## “Short” Dictionary Definition

### Short *noun*

- *knee-length trousers*

### Short *verb*

- *to sell a stock in expectation of a fall in prices*

### Short *adjective*

- *Describe flaky pastry*

### Short *adjective*

- *limited in distance*

## "Short" Dictionary Definition

### Short *noun*

- knee-length trousers

### Short *verb*

- to sell a stock in expectation of a fall in prices

### Short *adjective*

- Describe flaky pastry

### Short *adjective*

- limited in distance

Let neutrinos propagate over some **distance L**

Offener Brief an die Gruppe der Radioaktiven bei der  
Universitäts-Tagung in Bielefeld.

Absehrift  
Physikalisches Institut  
der Kglg. Technischen Hochschule  
Zürich

Zürich, 14. Dez. 1930  
Christstrasse

Liebe Radioaktive Damen und Herren,

Wie der Überbringer dieser Zeilen, den ich halloviellst  
anzubieten bitte, Ihnen das selbsten auszusprechen wird, bin ich  
angelehnt der "Moloch" Statistik der  $\beta$ - und  $\alpha$ -Kette, sowie  
des kontinuierlichen  $\beta$ -Spektrums auf einen verwerflichen Ausweg  
verfallen um den "Wohlbegriff" (1) der Statistik und den Beiratsrat  
zu retten. Mithin die Möglichkeit, es könnten elektrisch neutrale  
Teilchen, die ich Neutrinos nennen will, in den Kernen existieren,  
welche den Spin  $1/2$  haben und die Ausschliessungsprinzip befolgen und  
sich von Lichtgeschwindigkeit unterscheiden nach demselben  
Gesetz mit Lichtgeschwindigkeit laufen. Die Masse der Neutrinos  
kann von derselben Ordnung sein wie die Elektronenmasse sein und  
Sicherfalls nicht grösser als  $0,01$  Protonenmasse. Das kontinuierliche  
 $\beta$ -Spektrum wäre dann verständlich unter der Annahme, dass beim  
 $\beta$ -Zerfall mit den Elektronen jeweils noch ein Neutron emittiert  
wird, damit, dass die Summe der Energien von Neutron und Elektron  
konstant ist.

Pauli predicts  
"neutrinos"

