

# A multigap RPC based detector for gamma rays

Borislav Pavlov  
Univeristy of Sofia  
“St. Kliment Ohridski”

**XI Workshop on Resistive Plate Chambers and Related Detectors**  
**INFN - Laboratori Nazionali di Frascati**  
**5-10 February 2012**

# Content

**The aim is to use RPC in a PET system**

- Positron Emmission Tomography (PET)
- Why to use RPCs in a PET system ?
- Different designs
- Simulation results
- Conclusions

# Positron-Emission Tomography (PET)

<u>Isotope</u>	<u>half-life</u>
$^{11}\text{C}$	20.3 min
$^{15}\text{O}$	2.03 min
$^{18}\text{F}$	109.8 min
$^{75}\text{B}$	98.0 min
$^{13}\text{N}$	~10 min

The concept of emission and transmission tomography was introduced by David E. Kuhl, Luke Chapman and Roy Edwards in the late 1950s.

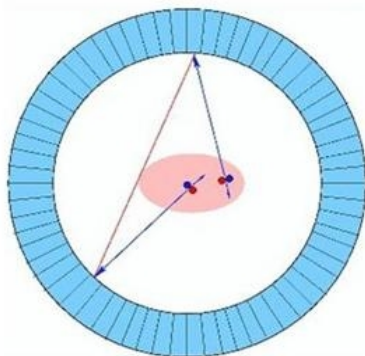

A good PET description:

- ❖ G. Muehllehner, J.S. Karp, *Phys. Med. Biol.* **51** (2006) R117-R137
- ❖ T.K Lewellen, *Phys. Med. Biol.* **53** (2008) R287-R317

# PET - physical limitations & problems

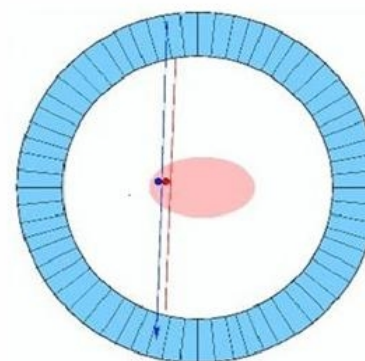

Random coincidences

Scattered photons

Parallax error

Time resolution

Energy resolution

Spatial resolution

- ❖ B.J. Pichler, H.F. Wehrl, M.S. Judenhofer, *J. Nucl. Med.* **49/2** (2008) 5-23
- ❖ N.E. Bolus et al., *J. Nucl. Med. Technol.* **37/2** (2009) 63-71

❖ P. Fonte, A. Smirnitski, M.C.S. Williams, *NIM A* **443**, 201-204 (2000)

❖ A. Blanco et al., *Nucl. Instr. Meth.* **A508**, 88-93 (2003)

# Scintillator-based vs RPC-based PET

- High price
- Higher sensitivity for scattered photons
- Energy measurement
- Parallax error
- Time resolution  $> 200$  ps
- Spatial resolution  $\sim 2$ -3 mm
- PMT, APD, ...
- FOV 16-25 cm
- Much cheaper
- Sensitivity decreases with E
- Practically no parallax
- Time resolution  $\sim 30$  ps\* , even 20 ps, Williams et al. Nucl. Instr. Meth. A 594 (2008) 39-43
- Spatial resolution  $\sim 300$   $\mu\text{m}$
- No need of PM
- Not affected by magnetic fields
- Large area  $\rightarrow$  large FOV  $\sim 1$  m
- Main problem: increase efficiency for 511 KeV photons

\*The quoted resolution is for charged particles and is not so good for gammas:

- ❖ C. Lippmann et al., Nucl.Instr. Meth. A 602 (2009) 735-739
- ❖ L. Lopez et al., Nucl.Instr. Meth. A 573 (2007) 4-7.
- ❖ A. Blanco et al., Nucl. Instr. Meth. A 508 (2003) 70-74.

Without ToF:  
 $\Delta Z = \text{LOR} (\sim 70 \text{ cm})$

With ToF:  
 $\Delta Z = C \cdot (t_2 - t_1) / 2$

if  $\Delta t \sim 100 \text{ ps} \Rightarrow$   
 $\Delta Z \sim 2 \text{ cm}$

**RPC**

# RPC PET R&D @ Sofia University

- Two main goals:

To increase the efficiency for 511 keV photons

To suppress Compton scattered photons

- Photon spectrum simulation (done)
- GEANT simulation of different RPC designs (done)
- GEANT simulation of multigap RPC (done)
- Prototype building and tests (in progress ...)

