

General idea:

- need a light detector capable for tracking (material budget: few% X_0)
- use a TPC based on MM technology (drift gap of 5cm)

DAQ:

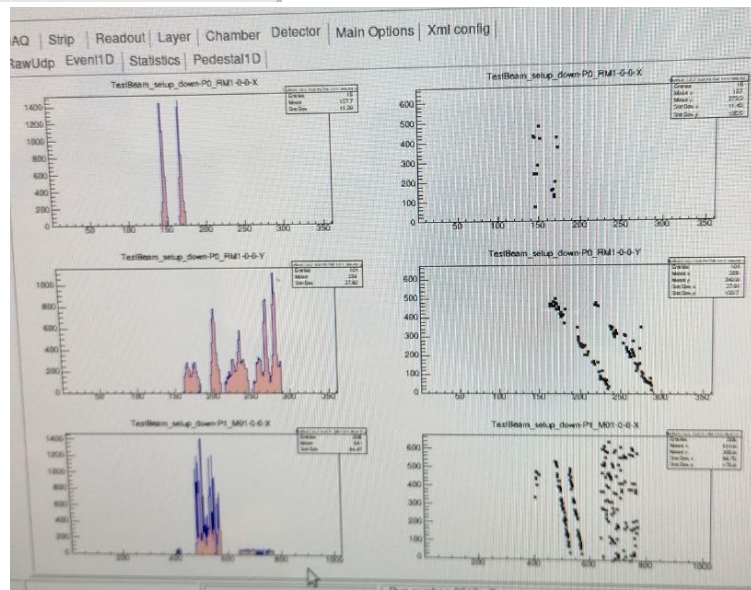

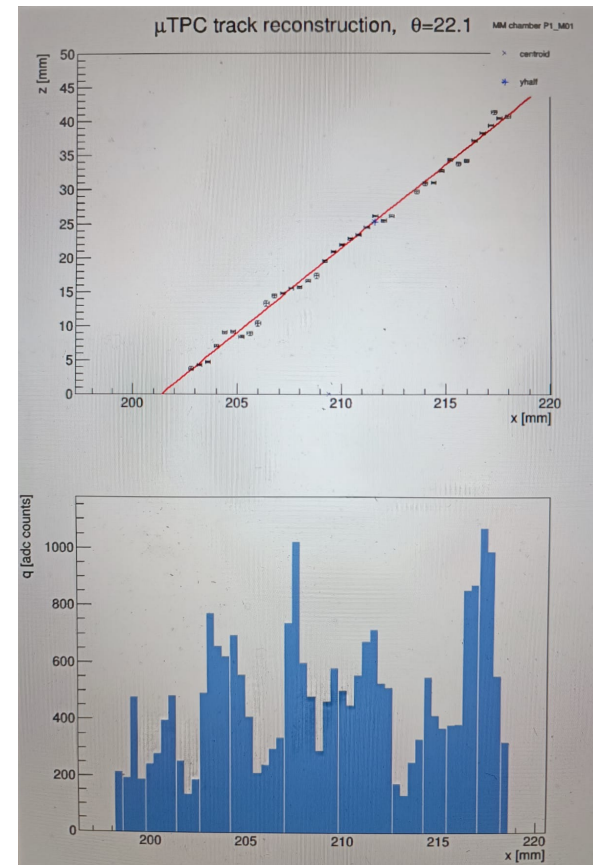

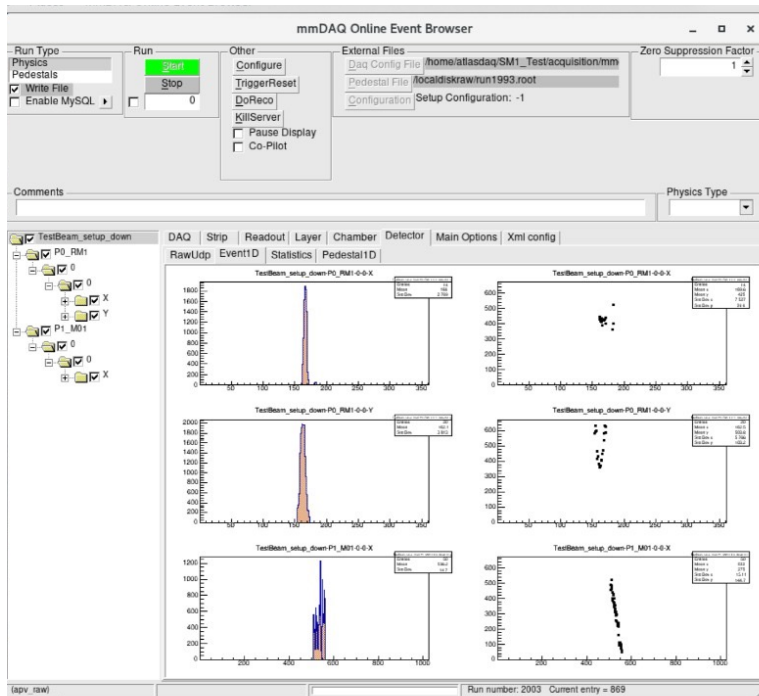

- APV based -> acquisition window of ~ 700 ns
- Fast gas mixture Ar:CF₄:Iso (88:10:2)

Thanks for the effort!

Great success!

Data and analysis code in sharing:

- inside atlasui -> padMMe directory
- all atlas and padme users should have access
- I will copy the code there with all the raw and reco data + some debug plots
- reco ntuples includes plots and a tree to be used for simple macros
- Logbook:

https://docs.google.com/spreadsheets/d/1BMz_SQ0aQujxPrjG2gUZOpf8K51RphMMYqKRy_mhv40/
