

Readout Systems for HEP and Quantum Circuits

Luis Ardila-Perez
luis.ardila@kit.edu

Superconducting sensors MMCs (ECHO)

Monolithic CMOS sensor (LHCb)

Silicon Tracking System of the CBM experiment (FAIR)

Optical data transmission with Silicon Photonics

Processing high data rates ~50 Terabit/s (CMS)

Data visualization (USCT)

IPE has specialist groups in every step of the DAQ chain (from sensor design to data visualization/storage)

Research Interest: Next-Gen DAQ Systems

Scalable Next-Gen
DAQ systems

STAR Heavy Flavor Tracker

VME STAR HFT SSD RDO (Virtex-6)

Designed and commissioned the readout system for the Silicon Strip Detector (SSD) at the STAR experiment

CMS Phase-2 L1 Track Finder

CMS Silicon Tracker

ATCA CMS OT-DTC (Virtex US+)

Unified
Management
Mezzanine
(Zynq US+)

DAQ System for the CMS Phase-2 upgrade to read the Silicon Tracker and perform online data reconstruction

Cryogenic Superconducting Circuits

D. Richter (U. Heidelberg)

Metallic Magnetic Calorimeters

Highly precise, single particle detectors (1.6 eV at 6 keV)

Microwave SQUID multiplexed

Superconducting Quantum Bits

Building block for quantum computing

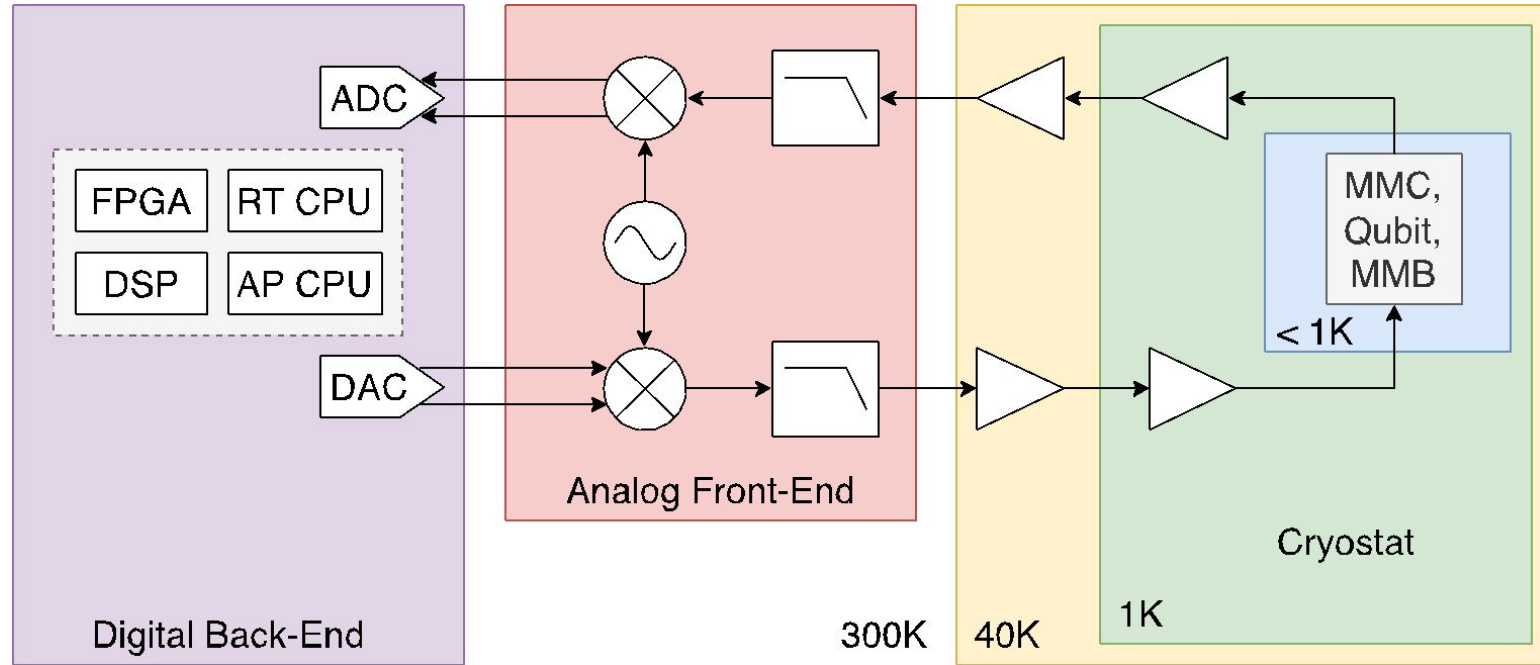

Alexander Stehli (KIT)

Key Requirements

- Operated at very low temperature (<100 mK)
- Interfaced with **microwave signals 2 – 12 GHz**
- Large signal **bandwidth** requirements < 500 MHz

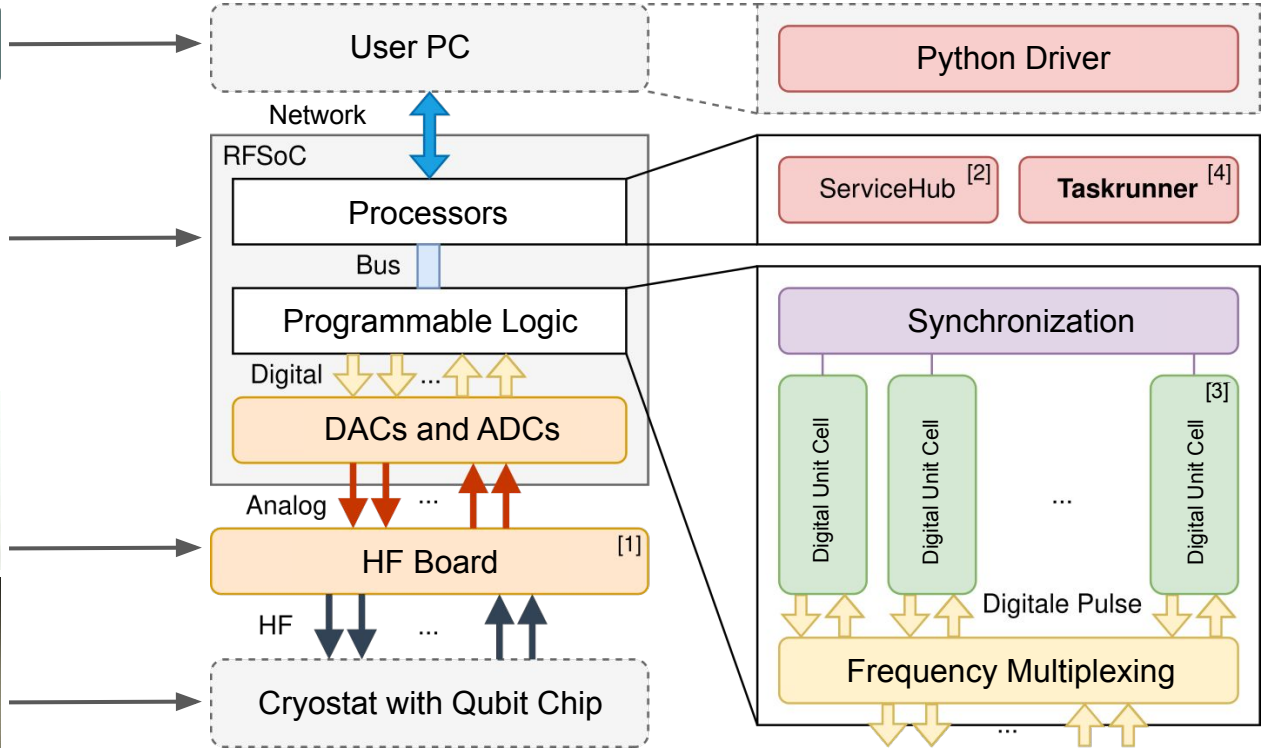

Quantum Circuits require Frequency Division Multiplexing

Software Defined Radio (SDR) System Arch.