# RPC-PET: design & optimization

- ❖ *The simulations are performed, using Geant 4 (<http://www.geant4.org/geant4/>)*
  - *Compton scattering, photo-effect*
  - *multiple scattering, ionization, Bremsstrahlung*
- ❖ *Detector „basic unit“:*
  - two glass plates, 2 mm*
  - gas gap 300  $\mu\text{m}$*
- ❖ *Gas composition (for material budget): 85%  $\text{C}_2\text{H}_2\text{F}_4$  + 5%  $\text{i-C}_4\text{H}_{10}$  + 10%  $\text{SF}_6$*
- ❖ *Two designs are considered:*
  - *Gas-Converter (GC)*
  - *Gas-Converter-Insulator (GCI)*

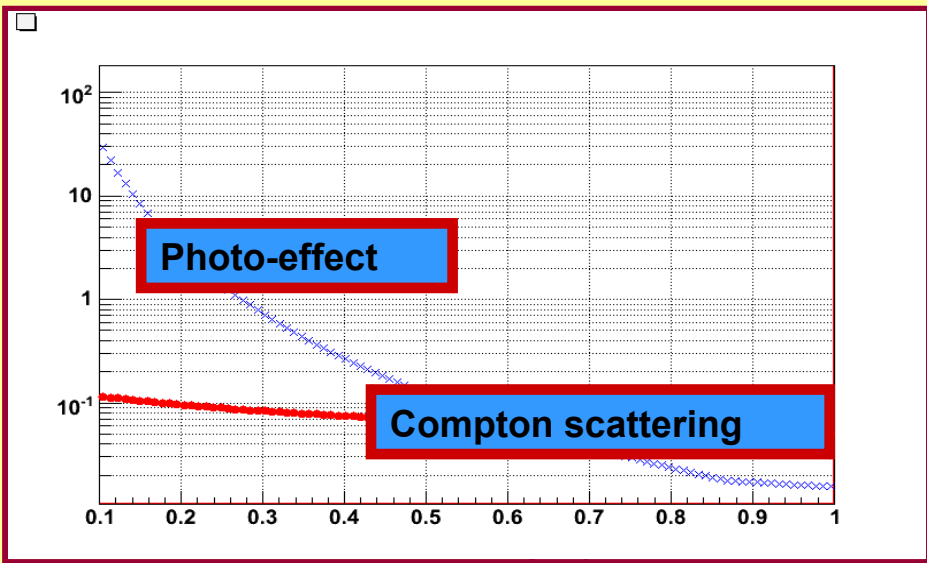

# Photon propagation in the human body

## The body model

(homogeneous parallelepiped)

$40 \times 40 \times 150 \text{ cm}^3$   
 $1.01 \text{ g/cm}^3$

38% are absorbed

82% of the remaining are with  $E < 511 \text{ KeV}$  (or 51% of the initial gammas)

18% of the remaining (or **11%** of the initial gammas) are suitable for PET

Contents:

O	61.4 %
C	22.9 %
H	10.0 %
N	2.6 %
Ca	1.4 %
P	1.1 %
K	0.2 %
S	0.2 %
Na	0.1 %
Cl	0.1 %

## Electron yield in the gas

- Successful photons conversion : at least one interaction within the converter has lead to the ejection of an electron into the gas gap:
  - photon interaction in the converter
  - electron propagation to the gas

$$\frac{dN}{dx} = kN_{\gamma} - sN$$

$$N = a(1 - e^{-x/b})$$

$$N = a(e^{-x/c} - e^{-x/b})$$

$k$  photon interaction coefficient

$N_{\gamma}$  number of photons at  $x$

$s$  electron interaction coefficient

$N$  number of electrons, entering the gas

$C$  photon attenuation coefficient

Thin converter; **a** is max e yield;  
saturation  $\rightarrow$  95% yield thickness