AbsoBrif/15.12.56

Physikalisches Institut  
der Hög. Technischen Hochschule  
Zürich

Zürich, 14. Dez. 1956  
Christmann

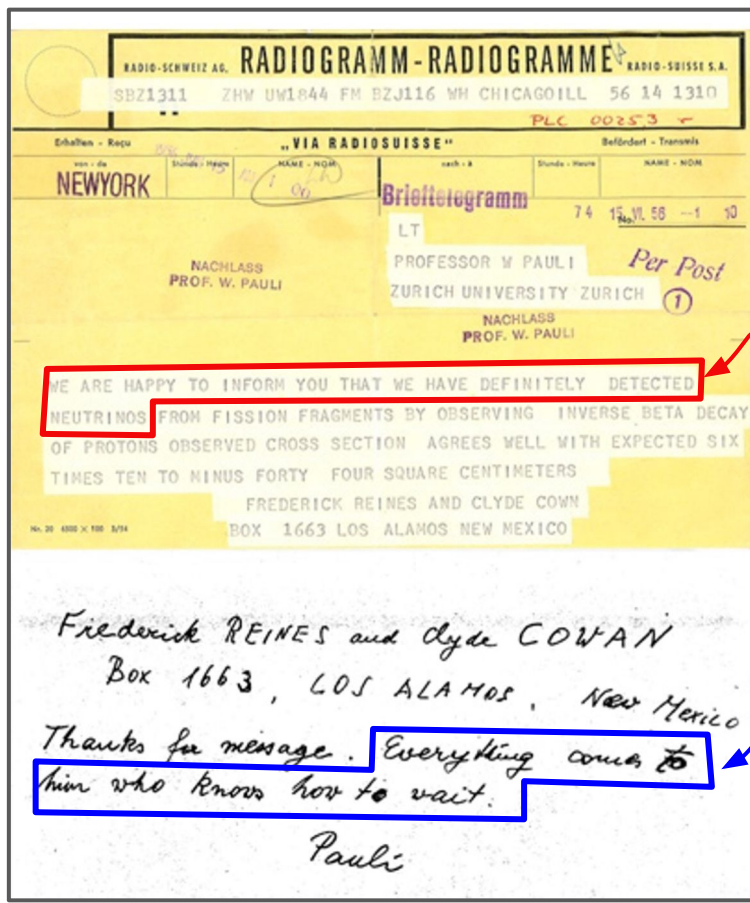

Liebe Radioaktive Damen und Herren,

Via der Überbringer dieser Seiten, den ich herzlichst annehmen bitte, Ihnen das nächste auszusenden wird, bin ich gewöhnt der "Räuber" Statistik der  $\beta$ - und  $\beta^+$ -Kette, sowie des kontinuierlichen beta-Spektrum auf einen verwerflichen Ausweg zu führen um den "Wochenblatt" (1) der Statistik und den Bericht zu geben. Mithin die Möglichkeit, es könnten elektrisch neutrale Teilchen, die sich Neutrinos nennen will, in den Fermi  $\beta$ -Kette, welche den Spin  $1/2$  haben und die Ausschlagungsprinzip befolgen und sich von Lichtgeschwindigkeit bewegen. Die Masse der Neutrinos würde von derselben Ordnung sein wie die Neutrinos sein und somit nicht größer als  $0,01$  Protonenmasse. Das kontinuierliche beta-Spektrum wäre dann verdrängt nach der Annahme, dass beim beta-Zerfall mit dem Elektron jeweils ein Neutron emittiert wird, damit, dass die Summe der Energien von Neutron und Elektron konstant ist.

Brief History  
Global 3ν Picture

See lectures by E. Lisi, J. Maricic, F. Di Lodovico, A. Weber ..etc, for more on these experiments and **many, many more**

# Global three flavor neutrino paradigm

$$c_{ij} = \cos(\theta_{ij})$$

$$s_{ij} = \sin(\theta_{ij})$$

- 1. Introduction
- Short-Baseline?
- Brief History
- Global 3ν Picture

Neutrino Mixing Matrix

$$U_{\text{PMNS}} = \begin{pmatrix} U_{e1} & U_{e2} & U_{e3} \\ U_{\mu1} & U_{\mu2} & U_{\mu3} \\ U_{\tau1} & U_{\tau2} & U_{\tau3} \end{pmatrix} = \underbrace{\begin{pmatrix} 1 & 0 & 0 \\ 0 & c_{23} & s_{23} \\ 0 & -s_{23} & c_{23} \end{pmatrix}}_{\text{Atmospheric Sector}} \underbrace{\begin{pmatrix} c_{13} & 0 & s_{13}e^{-i\delta_{CP}} \\ 0 & 1 & 0 \\ -s_{13}e^{i\delta_{CP}} & 0 & c_{13} \end{pmatrix}}_{\text{Reactor Sector}} \underbrace{\begin{pmatrix} c_{12} & s_{12} & 0 \\ -s_{12} & c_{12} & 0 \\ 0 & 0 & 1 \end{pmatrix}}_{\text{Solar Sector}}$$

$\delta_{CP} \approx ??$

What's the value of  $\delta_{CP}$ ? Is there **CP violation** in neutrino sector

$\theta_{23} \approx 45^\circ$

$\theta_{13} \approx 8.5^\circ$

$\theta_{12} \approx 34^\circ$

What's the content of  $\theta_{23}$  (Measured)

$$|\Delta m_{32}^2| = 2.5 \times 10^{-3} eV^2$$

What's the **sign** of  $\Delta m_{32}^2$ ?  
The "Mass Ordering" problem

# 2. Anomalies

A 3D visualization of a network graph. The graph is contained within a wireframe sphere. The nodes are represented by small, semi-transparent spheres in various colors, including orange, purple, and blue. The edges are thin, light blue lines connecting the nodes. The overall appearance is that of a complex, interconnected network structure.

