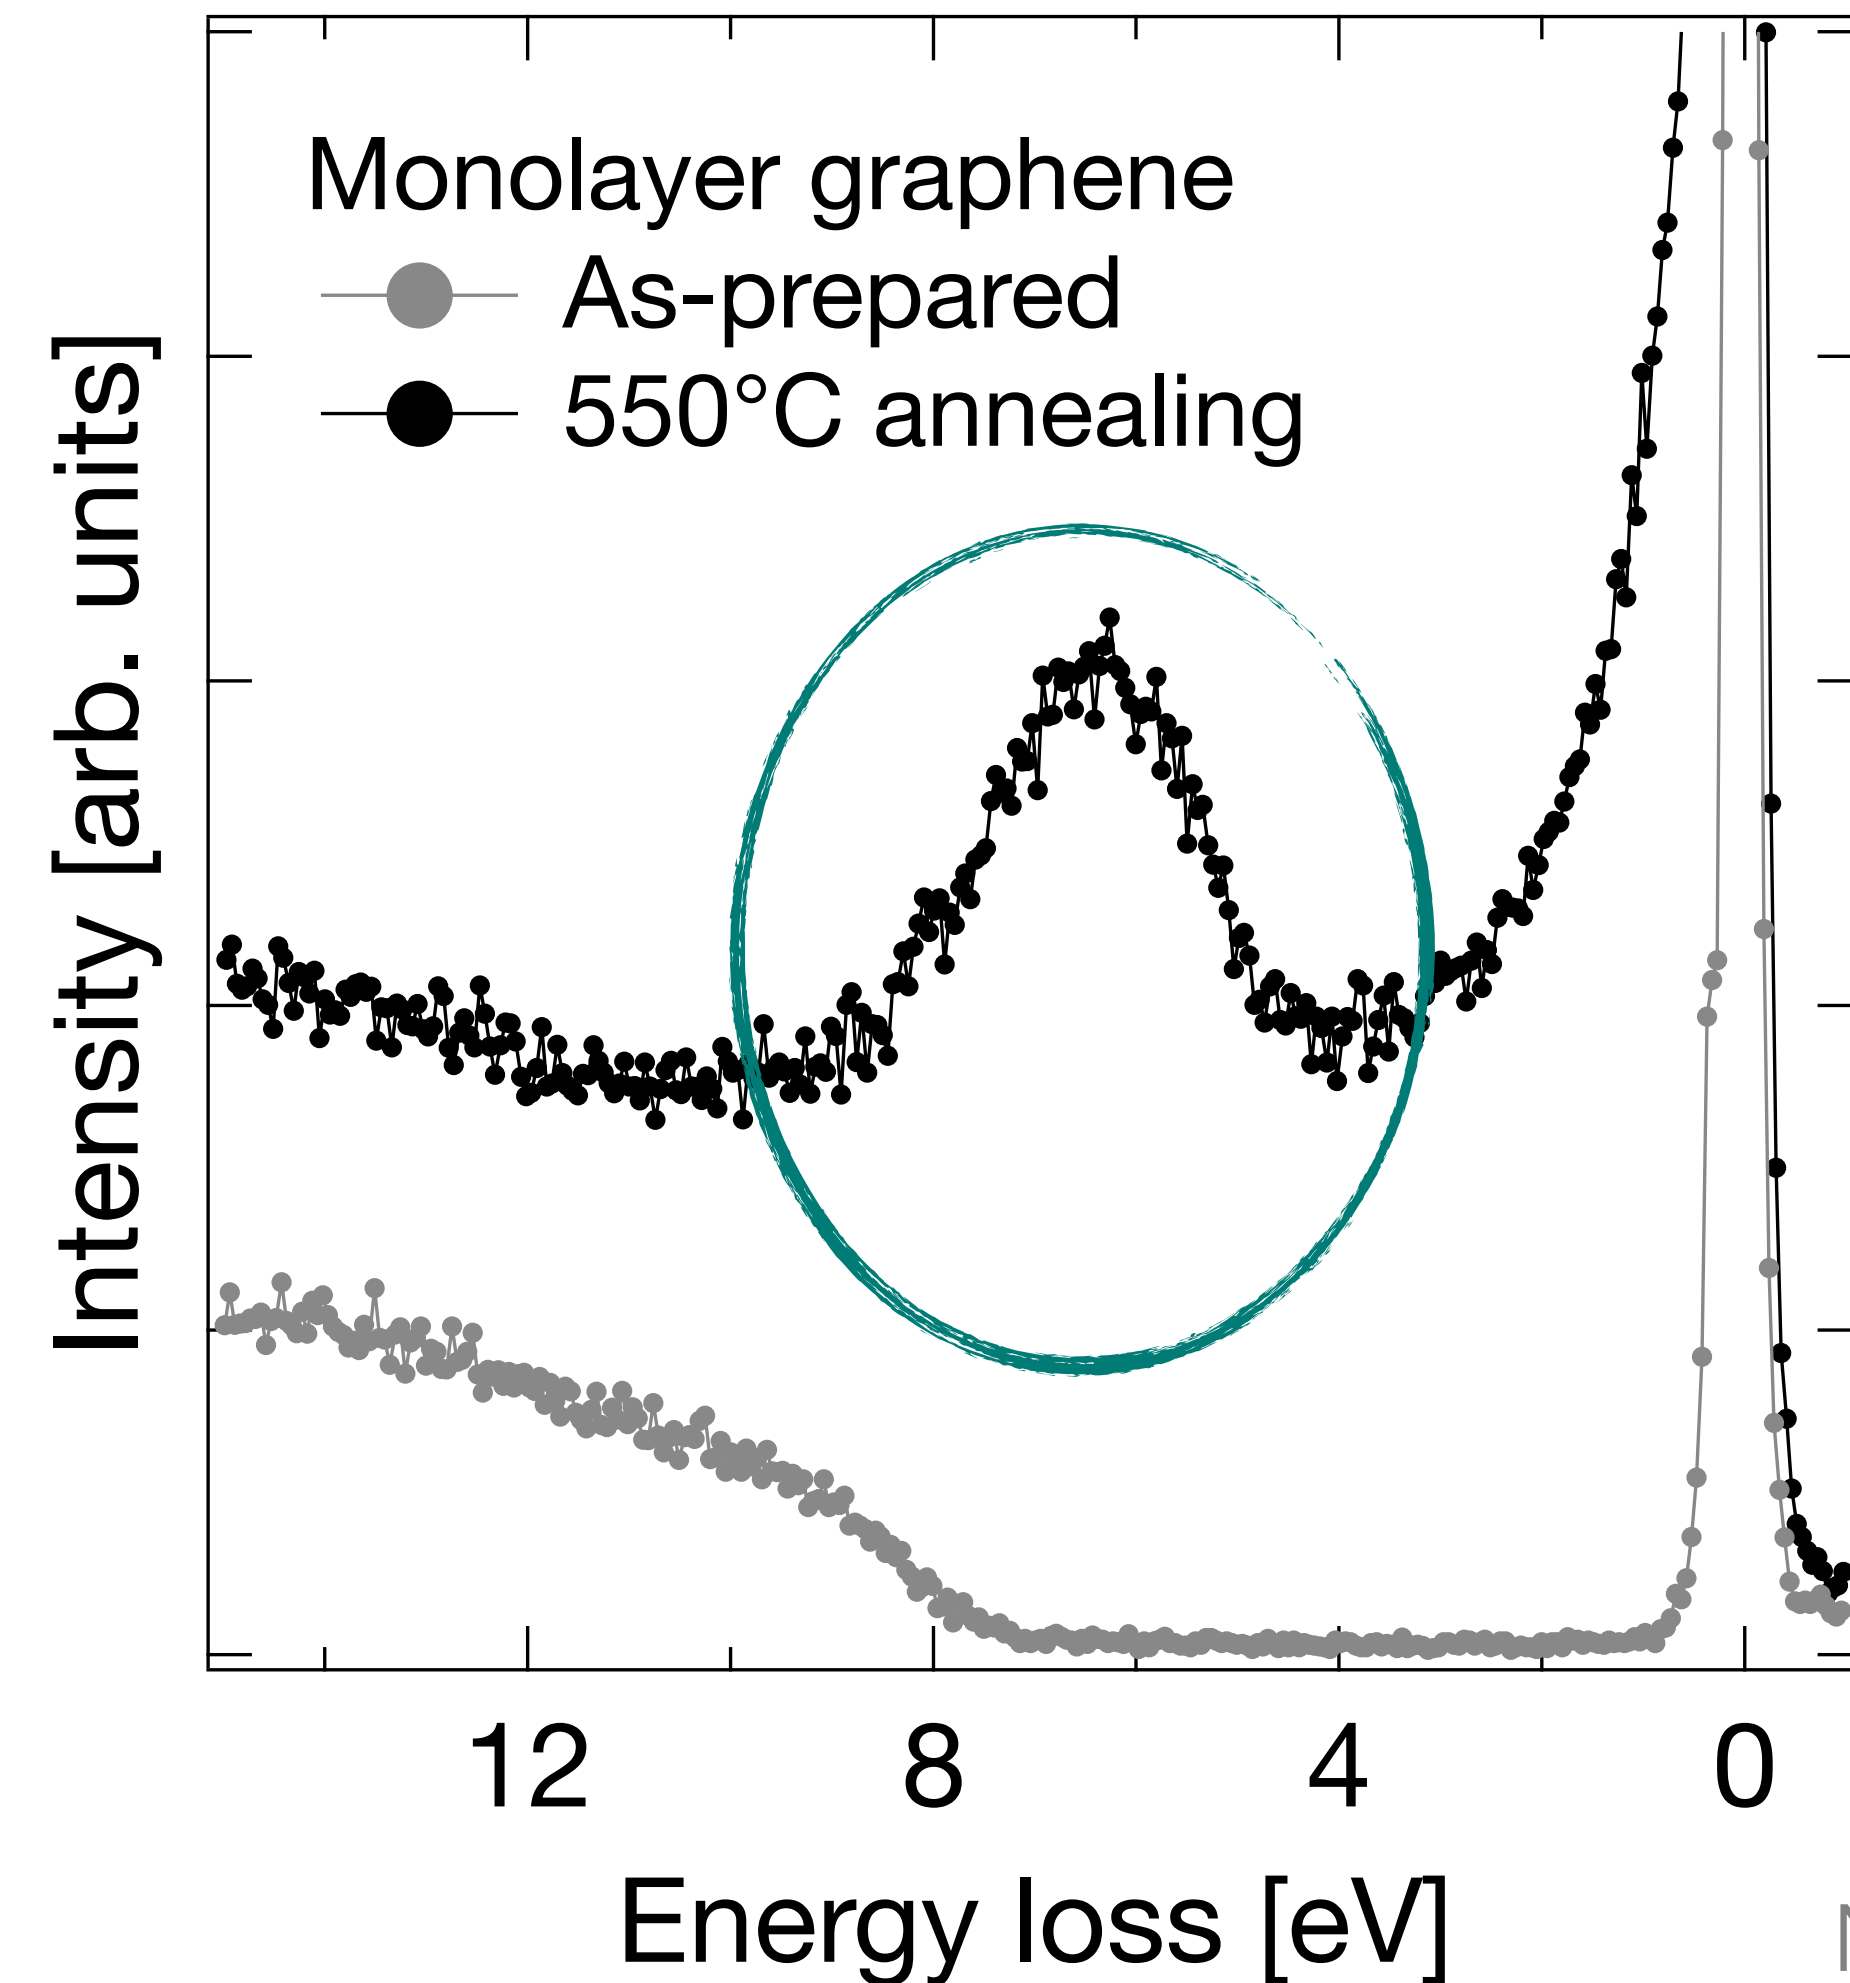

# From insulator to $\pi$ -plasmon excitation

Focus on  $\pi$ -plasmon:

