

# Testing quantum gravity on a quantum computer

Alfredo Iorio  
Charles University  
Prague

INFN online meeting  
December 14<sup>th</sup>, 2023

# PLAN

- \* A turn of history
- \* Two directions to use a QC:
  1. the analog way (example)
  2. the correspondence way (example)
- \* Open problems for 2:
  - firmly establish a (the) correspondence
  - build an appropriate QC

# \*A turn of history

The current understanding is that gravity is *emergent*:

from an underlying spin foam

from a QFT one dimension less

This gave a powerful toolbox of correspondences, dualities, symmetries, that map

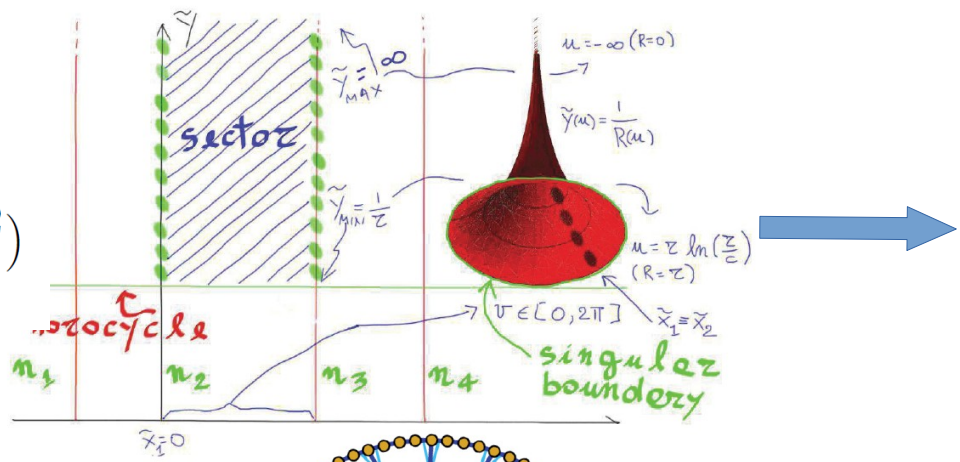

Quantum system

Gravity system

# \* Two directions to use a QC: 1. the analog way (example)

$$dl^2 = \frac{1}{\tilde{y}^2}(d\tilde{x}^2 + d\tilde{y}^2)$$

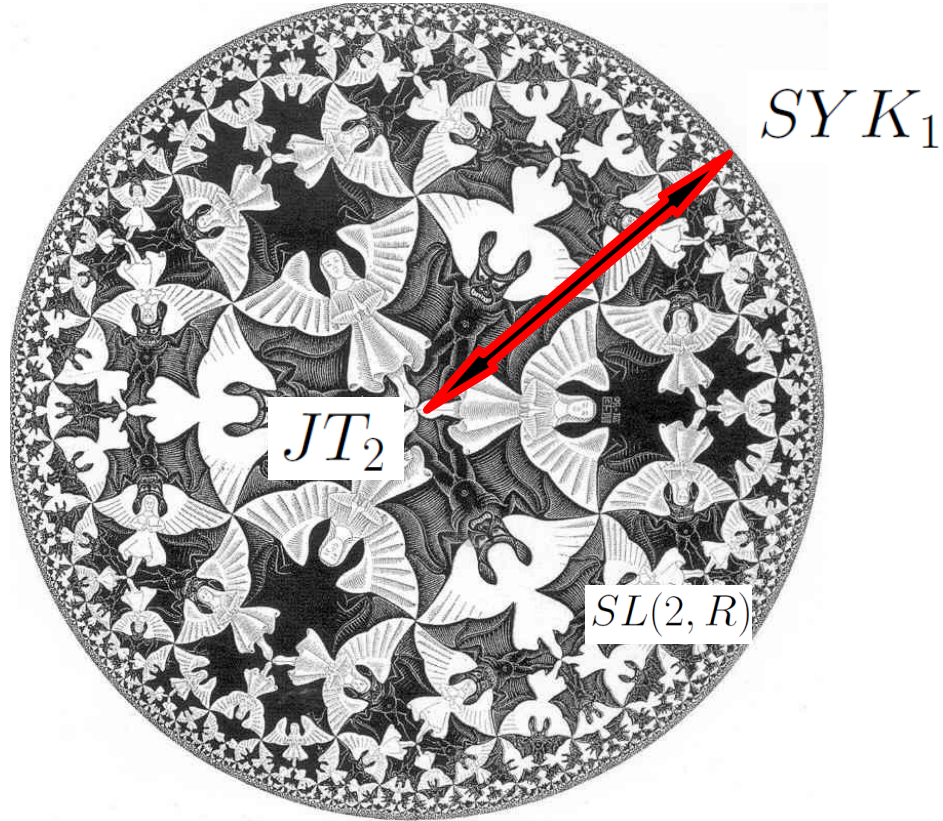

$$dl^2 = \frac{d\tilde{x}^2 + d\tilde{y}^2}{(1 - \tilde{x}^2 - \tilde{y}^2)^2}$$

(Magic) quantum circuit of superconducting qubits, coupled to microwave resonators

\* 2. the correspondence way (example)

# \* Open problems for 2: - firmly establish a (the) correspondence

This is an example of  $AdS_2/CFT_1$  correspondence

In the large  $N$  limit  
( $G_N \sim 1/N$ ), for  $T \rightarrow 0$

Same (Schwarzian) action

Same correlators (enjoying  $SL(2, R)$  symmetry)

Same thermodynamics, e.g.

$$\frac{\partial \mathcal{S}}{\partial Q} = 2\pi \mathcal{E}$$

(important role of quantum chaos,  $\lambda_{Lyap} \leq 2\pi T/\hbar$ )

# \* Open problems for 2: build an appropriate QC

Measure  $S_{ent}(\sigma)$