A search for  $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$  oscillations has been conducted at the Los Alamos Meson Physics Facility by using  $\bar{\nu}_\mu$  from  $\mu^+$  decay at rest. The  $\bar{\nu}_e$  are detected via the reaction  $\bar{\nu}_e p \rightarrow e^+ n$ , correlated with a  $\gamma$  from  $np \rightarrow d\gamma$  (2.2 MeV). The use of tight cuts to identify  $e^+$  events with correlated  $\gamma$  rays yields 22 events with  $e^+$  energy between 36 and 60 MeV and only  $4.6 \pm 0.6$  background events. A fit to the  $e^+$  events between 20 and 60 MeV yields a total excess of  $51.8^{+18.7}_{-16.9} \pm 8.0$  events. If attributed to  $\bar{\nu}_\mu \rightarrow \bar{\nu}_e$  oscillations, this corresponds to an oscillation probability of  $(0.31^{+0.11}_{-0.10} \pm 0.05)\%$ .

14.60.Pq, 13.15.+g

We present the results from a search for neutrino oscillations using the Liquid Scintillator Neutrino Detector (LSND) apparatus described in reference [1]. The existence of neutrino oscillations would imply that neutrinos have mass and that there is mixing among the different

was 1787 C in 1993, 5904 C in 1994, and 7081 C in 1995. Most of the  $\pi^+$  come to rest and decay through the sequence  $\pi^+ \rightarrow \mu^+ \nu_\mu$ , followed by  $\mu^+ \rightarrow e^+ \nu_e \bar{\nu}_\mu$ , supplying  $\bar{\nu}_\mu$  with a maximum energy of 52.8 MeV. The energy dependence of the  $\bar{\nu}_\mu$  flux from decay at rest (DAR) is very well known, and the absolute value is known to 7% [1,3]. The open space around the target is short compared to the pion decay length, so only 3% of the  $\pi^+$  decay in flight (DIF). A much smaller fraction (approximately 0.001%) of the muons DIF, due to the difference in lifetimes and that a  $\pi^+$  must first DIF. The total  $\bar{\nu}_\mu$  flux averaged over the detector volume, including contributions from upstream targets and all elements of the beam stop, was  $7.6 \times 10^{-10} \bar{\nu}_\mu/\text{cm}^2/\text{proton}$ .

A  $\bar{\nu}_e$  component in the beam comes from the symmetrical decay chain starting with a  $\pi^-$ . This background is suppressed by three factors in this experiment. First,  $\pi^+$  production is about eight times the  $\pi^-$  production

LSND first results came out in 1996 there was **No mention of "sterile" neutrino whatsoever.**

At this point, **while there was compelling evidence building for solar and atmospheric oscillations**, the  $3\nu$  paradigm was by **no means taken for granted** by entire HEP community

### Abstract

This review is focused on neutrino mixing and neutrino oscillations in the light of the recent experimental developments. After discussing possible types of neutrino mixing for Dirac and Majorana neutrinos and considering in detail the phenomenology of neutrino oscillations in vacuum and matter, we review all existing evidence and indications in favour of neutrino oscillations that have