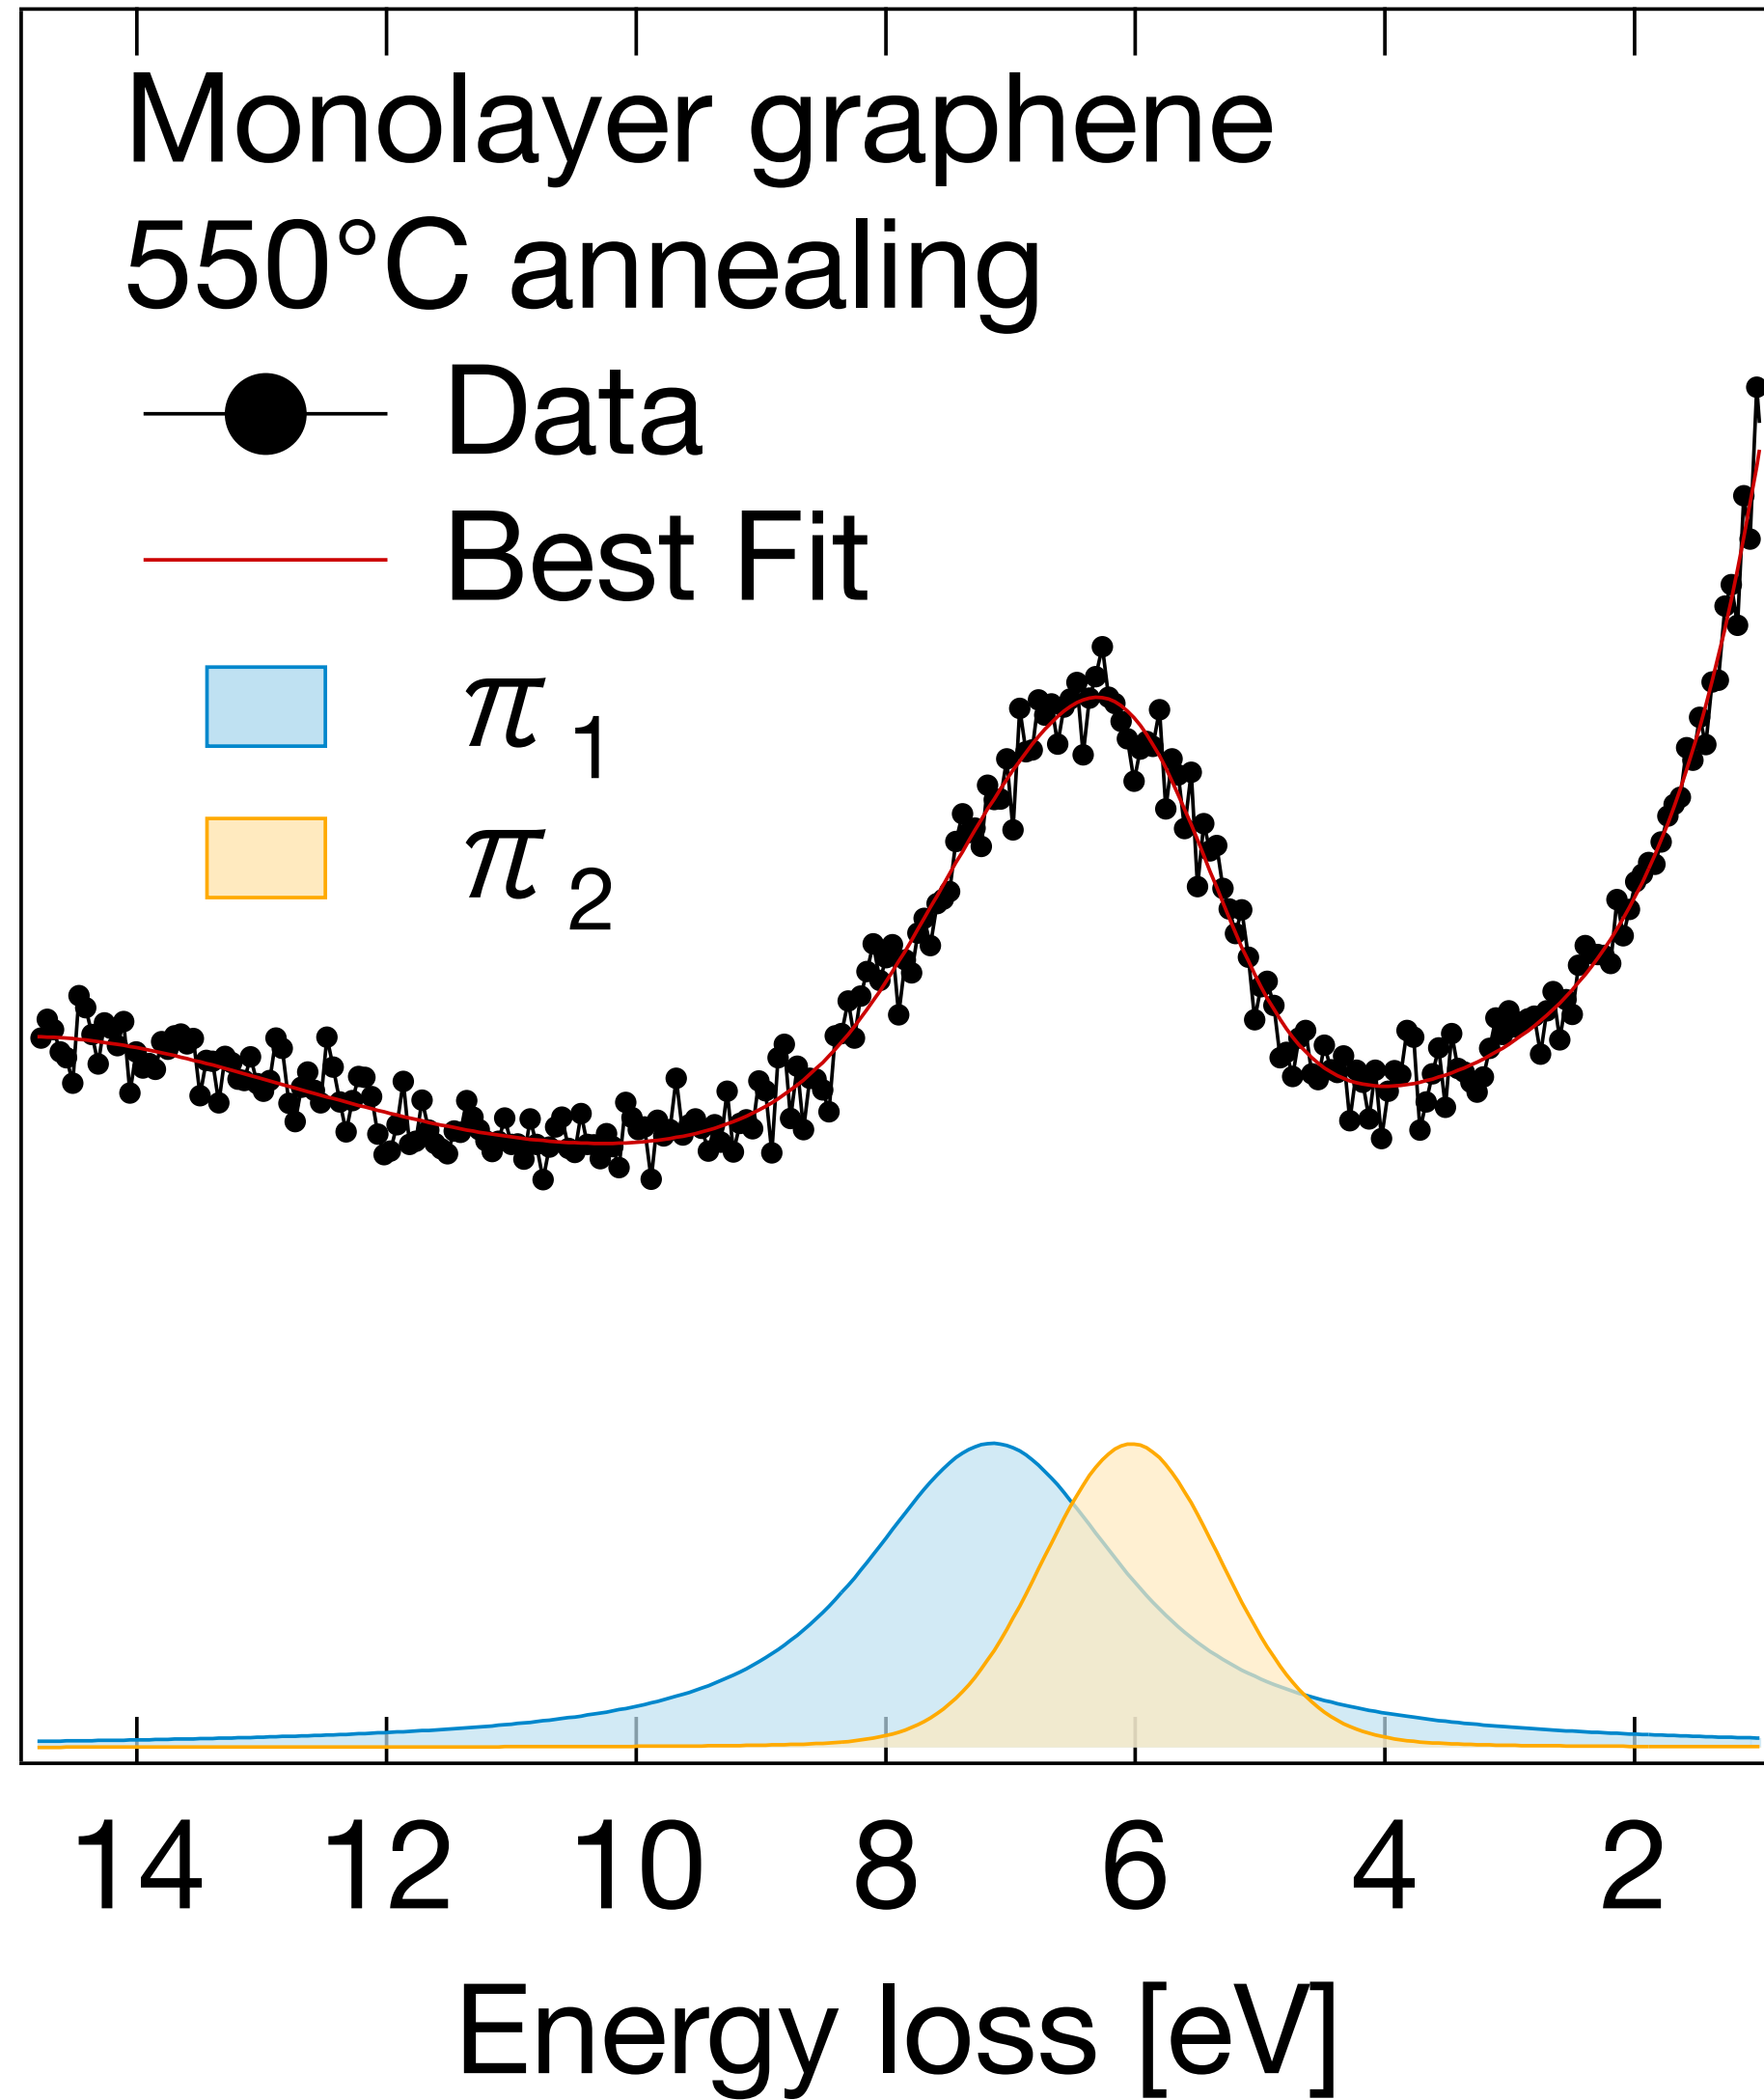

- ❖ Collective excitation associated  $sp^2$  domains ( $> 5$  nm)
- ❖ Footprint of good quality!

