Partition function of Argyres-Douglas theories on the blowup.

Friday, 23 February 2024 11:30 (15 minutes)

Supersymmetric QFTs can be studied at the non-perturbative level because quantum corrections are under control. In particular for $N=2$ theories the IR dynamics is encoded in the Seiberg-Witten curve which is naturally related to an integrable system. In presence of a self-dual Omega background the integrable system becomes time-dependent and is given by Painlevé equations. In this talk we will study the Nekrasov partition function of $SU(2)$ gauge theory in 4d on the blowup of spacetime and we will show that this gives a new expansion of the Painlevé tau function which encodes interesting physical informations and has special properties in the case of Argyres-Douglas theories.