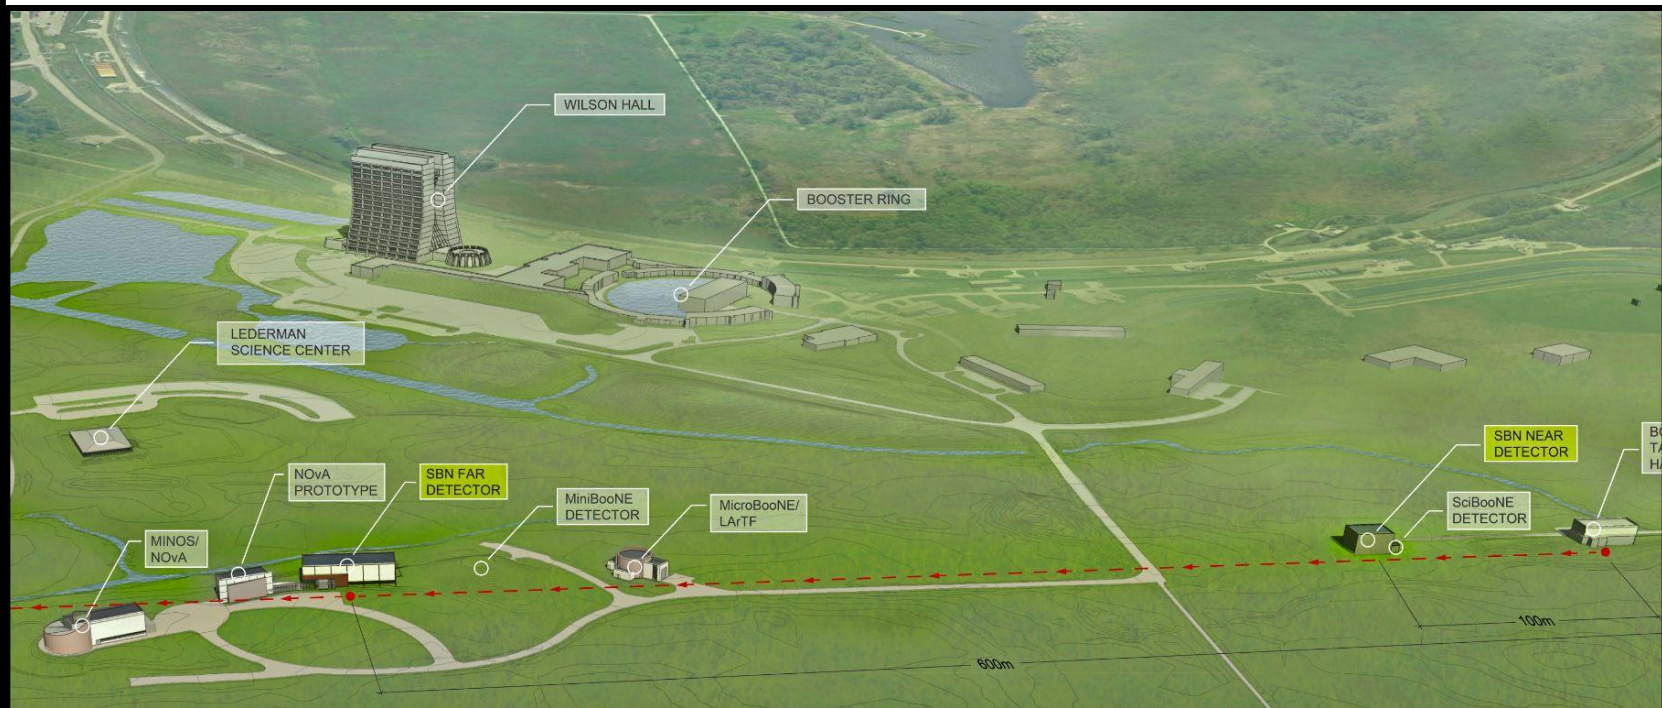

*"..we would like to finish this section by **emphasizing the importance** of the results obtained in the **LSND experiment for neutrino physics.**"*

*"..taken together with the **indications in favour of solar and atmospheric neutrino oscillations** require the **existence of at least one sterile neutrino**"*

Why the Debate?

- 3. MicroBooNE  
LArTPC Detectors  
Photon Searches

MicroBooNE's **primary aim** was to discover if the excess in MiniBooNE was **electrons** or **photons**.

First results focused on the extremely rare and unmeasured standard model process, **neutrino induced neutral current  $\Delta$  radiative decay (NC  $\Delta \rightarrow N\gamma$ )**

Only needs to be  **$\sim 3.18$  times higher than predicted** in order to **explain the MiniBooNE anomaly**

MicroBooNE Simulation, Preliminary

NuMI has ~x8  
times more  $\nu_e$   
relative to  $\nu_\mu$  in its  
beam composition

96%  $\nu_\mu$  & anti- $\nu_\mu$   
4.0%  $\nu_e$  & anti- $\nu_e$

Sterile Sensitivities  
Using NuMI Beam

Unphysical "Appearance Only".

Proper "3+1" combined appearance/disappearance

Addition of NuMI breaks the degeneracy!

Allows full 3+1 to get very close to "appearance only"

- LSND 90% CL (allowed)
- LSND 99% CL (allowed)
- MicroBooNE 95% CL<sub>s</sub> (BNB data) profiling over sin<sup>2</sup>θ<sub>24</sub> in the 3+1 oscillation scenario
- ⋯ MicroBooNE 95% CL<sub>s</sub> (BNB data) ν<sub>e</sub> appearance-only
- ⋯ MicroBooNE 95% CL<sub>s</sub> (BNB+NuMI sens) sin<sup>2</sup>θ<sub>24</sub> = 0.005 in the 3+1 oscillation scenario