EELS layout  
Primary electron energy 90 eV

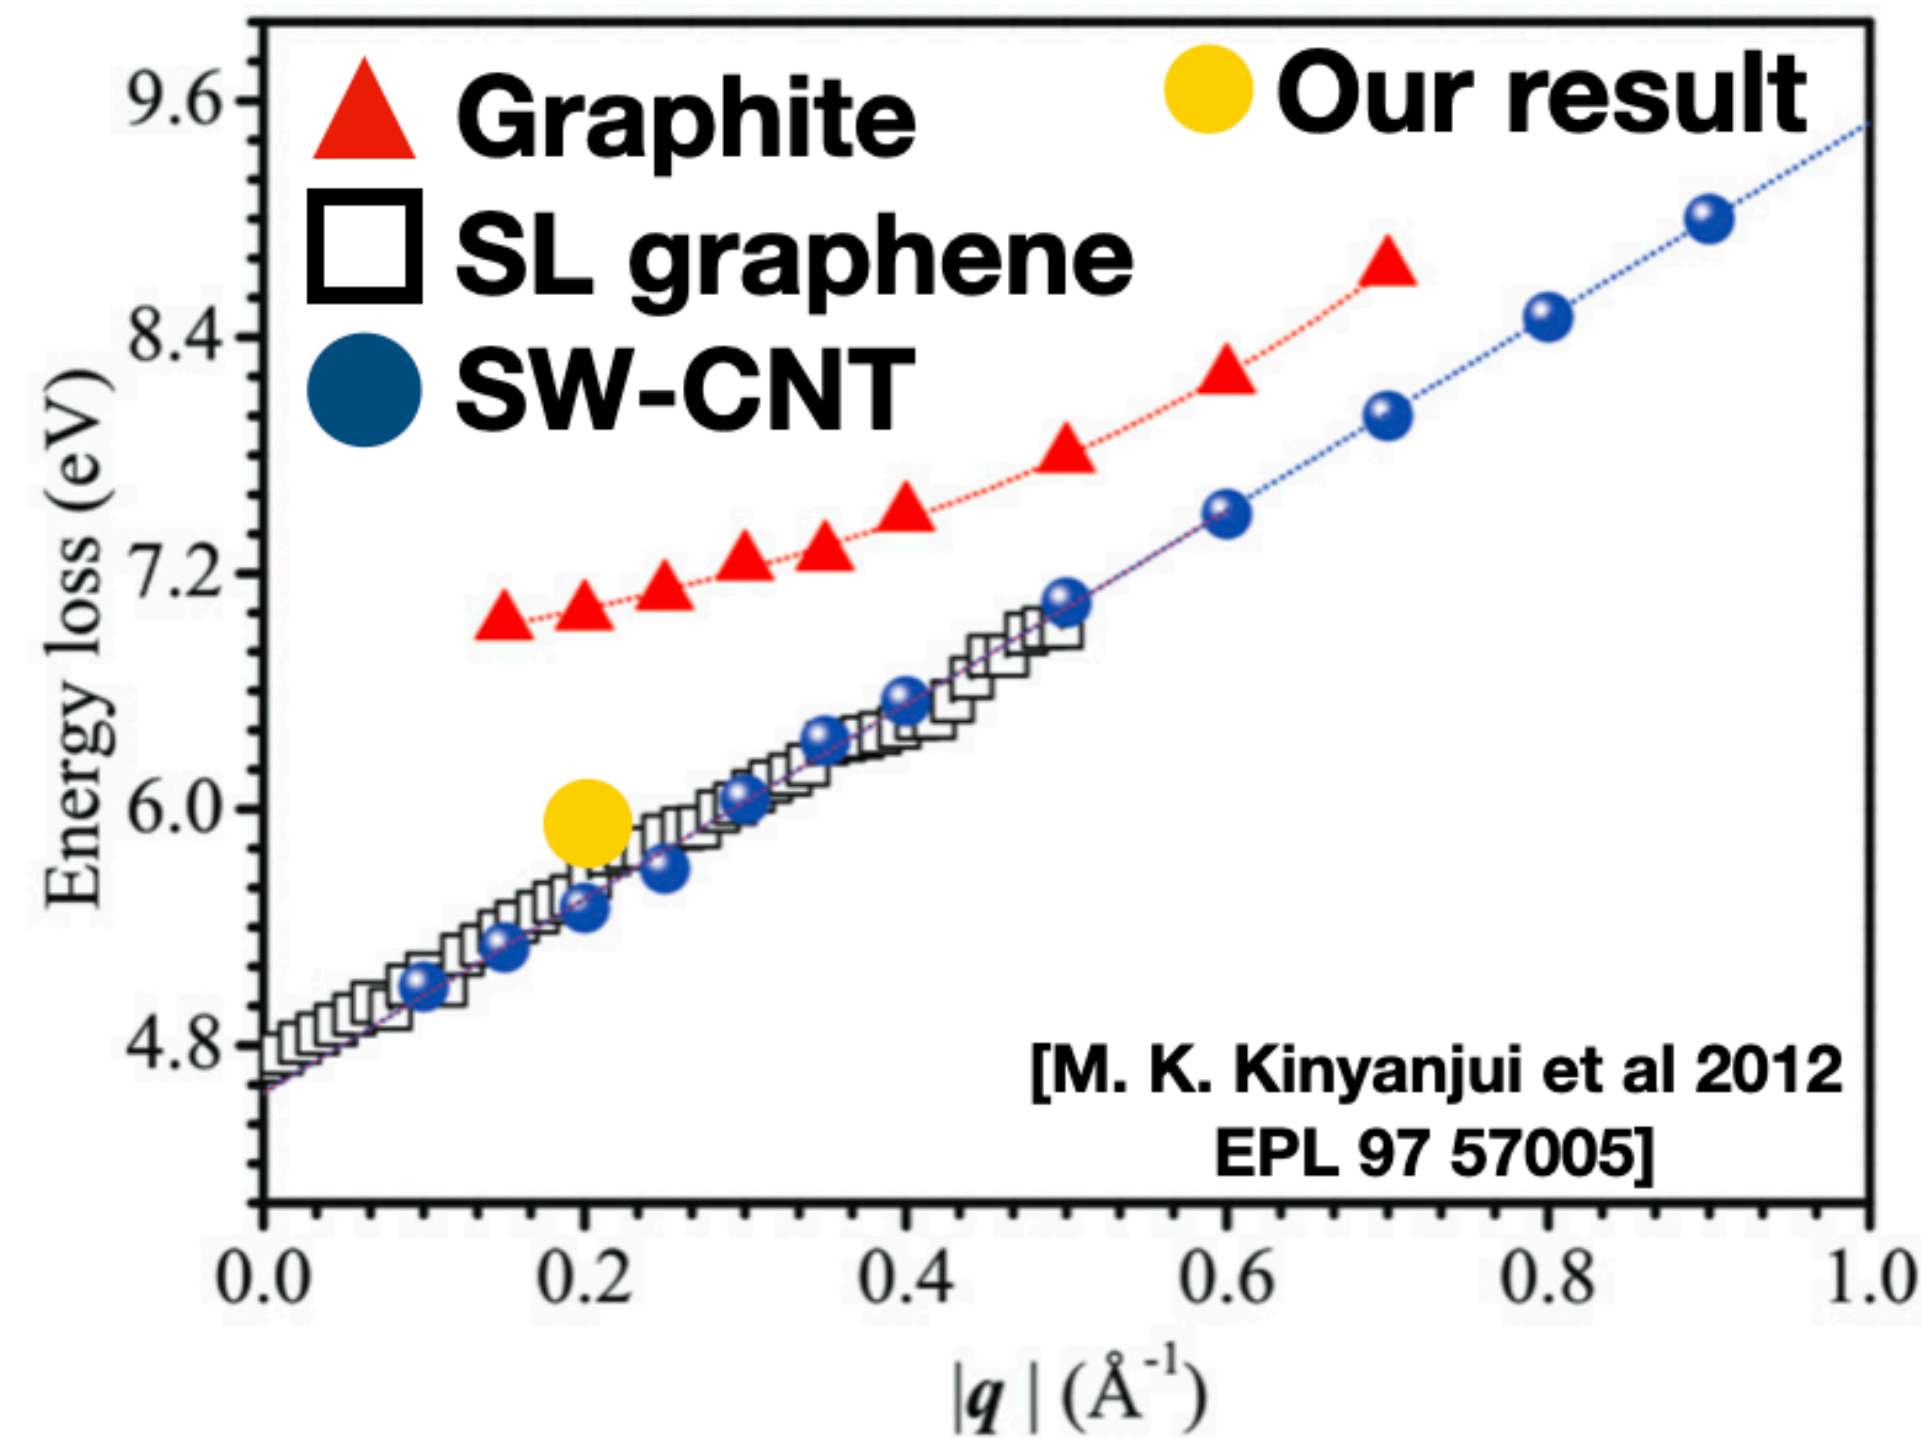

# EELS on monolayer: suspended graphene footprint

Intensity [arb. units]

Monolayer graphene

Component	Energy loss [eV]	Area	FWHM [eV]
$\pi_1$ -plasmon	6.9	143	2.3
$\pi_2$ -plasmon	5.9	87	1.7

# High temperature annealing cleans...but damages

550°C annealing removes PMMA

but damages graphene

Damages probably caused by **strain** due to different **thermal expansion coefficients** of Ni and Graphene

# Transmission measurement: average on several grid holes

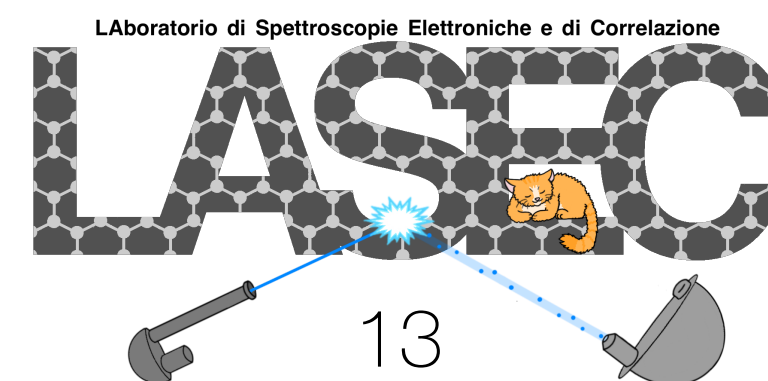

Monochromatic electron gun:

- ✦ Continuous electron beam
- ✦ Tuneable energy 30 - 900 eV
- ✦ Resolution = 45 meV

Dimension outline:

- ✦ Grid effective diameter 2 mm
- ✦ Grid hole width 8 μm
- ✦ Beam size ~ 0.5 mm

# Evaluation of graphene coverage to correct transmission

- ❖ Software generates **histogram** based on pixels **grey level**
- ❖ Area of the **covered** holes, **uncovered** holes and **grid** regions
- ❖ Evaluate **graphene coverage** and **geometrical transmission**

## Grid geometrical transmission

- ❖ Sample A (37 ± 1)%
- ❖ Sample B (44 ± 1)%

## Graphene coverage

- ❖ Sample A (38 ± 1)%
- ❖ Sample B (42 ± 1)%

# Electron current measured with a Faraday cup

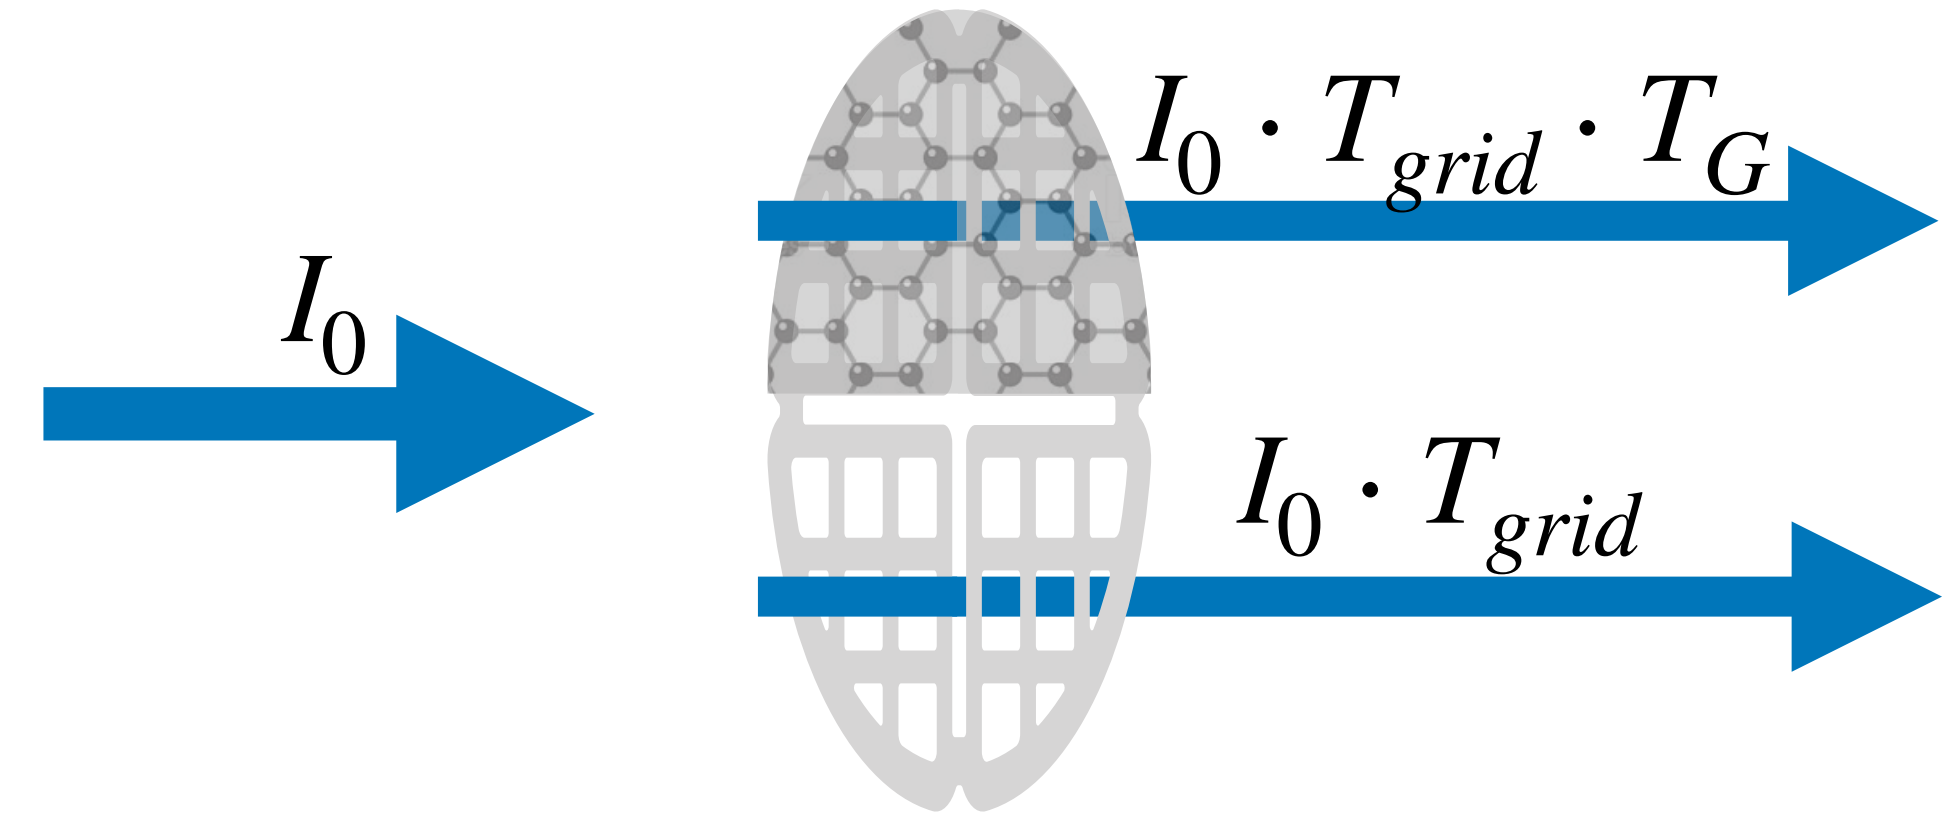

Transmission defined as

$$T_S = \frac{I_S}{I_0}$$

- ❖ For each step, **current** measured as a function of the energy within 30-900 eV
- ❖ Check **stability** with current measurement before and after

# Graphene transmission: coverage correction

$$I_S(E) = a[I_0 T_{grid} T_G(E)] + b[I_0 T_{grid}]$$

$$a + b = 1$$

Coverage!