# Gas - converter design

Maximal electron yield (0.3 ÷ 0.38) %

Signal strips

insulator

Gas gap

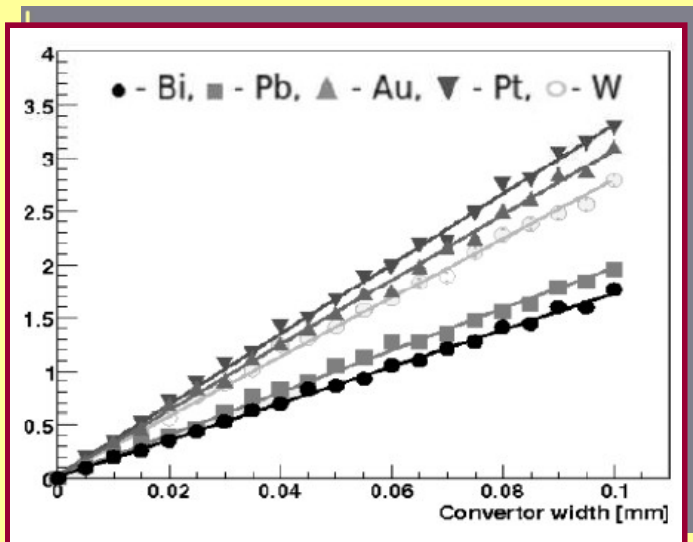

gamma

Converter

# Gas - converter design

$e^-$  yield for 5 different converter materials (% from the initial photon number)

$e^-$  yield and ejected electrons for 5 different converter materials. (% from the initial photon number)