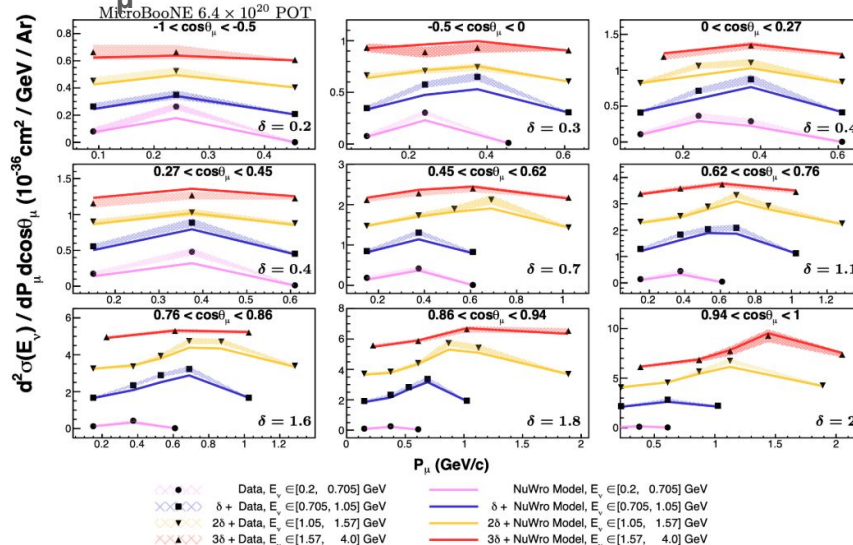

# Not just anomaly hunting, Cross-Section measurement

Liquid Argon is one of the important nuclear targets of the future.  
The SBN program aims to **improve our understanding of  $\nu$ -Ar interactions.**

## 3D $\nu$ CC Inclusive Cross Section Results

[Rev. Mod. Phys. 84, 1307 \(2012\)](#)

MicroBooNE: <https://arxiv.org/abs/2307.06413>

MicroBooNE already has 22 published cross-section papers,  
and **SBND/CARUS** will dwarf this in the long run

# Where do we currently stand on eV sterile

## 1. Introduction

Photon Searches  
Electron Searches

## 4. SBN Programme

Intro to the SBN  
Sterile Sensitivities  
Using NuMI Beam

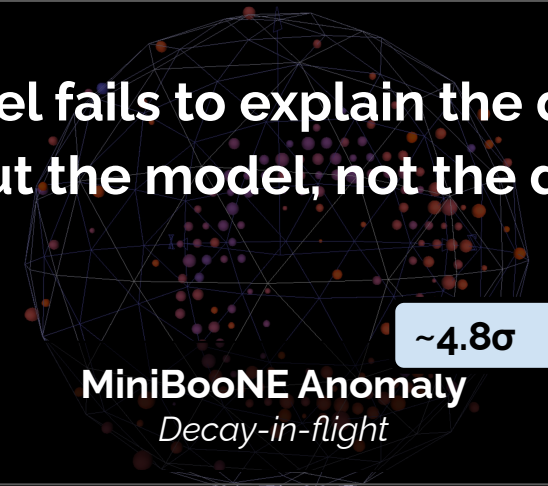

1. eV sterile neutrinos as solution for MiniBooNE and LSND are **not ruled out**
2. **MicroBooNE's results** combined with **extreme tension in global picture** has led to "**disfavor**" of eV sterile neutrino in community\*
3. While we **100% need to close the box** on the eV sterile question,
  - And **SBN, with its dual beams, will do this...**
  - We also need to **look outside the box..**

\*my opinion entirely!

# Anomalies still need explanations!

Using NuMI Beam

If a model fails to explain the data  
throw out the model, not the data.

The background of the slide is a vibrant, multi-colored cosmic web. It features a complex network of blue and purple filaments, with bright orange and red clusters of galaxies scattered throughout. The overall effect is a dense, textured field of light and color, representing the large-scale structure of the universe.

Future Probes

LArTPC technology used at the SBN is the perfect place to probe these models as an explanation for the MiniBooNE Anomaly

# What if a positive signal is observed in a search?

Very little in the Standard Model that produces  $e^+e^-$  pairs with wide ( $> 5^\circ$ ) opening angles at  $O(100 \text{ MeV})$  energies

**Observation would be a smoking gun signature of BSM physics!**

Sterile Sensitivities  
Using NuMI Beam
- The 'Dark' Sector  
Portals to Darkness  
Pheno Explosion  
Future Probes

Building on the first generation photon searches, **MicroBooNE** has several analyses targeting e+e- final states.