$I_S$  = measured current

$T_{grid}$  = grid geometrical transmission

$T_G$  = graphene transmission

$a$  = graphene coverage

SEM analysis

SEM analysis

$$T_G = \frac{\frac{I_S}{I_0 T_{grid}} - b}{a}$$

# Let's try to hydrogenate graphene on grid

Atomic hydrogen source:

- ❖ Hot tungsten capillary
- ❖  $H_2$  thermal cracking into H

Graphene on grid hydrogenation:

- ❖ Flat suspended graphene regions
- ❖ Controlled number of layers (possibly 1)
- ❖ 2D material! No “in-depth” hydrogenation issues

Nanoporous graphene hydrogenation

M.G. *et al.*, *Nano Letters* (2022),

<https://doi.org/10.1021/acs.nanolett.2c00162>

# Two graphene on TEM samples from same growth

**PRELIMINARY**

Dose [kL]

$$10 \text{ kL} = 3.6 \cdot 10^{-6} \text{ mbar} \cdot \text{hour}$$

Carbon hybridization  
changing from  $sp^2$  to  $sp^3$

# Different starting point, different saturation point

PRELIMINARY

# The more is $sp^3$ , the higher will be H-uptake

PRELIMINARY

Sample A result:

- Start with ~13%  $sp^3$
- 59%  $sp^3$  saturation after 320 kL dose

Sample B result:

- Start with ~42%  $sp^3$
- 100%  $sp^3$  saturation after 260 kL dose

# ~6.2 eV band gap measured with EELS

PRELIMINARY

Hydrogenated graphene:

- ❖  $sp^2$  to  $sp^3$  distortion
- ❖ Band gap opening
- ❖ Electronic transition onset  $\propto (E - E_g)^{1/2}$  for direct gap semiconductors
- ❖ EELS measurement <sup>2</sup> and fit with a straight line
- ❖ With this analysis  $E_g \sim 6.2$  eV for both samples

HANDLE WITH CARE:

- ❖ Background
- ❖ Excitons

# Valence band to understand CH bonding

PRELIMINARY

How many sides?

- ❖ C 1s not an unambiguous marker
- ❖ UPS: valence band features and bands dispersion

Betti, M.G. *et al.*, *Nano Letters* (2022), <https://doi.org/10.1021/acs.nanolett.2c00162>

# Result compatible with 1 side hydrogenation

PRELIMINARY

He discharge lamp:

✿ Spot diameter  $300 \mu\text{m}$

$$k_{||} = \sqrt{\frac{2m}{\hbar^2} E_k} \sin \theta$$

✿ VBM =  $E_F - E_g/2$ , with  $E_g = 6.2 \text{ eV}$

✿ Clue of 1side hydrogenation

# To Conclude

---

## Spectroscopy on graphene

550 °C annealing breaks graphene  
C 1s and  $\pi$ -plasmon: evidence of purely  $sp^2$  suspended graphene

Non-damaging cleaning

## Transmission through graphene

Transmission of electrons measured in an extended energy range (30 - 900 eV)

Extend energy range up to 18 keV

## Hydrogenation of graphene

Monolayer graphene: saturation depends on initial  $sp^2/sp^3$  ratio

Deeper understanding (H-uptake, band gap, CH bonding)

# 400 °C Is The Critical Temperature

Which is the **critical temperature**?

- ❖ Test sample (a *bad* one)
- ❖ Steps **increasing** annealing temperature
- ❖ **SEM** at each step
- ❖ Nothing happens **up to 400 °C**

# Evaluate Coverage and Correct Transmission Measurements

- ❖ Map the sample with fixed SEM parameters
- ❖ Evaluate actual coverage and geometrical transmission
- ❖ Correct the transmission

# Careful Comparison: Experiments May Not Be Compatible

# Which Is the Nature of Transmitted Electrons?

---

# Scattered Electrons Contribution in the Order of 10%

Contribution of scattered electrons:

- ❖ Measure current polarising (or not) internal cup
- ❖ Current variation due to scattered electrons refocusing
- ❖ Take into account accepted solid angle
- ❖ Scattered electrons contribution of 11% for  $E_k = 30 \text{ eV}$

# Transmission Outlook: Total Cross-Section Measurement

For the **total cross-section** evaluation:

- ❖  $n_G$  = carbon atom surface density in graphene
- ❖  $\sigma_{tot}$  = total cross-section
- ❖ All and only the **non-scattered** electrons  $I(E)$  should be measured

$$I(E) = I_0 e^{-n_G \sigma_{tot}(E)}$$

$$I(E) = I_0 e^{-\frac{d}{\lambda_{EAL}}}$$

Which thickness  $d$  must be used for ML graphene?

- ❖ Interplanar distance in graphite: 3.35 Å
- ❖ Twice the radius of covalent bond: 2.48 Å

The attenuation length obtained in this way is affected by the arbitrariness of the thickness choice

$$I(E) = I_0 e^{-n_G \sigma_{tot}(E)}$$

Where:

- ❖  $n_G$  is the surface density of the carbon atom in graphene
- ❖  $\sigma_{tot}$  is the total cross section

A correct measurement of the non scattered electrons  $I(E)$  allows to obtain the total cross section

# High Temperature Annealing: Good Quality Graphene

550°C annealing  
in vacuum

Both C 1s spectra reveal a good quality graphene:

- ✿ Main contribution due to  $sp^2$
- ✿ Slight amount ( $\sim 20\%$ ) of  $sp^3$  in the trilayer
- ✿ Lorentzian width of  $sp^2$  higher in the monolayer

Monolayer graphene					
Component	Binding energy [eV]	Area	GW [eV]	LW [eV]	Asymmetry
$sp^2$	284.45	204	0.45	0.58	0.1
$\pi$ -plasmon	290.9	4	1.9	0	0

Trilayer graphene					
Component	Binding energy [eV]	Area	GW [eV]	LW [eV]	Asymmetry
$sp^2$	284.47	311	0.46	0.24	0.1
$sp^3$	285.1	84	0.5	1.5	0
$\pi$ -plasmon	291.0	10	2.2	0	0

# High Temperature Annealing Cleans...

Full covered, few spots no graphene

but PMMA contamination

# High Temperature Annealing Cleans...

Full covered, few spots no graphene  
but PMMA contamination

550°C annealing

Effective for **cleaning**, high quality  
graphene with **sp<sup>2</sup>** contribution only