**BUT** higher sensitivity for scattered in the body photons !

# Gas - insulator - converter design

Maximal electron yield for 511 KeV photons

$(0.315 \pm 0.005) \%$

~ 0.17% lower than in GC design

95% level

$(40.7 \pm 3.0) \mu m$

Signal strips

insulator

Gas gap

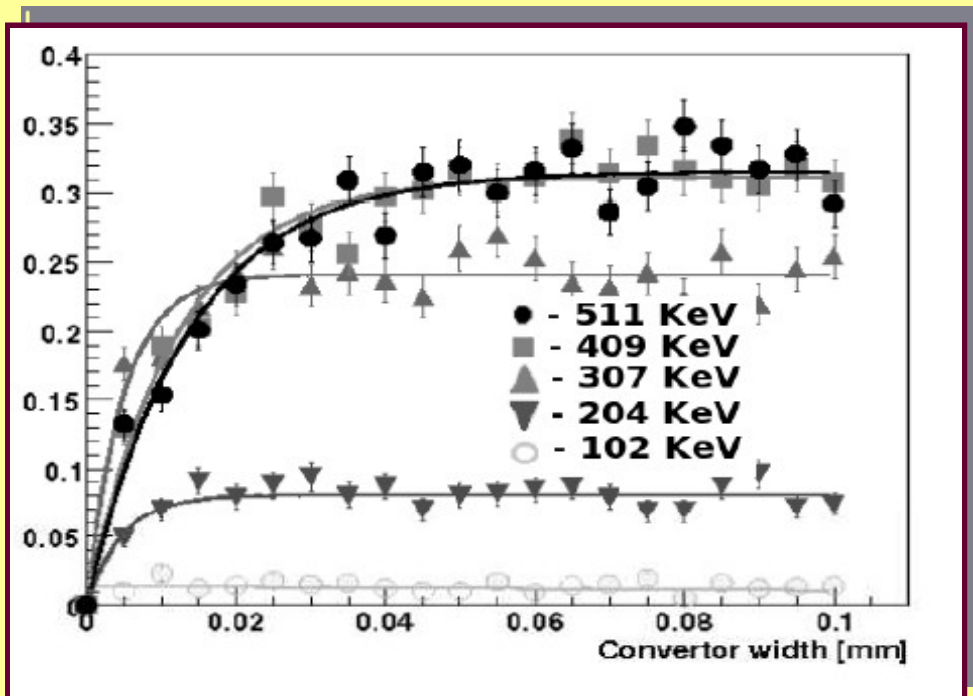

Converter

gamma

# Gas - insulator - converter design

$e^-$  yield / converter width

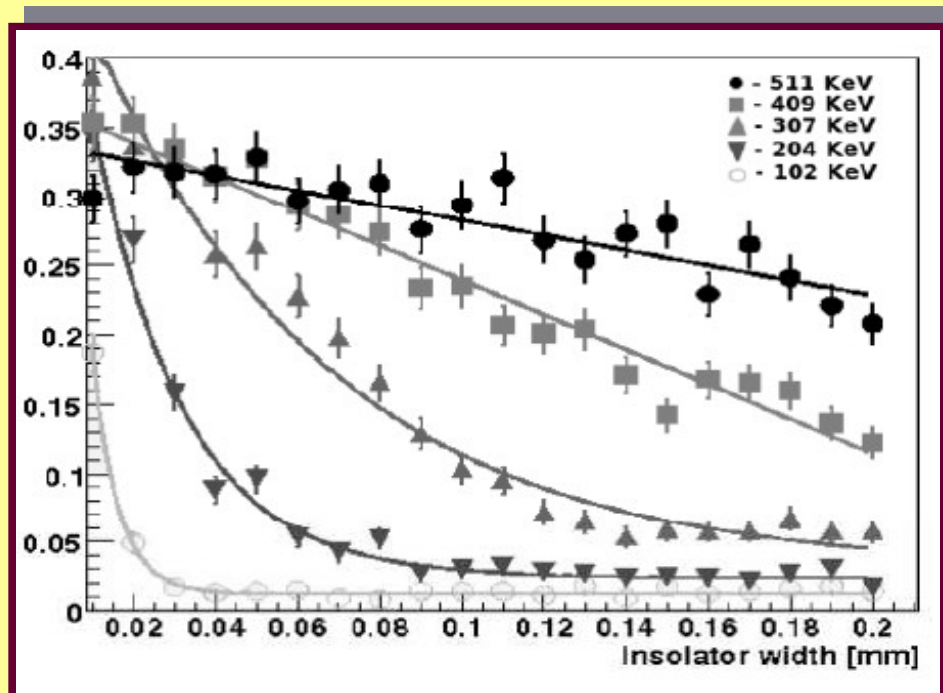

$40 \mu\text{m}$

$e^-$  yield / photon energy /  $40 \mu\text{m}$

# Gas - insulator - converter design

e<sup>-</sup> yield / insulator width

100 ÷ 200 μm

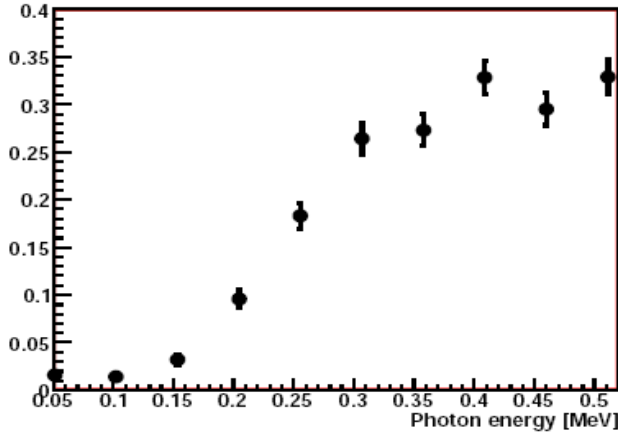

# Gas - insulator - converter design

Insolator 0.05 mm

Insolator 0.1 mm

Insolator 0.15 mm

Insolator 0.2 mm

0.1 mm insulator:

511 KeV -26% reduction

307 KeV -68% reduction

yield ~ 3:1

0.2 mm insulator:

511 KeV -40% reduction

307 KeV -90% reduction

yield ~ 5:1

The reduction is in  
Comparison to GC design.