**Dark-trident** searches using the MicroBooNE detector and NuMI Beam

Targeting phase space that can explain the MiniBooNE anomaly

# SBND: A Dark Sector Factory

- Introduction  
Short-Baseline?  
Brief History  
Global 3v Picture
- Anomalies  
At Short Baselines?  
Began with LSND  
Enter MiniBooNE  
Why the Debate?
- MicroBooNE  
LArTPC Detectors  
Photon Searches  
Electron Searches
- SBN Programme  
Intro to the SBN  
Sterile Sensitivities  
Using NuMI Beam
- The 'Dark' Sector  
Portals to Darkness  
Pheno Explosion  
Future Probes

A lot of dark sector physics is **not oscillatory** or L/E dependent

$$\propto \frac{1}{R^2}$$

$$\frac{R_{uB}^2}{R_{SBND}^2} \approx \frac{470^2}{110^2} \approx 18$$

Huge Rate increase!

SBND will collect more data in **3 months** than MicroBooNE did in **5 years!**

Now → Future  
**"Portal Era"**

- Access to increasingly high precision neutrino data
- Neutrinos as a tool, or a probe, to unlock new physics

# Conclusions II

## 1. Introduction

Short-Baseline?

Brief History

Global  $3\nu$  Picture

## 2. Anomalies

At Short Baselines?

Began with LSND

Enter MiniBooNE

Why the Debate?

## 3. MicroBooNE

LArTPC Detectors

Photon Searches

Electron Searches

## 4. SBN Programme

Intro to the SBN

Sterile Sensitivities

Using NuMI Beam

## 5. The 'Dark' Sector

Portals to Darkness

Pheno Explosion

Future Probes

## 6. Conclusions

- The  $3\nu$  paradigm fits most global data astoundingly well
- But **persistent anomalies** still hint at something happening at **short-baselines** outside our understanding
  - *Regardless of your personal opinion of "light eV scale sterile neutrinos" the anomalies themselves remain unexplained!*
  - *Big Picture: **Let data point the way!***

# Conclusions II

## 6. Conclusions

- The  $3\nu$  paradigm fits most global data astoundingly well
- But **persistent anomalies** still hint at something happening at **short-baselines** outside our understanding
  - *Regardless of your personal opinion of "light eV scale sterile neutrinos" the anomalies themselves remain unexplained!*
  - *Big Picture: **Let data point the way!***
- **MicroBooNE**, using **LArTPC technology**, has already **ruled out many possibilities** with first **photon** and **electron** searches, and has shown were capable of probing a vast array of possible explanations including *Dark Sector* ***e+e- results***
- **The full SBN program**, with **three detectors** across **two neutrino beams** will prove invaluable as we probe deeper into the anomalies and the dark sector

**Thank You!**

## JSNS<sup>2</sup> (J-PARC Sterile Neutrino Search at the J-PARC Spallation Neutron Source)

- JSNS<sup>2</sup> provides a **clean** and **direct test** of the LSND anomaly.
- Uses the **same neutrino source** (pion decay-at-rest), **same target**, and **same detection principle** (Inverse-beta-decay) as LSND.

## JSNS<sup>2</sup> (J-PARC Sterile Neutrino Search at the J-PARC Spallation Neutron Source)

- JSNS<sup>2</sup> provides a **clean** and **direct test** of the LSND anomaly.
- Uses the **same neutrino source** (pion decay-at-rest), **same target**, and **same detection principle** (Inverse-beta-decay) as LSND.

### 1st Phase: JSNS<sup>2</sup> [[1310.1347](#)]

- Commissioned 2020, First physics data in 2021,
- Expect first results in 2023!

### 2nd Phase: JSNS<sup>2</sup>-II [[2012.10807](#)]

Upgrade to **two detectors**, Has been granted stage-2 approval

- Near@24m (17 tons, 120 10" PMTs)
- Far @ 28m (32 tons, 220 10" PMTs)

Expected data taking in late 2023.