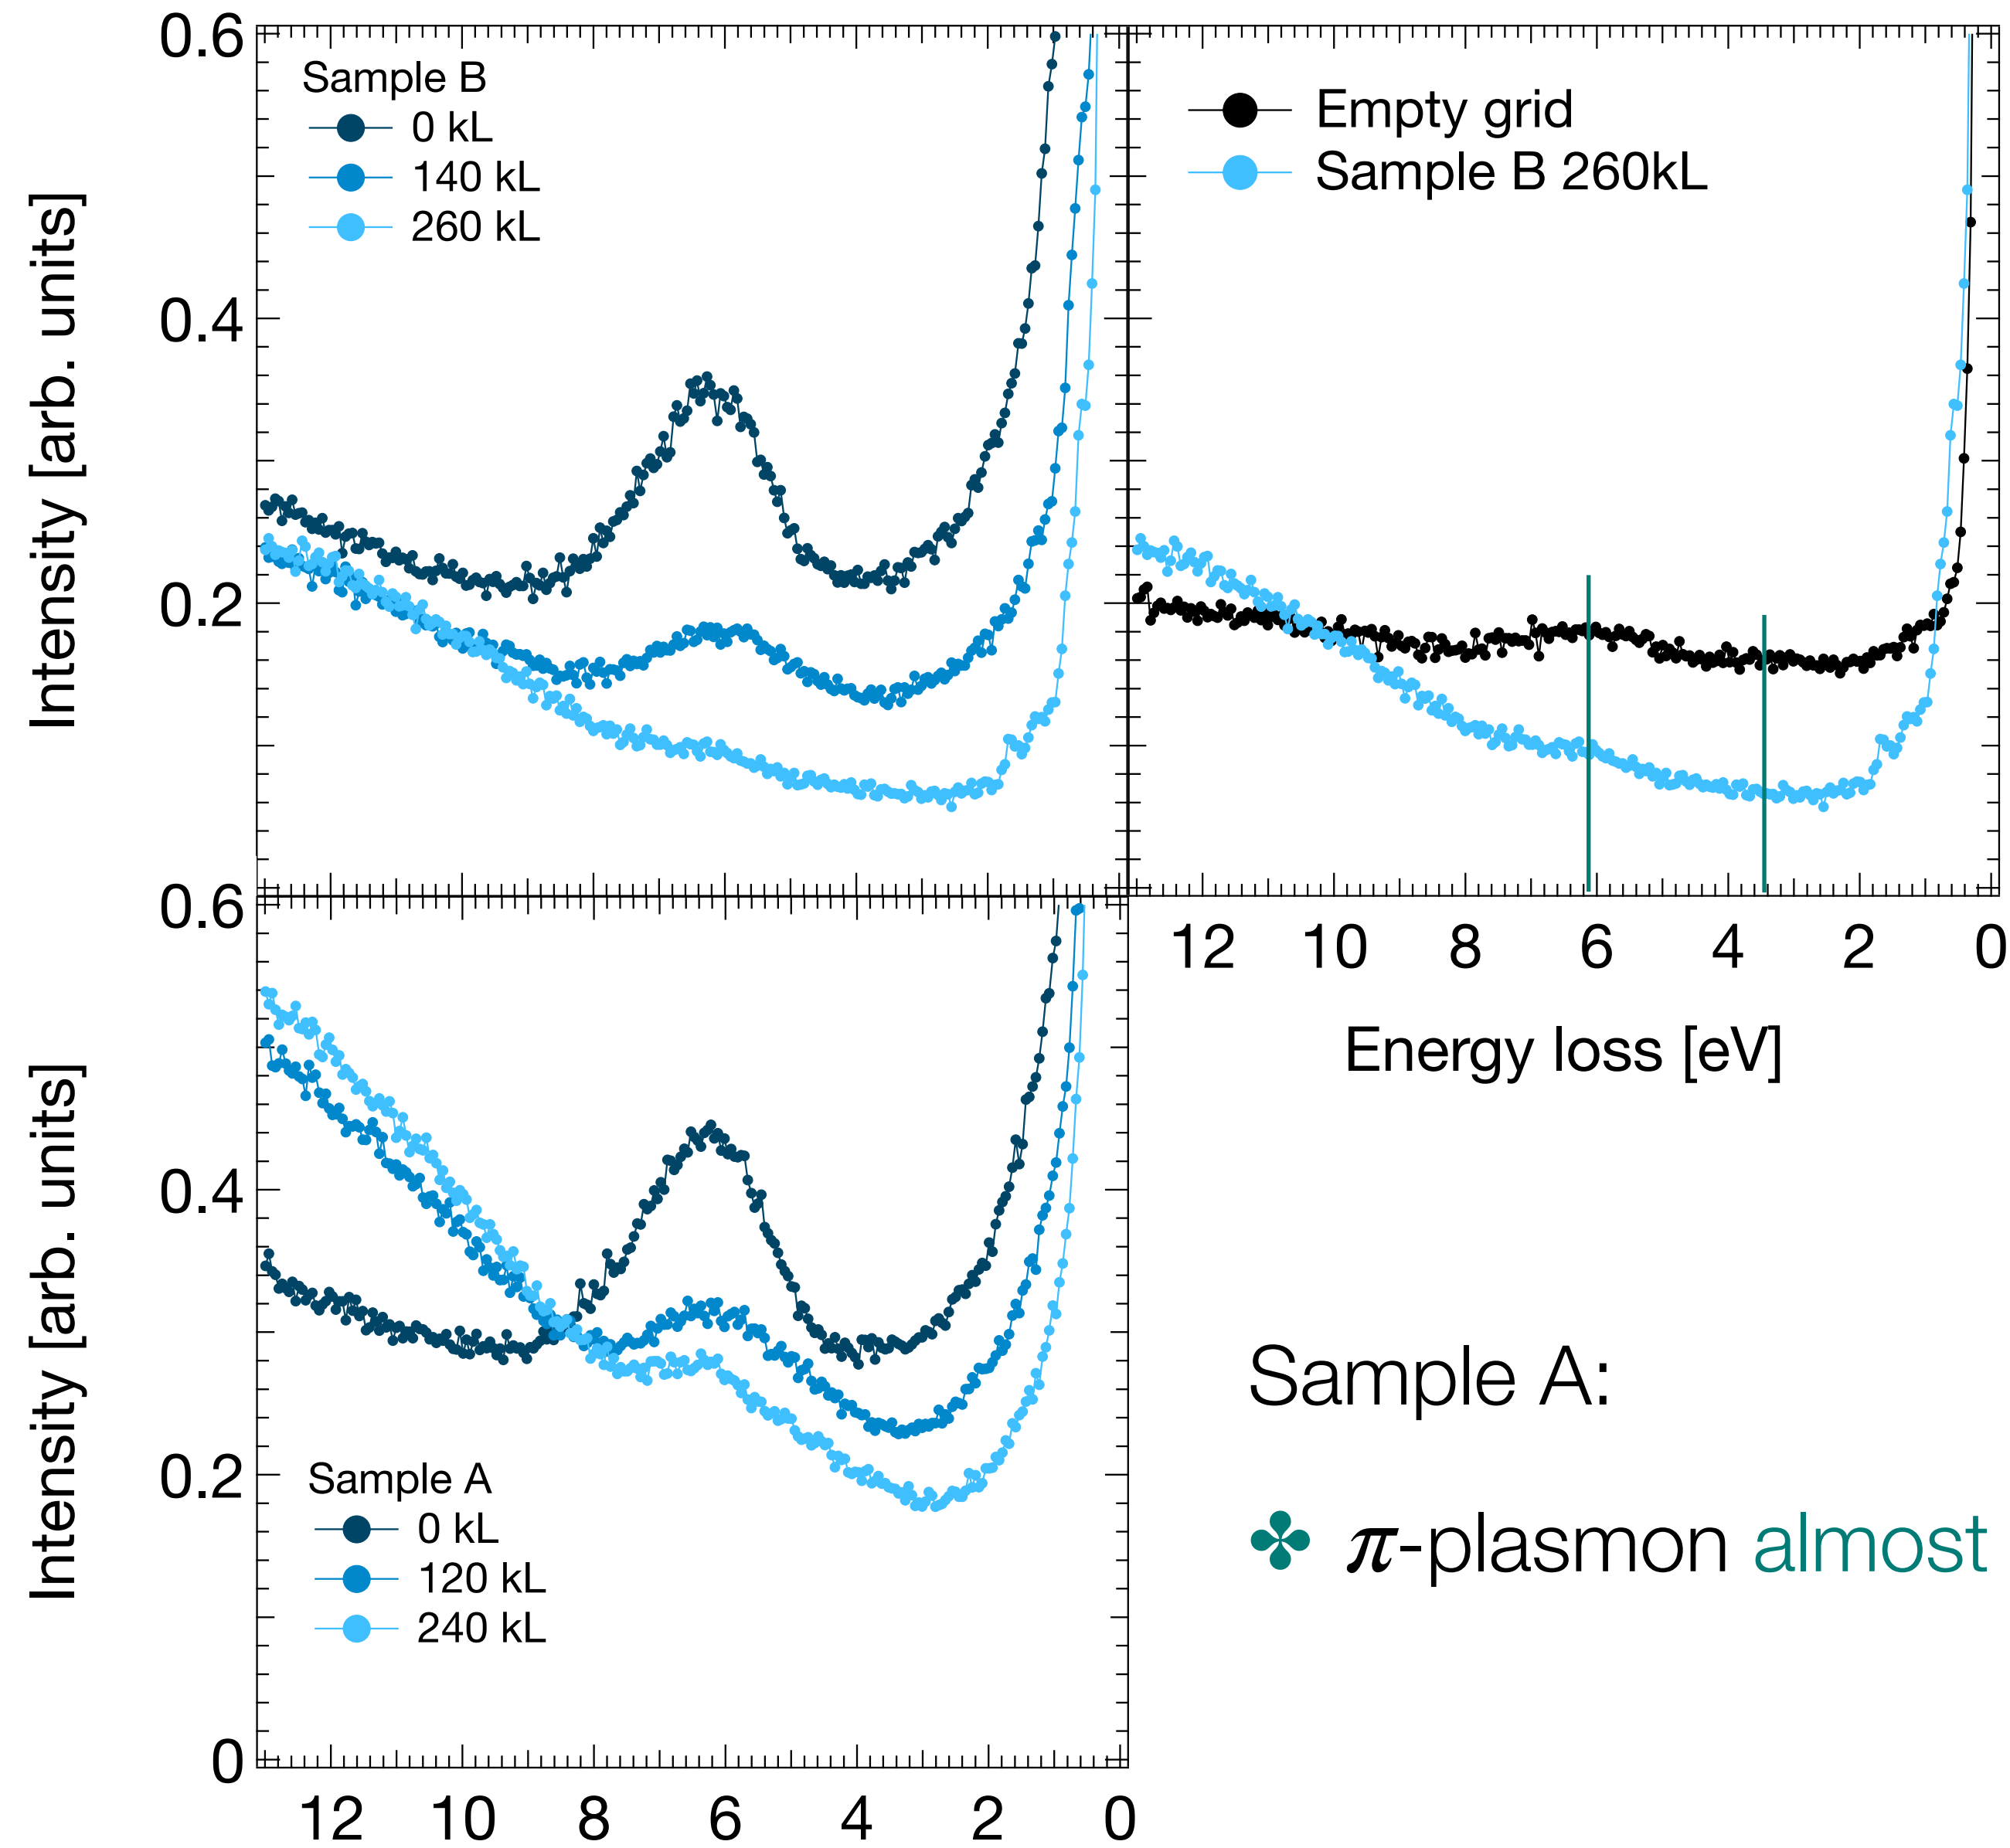

# Total C 1s Area

# Quenching of $\pi$ -Plasmon: Ni Losses Is What's Left

PRELIMINARY

Sample B:

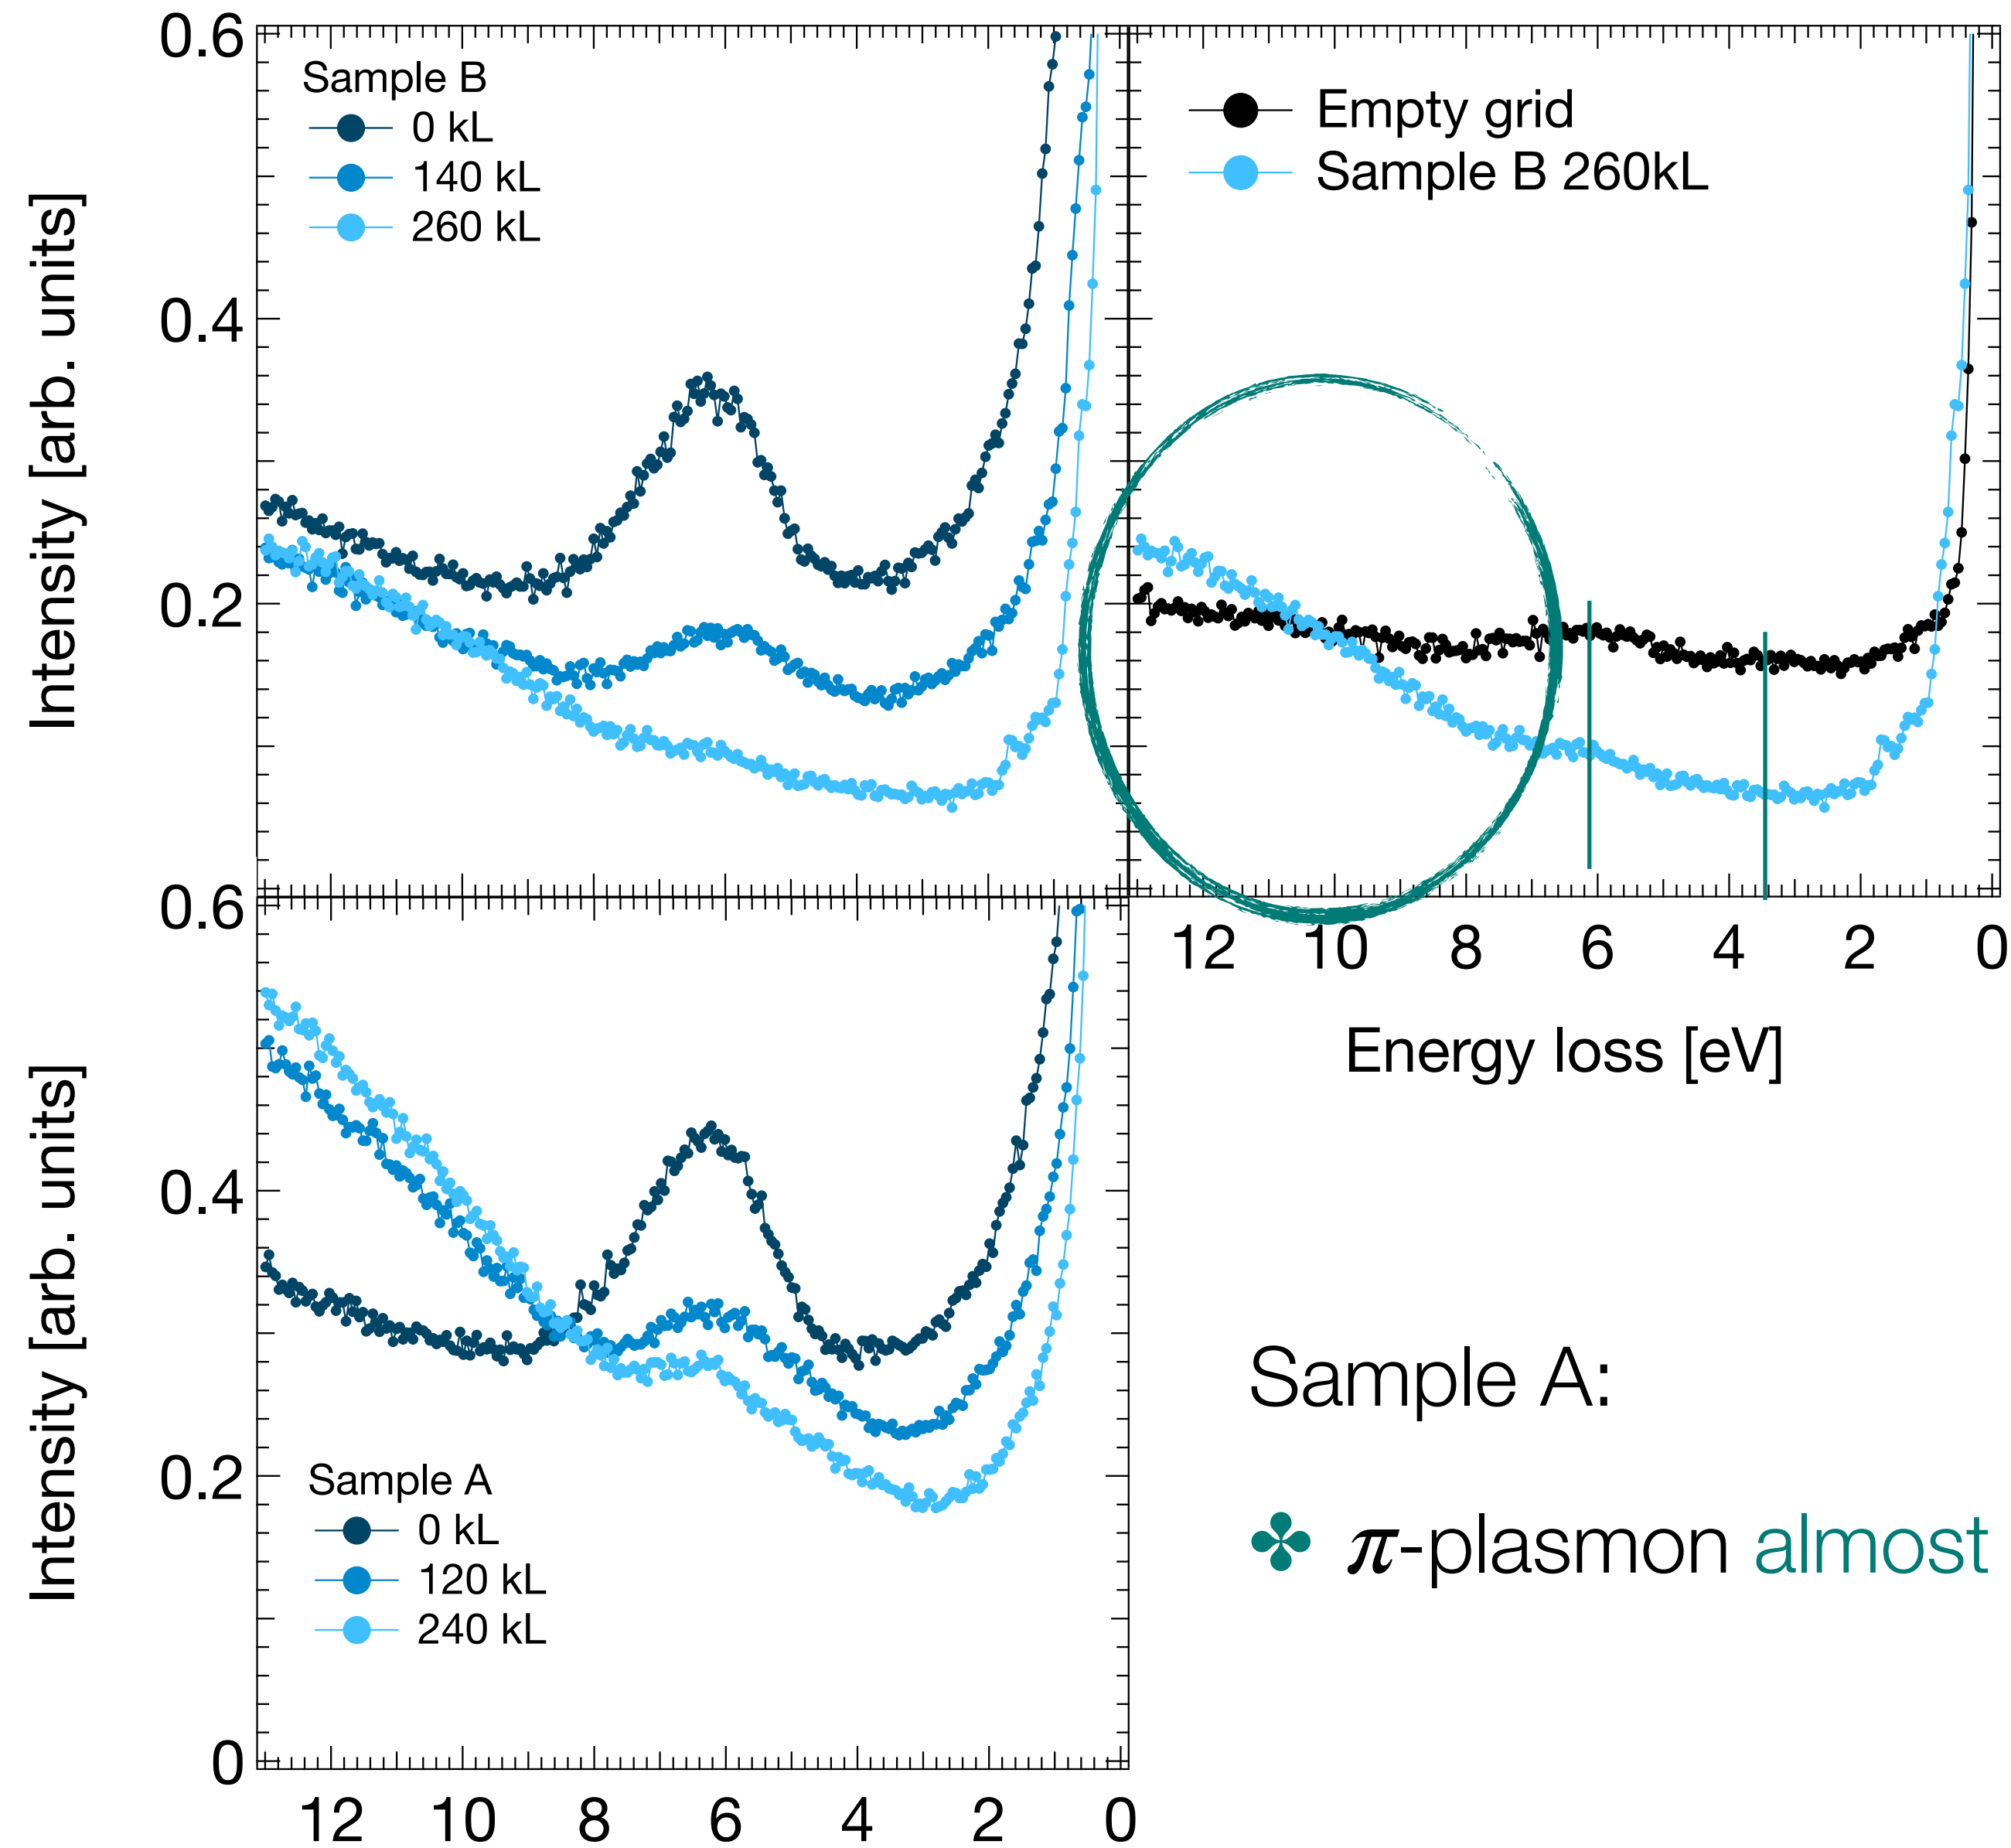

- $\pi$ -plasmon ~completely quenched
- Ni has losses at  $\sim 6$  eV and  $\sim 3.5$  eV

Sample A:

- $\pi$ -plasmon almost quenched despite 59%  $sp^3$  saturation

# Quenching of $\pi$ -Plasmon: Ni Losses Is What's Left

PRELIMINARY

Sample B:

- ✿  $\pi$ -plasmon ~completely quenched
- ✿ Ni has losses at ~6 eV and ~3.5 eV

Sample A:

- ✿  $\pi$ -plasmon almost quenched despite 59%  $sp^3$  saturation

# Hydrogenation of NPG: Different Depth Sensitivity

Hydrogenated nanoporous graphene (NPG):

- ❖ Synchrotron micro-XPS experiment
- ❖  $h\nu = 350 \text{ eV}$  (C 1s  $E_K = 60 \text{ eV}$ )
- ❖  $sp^3/(sp^2+sp^3) \approx 90\%$  achieved

Betti, M.G. *et al.*, *Nano Letters* (2022),  
<https://doi.org/10.1021/acs.nanolett.2c00162>

What's *new* then?

- ❖  $h\nu = 1486.7 \text{ eV}$  (C 1s  $E_K = 1200 \text{ eV}$ )
- ❖ Electron energy loss spectroscopy  
(*plasmon* investigation)