Software Defined Radio (SDR) DAQ System with a frequency mixing stage

QiController - System Architecture

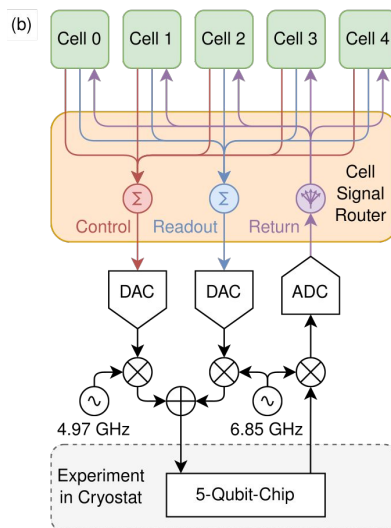

Qubit characterization, full-stack ownership, defining the classical-quantum interface.

Simultaneous Qubit Measurements

(a)

(b)

Parallel rabi experiment on a 5-qubit device

ECHo Experiment

UNIVERSITÄT
HEIDELBERG
ZUKUNFT
SEIT 1386

The Electron Capture ^{163}Ho experiment (ECHo)

- Investigates the upper limit of the **electron neutrino mass**
- Analyzes the energy spectrum in the electron capture process of ^{163}Ho
- Uses metallic magnetic calorimeters (MMCs) **BW > 1 MHz**
- Parallel readout of **12.000 sensors** using microwave **SQUID** multiplexing approach
- 400 channels per readout line with resonances between **4-8 GHz**

ECHo detector + μMUX :

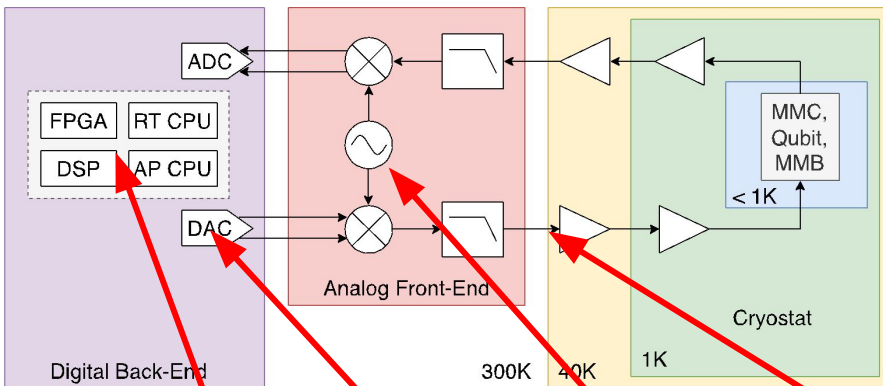

D. Richter (U. Heidelberg)

Ho^{163} spectrum:

Massively parallel detector array with 400 resonators per readout line

ECHo SDR-DAQ System Arch.

[Gartmann et al., J Low Temp Phys \(2022\)](#)

[Karcher et al., J Low Temp Phys \(2022\)](#)

DTS100G

EDCB

HDM-GS

Custom designed electronics with discrete ADCs and DACs and a wideband frequency mixer board

QUBIC Experiment

Goal: Measurement of the B-mode polarization of the Cosmic Microwave Background (CMB) radiation

(ESA Planck et. al. 2018)

-160 μ K 160 μ K

Superconducting sensors

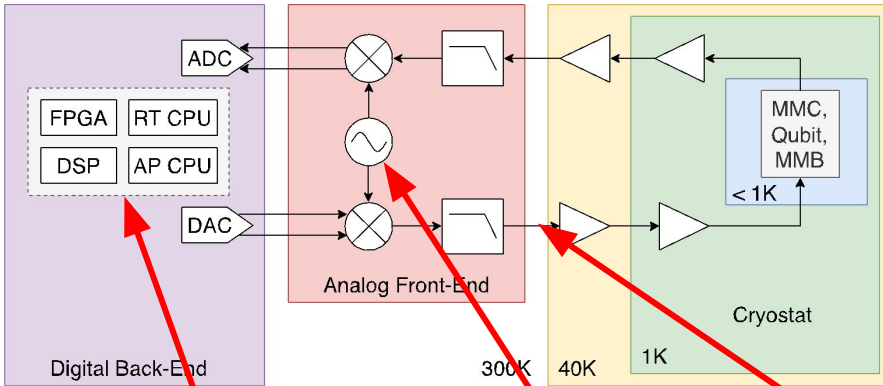

(Hamilton et. al. 2021)