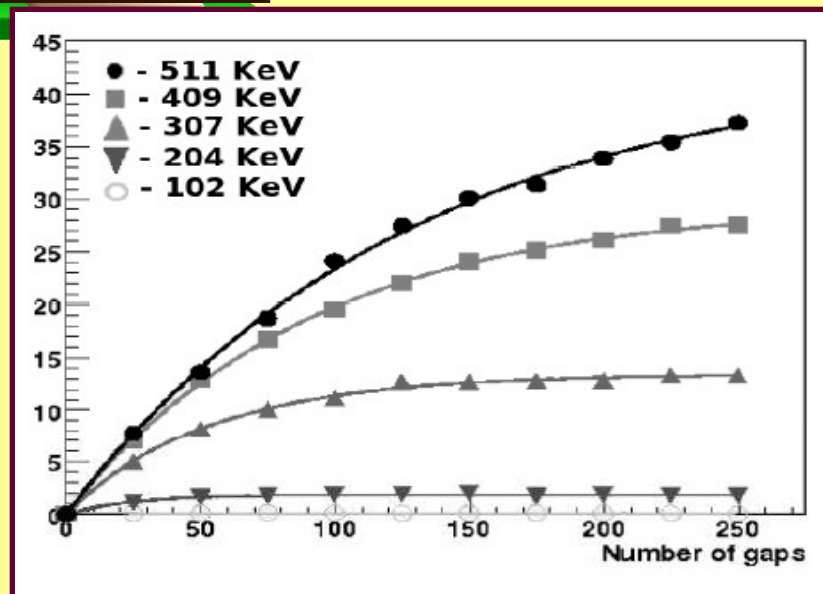

# Multi-gap GIC design

$$N = \sum_i a_0 e^{-(i-1)x/c} (e^{-x/c} - e^{-x/b})$$

max yield 511 KeV ~ 43%,  
95% level - at  $381 \pm 13$  gaps

- 100 gaps provide sufficient
- amplification
- lower-energy photons suppression

# Multi-gap GIC design

Max yield for 511 KeV:

$(23.8 \pm 0.4)\%$

converter Bi, 50  $\mu\text{m}$

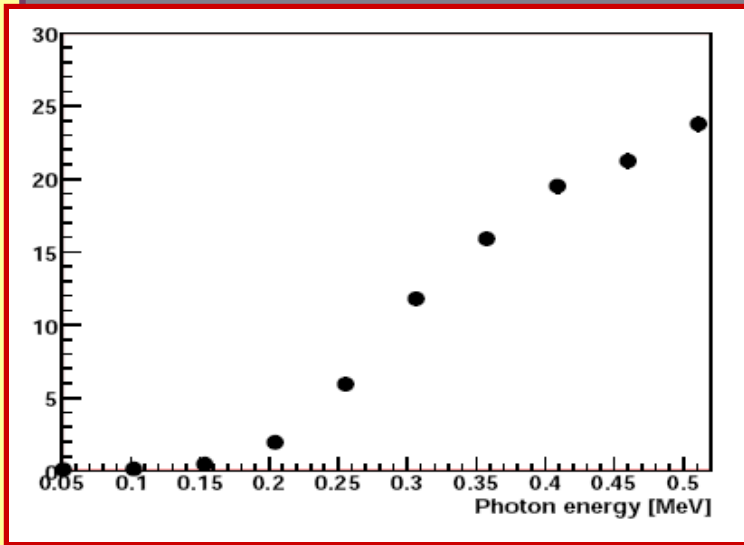

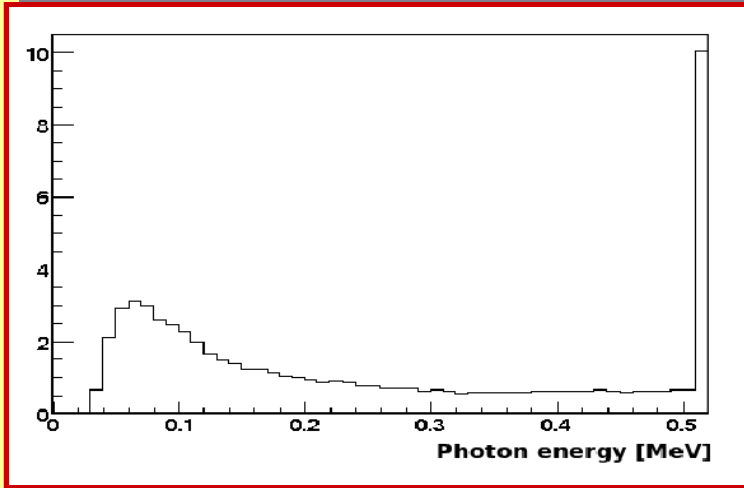

glass 50  $\mu\text{m}$

Highest sensitivity for 511 KeV

511 / 307 ~ 2:1

# Multi-gap GIC design

86% from the registered photons  
have energies  $> 383 \text{ KeV}$

## Conclusions

- Model investigations towards the design of an RPC-based PET detector;
- The intuitive direct-contact *GC* design is not optimal;
- For a sandwich-type *GIC* design the electron yield for 511 *KeV* photons decreases with 26%, but exceeds the one for 307 *KeV* photons by a factor of 2;
- In the multi-gap *GIC* design, the yield increases with the number of gaps, optimum  $\sim 100$  gaps;
- Optimized in the context of PET purposes parameters:
  - 100 gaps; 50  $\mu\text{m}$  Bi converter between 50÷100  $\mu\text{m}$  glass plates
  - the electron yield in the gas increases to 24%
  - sensitivity 511 *KeV* photons / 307 *KeV* photons  $\sim 2:1$ ;
- About 86% of the registered in the PET process photons are with energies above 380 *KeV*.