Different *depth* sensitivity

$E_K = 60 \text{ eV}$     depth  $\sim 9 \text{ \AA}$

$E_K = 1200 \text{ eV}$     depth  $\sim 90 \text{ \AA}$

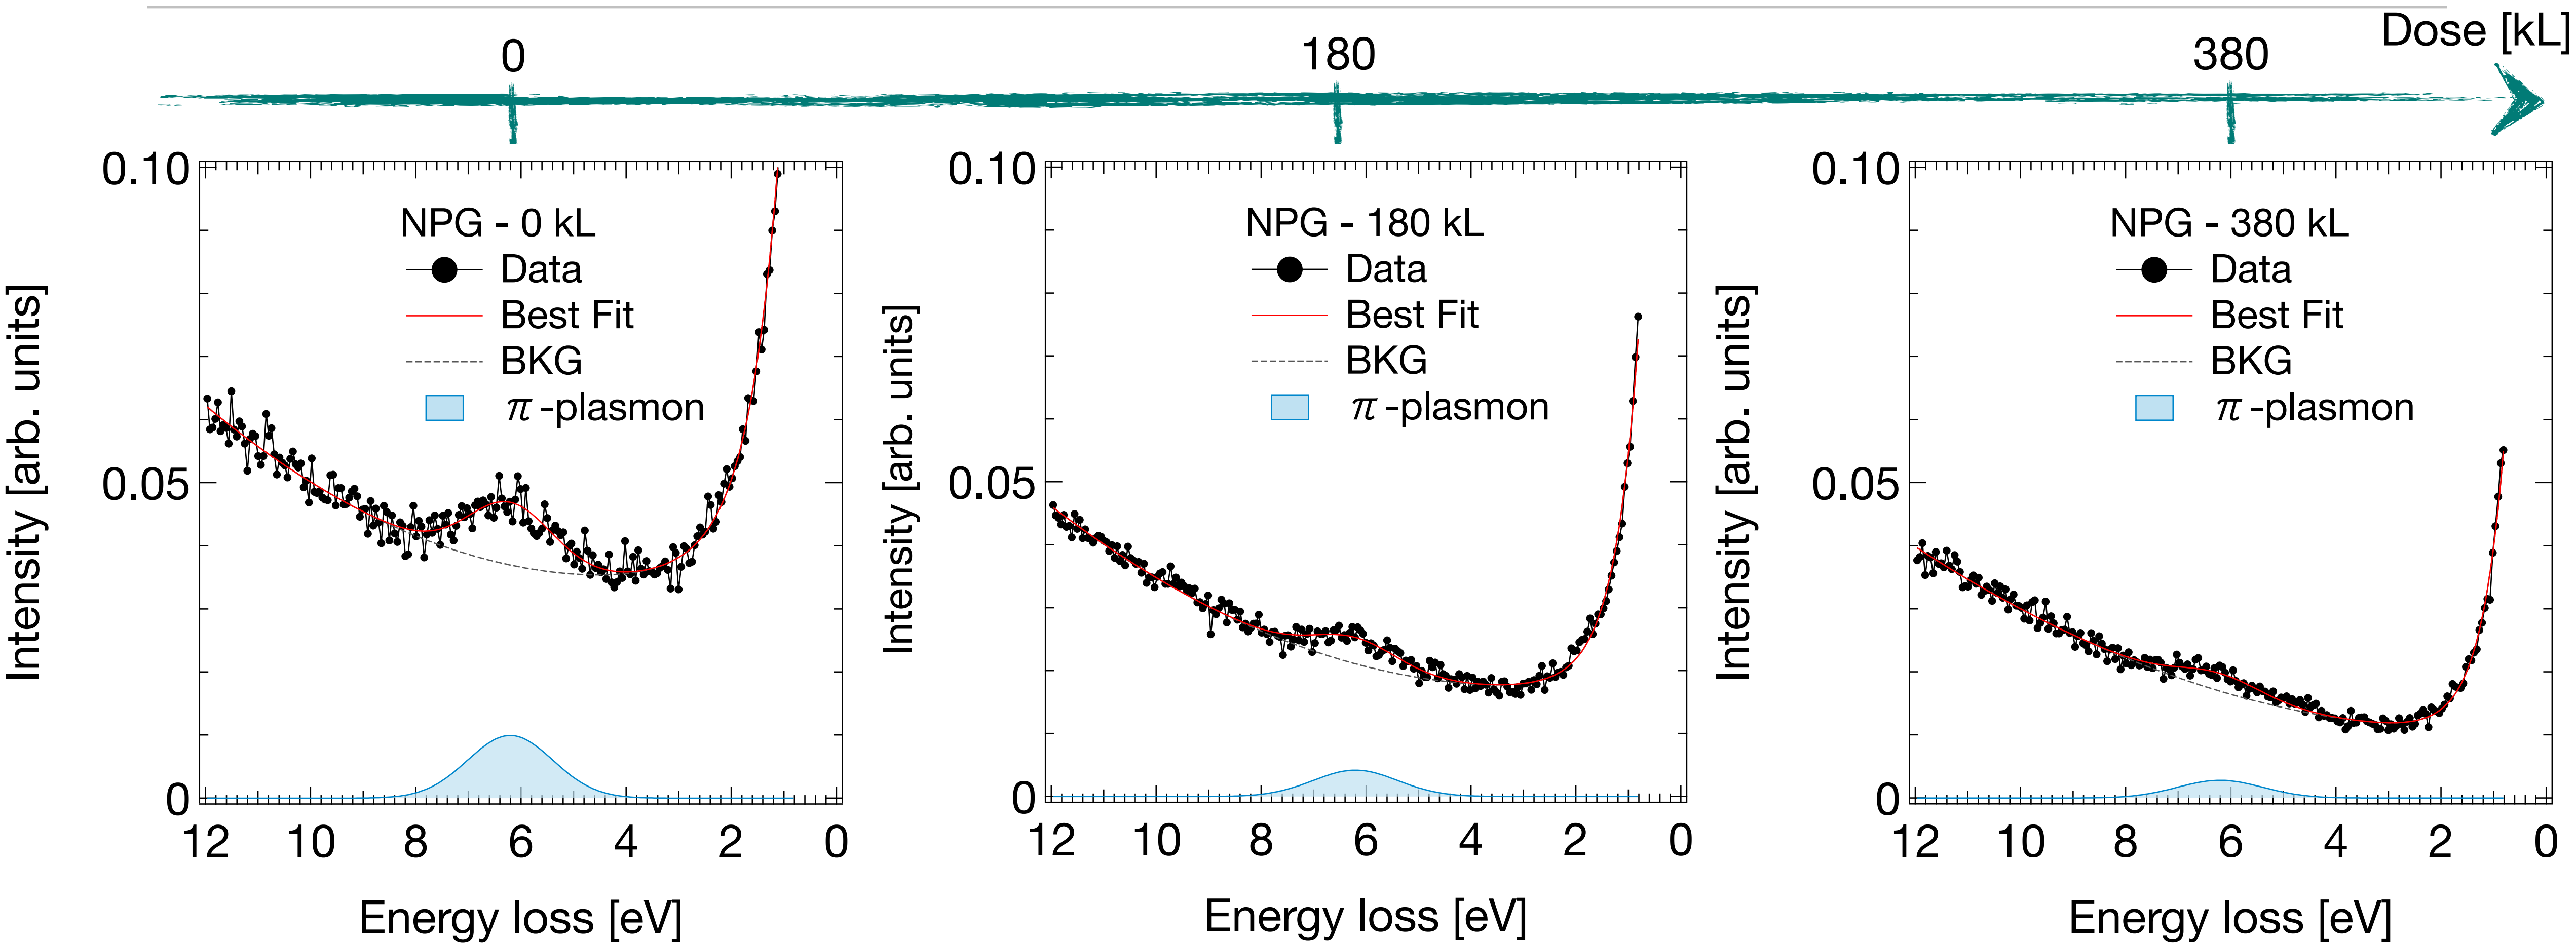

# Increase of $sp^3$ : XPS Footprint of Hydrogenation

Carbon hybridization  
changing from  $sp^2$  to  $sp^3$

# Quenching of $\pi$ -Plasmon: EELS Footprint of Hydrogenation

$\pi$ -plasmon:

- ✿ Excitation associated to  $sp^2$
- ✿ Quenching due to  $sp^3$  changing

# We Reached the 64% Saturation

XPS result:

- ❖ Decrease of  $sp^2$
- ❖ Exponential increase of  $sp^3$
- ❖ 64% saturation seems to be ~reached

XPS-EELS comparison:

- ❖ Behaviour seems compatible
- ❖  $\pi$ -plasmon not completely quenched
- ❖  $sp^2$  still there

# ~6.2 eV Band Gap Measured With EELS

PRELIMINARY

Hydrogenated graphene:

- ❖  $sp^2$  to  $sp^3$  distortion
- ❖ Band gap opening
- ❖ Electronic transition onset  $\propto (E - E_g)^{1/2}$  for direct gap semiconductors
- ❖ EELS measurement <sup>2</sup> and fit with a straight line
- ❖ With this analysis  $E_g = 6.2$  eV

HANDLE WITH CARE:

- ❖ Background
- ❖ Excitons

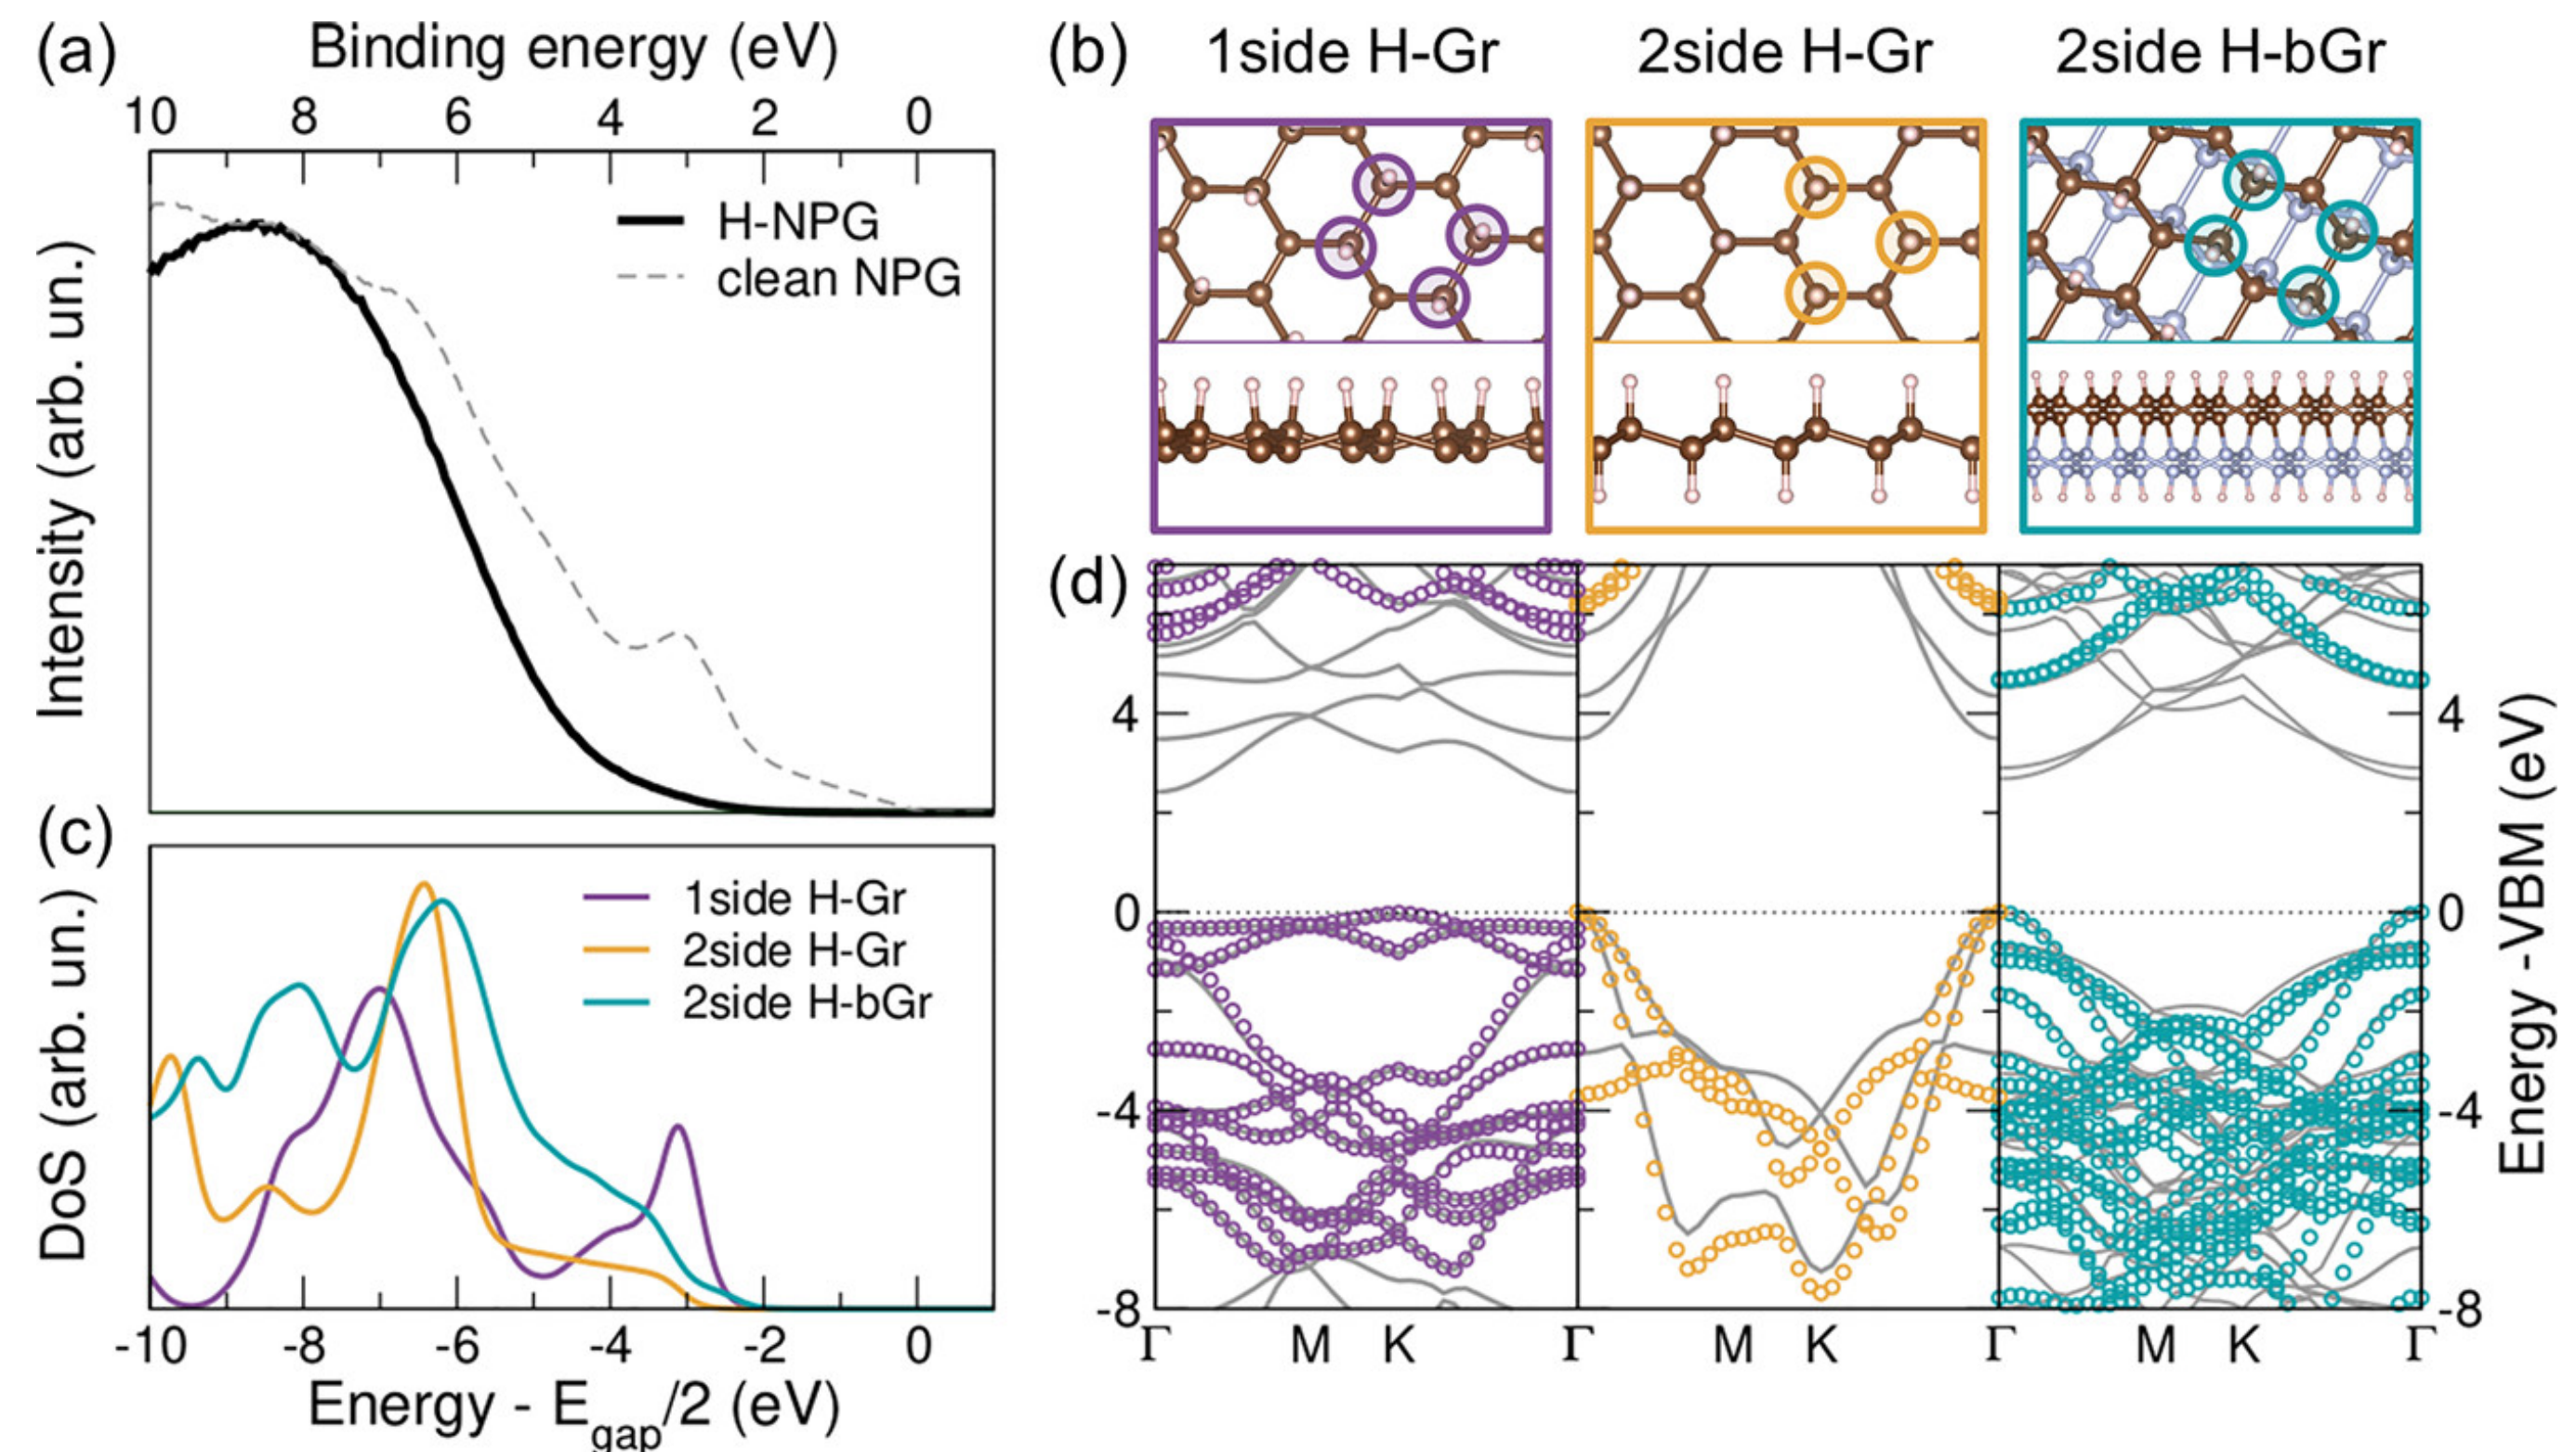

# Valence Band to Understand CH Bonding

PRELIMINARY

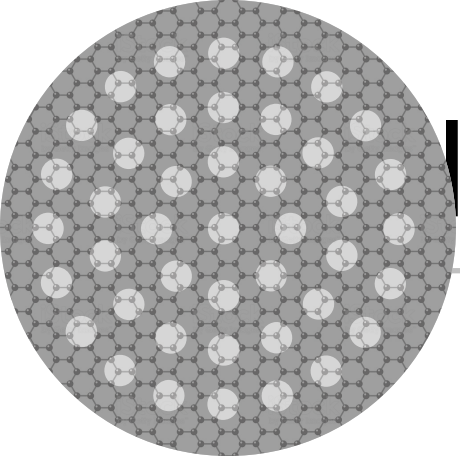

How many sides?

- ❖ C 1s not an unambiguous marker
- ❖ UPS: valence band features and angular resolution

Betti, M.G. *et al.*, *Nano Letters* (2022), <https://doi.org/10.1021/acs.nanolett.2c00162>

# Quenching of $\pi$ -plasmon: EELS footprint of hydrogenation

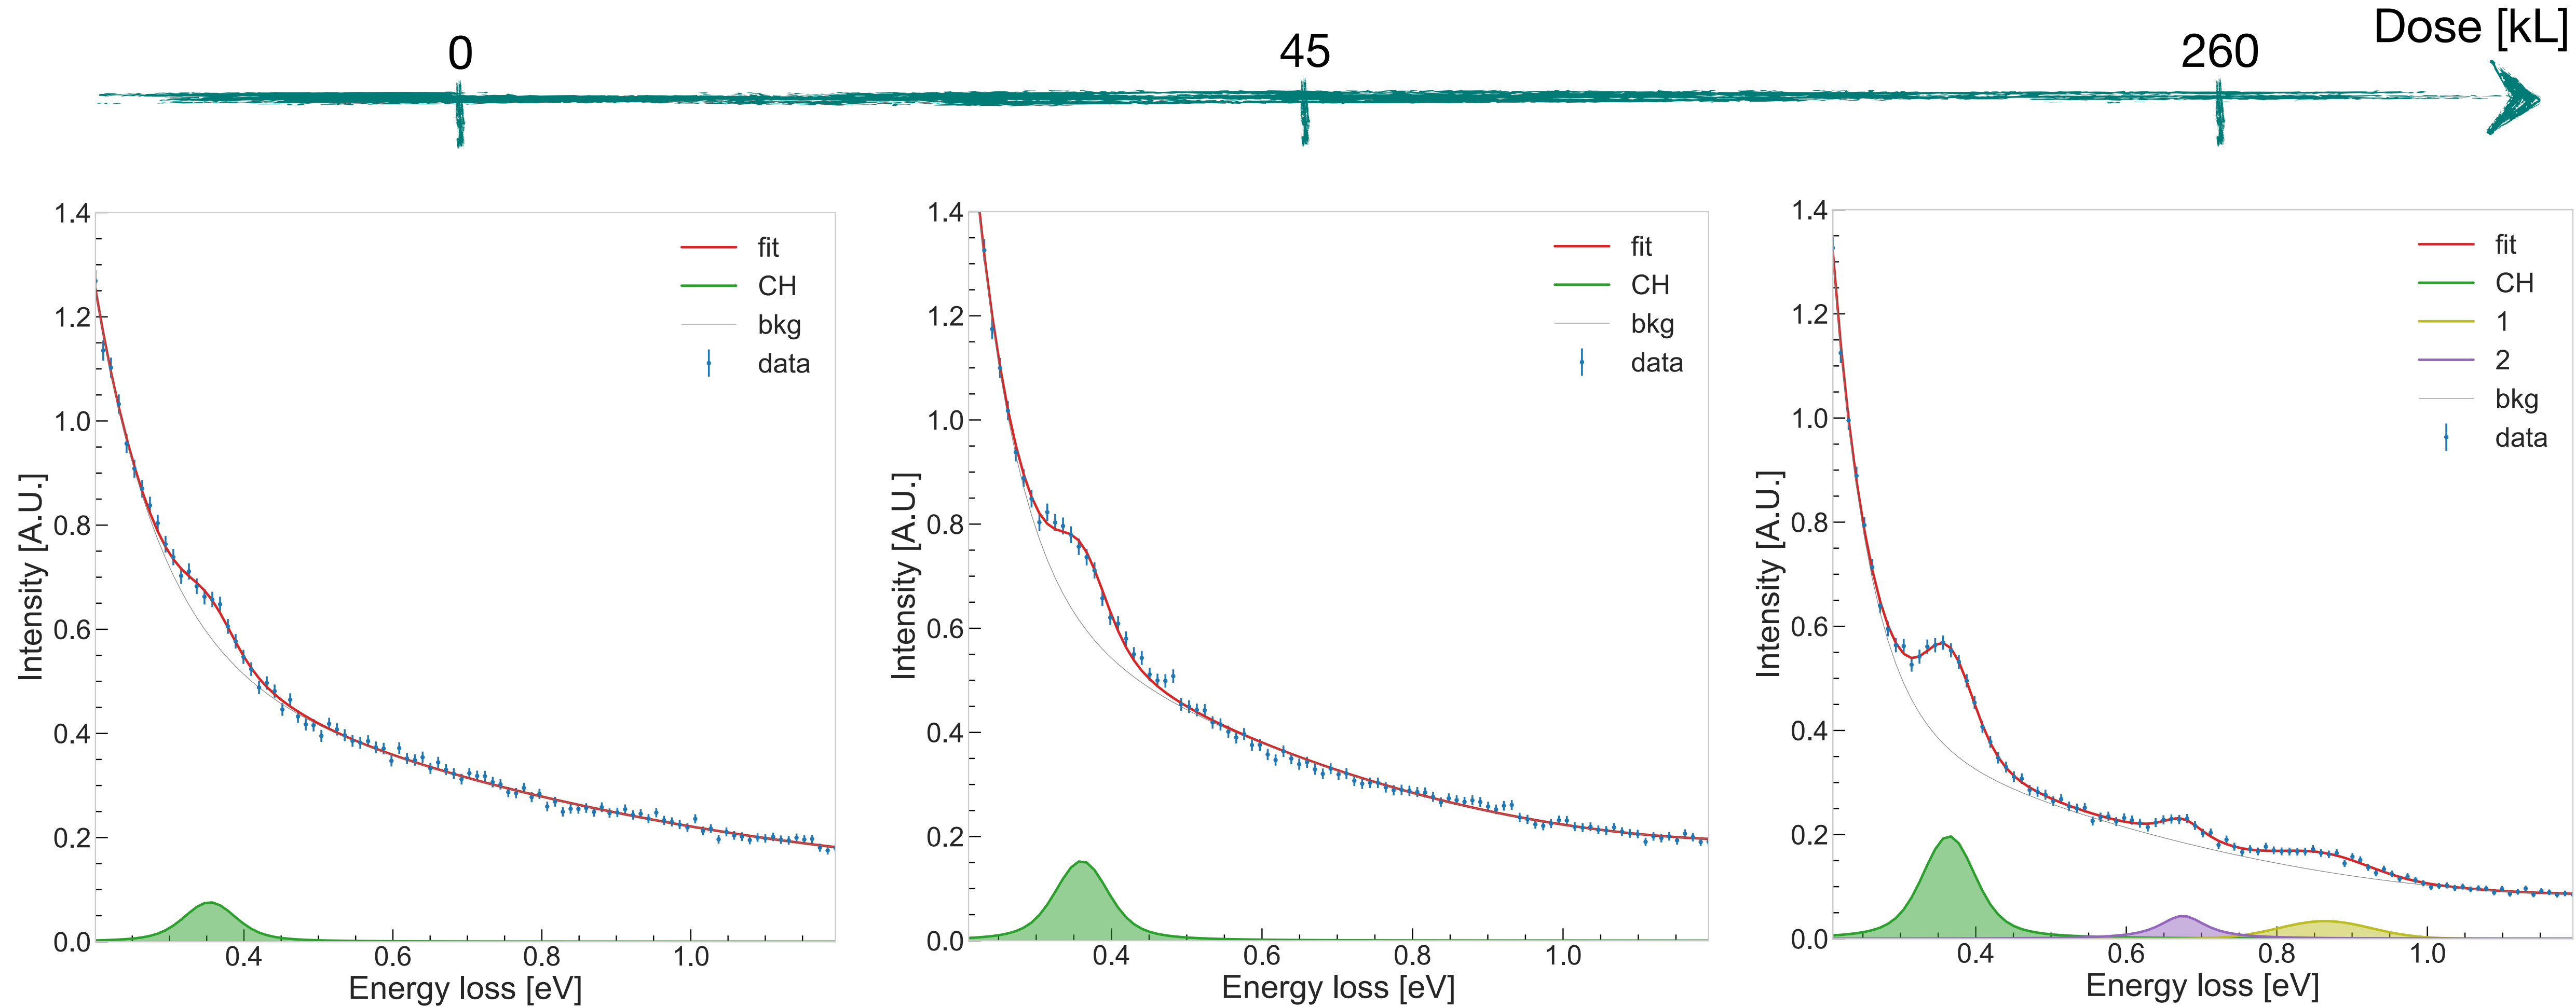

$\pi$ -plasmon:

- Excitation associated to  $sp^2$
- Quenching due to  $sp^3$  changing

# Growth of C-H stretching: EELS footprint of hydrogenation

C-H stretching mode  $\sim 360$  meV

# To Conclude

---

Graphene characterisation with **spectroscopy**:

- ❖ Contaminants **removed** with 550°C annealing but suspended graphene **breaks**
- ❖ C 1s only  $sp_2$  and evidence of suspended monolayer graphene

**Transmission** of low-energy electrons (30-900 eV):

- ❖ Graphene **coverage** and geometrical transmission evaluated with **SEM image analysis**
- ❖ **Measured** transmission **corrected** with coverage to obtain **graphene transmission**

**Hydrogenation** of C-nanostructures:

- ❖ Saturation of **NPG** achieved but H-uptake in **depth** should be studied
- ❖ **Monolayer graphene** saturation seems to depend on  **$sp^2/sp^3$  ratio**

Stil lots of fun to be had:

- ❖ Non-damaging cleaning treatment
- ❖ Total cross-section for electron-graphene interaction
- ❖ Deeper understanding of suspended graphene hydrogenation (band gap, CH bonding)