Argentina

QUBIC is a telescope at the northern Argentinian Andes which measures the CMB

Qubic SDR-DAQ

- 200 channels per frequency band with 4 MHz spacing (~1000 detectors in 4-8 GHz spectrum)
- **Power spectrum** of the individual tones satisfy the SQUID multiplexer requirements (**-40 dBm**)
- **Spurious free dynamic range comparable to ECHO electronics** when signal attenuated -10 dBFs

ECHO electronics is suitable for QUBIC. However, Gen3 RFSoc devices offer higher integration factor

BULLKID Experiment

kg-scale, low-threshold and low-background Dark Matter or neutrino scattering experiment

x15

1. carving of dices in a thick silicon wafer

4.5 mm deep grooves
- 6 mm pitch
- chemical etching

0.5 mm thick common disk:
- holds the structure
- hosts the KIDs

2. lithography of multiplexed KID array

KID array
- 60 nm aluminum film
- 60 KIDs lithography

3. assembly

✓ 60 detectors in 1

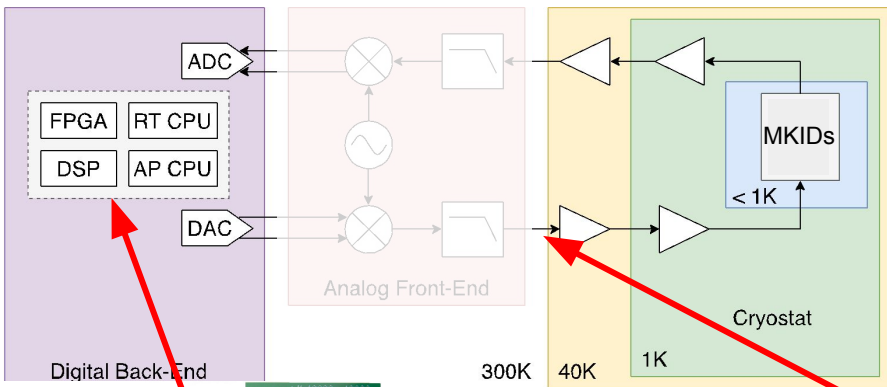

Assembly
- 3D-printed Cu holder
- Aluminum case

60 dices 0.35 g each
1 readout line

BULLKID requires 15 readout channels each with 60 KIDs and online data processing to trigger on events

BULLKID SDR-DAQ System Arch.

ZCU216

BKSFB

BULLKID Simple Filter Balun Board was designed and fabricated

IPE KryoDAQ Lab

- The **cryogenic DAQ lab** for characterization and development of next generation cryogenic detector DAQ (full chain evaluation)

T. Muscheid, R. Gartmann

Activities and goals at a glance

- Contributing to the definition of the **quantum computing stack** with a special focus on the **cryogenic - room temperature interface** (e.g., ptQube, QBriqs, QSolid)
- Delivering electronics for readout of **>1000** pixelated cryogenic detectors with a special focus on **frequency multiplexed readout** (e.g., ECHo, QUBIC, BULLKID)
- Delivering easy-to-use, scalable, highly integrated, and cost-efficient readout systems for the next generation experiments (e.g., KATRIN++)

Quantum Interface Controller (QiC) for 30 Qubits

- All interfaces communicating the different boards are available in a test setup for evaluation of their performance and influence on factors like fidelity

- A modular architecture based on ATCA was defined and it is currently in fabrication by FZJ-ZEA2 to realize a Quantum interface Controller (QiC) capable of scaling up to 100s of qubits.
